THE magnetic pole is constantly shifting to the eastward or westward of the geographical pole, being now 1,000 miles west. In 1657 it was due north; in 1816 at its western maximum, and in 1976 will be again due north, when it will take an eastern trip. These variations must give the surveyors something to do in running over old lines, and showing that the surveyors of early times did not know what they were about – discrepancies that may, in fact, be due to the shifting of the pole and the varying influences on the compass needle.

WE are told that out of the nine telegraph cables that now stretch from Continent to Continent under the Atlantic only three are in working order, and that of these three one only works one way. This last statement seems very singular, but is made on excellent authority. The fact is that the life of a submarine cable is limited at best, and that from eleven to fourteen years generally uses up the best of them. The idea, once prevalent, that a cable once safely laid down was good for all time has had to give way before discovered facts.

A GENERAL impression exists that slow-grown timber is the strongest, but this opinion does not, it is said, stand the test of experiment. There is in London a Government establishment for testing the quality and strength of all woods and metals used for Government purposes, the chronicles of which are said to be very interesting. Among other things which have been proved there is the fact that fast-grown timber—oak at least—is the strongest, and bears the greatest degree of tension.

CYCLING has assumed proportions in England such as no one dreamt of a few years ago, and the invention of tricycles available for ladies gave it a new start. There has been a most active emulation among manufacturers to produce the best article, and it is thought that this has now been attained. The clubs have arrangements with certain hotels throughout the country to accommodate them at exceptionally low rates. The most favorite route out of London is the old Bath coaching road, on account of its smoothness, but in most districts the roads are of a quality to make the American rider very envious.

AN Ohio man has, it is said, succeeded in devising an electric lamp as a headlight for a locomotive that will not prove a failure as many others have. It is so perfectly balanced that the carbons cannot shake together with the jarring of the engine. It is run by a little engine and dynamo placed on the side of the locomotive back of the Westinghouse air brake. The engine is, of course, in constant motion, and fed direct from the boiler by an eighth-of-an-inch tap. This invention will make travelling at night safer than in daytime. The electric light will show an obstruction a mile away. Collisions mostly occur on curves, but the cone of light sent out from one of these headlights would pierce the darkness so far in a straight line as to be seen from any part of the curve.

MEDALS AWARDED

EXHIBITION 1883.

(THE ABOVE CUT IS AN EXACT REPRESENTATION OF THE COMPANY'S FACTORY.)

Manufacturers of

Silver and Electro-Plated Ware

OF THE FINEST QUALITY AND DESIGN.

SPECIAL NOTICE.

The Toronto Silver Plate Co. is now in thorough running order, and is the first and only Silverware factory in Canada that manufactures the goods it sells from the raw material.

Their machinery is of the latest and most improved design, their labor as skilled as any in America, their designs are elegant and original, and they use all the newest processes for quality and finish now in use in the best United States factories.

They guarantee the quality of their goods to be equal to anything made in America. Prices will be found as low as for any goods of the same quality.

Their Flat Ware is all plated upon a base of 18 per cent. nickel silver, and guranteed to be 25 per cent. heavier plating than the regular standard quality of the best makers.

TRADE MARK.

They will be pleased at all times to show their Customers the very interesting process of manufacture in all its details, from the melting of the metal ingots to the finishing of the article.

They guarantee all goods bearing their Trade Mark.

They have now in stock Shelf and Hollow Ware of their own design and workmanship

SOMETHING NEW IN GOLD CASES

We would call the attention of the Trade to our

10 Karat Gold Cases.

These goods are manufactured by the American Watch Co. of Waltham, Mass., and are made in every Style and Size to fit the Waltham Movements. The outside, or wearing surface, is 14 karat gold. The inside, or not exposed surface, is 8 karat gold, and when taken together the case will assay 10 karat. Thus possessing every quality of a much higher grade of case, and for Style, Finish and Durability are FAR SUPERIOR TO ANY OTHER THAT IS OFFERED TO THE TRADE AT THE SAME PRICE.

Editorial.

FIRE.

The destructive conflagration last month at Port Perry, Ont., affords another and a very conclusive argument if any were needed in favor of adequate protection against the ravages of fire. A few weeks ago Port Perry was one of the busiest and most substantial towns in Canada, to-day the entire business portion of it lies in ashes, and it has sustained a loss that will take it many years to fully recover from. Like nearly all other Canadian towns, Port Perry was largely composed of wooden buildings, and the events of the past decade have fully proven that when once fire gets a hold on such a place a clean sweep is almost certain to be made. Very few of our Canadian towns are provided with steam engines and a plentiful water supply and the consequence is that most of them, and especially in dry summer weather, are at the mercy of any tramp who has enough of the devil in him to put a match to the outbuilding of some one who has perhaps refused him shelter. The case of Port Perry merchants is doubly hard, as for a long time they have been agitating to have the town buy them a steam engine and secure them against such a calamity as has just overtaken them. This it appears the majority of the ratepayers have persistently refused, alleging that as it would benefit the merchants more than any one else, they should pay for it themselves. As things have turned out, it would have been wiser for the merchants to have stood the whole expense, but as they could not see into futurity they did not do so. Now, however, that the entire business portion of the town has been swept away, the kickers have come to the conclusion that they were going against their own interests, when they refused to go in for adequate fire protection. Too late they have found that their prosperity depended almost entirely upon the merchants whose energies made it a trade centre. For the merchants who lost their all by this disastrous fire, we have nothing but the heartiest sympathy, and trust that they may very soon recover the financial ground they have lost ; for those, however, who selfishly opposed fire protection when it could have been of benefit, and who now feel the effect of the disaster, we can only say, "served them right." Through the energy of its merchants, Port Perry will soon phœnix-like rise from its ashes, a finer and a more complete town than the one destroyed ; when it does so we are certain the lesson of the late fire will never be forgotten, but that by water supply and fire engines, it will be put as far as humanly possible beyond the reach of a similar catastrophe.

THE LESSON OF THE FIRE.

The individual lesson of the Port Perry fire is not far to seek. "*Be sure you have your stock and buildings fully insured, and then even if you be unfortunate enough to be burned out you are in a position to start afresh without compliment to anybody.*"

We have written up the subject of adequate fire insurance in THE TRADER several times, but it is just as important now as it was the first time we touched upon it. We would earnestly advise every one of our readers to attend to this matter at once, and don't delay it a single day. If you have not got your stock and building fully insured, do so before you go to bed. We don't understand how a merchant can sleep soundly at night, when he goes to bed with the knowledge that should a fire occur during the night, he would rise a beggar in the morning. A word to the wise should be sufficient.

WARNING.

If we were to tell our friend Mr. Blank, the jeweler in Jonesville, that we had certain information that his store was going to be burglarized to-morrow night, we are certain he would not rest until he had exhausted every precaution in making his property secure. If our information were correct and he did not, he would be an ass of the first water.

Now while we are not in a position to telegraph to any of our readers the precise day or hour that an attempt is to be made upon their safes, we wish to draw their attention to the fact that such a thing may overtake them any day. Burglaries have been so common lately that one can hardly pick up a paper without reading of them. Why is this? We think that many if not most of the burglaries that occur are, though not occasioned, made possible by the carelessness of the person robbed. Probably no class of merchants suffer more from the depredations of those midnight prowlers than do jewelers, because their stocks are valuable, small in bulk and easily disposed of, and yet we think we are safe in saying that no class of merchants are more criminally careless in their protection. We have written up this subject at length in THE TRADER on two occasions, and we know for a fact that in spite of our warnings in several instances lately, the ordinary precautions suggested by us were totally neglected. Why this is we cannot tell. In view of the recent burglaries in Aurora, Uxbridge, Peterboro, and Cornwall, we think this an opportune time to sound a few words of warning to some of our readers who may heretofore have neglected this very important matter. In the first place we think that very many of the jewelers in Canada are unaware of the fact that

A FIRE-PROOF SAFE IS NOT A BURGLAR-PROOF SAFE AND CAN BE OPENED BY AN EXPERT IN FIFTEEN MINUTES.

No safe we think is absolutely burglar-proof ; what the ingenuity of one man has constructed, the ingenuity of some other man can destroy, if he has the time and opportunity. A so-called burglar-proof safe therefore is one that although it can be opened, will resist the operations of the burglar so long that he will not dare to tackle it for fear of detection before he can secure the contents. Then again the question of security depends very much

upon the position of a safe and the opportunity the burglar has of cracking it. A safe may be burglar proof in one position, and entirely worthless in another position, the difference being simply that in one position the burglar can work his own sweet will on it without fear of interruption, while in some exposed position he would not dare to touch it for fear that some one should see him before he had the job half done. Any ordinary fire-proof safe in Canada would afford as good protection as the best burglar-proof vault ever built, were it under the watchful eye of the "Sentry go" of the regular army, or had a wide-awake Toronto policeman sitting upon it all the time. In its ordinary position however in a merchant's store or office such a safe of this description

IS UTTERLY WORTHLESS FOR PROTECTION

against a burglar who really wants to get into it. A few minutes' drilling, a smart clip with a hammer on a small steel punch, a turn of the handle, and he is in quiet possession of the contents. Although these safes are first-class as against loss by fire, they are useless to stop even a novice in the art of burglary, and the sooner that the jewelers of Canada realize this the better. We think this is a fact that has never been brought home to the trade before. Most people when they invest in a safe, think they have purchased security, but such is not the case; they have simply purchased a mass of old iron which is no better protection against burglary than a wooden safe. For our part we think

THE SAFE MAKERS ARE VERY MUCH TO BLAME

in this matter, and while it is probably true that they don't misrepresent the goods, and sell a fire-proof safe only as a fire-proof safe, still they do not state the whole truth about it. We think they should state plainly to every customer buying a fire-proof safe that it was not burglar proof in any way and could be opened by an expert in fifteen minutes, and that they took no risk in the matter. As we said before very few jewelers are aware of this fact, and we are certain that had it been properly represented to them at the time they would never have dared to trust their all to the protection of such a sham. In doing this we think the safe makers would have consulted their own interests, for while it would not have deterred any person from buying a safe at all, many if not the most of their customers would have willingly paid a higher price in order to get something on which they could depend. As the matter now stands there are

THOUSANDS OF THESE WORTHLESS SAFES IN CANADA,

and to their tender security millions of dollars are entrusted every night in the full confidence that they can be really depended upon to keep it in safety. When a victim of this misplaced confidence comes down to his store some morning and finds that he has been cleaned completely out during the night, he feels like including safe makers as well as princes in the old scriptural injunction regarding whom to trust. This is a very important matter and the sooner our safe makers awake to the gravity of the situation the better for the future of their business. In the meantime in reference to these fire-proof safes that the country is flooded with we think that the safe manufacturers should devise some means of rendering them secure, and the sooner they provide

A REMEDY FOR THEIR PRESENT INSECURITY

the better. This we think they could do very easily in two ways, each of which would add very much to their security at a very moderate cost. We think that a plate of chilled steel hard enough to resist a drill, should be fastened on the inside of the door so as to protect the lock, and that the part of the lock that is now broken off by the burglar's punch and which is made only of cast iron, should be replaced by one of wrought iron or steel. Both of these things could be easily and cheaply done, and although they would not make an ordinary fire-proof safe into a burglar proof one, they would make it very much stronger and more trustworthy. We don't think there is a merchant in Canada who would refuse to have such an improvement made upon his safe, were it offered to him at a reasonable price, and we think that it would pay every safe manufacturer to offer to fix safes of his own manufacture at as near cost as possible. So much for this part of our subject. There is an old adage and a very true one which says that

AN OUNCE OF PREVENTION IS BETTER THAN A POUND OF CURE,

and in no case is this more true than in the prevention of burglaries. As we said at the outset of this article we have written this matter of prevention up fully in The Trader on two different occasions so we shall not do more here than simply draw the attention of our readers to some of the safeguards we have before pointed out. *The first is position.* Every merchant should have his safe in an exposed part of his shop, facing the window and as near to it as possible. (2) *Plenty of light.* There is nothing a burglar dreads so much as daylight or plenty of artificial light, therefore keep a good clear light close enough to your safe to show it up plainly. A safe well lit up and in such a prominent position that everyone passing the store is sure to see it, is pretty safe from any attempt at burglary. (3) *A good live dog.* Every jeweler's safe should have a watchman of some kind or other. If you cannot get a man to watch it, a good dog is the next best thing, especially if added to a good voice he have the grit to put his teeth into an intruder.

These things are all simple and inexpensive, and better than all, although not absolute protection, they add very materially to the safety of any merchant's stock. There is

STILL ANOTHER PRECAUTION

that we think every jeweler in Canada should adopt regarding their stock, and although it may not do anything towards keeping out a burglar it may add materially in his detection and in recovering the goods. And that is, *let every jeweler keep an accurate list of every watch movement and case he buys or sells*, so that if at any time he should be robbed he can give the police a clue whereby the goods can be at once recognized if offered for sale anywhere. As things now are, the police often get goods into their possession without any idea of who the owner is, but had they such a list of numbers of watches and cases and such like articles they could at once identify them. In conclusion we can only say that the danger of burglary is more real than apparent. A burglar never gives any premonitory warning. He lays his plans, strikes and vanishes, and it is only by accident that the old hands are ever caught. If any of our friends are ever unfortunate enough to have their safes burglarized, remember that the first thing to do, after notifying your local police, is to telegraph to the chiefs of police in all the neighboring towns and along the border, so that their escape may, if possible, be cut off. Prompt action in this way is often productive of good results.

PERIPATETIC SWINDLERS.

There is scarcely any line of legitimate trade that offers so many opportunities to unprincipled adventurers and swindlers to exercise their talents in as the jewelry business. Speculators and swindlers are constantly devising ways and means for deluding the unwary under cloak of being dealers in jewelry or kindred goods, and the legitimate trade not only suffers great loss of custom from their "tricks and their manners," but have to bear the stigma of being engaged in dishonest practices. Not only is the trade injured in reputation by these adventurers, but retail dealers frequently find their market for goods seriously demoralized by reason of its having been flooded with spurious and worthless goods, made expressly to deceive the ignorant and the unsupecting. Among the worst of these unprincipled adventurers is the travelling auctioneer, who goes about the country with a stock of spurious goods which he sells to the lowest bidder as genuine. Their plan is to visit a city or village, hire a vacant store, and therein exhibit their cheap and worthless stock. The residents of the place and the farmers in the vicinity are then notified by handbills and circulars, that there is to be a "bankrupt sale of a stock of choice jewelry, plated ware, cutlery, etc." Assurances are freely given that these goods constituted the stock of some large dealer in a distant city who has just failed, and a peremptory sale of the goods has been ordered. Occasionally these auctioneers claim to represent some manufacturer who has been obliged to take this mixed stock to secure an amount due him, and a quick sale is necessary. The auctioneer swindle has been quite extensively worked, and the auctioneers, strangers of unknown reputations, have induced people to buy their cheap and valueless goods who would scarcely think of spending a dollar with the resident dealer, well known in the community, for fear of "being swindled." In many instances these auctioneers are backed by some eastern manufacturers of bogus goods, made expressly for this business; or by some western jobber in such goods, who keep the auctioneers stocked up with whatever they require. Their gold goods, so-called, have no right to be so designated, for the reason that so little gold enters into their composition that it would be a perfect surprise to it if it were ever detected by the process of assaying. Their plated goods are made of cheap, trashy stuff, having the thinnest possible film of silver plating that can be deposited thereon by the electro plate process. Their other goods are all of the "skin" kind, having no intrinsic value whatever, for when a few days' wear takes away the gloss, what remains is useless. Yet these auctioneers work off large quantities of this stuff every year, the profit on which is very large. The American people, as Barnum says, delight in being humbugged; we may add that they also delight in being swindled, otherwise they would not be caught time after time, and year after year, by the same old dodge and the same artful dodgers. A safe rule to follow is to have nothing whatever to do with auctioneers who sell jewelry unless you know that the stock they offer was the legitimate stock of a legitimate dealer. Occasionally a jeweler is obliged to sell his stock at auction, but when he does so he is very careful to give the public an honest description of his goods. It is the peripatetic, unknown, irresponsible auctioneering adventurers that are to be avoided. It is safe to regard all such as swindlers and their goods as bogus, made, like Hodge's razors, to sell, and whoever buys is sure to be badly bitten.

Another class of peripatetic adventurers who are to be avoided are the vendors of eye-glasses and spectacles. These chaps usually advertise themselves as "celebrated opticians," whose knowledge of the human eye and its many defects, is, like Captain Cuttle's watch, which being set ahead a quarter of an hour in the morning and fifteen minutes in the afternoon, was "excelled by none and equalled by few." They advertise liberally in the local papers, and so gain the favor of the editor, and frequently announce free lectures on "diseases of the eye." Getting an audience, they recite a lot of well known facts regarding the eye, to be found in any text-book on optics, and conclude by offering for sale eye-glasses and spectacles for which they claim especial virtues. A feature usually dwelt upon is the exceeding cheapness of their goods, offering spectacles for one dollar which, they assert, the local dealer would charge them two and a half or three dollars for. They find persons, generally those past middle age, and frighten them by assuming to find defects in their eyes which bid fair to render them blind at an early day. "Madam," said one of these peripatetic quacks to a lady whose eyes he was examining, "the condition of your eyes is alarming; they are not equal in their powers of vision, consequently one is doing the most of the work; the result will be that one will be destroyed from lack of use and the other from overwork; this must be remedied; the lazy eye must be brought to pull its share of the load; here is a pair of glasses especially designed to remedy such defects, one glass being intended to hold one eye in check and to develop the full working capacity of the other; only two dollars for this pair that a jeweler would charge you five for." If the old lady had thought to ask him how many persons have eyes precisely alike, the quack would not have told her that there were very few, but would have invented more lies for her benefit. But these fellows, by their varied and ingenious devices, manage to sell many glasses at good prices that are in fact worse than worthless, for they are so inferior that they are positively injurious to the sight of whoever uses them. Such glasses as they sell can be bought for a few cents each from the manufacturers, and are so poor in quality that the local dealer would be ashamed to have them in stock. Yet people will pay these swindling quacks one, two or three dollars a pair for them, when the regular dealer would be glad to order them for them at twenty-five cents. But great is humbug and immense is quackery. All such itinerant scamps should be prosecuted for obtaining money under false pretences. The law ought to be broad enough to cover their arrest and imprisonment on the *prima facie* evidence of their advertised claims and bogus endorsements. They are unprincipled swindlers, who are robbing the public at every opportunity.

A good way to circumvent these swindling auctioneers and optical tramps is for the local dealers in the places where they advertise to appear, to get out circulars and scatter them broadcast through the community, reciting the facts above set forth. If the names of two or three dealers and well-known citizens are attached to such circulars, they are sure to have the desired effect. We have known

New Patterns of Engraving

ON

KEYSTONE

instances where this has been done with the effect of driving the peripatetic swindlers out of town before they opened up their spurious goods. Extracts from articles that have appeared in *The Circular* on this subject have been inserted in the local papers, side by side with the advertisements of the quacks with good effect on several occasions. When the public is placed on its guard in this manner, it is usually sharp enough to avoid being swindled.—*Jewelers' Circular.*

THE BURGLAR'S BANE.

It was a small back parlor, overlooking the solitary garden, beyond which was the open country, and the curious inventions in which he manifested such pardonable pride were contained in a large glazed case against the wall. At a cursory glance they did not present a very formidable appearance. Most conspicuous among them was a pair of stout solid, but otherwise ordinary looking boots, two or three door-mats, a couple of high-crowned hard felt caps, and several walking sticks with nothing peculiar in their appearance, excepting the knots and ferrules.

THE MOST ODD-LOOKING ARTICLE

of the collection, however, was an implement that bore some resemblence to a dog's collar, except that it was set round with short curved steel teeth, and that, and at what seemed to be the back of it, there was a short tube like a pistol barrel. In an adjoining case were another collection of curious implements designed to frustrate burglary in all its various branches, but I had not come on purpose to investigate the merits of the "Strangler's Bane," and, therefore, begged of him, as the time at my disposal was limited, to favour me with an inspection of that article in the first place at all events. "If you will accompany me for a few minutes into the garden," remarked the ingenious gentleman, "I will practically demonstrate to you its utility. It is my latest invention, and I think you will say not inappropriately designated it." We proceeded to the grounds behind the house, and, leaving me alone for a short time he returned equipped as though going for a country walk. He had changed his light shoes for a pair of heavy boots, his embroidered silk skull cap had been abandoned for a black hard felt hat, a muffler handkerchief was tied about his throat, and he carried in his hands a substantial-looking walking stick. At first glance I did not recognize the articles enumerated, but closer inspection convinced me that they were among those I had seen in the glass case. "As I now appear," said he, smilingly confident, and pacing up and down in order that I might view him in all points, "I flatter myself that I am a match and considerably

MORE THAN A MATCH FOR THE MOST DETERMINED PAIR OF RUFFIANS

that ever attacked an unsuspecting traveller, though I think I may venture to say that you have no more idea of the secret of my strength than the enemies of Sampson had of his before he was betrayed into revealing it." I knew, at all events, that the secret was not concealed in his hair, as was the case with the slaughterer of the Philistines, since, as already stated, I had seen him with his cap off, and his scanty locks had been somehow scorched off his cranium. I made a guess and suggested that he no doubt relied on his stick for immunity from danger in the event of any unsuspected attack being made on him. "It is an improvement on the ordinary sword-stick I presume," said I. It seemed to gratify him immensely that I should be so wide of the mark. "Well the fact is," he replied, "I could really do without the stick altogether. It is useful but by no means indispensable. Its purpose is to summon assistance to the spot where I happened to be attacked, though, unless more than a couple of fellows set on me, I could easily tackle them without any help. You shall see how the whole machinery works." He called out "Joe," and a man made his appearance. "This is my gardener," said the inventor, "and he is accustomed to assist me in my experiments. You of course are aware that the plan adopted by the villains who lurk in dark and unfrequented places to attack the unwary is to spring on their victim and grasp him round the neck from behind, and so hold him half-throttled whilst the second robber assists in front and dispossesses him of all he may happen to have in his pockets. Joe, here, will

ACT THE PART OF A GARROTER.

You have got your thick leather gloves on, Joe? That's right. You may as well bob down when you grasp me. There is no bullet in the barrel, of course, but the flash of the powder might hurt your eyes." Joe, with a perfectly serious countenance, touched his cap, and retired a few paces to the shade of a large bush of holly near the path, and his master, buttoning his coat and tucking his stick under his arm, proceeded to enact the part of a person walking briskly along the Queen's highway. He took a couple of turns to and fro on the gravel path, and then, as he passed the lurking gardener, he gave him a nod to indicate that now was his time. Acting on the hint, the latter promptly sprang out of hiding, and seized his master from behind, gripping his throat with both hands. What immediately ensued caused me to hold my breath in amazement. Whipping the short stick from beneath his arm, the ingenious inventor of the Strangler's Bane struck the knob of it smartly on the ground, then raised it with an upward jerk, and

INSTANTLY FOLLOWED A TREMENDOUS BANG,

and at the same moment, with a sounding whiz, there mounted into the air something like a rocket, only instead of bursting when it had accomplished its skyward flight it remained in the shape of a blue star floating as high up as the housetop. Nor was this all. It was well for Joe that his hands were protected by the thick leather gloves, and that he bobbed down as he had been directed. No sooner had he spanned his master's throat than a row of crooked steel teeth penetrated the muffler and partially pierced the tough buckskin, while, as though operated by one and the same agency, a crack as of a pistol shot was heard, accompanied by a flash, both proceding from the region of the nape of the attacked one's neck. Even this was not all. He stamped his heel in quick succession on the hard gravel and straightway there sprang out of the toe part of the heavy double-soled boots a bayonet-shaped spike, about three inches in length and evidently sharp as a needle. Two similar though not more than half the length of the others, appeared likewise at the heels. With much more coolness and determination than an actual garotter would have displayed on such bewildering conditions, Joe stuck to his man until the latter kicked out backwards, and then had to skip back with considerable liveliness to escape the spur. Instantly the victim faced round on his assailant and made a stab at him with the dagger that by this time appeared at the ferule extremity of the walking stick, and Joe, instantly succumbing, fell on his knees and was at his victorious master's mercy. —*Exchange.*

ROLLED PLATE GOODS.

We have received numerous inquiries of late from dealers throughout the country who are desirous of knowing why it is that they do not get as good a quality of rolled-plate goods as formerly. Several causes combined have had a tendency of late years to induce manufacturers to make an inferior quality of rolled-plate goods. The principal one is the largely increased demand for cheap goods coming from outside dealers. Dry goods merchants have added to their stocks lines of cheap jewelry, consisting of sleeve buttons, scarf pins, ladies' bracelets, pins, etc., while gents' furnishing-goods dealers now carry full lines of gentlemen's jewelry of the cheaper sort. This is mostly rolled-plate goods,and these outside dealers have been constantly clamorous for cheaper goods. Quality possesses no merit in their eyes—they want cheap goods that are attractive and will sell readily. Not being regularly in the trade, they do not fear after-consequences for no one ever thinks of returning cheap goods bought at a cheap place because they are cheap. A regular dealer, however, must face the consequences if he sells goods that do not give satisfaction. To meet the outside demand for cheap goods, manufacturers have been obliged to reduce the quality, and, as a consequence, much of the rolled-plate goods to be found in the market are far inferior to those made a few years ago. The plate put upon the base metal is not so thick as formerly, while the gold embraced in it is not of so fine a quality. Eight and ten karat plate has taken the place of fourteen and sixteen karat, while the plate has lost its thickness and is but the semblance of what it formerly was. These goods look well when new and fresh, but they will not wear with any satisfaction. Rolled-plate goods of the old sort were good for ten or twelve years' wear, but the modern plate will scarcely wear a year, and, beside, is clumsily made. There are some manufacturers of rolled plate who still maintain the old standard, and whose goods are as meritorious to-day as ever, but there are many others who have so debased their products that they scarcely possess a symptom of gold.

The remedy for this lies in patronizing only those manufacturers of rolled plate goods who make a good article, and who do not seek the orders of outside dealers, but confine their sales strictly within the trade. There are many manufacturers who do this, and such men are entitled to the confidence of the trade. They make cheap goods to be sure, but they sell them for just what they are, and to meet a legitimate demand. A still better way to meet the evil complained of is to educate the people to an appreciation of the better grades of goods; to teach them the difference between cheap and flashy jewelry and goods possessing intrinsic value combined with beauty of design and elegance of workmanship. Fortunately, the people are rapidly acquiring this knowledge, and the demand for the better grades of goods has never been so great as now. But there will be a demand for rolled plate goods, and it is unfortunate that a certain class of manufacturers are so debasing the quality of them as to bring them into discredit. Some of the rolled plate jewelry now in the market is little better than fire gilt, and will tarnish almost as quickly. Legitimate dealers in the trade should refuse to buy such goods, but should leave their sale exclusively to the dealers in furnishing goods and Yankee notions. In France the law will not permit imitation goods to be sold in the same shop where genuine goods are kept. It is not possible to apply such a law to the trade in this country, but retailers themselves should draw a broad line of demarkation between jewelry proper and the "cheap and nasty" stuff that is sold by dry-goods merchants, fancy goods dealers, and curbstone vendors. There is a distinction between the goods broad enough for anyone to see, and they will find it to their interest in the end to refuse to be identified with the latter class. The trade in rolled-plate goods is legitimate, for there is a legitimate demand for them; but the traffic in "skin" goods will not be countenanced by dealers of respectability.—*Jewelers' Circular.*

BUSINESS CHANGES FOR JULY.

W. H. McCaw, jeweler, Port Perry, burned out. Laing & Meharry and T. W. Parrish, hardware, Port Perry, burned out. Von Gunten Bros., jewelers, Chatham, offering to compromise. Wood & Leggatt, hardware, Hamilton, have admitted H. Vallance and W. A. Woods as partners, style as before. W. F. Johnston, hardware, Arthur, Ont., sold out to B. Johnston. Estate of C. A. Rothwell, Strathroy, Ont., jewelry and fancy goods, sold out. C. D. Graham, jeweler, Ottawa, assigned in trust. J. L. Cassidy, wholesale crockery, Montreal, asking an extension.

BUSINESS NOTES.

The Burglar-Proof Safe question is apparently going to be a live one in Canada amongst our jewelers. We would advise every one of our readers to read the editorial on it in this issue, and then look into it at once.

The "Keystone & Boss" case people are making a big push for this fall's trade, and their new line of goods appears to embrace all the novelties and improvements possible in an ordinary watch case. The well-known reliability of their goods makes their continued success beyond a peradventure.

We understand that the Bates & Bacon filled cases, especially those made on their patent dust-proof principle, are having a big run in the States. The manufacturers are a thoroughly reliable firm, whose trade mark is always a guarantee for anything bearing it, and we predict for their goods a favorable reception in Canada.

In our advertising columns will be found a few cuts of Quigley's new patent case, shewing how it appears when open or closed. This case is fast becoming popular in Canada, and we are informed that in the States a manufacturer has purchased the patent, and is pushing it for all he is worth. From this it looks as though Canadian inventive talent were coming to the front.

The recent cut of the Waltham Watch Co. seems to have completely demoralized the watch business in this country. What's next, everyone is asking, and this is a query that no fellow can explain. The probability is that the good crop in the U. S., and consequent revival of trade will make prices advance in the near future all along the line.

The store of Mr. A. M. Gilpin, jeweler, of Uxbridge, Ont., was entered by burglars on the night of the 7th July, the safe forced open and worth about $2,000 of goods stolen. Detectives have been placed upon the job, and as things at present stand, strong hopes are entertained of getting the goods back in the near future. If this can be accomplished and the burglars secured they should be rigorously dealt with.

The filled case business is apparently going to suffer or benefit, which ever way it may turn out to be, from plenty of competition. Formerly there were but two manufacturers in the United States. Now half a dozen are claimants for public favor. Amongst others, the Dueber Watch Case Manufacturing Co., one of the largest in that country, are in the market, and it is needless to say that in this line of goods, as in everything else they turn out, their work is first-class in every respect. Some of their new engravings are very fine, and their goods all around must make a favorable impression amongst the trade.

Amongst the sufferers of the Port Perry Fire, we are sorry to learn, was Mr. W. H. McCaw, the well-known jeweler. Mr. McCaw had, by hard work and close attention to business, succeeded in making himself comfortable, and his friends, and the trade generally, will sympathise with him in the heavy loss he has sustained. We understand that Mr. McCaw

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

with his accustomed energy, intends rebuilding his store on the old site. In the meantime he has improvised temporary premises.

ANOTHER of the sufferers in the Port Perry fire was Mr. T. W. Parish, hardware merchant. We had a call from him while in the city the other day, and he was loud in his praise of his "Taylor" safe, which he said had received the hardest test that any safe could have been put to. After the building had been burned the safe fell into the cellar into the coal oil tank, and got a second roasting from flames as hot as could be got up anywhere this side of Hades. In spite of this double mishap however, when opened, the contents were found to be all right. Mr. Parish says that the J. & J. Taylor safe is the one for his money.

WORKSHOP NOTES.

CARBOLIC ACID ON METAL CUTTING TOOLS.—Carbolic acid is recommended for moistening the tools with which metals are worked. The efficiency of the grindstone is even said to be increased by the use of the acid. The dark and impure acid can be used for this purpose.

GOLD-COLORED VARNISH.—For preparing a gold-colored varnish, pulverize 1 drachm of saffron and one-half a drachm of dragon's blood, and put them into 1 pint of spirits of wine. Add 2 ounces of gum shellac and 2 drachms of Soccotrine aloes. Dissolve the whole by gentle heat. Yellow painted work varnished with this mixture will appear almost equal to gold.

RE-SHARPENING OLD FILES.—First clean well with scratch brush, then with benzine; see that the file is thoroughly clean, then place it in a bath of the following solution: One part acid, five parts sulphuric acid. Let it remain for three or four days or until the edges of the file are fully restored. Wash thoroughly with water to remove the acid, when the file will cut as good as new.

RE-LACQUERING BRASS ORNAMENTS.—The following is a good method for re-lacquering brass ornaments: Wash the objects in a hot solution of potash (made pretty strong). When the lacquer is removed the articles should be washed and dried, then re-polished before lacquering; clean well and wipe with lime. Then when free from rust or dirt, warm on a stove until just hot enough to hold, then lacquer with either brush or piece of raw cotton.

RUSSIAN NIELLO.—The composition of the Russian tula or niello silver has hitherto been kept a secret to the *Berliner Tageblatt*. The firm of F. Zacher & Co., in Berlin, have discovered the method of manufacture and have made it in large quantities. It consists of nine parts silver, one part copper, one part lead, and one part bismuth, which are melted together and saturated with sulphur. This mixture produces the gorgeous blue which has often been erroneously spoken of as steel blue.

BRITTLE GOLD.—The goldsmith is often puzzled to soften gold so it can be forged out thin without cracking and breaking. Some gold can be forged out easily while others is very hard and brittle, because the impurities or alloys, such as a little lead or zinc, tend to make it so. Melting over a stone coal fire would do the same. Gold should be melted over charcoal or coke, and, if of low grade, should not be exposed to the heat too long. If it has no "grain" melt again. If it does not take grain then melt again and add a little saltpetre, and, a little later, some borax. For ordinary meltings fuse with borax, stir well and add a little sal ammoniac just before pouring it out. In forging gold it should be annealed as often as it begins to get hard and brittle. Low grade gold needs annealing oftener than finer gold. Heat red hot and let cool without tempering.

AN INDIAN BRONZE.—The Hindoos possess a remarkable ability for making alloys of iron, copper, zinc and tin. Let us cite the Biddery; the alloy is called after the city where it is most prepared and found in all its purity. The eminent qualities of this alloy are that it is non-oxidizable in and even if the latter is charged with humidity, under the burning tropical sun. It is perfectly malleable and does not crack except, perhaps, by violent blows. Objects of art manufactured from this alloy are colored black by plunging them into a single solution of saltpetre and sal ammonia or sea salt and blue vitrol. One receipt for preparing the alloy reads as follows: 16 parts copper, 4 lead and 2 tin, melted together. Zinc is combined with this mixture in a proportion of 3 to 10. Doctor Hamilton gives another formula: zinc, 126 parts; copper, 460; lead, 414; no tin. These ingredients are finely crushed and inclosed in a crucible with a mixture of beeswax and resin, to prevent calcination and to simply effect fusion. The fusing alloy is run into an earthen mould and shaped into the desired form. To give it a black color, a solution of sulphate of copper is used.

OTHER NOTES.

A WRITER in England has been trying to remember whether there were not opals among the wedding presents of the Duchess of Albany. He is inclined to believe that there were. "No jeweler in London," he writes, "would let a young man buy an opal for an engagement ring, any more than an emerald."

THE ingenious Dr. Farr, calculates that the march of 1,000,000 children through life will be about thus: Nearly 150,000 will die the first year, 53,000 the next, 28,000 the third, and so on to less than 4,000 in the 13th year. There will be 500,000 alive at the end of 45 years, 370,000 at 60, 90,000 at 80, 38,000 at 85, 2,100 at 95, 223 at 100, and at 108 there will just be one survivor to tell the tale.

THE latest wrinkle in photography is a *fac simile* of a postage stamp with the portrait of any one who chooses to pay for the curiosity in the centre. The stamps are made in large sheets, containing 100 pictures each, and the edges are punctured so that they can be separated just like the government stamps. The portraits are not taken from life, but from ordinary card or cabinet photographs.

TEN years ago neither India, Australia, nor the Argentine Republic, had sent a cargo of wheat to Europe. This year the amount of exportable wheat from India, is estimated at 50,000,000 bushels, from Australia 25,000,000, and from the Argentine Republic at 10,000,000 bushels, a total of 85,000,000 bushels. In each of these countries the opening up of the country by railroads is stimulating wheat production in a surprising manner.

SPONGE-PLANTING is an enterprise that some speculative Frenchmen have on foot. It is proposed to bring the sponges from the waters of Syria and the Archipelago. They will be carefully selected, placed in a box pierced with holes, along with the rocks to which they were found adhering, and transplanted in that part of the Mediterranean that washes the shores of Algeria and France. Three years at least will tell whether Frenchmen will continue to pay at the rate of almost fifty francs a pound for sponges.

Editorial.

THE OUTLOOK.

As usual at the opening of the fall trade every merchant and manufacturer is asking himself, "What are the prospects ahead? Shall I lay myself out for a large or a small trade? What is my best policy?" The lesson of last year has, we think, not been thrown away in this country, and our merchants have profited more by it than many people imagine. The premonitary warnings of a commercial crisis were, we are glad to say, heeded with almost as much alacrity as the whistle of "down brakes" is obeyed by a brakeman on a passenger train, and the result has been that although we did not get off altogether "Scot free," the damage was very slight compared to what it would have been, had the warning not been promptly attended to.

The effect of this action has been a very decided decrease in our imports, and as a consequence, lighter stocks have been carried by both wholesale and retail dealers all over the country. Buying has been more carefully done than formerly, indeed as a rule with the generality of merchants it has been simply a hand to mouth purchase of goods, enough to keep their assortment up. As a rule payments have been fully up to the average, so that in a general way, our merchants to day stand fully better than they did at this time last year. As a rule although their stocks are lighter, they owe much less than formerly, and are in a position to buy if the prospects of trade seem to warrant such a conclusion.

As all our prosperity comes from the soil, we naturally turn to our crop reports in order to form an intelligent idea of what trade may be expected during the coming months. From Manitoba and the North-West we learn on reliable authority, that the wheat crop in those provinces is excellent and they calculate on having at least 5,000,000, bushels of wheat to dispose of after supplying their own wants. The effect of this large crop will be to put the North-West on its feet again and counteract in a great measure the depression that has existed there ever since the collapse of the land boom. In Quebec and the Maritime Provinces, the crops appear to be above the average and if safely harvested there is no doubt that a decided revival of trade will result from this cause. In the Province of Ontario the returns from the Bureau of Industries for August 7th, assure the fact that the crop in this province is the best it has had for years.

The fall wheat gives an average yield of 21⅓ bushels, and the spring wheat of 18⅓ bushels per acre—the average of both being 20 bushels—and the aggregate production exceeds that of last year's harvest by 10,360,000 bushels. Barley was a good crop in the southern and southwestern counties of the province, but in the northern and northeastern counties it was affected by the summer drought. The grain, though plump and heavy, was in large areas discolored by the rain showers of the last week of July. The accounts of the oat crop are much the same as for barley, but, being two or three weeks later in ripening, it has been greatly benefited by the July rains, and the yield will probably exceed the estimate. The area in rye is much less than last year, and the average yield about the same. Peas is a bountiful crop, and it is ripening under the most favorable circumstances.

The area and production of the foregoing crops is as follows :

	1884	
	Acres.	Bushels.
Wheat	1,586,961	31,730,344
Barley	701,435	17,860.777
Oats	1,485,620	49,383,000
Rye	104,141	1,630,417
Peas	570,628	13,106,062

From the above reports it will be seen that in this country the conditions are all favorable to a good trade for the forthcoming season. We shall be surprised indeed if business this fall, although probably later than that of last year, does not largely exceed it in volume and safety.

A NEW COMPETITOR.

It has generally been accepted as sound common sense that no Government should ever engage in any business that can be better accomplished by private enterprise. Thus while we have Government mail service and in some countries telegraphs run by Government, as a rule these private enterprises do not clash with private business.

It seems, however, that the Government of Canada is going to lead the van in a new departure from the above usually recognized lines, inasmuch as they propose to sell direct to the consumer such articles of merchandise as they may from time to time confiscate on account of disobedience to the existing customs regulations.

We have before us this moment a Government advertisement, clipped from a Winnipeg paper, which sets forth, "That an auction sale of $10,000 worth of confiscated jewelry will take place at the ware, house of a well known Winnipeg auctioneer on Tuesday the 12th day of August, at the hour of 8 o'clock p. m. and on the following evenings until all the goods are disposed of." This interesting advertisement is dated from the Custom House at Winnipeg and signed by W. R. Mingaye, Collector of Customs for that Port.

Now we do not know whether this auction sale of jewelry is run by Mr. Mingaye on his own account, or whether it is with the consent of the Customs Department, but whichever it is, it is a disgrace to the country. It is however very much in keeping with many other arbitrary things that the Customs Department do at the present time, which many good conservatives will retaliate for by voting against the Government at the next general election. How any Government possessing an ounce of brains, expects to keep in power by exacting 20 or 25 per cent duty upon the goods imported by merchants, and then spoils the business of these merchants by offering to their customers at public auction, similar goods upon which neither duty nor original cost had been paid, we fail to understand. The merchants of Canada in general and Winnipeg in particular may be long suffering but they are not fools, and when they do take action as

they will shortly be compelled to do regarding the present customs abuses, the Government will either have to take back water or stand from under.

It is possible that the Customs Department at Ottawa are ignorant of Mr. Mingaye's action in this matter, if so the sooner they go to work and straighten Mr. Mingaye out, the better for Winnipeg and themselves. Mr. Mingaye has the reputation locally of being a crank of the first water, and judging the man from his arbitrary and usually absurd decisions, we should say that if he has not the whip hand of the Department, that the sooner he is bounced from his present position the pleasanter things in the Winnipeg Custom House will run. As it is, his usefulness in that port is gone, and we think we only express the general feeling amongst Winnipeg merchants when we say that he is entirely unfitted for his position and should speedily give place to some person better qualified to fill such an important position.

If Government have to sell confiscated goods it should be done *en bloc* to merchants, and not in small quantities to the consumer. Such a course as has just been pursued is disastrous to the interests of the honest merchant who pays the duty levied by the Government, and is an injustice that should only require pointing out to the Department to be remedied. If, however, the stupidity or greed of Customs officials should again override common sense and public opinion on this particular, every effort should be made to have them ousted from a position that they have more than proved themselves unfitted for.

CUSTOMS TROUBLES.

A good deal of excitement has been occasioned in jewelry circles by the report that the Customs authorities in Montreal had seized stocks of watch cases in Montreal and Toronto for undervaluation. From what we can learn, there is more smoke than fire about the present seizures, and had the inspectors known their business, they would have made certain of their ground before they proceeded to make the matter public.

When boiled down, it appears to be simply a question of what is the value of the goods, and from what we know of the question we think the Customs people are in the wrong. It seems absurd that such firms as Schwob Bros. and H. & A. Saunders who have never had any complaint whatever lodged against them in the Customs Department during their entire business career, should be pilloried before the public as law-breakers by some ignorant Customs officer before even an official investigation had revealed the fact whether they were guilty or innocent. However, it is a way our Customs authorities have of doing, and we suppose that the trade ought to thank their stars that they are allowed to pass goods at all, even though they pay the duty demanded.

Perhaps it may dawn on those worthy *public servants* some day that they are not masters of the people, but the people's servants, and that importers have rights as well as the Department. Until then, the trade of Canada will "grin and bear" the imposition as best they may.

Regarding the *cash* or *credit* value of goods, and the amount that duty should be levied upon, we may have something to say upon it in a future issue; in the meantime the trade will wait the decision of the Customs Department with considerable interest. The government side of the story as published in their organ is as follows :—

THE MONTREAL SEIZURES.

"The seizures made here have caused considerable consternation and surprise, some of the firms being among the oldest and wealthiest in the city, whose characters have always stood high for conducting their business in a straightforward and conscientious manner. These observations apply especially to Messrs. Schwob Bros. and Messrs. H. & A. Saunders, who have never had any complaint lodged against them by the Government. For those now under the consideration of the Customs Department both these firms claim to have acted in a straightforward manner in making their entries, having had no knowledge, they say, that there was any trickery being resorted to by Messrs. Joseph Fahey & Co., of New York, in making out the invoices of the goods shipped to their order here.

Messrs. Schwob Bros., who feel the indignity of being mixed up in defrauding the Government, have placed their case in the hands of Mr. D. Girouard, Q.C., and will show that they have made the entry in a *bona fide* spirit, and in the belief that they were acting entirely in accordance with the tariff laws.

DISHONESTY OF AMERICAN IMPORTERS.

The class of goods which the Customs officials have seized, both here and in the west, is silver cases for watches, and the charge is that the firm of Messrs. Joseph Fahey & Co., of New York, have been furnishing fraudulent invoices for the purpose of enabling their customers in Canada to defraud the Customs. In the invoices sent here by the firm the terms of sale are printed as being with a discount of 15 per cent. trade discount, with 6 per cent. for cash in ten days and 5 per cent. in thirty days, but no discount after a month. Now in the invoices supplied to the purchasers in Canada the pen is run through the figures five and six, and sixty days net for cash substituted in red ink.

CONCLUSIVE PROOF OF FRAUD.

There is no doubt of this being done deliberately for the purpose of defrauding the Canadian Customs, is proved by a letter which has fallen into the custody of the Customs Department, and has been impounded there for the purpose of proving the premeditated intent of the American manufacturing firm to connive at the fraud upon the Customs. The letter of Fahey & Co., from which I have taken an extract, says in answer to a customer here who wanted to take 60 days for payment, as stated in the invoice, that the firm knows no such terms as 60 days; that at the request of Canadian customers, for reasons best known to themselves, the firm so marked their invoices, but all their payments were to be in ten days or thirty days, which was the longest time to give the five per cent. discount. In making the entries the tariff law expressly lays it down that they be made at the fair credit value, but to make it appear otherwise the invoice was falsified to 60 days. Besides this letter showing the intent, the Customs Department has an affidavit solemnly made before a proper officer at the time of making the entry that the value was properly stated in the invoice. In the books of a firm here which have been examined by the officials of the Customs the facts contained in the letter of Fahey were confirmed, but the absolute falsity of the affidavit shown. It was demonstrated that all the firms here had paid within the ten or thirty days so as to get the cash discount.

STRIKING AT THE ROOT OF THE EVIL.

The Department of Customs has resolved upon confiscating every dollar due Fahey & Co., by the firms where seizures have been effected, as the law here directs, as no firm can legally collect money due on goods that have been fraudulently entered on a false invoice in the Customs. This is intended to strike at the root of the evil."

A BANKRUPT ACT.

We notice in the Government organ of last month a despatch to the effect that a deputation from our London (England) Chamber of Commerce had upon the 9th August, waited upon Sir Leonard Tilley, Finance Minister of Canada, at the Grand Hotel, Charing-cross, to urge upon the Government of the Dominion the advisability of supplying the lack of a bankruptcy law in Canada. The deputation, which was introduced by Mr. Samuel Morley, M.

FOR SALE BY

ALL CANADIAN WHOLESALE HOUSES.

P., having stated their views, Sir Leonard Tilley said he would take an early opportunity of conveying to his colleagues the views of the deputation, and he thought he might say for the Government that before Parliament met they would give the matter their earnest consideration.

This "earnest consideration" dodge is the one usually resorted to by the powers that be, when they want to put anything off and still remain friendly with those making the application. Now that our Minister of Finance knows that the manufacturers of England, as well as the merchants of Canada desire such a law, we trust that the matter will not be allowed to end at the "earnest consideration" of the Government, but that they will really bestir themselves and do what they should have done two years ago, pass a Bankruptcy Act worthy of the name. This the country demands, and is what the country will have sooner or later, whether those at present in power do it or not

OBITUARY.

We are sorry to learn through the columns of our esteemed contemporary the *Jeweler's Circular*, of New York, of the death of its founder and proprietor, Mr. Daniel H. Hopkinson.

Mr. Hopkinson, like many other men who have made their mark in America, was an Englishman by birth and education. Finding his native land unsuited to his energies, he emigrated to this country, and after years of toil and adventure achieved a marked business success by starting the trade journal indicated above. Of Mr. Hopkinson's abilities as a journalist we need not say more than that in a comparatively short space of time his new literary venture had achieved a success which placed it in the forefront of all trade journals and made it one of the most elegant, readable and reliable periodicals we have ever seen. *The Jeweler's Circular* will be Mr. Hopkinson's best monument, and it is not probable that his memory will fade during the life of the present generation of jewelers in the United States.

Correspondence.

We do not hold ourselves responsible for the opinions of our correspondents.

TORONTO OFFICE OF GOLDIE & McCULLOCH, 50 CHURCH ST.

August 4th, 1884.

The Editor of THE TRADER :—

DEAR SIR :—I have read with much interest the article headed "Warning" in the August issue of your valuable paper, and know that if your "words of warning" were more generally heeded, the business community, more especially the jewelers, would largely profit thereby, and the burglars' profession (?) would not enable them to realize such rich harvests as we frequently hear of them doing.

Many merchants, and especially jewelers, who require large safes for their goods as well as their books, feel that, owing to the expense necessarily incurred, they cannot afford to purchase burglar-proof safes.

Messrs. Goldie & McCulloch realized this fact and, being determined to give their customers all possible protection in their fire-proof safes, they, from the first safe manufactured, and ever since, have made of brass that part of the lock you speak of as generally made of cast iron, and so easily broken by the burglar, and about a year ago they also commenced introducing a *plate of drill-proof steel* (the same as is used in making their burglar-proof safes), as now suggested in your article, in the door of every fire-proof safe manufactured by them, for the very purpose of preventing the lock being drilled.

This they have ever since continued to do, and their fire-proof safes have thus been made inaccessible to the burglar by the drilling process you refer to. They cannot be opened except by the use of powder, which is a very noisy and dangerous process.

Yours respectfully,

GEO. F. BOSTWICK,

Toronto Agent for Goldie & McCulloch.

To the Editor of THE TRADER :

DEAR SIR,—Knowing that your columns are always open to promote the good of the trade, I send you an account of the manner in which Gus Kleiser does business on the road. About the 21st of last April, a man by the name of J. H. Flood, a tea agent for Jas. Laut & Co., Toronto, came into my shop with a nickel case, S. W. Co. watch, and asked me what I would allow him for it in trade for a new silver one—one of the best I had—upon which I showed him some. He then said he would buy a gold one, upon which I showed him an open-faced one, which did not suit, as he wanted a hunting case. I offered to send to Toronto and have two or three sent on approbation, but that did not suit. Gus had to appear to complete the arrangements, which he did a few minutes after, and when I inquired if he had any gents' gold watches, he informed me that he had two, and left them with me, naming the price. One I thought rather high, but he said it was a 14 k. with Montauk movement, the other was reasonable and an Elgin watch with 10 k. case.

A few minutes after Mr. Flood appears upon the scene, which would not have been complete without him, as you will see by the sequel. Upon my showing him the watches he agreed to take the Montauk, and made a great display of money, pulling out, I should think, from one to two hundred dollars, or perhaps more. But instead of paying for the watch and taking it away (which was not in the programme) he paid $5 on it and agreed to take it in the afternoon, but forgot, and left along with Kleiser on the next train.

I wrote him in May in care of Messrs. Laut & Co., when he sent me word to sell the watch. I did not then suspect anything wrong, but as Mr. Kleiser never made his appearance after, I began to have suspicion all was not as it should be.

I happened to have a young man working for me who told me of the trick played by the same parties upon Mr. Vick, of Owen Sound, upon which I wrote him and received the enclosed card.

I then came down to Toronto to see Kleiser to make some arrangements for him to take it back, but failed. He first sent me to Mr. A. Kleiser and said I was to leave the watch with him and he would pay me, but he refused. I then went and saw him again, when he wanted me to leave the watch and he would send me the money in two weeks. I know I am a fool, but did not think others thought me such a one as that. He tells me that if I sue him I cannot get anything. What I want to know is whether it is a civil or a criminal act, as, in my opinion, they are a pair of confidence men and nothing more. Hoping to see your opinion,

I remain, yours truly,

B. RICHARDSON.

P.S.—He told me he had sold a dozen in the same way.

We would advise Mr. Richardson to consult a lawyer and if these men can be indicted criminally to put them through. The whole transaction is only another warning to jewelers of the folly of dealing with irresponsible parties when there are so many reputable houses in the trade, from whom goods can be bought cheaper than from these "trunk jobbers."

THE ART OF COLORING CORNELIANS, CHALCEDONIES, AND OTHER KINDRED MINERALS.

In the name of *Gemmæ*, the ancients embraced more precious stones than we of modern date do by that of jewels; this only comprises precious stones which, from their color, transparency, fire, hardness, scarcity and other properties, are eminently qualified to serve as adornments. The ancients held in high esteem the many varieties of quartz, half jewels, parti—as well as singly colored, or veined, cloudy, or spotted, because they furnished an excellent material for the pursuits of art, and as being better adapted to the art of cameo cutting. Pliny mentions an agate which, with its natural spots, represented Apollo surrounded by the nine muses. It is not a matter of astonishment that the ancients should have practiced every means within their knowledge to alter or heighten the colorization of the various tinged quartz classes, and, indeed, Pliny states that there is no falsification as lucrative as that of the artificially coloring gems. They were manufactured of glass and paste, and cemented upon tablets; especially the sardonyx was much imitated. The same author states that, among other manipulations, the quartzose gems were boiled in honey for seven days. The agate cutters of Idar and Oberstein made use of the same means to change feebly-colored gems—chalcedonies. cornelians, into pronounced and very beautiful onyxes. The gem cutters of Italy in former years visited these gem-producing regions and eagerly bought up everything in the market, as they understood the art of artificial staining, until some traitor among them gave or sold away the secret which Pliny already mentions as being practiced at the time of the birth of Christ.

This art is based upon the peculiarity that some of the bands of the chalcedony are more porous than others, and will imbibe coloring fluids, whereby they may be changed into onyxes, specially adapted to cameo cutting, owing to their different shades; and even agates intended for other purposes, may be considerably enhanced by the procedure.

An empyrical way of ascertaining whether a stone will imbibe color is practiced by the gem merchants, by breaking off a small piece and wetting the larger one with the tongue; if several strata imbibe the fluid, the stone is deemed good. Very large ones plentifully veined, especially those containing red streaks, are valued highly, increasing with the number of veins. One was found in 1844, weighing 100 pounds, which sold for $600 on the spot; it was cut into cameos, at an expense of $150, which brought, when sold, $2,000.

The coloring is done in the following manner: The stones are first washed very clean, to free them from all extraneous matter, and dried in the ordinary temperature; they are next emersed in a solution of honey and water; the pot must be new, or at least, very clean, above all, free of grease. It is placed into hot ashes, or upon a warm stove, the fluid, however, must never come to ebullition, and the stones are at all times kept under water by adding a quantity every day or two, to replace that which evaporated. The stones thus are left for two or three weeks, then taken out, washed, and put into another pot, into which sulphuric acid is poured, to completely cover them. The pot is covered with a slate, placed into the hot ashes, and surrounded with live coals. The large so-called soft stones will be found colored within a few hours, others require an entire day, while again others do not become stained. When to satisfaction, the stones are taken out of the acid, washed, dried upon a stove, cut and put into oil for a day, which causes any previous little cracks to disappear, the stone becomes more fiery; the outward oil is afterward removed by rubbing with bran.

The previous insignificant-looking light grey veins will, in proportion to this porosity, be found stained brownish grey or black; the white ones have turned purer, and their veins have become brighter in color. The chemical process which took place is very easy of solution; the honey penetrated into the pores and has become carbonized by sulphuric acid. White and many red streaks appear to be unimperceptible, but the intensity of their color is heightened.

The so called Brazilian cornelian is also "cooked" as in the preceding manner. Great quantities of the crude stone are imported into Northern Italy, and those adapted to cameo cutting bring high prices sometimes $2,000 per cwt. These cornelians contain an oxyhydrate of iron, and are generally entirely unimpregnable; the reddish tints are often deadened by being carbonized, and either are not visible, or appear as an admixture of the grey and black colors, hence they often play into brown.

Pliny, who simply speaks of the method from hearsay, mentions the treatment by honey alone, and omits the sulphuric acid, without which, as is clearly perceptible, no colorization can take place. But as his mention may be acceped as proof positive that the Romans understood the art of coloring, we may go a step further and accept that they were also acquainted with sulphuric acid and its action. No direct proofs can be cited, but the acid is, as is well known, a product of volcanoes, and it is not difficult to imagine that they fully understood it, since they were very well acquainted with sulphur and the natural sulphurets. If they possessed no direct sulphuric acid, they at least were acquainted with solid and liquid substances which contained the free acid, and which answered their purposes.

In the already mentioned districts of Oberstein and Idar, the parties engaged in the art also understood how to produce a beautiful citron yellow. The following is the process: The stone is dried for several days upon a stove, which must not be too warm, however; it is next put into a clean pot, which is filled with commercial muriatic acid; a cover is cemented over it with clay, and the pot is left untouched for two or three weeks, remaining in a warm place. The chemical action is open to debate, whether the yellow color is produced by a salt in the acid, which unites with some free element contained in the stone, or whether the coloring principle is contained in the acid itself, and is imbibed by the stone.

Among the gems cut by the Greeks and Romans, many specimens are found with blue veins. It is supposed that they were colored artificially, but the secret has died with them. The cameo cutters of Idar use the following method for blue: The stone is placed into a solution of salt of oxide of iron, and afterwards saturated with a solution of prussiate of potash. The color called Prussian blue is thus produced.

Or a solution of ferrous salt is made. The stone is placed at first into a solution of prussiate of potash, chloric gas is conducted upon it, whereby potassium ferridcyanide is produced, which, when the stone has been saturated in the solution of ferrous salt, produces Prussian blue, and colors the different bands. A third

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

method is used which gives an evanescent color, by conducting a gaseous solution of prussic acid upon the stone saturated with a solution of chloride of iron. The method is dangerous as well, owing to the poisonous qualities of the acid.

The color is agate, chalcedony and Brazilian cornelian may also be altered by exposing them to a gentle heat, The white chalcedony often becomes purer of color, the red tints become more pronounced, and the dead yellow will change into a beautiful red, which is especially the case with the cornelian, whereby a veined stone is changed into a handsome cornelian, and a single colored one receives its true cornelian lustre and fire. The following is the method : The stone is placed for two or three weeks upon a hot stove, and its water thoroughly dried out, then it is put into a crucible and dampened, not saturated, with sulphuric acid. The cutter simply dips the stone into the acid, and places it into the crucible. This is well covered and placed in a strong fire until red hot ; the fire is permitted to die down slowly, and the crucible is taken out only when thoroughly cold. The burning effects a thorough anhydration of the oxyhydrate of iron, which permits the color to become more lustrous and to assume the peculiar cornelian tint. Smaller articles are burned before being cut ; larger ones, such as dessert plates, vessels, vases, etc., after cutting ; for the reason that smaller articles are not liable to crack, larger ones will, however, and it is sought to reduce them as much as possible by cutting.—*Exchange.*

MOTHER-OF-PEARL AND PEARL INLAYING.

Mother-of-Pearl is chiefly obtained from the pearl oyster (*Meleagrina margaritifera*) which is found in the Gulf of California, at Panama, Cubagua, Ceylon, Madagascar, Swan River, Manila, and the Society Islands. The black-lipped shells from Manila are most highly prized. The Society Islands furnish the silver-lipped sort, and Panama the " bullock " shells.

The genera *Haliotus*, turbo, etc., also furnish some mother-of-pearl. Technically the mother-of-pearl obtained from the pearl oyster is known as white pearl ; that of *Haliotus* or sea-ear as aurora or ear shell ; it is easily distinguished from the former by its prismatic colors and wrinkled appearance.

The peculiar and varied tints exhibited by mother-of-pearl is due to the structure of its surface, which, owing to the great multitude of minute grooves upon it—often many thousands to the inch—decompose the light which falls upon it and reflects different hues.

The pearl shell is lamellar in structure, and admits of being split into laminæ, but this method of dividing it is seldom resorted to owing to the liability of spoiling the shell.

In working up the mother-of-pearl the saw file, and grindstone are the principal tools employed. A shell is selected with a coating of the substance of a thickness as nearly as possible to suit the required purpose. Square or angular pieces are cut out with a small circular or buck or fret saw to suit convenience, the piece being held and manipulated with the hand or clamped in a vise. Buttons and such circular pieces are cut with an annular or crown saw fixed upon a mandrel. All such tools used in cutting pearl must be kept well moistened with water to prevent over-heating. The pieces are usually dressed upon a grindstone, the edge and face of which are grooved, or ridged to prevent clogging. The stone is kept wet in use ; for this purpose weak soapsuds are better than water alone.

When the pieces have been properly shaped on the stone they are dressed with pumice stone and water. In some cases the better plan is to have the piece of pumice stone shaped so as to adapt it to the form required and held in a vice while the work, held in a clamp, is revolved in contact with it on the lathe. After the application of the stone fine powdered pumice stone, free from coarse grit, is applied with a cork or cloth moistened with water. In the final polishing rotten-stone is employed. This is moistened with dilute sulphuric acid (1 acid 15 water) and applied with a cork. The acid is said to develop finely the striated structure of the shell. In some works it is thought necessary to use emery before the rotten-stone and to use a limpid oil in place of the acid.

Knife and razor handles of pearl, after being roughed out, are drilled where the rivets are to be inserted, lightly riveted together, shaped on the stone, and finished as above described, the last finishing touch often being done by friction of the hand of the workman.

In some shops much of the polishing is done on cloth-covered wheels, the moist cloth carrying the polishing materials. Separate wheels are used for the different materials. For some common work powdered chalk or Spanish whiting is used in place of rotten stone.

Pearl is etched by a process very similar to that used in etching copper. The designs or patterns are drawn upon it with asphaltum varnish, and all parts not intended to be etched having been similarly protected, the piece is submitted to the action of nitric acid. When the parts unprotected have been sufficiently eaten away by the acid the piece is rinsed in cold water and the varnish washed off with a little turpentine or benzine.

Thin pieces of mother-of-pearl of a like pattern are usually gang-cut ; that is, the thin plates are glued together, then held in a clamp and cut, drilled and dressed as one piece, after which they are separated by being thrown into hot water, which separates the glue.

In common pearl-inlaid work, films or very thin pieces of mother-of-pearl are connected to a background, usually of *papier mache* or iron by japan varnish. The plate having been cleaned and dried receives a coat of the varnish, and when this is nearly dry the pieces of pearl, cut out with a scissors by the artist, to represent leaves or designs, are pressed against and adhere to the varnish. The plate is then put in the japanner's oven until the coating becomes hard. A second coating of varnish is then put on—indiscriminately over the pearl and all—and when this has been dried or hardened in the oven the portions adhering to the pearl pieces is removed with a knife blade, and the whole surface is rubbed smooth with pumice water and stone. With the aid of a little gold size, gold leaf and color, and camel's-hair brush the artist then developes the design, the beauty of which depends of course upon his skill. Finally the article receives a coat of clear spirit varnish.

Besides the white and aurora shell referred to above, the glistening green snail shell is very frequently used. Its tints are light and dark green, yellow, and pink, blended. The varnish surface is sometimes ornamented with transferred drawings or engravings. When the varnish is nearly dry the engraving is spread out face downward upon it and carefully pressed so as to exclude air bubbles. After the varnish is thoroughly dry the paper is well moistened with warm water by means of a sponge. It may then be rubbed off, the lines of the print remaining adhering to the varnish.—*Exchange.*

American Watch Company.

THE LARGE increase of our plant during the last three years, and the economies resulting therefrom, enable us to make a substantial reduction in some of the grades of our goods, and to give the benefit of it to our customers and the public, without sacrifice to ourselves or the standard excellence of our productions.

We do not, however, intend to pursue the policy adopted by some other companies, of selling any grade of our goods at a loss, for the purpose of inducing the sale of higher grades which, although giving good value for the money, yet, from their higher price, must naturally meet with a limited sale.

All our prices are regulated by cost and intrinsic value, and an experience of nearly thirty years has so far satisfied watch buyers and watch wearers of this and other countries of the superior quality of our watches as timekeepers, that we are enabled to maintain a slightly higher range of prices throughout our entire list than any of our competitors, with entire satisfaction to ourselves and the public.

We disclaim any intention or desire of making a watch to compete in lowness of price with the cheapest grade of goods steadily poured upon the market. On the contrary, as we never, under any circumstances, intend to put other than good timekeepers on the market, we consider the constant reducing of prices below the cost of really good work, as practiced by certain watch companies, to be prejudicial to the permanent good name of American watches.

We could, of course, by the employment of cheap and unskilled labor and the use of inferior materials in manufacture, make goods for as low and no doubt much lower prices than other companies, but the tendency of lower prices reached in this way is not consistent with the uniform excellence we wish to maintain, and, if persisted in, must inevitably result in a general deterioration of workmanship and of product, by which the public and ourselves would be, in the end, the great losers.

We challenge competition in the price and quality of our WATCH CASES if gold is weighed against gold, but not if our gold is weighed against steel springs and other base metal which our competitors weigh in and sell at the price of gold. Our movements are often sold by dealers in cases of other make than our own, and it frequently happens that a good movement is used to sell a bad case, or that a badly made inferior case throws discredit upon a good movement. In either case purchasers are warned against the results of this practice. We intend, in the future, as we have largely in the past, to case our own product, and thus avoid all question as to the character of either the watch case or the watch movement.

To reiterate :—The WALTHAM WATCHES are deservedly popular, because the purchaser as a rule, gets the best value for the money expended. The dealers are enabled to sell the goods with comparatively little trouble, and, at the same time, please their customers and make a profit for themselves.

BUSINESS NOTES.

Mr. George A. Bray, formerly with P. W. Ellis & Co., has made an engagement to travel east and north for Messrs. McNaught & Lowe.

We understand that Mr. Manning, for some years traveler for Messrs. John Segsworth & Co., has left that firm's employ and will travel for Messrs. Eves & Co. in future.

Mr. John W. C. Campbell who has, until recently, been pushing the "Culp" moter in the United States has made an engagement to travel for Messrs. Rothschilds & Co.

Mr. Thomas Marshall, the well-known traveler, formerly of Carrier, Marshall & Co., has left the employ of that firm and will now travel with jewelry upon his own account.

Mr. Charles Segsworth with an experience of half-a-dozen years in the office,has been promoted to the road, and in future will look after his trunks instead of driving a quill.

Mr. Feely the well-known and popular traveler of Simpson, Hall, Miller & Co., has, we understand, made an engagement to travel for the Meriden Britannia Co., of Hamilton.

We were glad to notice upon the street the other day the portly figure of Mr. Samuel Stern who has only lately returned from Europe where he has been for the past three months selecting goods for his fall trade. Mr. Stern's trip has apparently agreed with him and he looks as though he could go through the fall trade with more than his usual energy.

The Boss & Keystone Watch-Case Company in order not to be behind the times have also arranged with Mr. Frank Ross to do missionary work for their goods in connection with Illinois movements. Boss & Keystone Cases, as a rule, don't require very much talking up, but whatever they do want in that way can be amply supplied by Frank Ross. He's-a-dandy.

The Illinois Watch Co. have again reduced their prices in order to meet the last cut of Waltham, Hampden and Elgin Companies, and now advertise that they are as low in price as any. They are represented in Canada by that well-known "missionary" Mr. Frank Ross, who has lately made his first tour of theDominion and alked up these goods with marked success.

Mr. P. K. Hills, Jr., representative of the Waltham Watch Co., in Canada, for the purpose of looking after and allowing the rebate on movements,completed his work satisfactorily and returned home to New York about the middle of last month. Mr. Hills is a thorough gentleman and won golden opinions from all the dealers with whom he came in contact, and the general verdict of the trade was that they would'nt mind being rebated in a similar manner once a month.

Messrs. McNaught & Lowe, the Canadian agents of the "Hampden Watch Co," have just issued a new list of that Company's movements by which it will be seen that the Hampden people have taken the bull by the horns and made good solid reductions all through their goods. Although their movements are now as cheap in price as any in the market, the Company guarantees that the old standard of finish and reliability will be maintained throughout, and that as heretofore they intend to make the finest goods of any Company in America.

The big Exposition at Toronto on the 10th of September and following days, bids fair to be a bigger success than any of its predecessors. The management, in addition to the usual features, have added a long list of attractions amongst which are the Electric Tower and the Electric Railway, each of them novelties that will be well worth seeing. As usual the railways will make specially low rates from all points east and west during the two weeks of its continuance, so that we may expect to have a large number of visitors to enjoy the sights afforded by Toronto's great Semi-Centennial Exhibition.

Messrs. McNaught & Lowe have just to hand a very fine assortment of fine Marble Clocks direct from the best manufacturers in France. These clocks are large and extremely suitable for presentations. They also show a novelty in the shape of French Wall Clock Movements set in heavy enamelled metal placques which are embellished by elegant paintings done by hand by first-class artists. This firm have also on the way, shortly to arrive, several very rare and expensive French Marble Clocks with Westminister Cathedral chimes in them.

The perpetrators of the Wagoner robbery at Cornwall still remain undiscovered, although every effort has been made to trace them out. Mr. Wagoner's loss will be nearly $3,000 and he has the sympathy of fellow-townsmen and of the entire trade. The sooner that a Jeweler's Protective League is formed in Canada to follow up such robberies as this, the better for the trade. We propose in our next issue to write up the project, and in the meantime would advise every one of our readers to put in practice the hints we gave in our editorial,headed "warning" in our last issue.

As will be seen in another place it appears that we did our Canadian Safe Makers an injustice in our editorial article headed "warning" in our last issue. Messrs. Goldie & McCulloch, the well-known Safe manufacturers, Galt, Ont., send us a letter which appears in another place, stating that they have been in the habit of doing exactly as we advised in regard to safes, in order to make them more secure. We are glad to know this and willingly insert their letter of correction as our strictures were entirely in the interests of the retail trade, and made with the view of obtaining greater security for them.

In a conversation with Messrs. J. & J. Taylor, the well-known and reliable Safe makers of Toronto, we find that as far as they are concerned they use the brass, instead of the iron casting in their combination locks as suggested by us. They also state that they will willingly put the chilled steel plate to protect the lock,on any new fire-proof safe to order without any extra charge. Every jeweler ordering a new safe should see that this is done, and, if he can at all afford it, should see that he buys a Burglar-Proof and not simply a fire proof safe. A couple of hundred dollar's worth of safe is cheap compared with the loss occasioned by a general clean out such as several of our jewelers have experienced during the new year. Those who have fire-proof safes and can afford it should only keep them as long and no longer than they can arrange to replace them by somethingworthy of the name of a safe. If you can't afford that, then you had better sit on it all night and protect it with a shot gun.

WORKSHOP NOTES.

RUBY PIN.—If it is necessary to tighten a ruby pin, set it in asphaltum varnish. It will become hard in a few minutes, and be much firmer and better than gum shellac, as generally used.

TEMPERING BRASS.—Brass is rendered hard by hammering or rolling; therefore, when you make a thing of brass necessary to be tempered, you must prepare the material before shaping the article. Temper may be drawn from brass by heating it to a cherry red, and then simply plunging it into water, the same as though you were going to temper steel.

POTATO CELLULOID.—According to a Vienna journal, a substance may be produced from potatoes possessing the properties of celluloid. For this purpose the peeled potatoes are boiled for 36 hours in a fluid consisting of 8 parts sulphuric acid and 100 parts water, then dried between blotting paper and relieved of the superfluous water by pressing. Pipe bowls are at present made therefrom in France that can barely be distinguished from real meerschaum, and billiard balls are likewise made from it by strongly pressing.

ESSENCES FOR CLEANING WATCHES.—Essences for cleaning watches are rapidly coming into custom. They are to be obtained at many of the material dealers and at all drug stores. The object is immersed and left in them for a few minutes, to permit all adhering matter to dissolve; not too long, however, since several qualites are apt to leave stains. The piece is to be dried on removal, and finish by passing a fine brush over that has been charged with chalk and subsequently rubbed on a hard crust of bone. This will produce a brilliant surface on either gilding or brass. The following composition, the ingredients of which may be obtained in a drug store, has been highly recommended: 90 weight parts of refined petroleum and 25 parts of sulphuric ether. The object is immersed for several minutes, in fact they may remain for a longer period without danger, and on removal from the bath are found to be clean and bright. It must not be forgotten that many of these essences are liable to ignite with the mere proximity of a lighted lamp.

Editorial.

THE PRICE OF WHEAT.

The price of wheat is a thing that is of interest to every man, woman and child in the Dominion of Canada, because upon the price as well as the quality of our wheat crop depends very much of the volume and success of our next year's trade.

A bountiful harvest is an assured fact in almost every wheat producing country in the world, and as a result the price of grain will be low. It is low at present, and the probability is that it will be lower before the year is over. This being the case, every dealer should exert himself to get his customers who are farmers, to market their produce as soon as possible. It is their safest plan, as they will save on the weight of the grain as well as have the advantage in price and the interest on their money. The sooner this year's crop can be marketed and the money put into circulation amongst our storekeepers the better for the general prosperity.

The outlook is favorable, for although the price of grain is low, our harvest is far more abundant than usual, and we therefore look forward with confidence to a very prosperous mercantile year.

CANADA'S GREAT FAIR.

The citizens of Toronto delight to dignify their annual exhibition with the name of "Canada's Great Fair," a title which some of the other cities in Canada were disposed to resent as being an appropriation to which they had no real title.

Especially was this the case with the directors and supporters of that moribund institution hitherto known as the Provincial Exhibition, which has apparently outgrown its usefulness and only manages to exist by having itself grafted upon the Dominion. In spite, however, of such jealousy and opposition, the Toronto Exhibition has grown and prospered until it has, without any shadow of a doubt, become the most important annual Fair in the Dominion, and is now really entitled to the much disputed distinction of being "Canada's Great Fair." Indeed, our own individual opinion is, that outside of the Centennial Exhibition of Philadelphia, in 1876, as regards the size of its buildings, the quantity, variety and quality of its exhibits, or the great assemblage of visitors from all parts of Canada and the United States, it is equal, if not superior to any similar Exhibition on the American continent.

It is an institution that reflects the highest credit upon the management that originated it and brought it to its present high state of efficiency, and every citizen of Toronto should feel proud of its success. The increase in the gate receipts over last year is $2,941.61, and as it may be interesting to our readers to compare the daily receipts of this year with those of previous years we give them below:

D'y's	1879.	1880.	1881.	1882.	1883.	1884

A COMMON SENSE VALUE.

Our readers will recollect that in our last issue we passed some strictures upon the absurd way in which our Customs Department make their valuations upon the goods imported into Canada.

We said then that we thought the watch case seizure was pretty much on a question of value, and that from what we knew about the subject the Government were in the wrong and the importers in the right. Recent developments have strengthened this view, and it now looks as if the Department will not only have to give the goods back, but may think themselves lucky if they escape an action for damages. There is surely something wrong, either with the law or its administration, when any customs understrapper has it in his power to have an importer's stock seized and his good name taken away, on the merest suspicion. Surely if our Customs Officials are not to be men thoroughly conversant with the goods they attempt to appraise, they should, at least, be men endowed with enough common sense to know that they should make sure of their ground before they proceed to jeopardize the good name of any importer. We have not the slightest doubt but that both Messrs. Schwob Bros. and Saunders & Co. will come out of this affair with clean hands; and that the reputation for honorable dealing, which they have enjoyed for a quarter of a century, will not suffer in the least; but it surely is no credit to our law that the reputation of such merchants can be at any time menaced and themselves put to expense and inconvenience simply at the caprice of some greedy official, who imagines he has a chance of making a haul out of them.

As we said before, the seizure was made pretty much on a question of difference in value between the importers and the Customs Department.

Boiled down, the difference is this: The Customs Department claim that they are entitled to levy *ad valorum* duties on the *Credit* value of an article, while importers, as a rule, contend that the real value of any article is what it cost in *gold*.

We think that the case has only to be stated in cold blood, without any arguments, in order to have any intelligent man make up his mind that the importers are right and that the Department is wrong.

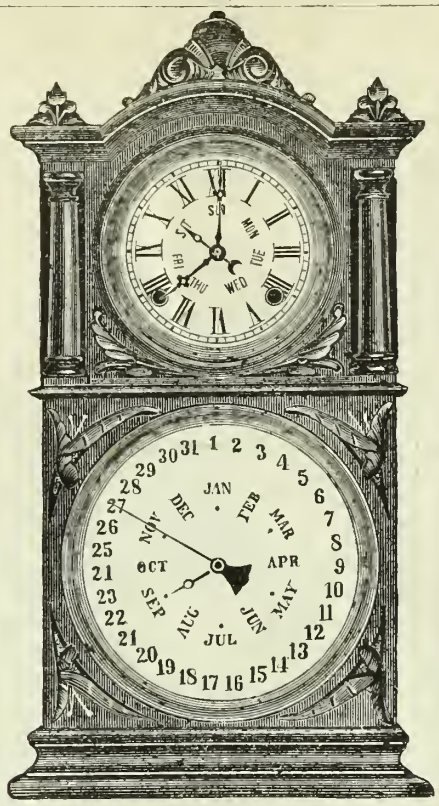
The basis of all commercial intercourse

is *gold* or its equivalent. Foreign nations trading with each other do not want to exchange merchandise for promises to pay, but they want in exchange either goods or specie, and gold being the only medium of exchange which has a universally recognized value, has therefore been adopted as the standard of all values.

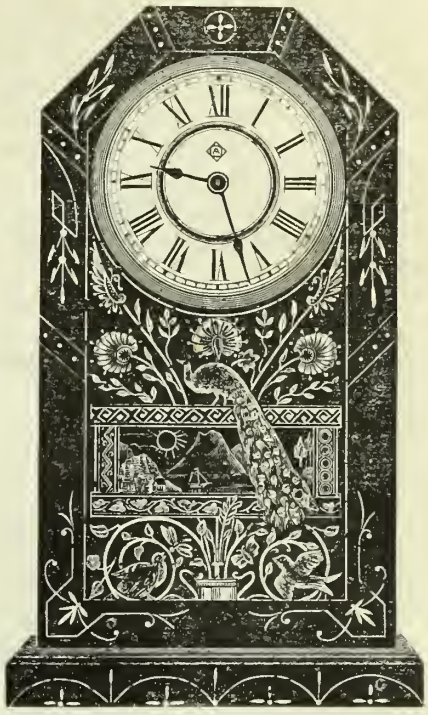
That this principle is correct can be easily proved from the action of the Canadian Government itself; for when, during and after the American War, U. S. currency was only worth fifty or seventy-five cents on the dollar, they allowed importers to bring the prices of American imports to a gold value by deducting from the face value of the invoices the difference between its greenback and gold value, and then levied duty upon its gold and not its original value. The nearer the greenback approached the value of gold the less discount was allowed, until American currency became like our own, redeemable in and equivalent to gold.

If you go into the open markets of the world and ask any manufacturer what is his price for an article, he will, if he wants to get your trade, quote you his cash price. If you want to buy on time the price will be greater, according to the amount of time you require. The price of the goods, however, remains the same as in the first quotation, the difference in price simply being a charge for the use of the money for the time specified. That "Time is Money," is a truism, and it is just as true in this case as in any that we know of.

A great many of the large American factories who do business in Canada do it almost upon a cash basis. Their outside limit of time is thirty days, and if the purchaser cannot pay them in that time they are content to go without his trade. To those who pay their accounts in thirty days they allow a trade discount of five per cent., and if they want any cash discount they are allowed to take off one per cent., if the bills are paid in ten days after the goods are invoiced. Our Customs Department in their wisdom have, in many cases, decided that this trade discount is not legal, and that Canadian importers must pay on the gross value of the goods. That is to say, that the Canadian importer has to pay duty on 5% more value than the United States jobber pays for the same goods. This may be common sense, but we doubt it, and it may be expedient in order to exact another one per cent. of duty from Canadian importers; but one thing we are certain of, it is a suicidal policy for the Government, as the next general election will prove. The importers of Canada are the persons who, in the first place, pay the duties by which the work of the Government is carried on; and they have the power, if they have the will, to hoist the present or any other Government that treat them with injustice and scant courtesy. The importers are a power, and they will be here and doing business long after the present Government has given place to others. They are long suffering, but it is not good policy to grind them down too much. Very few of them object to pay the duty demanded by Government, and all they ask is to have it levied in a fair and impartial manner, as is not now done. Let them pass their goods at their gold value, and if the duty is not high enough raise it; but don't hoodwink them by pretending to levy 20 per cent., and exact 25 per cent. by raising the face value of the invoices. It is neither justice nor common sense.



Selected Matter.



THE SILVERSMITH AND HIS STRANGE VISITOR.

"Many, many, years ago, even before the last century was old enough to go into knickerbockers at the corner of Cock Lane and Snow Hill of the olden time, before the railway station grew there, when the crystal Fleet river tumbled down from the northern heights into the silvery Thames, at the historical corner there lived, moved, and had his being, along with a sharp little wife and noisy big family, a certain silversmith. *Laudatur temporis acti*—a praiser of the times past—let us be. Unto this silversmith there came one day a middle-aged man comfortably clad in the work-a-day costume of the period, and asked him if he could make models in tin and copper as well as in silver, according to drawings which were produced. Now the sharp little wife, who was always on the listen from the room overhead, where the family dwelt, shot her last baby on to the bed, and herself down the rickety stairs like an arrow, and, before her manly husband could utter a word in reply, exclaimed, "Aye, that he can, better than any man in the City of London! It was only this very week that he made a six-quart copper kettle for Mr. Alderman Snoozle's wife; and I took it home myself, wrapped up in one of my best Sunday aprons, to the alderman's house in Austin Friars.'

The two men looked at each other silently, the stranger scratching his wig with some of his spare fingers. An outburst of infantile music aloft took the small body away as quickly as she had come, and the conference was resumed. In about twenty minutes down she came again, arrayed in cap and curls—she had only just taken the last named out of paper, her Sunday gown and ditto apron. Her sturdy husband looked upon her with real, pleasurable pride; in fact, he was lovingly fond of his morsel of womanhood; and the morsel knew that well, and she had glided into the belief, and acted upon it, that he could do nothing properly unless she had her 'say' in it. She made a most graceful courtesy to the stranger, and begged that he would step up stairs and have 'a dish of tea." He, nothing loth, bowed and followed madam, and was ushered into a commodious, well-furnished room, ornamented with a comfortably laid tea-table, upon which silver was prominently shining—quite a contrast to the dingy place below. Two large windows looked into a small garden, whilst the greensward of Smithfield could be seen at no great distance, whither the elder had been sent to play. A neat handmaiden was bustling about the tea-table; and when all three had taken their seats, the infant silver-blosson was handed to her, and she left the room. The stranger, in looking around, smiled, for upon the walls in nice frames were portraits of William and Mary, Queen Anne, and Lord Godolphin—her Prime Minister. He went on with his tea, listening to his hostess, who was eloquent about the Queen and about Common and Alderman of the city, and the city itself. And the little lady could talk! There was no hitch nor stammer, nor 'trying back' with her; like the Fleet river within sight of one of the windows, she could roll along a constant stream of loquacity. The stranger did not recommence his conversation about model-making, and it was evident to the smith that he desired to be alone with him. The latter thereupon made signals to his spouce, but she was not to be so easily disposed of. Where ever he was, and whatever he was talking about, she felt that

she had a right to be there too, and to have her 'word in' as well. Acting upon that, she became suddenly stupid as to the meaning of his signs, and nods, and jerking of his elbows, and so on ; in fact, all his coughs and sneezings and signs were thrown away upon her, and for that matter he might as well have made them to the Sphinx of the great Pyramid. But there were times occasionally when even the silversmith felt that he was the head of the family, and acted upon it. At length the stranger hastily drew his Tompion out of his fob, and rubbing the thumb of his left hand across the glass as he scanned the dial breathed, as it were, into the smith's ear, 'Had I not better call in some other day?' That whisper electrified the smith, and he jumped up and motioned his by far stronger half to the door. ' Wife', he exclaimed, in tones that she could not mistake, ' wife, hadst thou not better go into Smithfield and take the air along with the children ? Dolly, the maid, will stay at home for thee : *I mean thee to do it.*' The little lady knew by the tone of his suppressed voice that he did mean it. Experience had taught her that much ; furthermore, experience had also taught her that it would have been an easy matter for him to have whipped her up in his arms and landed her with all gentleness upon the doorstep, Dolly following with her hat and cloak. None knew better than she when the limit had been reached, and when the time came to beat a 'masterly retreat.' So she gave the soft answer that turneth away wrath, went into the kitchen, left a few directions with Dolly, and reappearing in her hat and cloak before her husband and his strange visitor, told them whereto she was going, and that Dolly whould gladly attend to all their wants, and courtsyed herself out of the room. A significant ' Hem, hem !' caused her husband to follow her ; and when he got upon the landing, she pulled the room door to a close, and, springing upon her little tiptoes, flung her arms round his neck and kissed him several times. She hoped that he would look over it, and she would never do so again. It was very stupid of her, so it was, not to leave the room when he first wanted her to go ; but it shall not happen any more, &c., &c., &c. Ah, the little story-teller ! Why, they had been married some dozen years or so ; she generally managed to have ' tiffs' of one kind or another about once a month, and this was how they ended. ' She would never. never, do so again ; it should not happen any more' ; and all the rest of it.

" When they were alone, the stranger unfolded some drawings that a man-servant had carefully carried, and he asked the silversmith if he could work from them, the latter replied, ' that he could,' but he was unable to name a price. The stranger answered, ' We shall not fall out about the price, if you will only do what I tell you. But that has been my difficulty all along. Workmen will insist in thinking for me, and in making the models as they please ; so that I have been nearly driven to despair. You work according to my plans and orders, and it shall fare you well. As you see by the drawings, I am interested in ships of various kinds, and I want to find out which form of model will sail fastest. I am having them now made of copper, because if I went to a regular model-maker, down by Wapping or Redriff, he would be curious to know my business ; and that I would not allow. On the other hand, should I be seen coming in to you, nobody would suspect my errand, and, as I have said, if you follow my advice and keep my secret, it shall fare you well.'

" And having thus delivered himself, the stranger took his departure. But he had only been gone time enough to enable the drawings to to be locked away, when in rushed the silversmith's wife, quite out of breath. " Oh, Jacob, Jacob,' she exclaimed in gasps, that stranger is a man of quality, I am sure ; for I saw him get into a hackney coach, and his man-servant get up beside the driver.' Did he see you?' asked Jacob, nervously. ' No, that he didn't,' said she, for when I saw him get into one of the best hackney coaches, and have a man-servant, my heart told me he was one of the higher gentry ; maybe from the Queen's court. When I placed my eyes upon him, I drew the hood of my cloak over my head, and got behind a Fleet Porter, so that there was no chance of him seeing me.'

" ' Thou art a dear, thoughtful, good wife—worth thy weight thrice over of gold from the mint. Let me kiss thee for a brave wench.

" ' There is something, in this, I tell thee, Jacob ; and if any of our neighborfolk should seek to know who he is when he comes again, tell them that he is an uncle of mine from Hampshire, who is a hog-breeder ; and that, having to come to London about the lease of his farm, he has called upon thee to get a copper to boil pigs' feet in.'

" And so that was settled. The stranger came about twice a week, and he expressed great satisfaction with the silver-smith's work, and with the admirable way in which the instructions had been carried out.

"At length the settling day arrived, the last model having been delivered. The stranger, having had another ' dish of tea,' shook the little lady warmly by the hand she never giving the least sign of what she thought him to be. As he was leaving, he carelessly threw a small bag-full of gold upon the table saying, ' I hope thou will find enough to pay thy husband for what he has done for me. I now know that thou keepest the purse, and so I hand it over to thy care ; ' and away he went.

" 'Jacob, Jacob ! ' she exclaimed, with tears in her eyes, which were shared with the corners of her apron, as she tumbled the glittering guineas out of the bag upon the tea-board, ' I think now, Jacob, that there will be some hope of getting one of the boys into the Bluecoat School.'

" A great deal passed in the way of public events, and in less than two years the silversmith, by the aid of the mysterious stranger, made a large fortune at a stroke, in taking the contract for the silver services of the numerous messes of the Officers of the Royal Navy.

" The stranger was a member of the Board of Admirality, and the silversmith was Jacob Arugross, sometime an alderman of the city of London — AND MY ANCESTOR."

C. STUART MURRAY in the *Metalworker.*

CAMEO SHELLS AND CAMEO CUTTING.

The word *cameo* is derived from the Arabic, and is equivalent in signification to bass-relief. It was originally restricted to hard stones, such as onyx, sardonyx, etc., engraved in relief, but the term has since been extended to include gems cut on shell, lava, and other substances. Certain descriptions of univalve shells are well adapted for cameo cutting, from their substance being made up of different colored layers, and also from a difference of hardness and texture and the various layers, some approaching more nearly to the nature of a nacreous than of a porcelanous material. The good workman always carefully puts his work

on the shell in such a manner that the direction of the laminæ of the central coat is longitudinal. In cameos the central layer forms the body of the relief, the inner layer being the ground, and the outer the third or superficial color, which is sometimes used to give a varied appearance to the surface of the figure. The cameo cutter selects from the shells which possess the three layers: (1) those which have the layers strongly adherent to each other; (2) those in which the middle layer is thick; (3) those in which there is a good distinction of color between the layers; and (4) those in which the inner layer is of the color suited for his purpose.

The kinds of shells now employed, and which experience has shown to be the best for the purpose, are: The "Bull's Mouth" (*Cassis rufa*), which has a *red* inner coat, or what is known as a *sardonyx* ground; the "Black Helmet" (*Cassis madayascariensis*), which has a blackish inner coat, forming what is called an *onyx* ground, and which shows up white on a dark claret color; the "Horned Helmet" (*Cassis cornuta*), which has an *orange-yellow* ground; and the "Queen Conch" (*Stombus gigas*), with a *pink* ground. The latter shell is about ten inches long, with a rose-colored aperture and an extremely broad lip rounded above. The bull's mouth and the black helmet are the best shells, for the horned helmet is apt to separate from the ground or to "double," as the French workmen express it. The queen conch seldom has the two colors distinctly marked from each other, and the pink of the ground fades on exposure to light. The red color of the bull's mouth extends but a short distance within the mouth of the shell, and becomes paler as it proceeds inwards. Hence this shell affords only a single cameo large enough for a brooch and several small pieces for shirt studs, etc., while the black helmet furnishes on an average about five brooches and several stud pieces. The queen conch yields only a single good piece. *Cassis flammea*, which is about six inches long, and *C. decussata* and *C. tuberosa*, which are white upon a dark claret color, are also occasionally used. The bull's mouth shells are derived from India and Ceylon, and the black helmets and queen conchs from the West Indies.

Genoa and Rome are the seats of the best work in cameo cutting, although many common ones are cut in France. In Rome there are about 80 shell cameo cutters, and in Genoa 30. The art of cameo cutting was confined to Rome for upwards of 40 years, and to Italy until the last 26 years, when an Italian began the practice of the art in Paris, and now over 3,000 persons are employed in the industry in the latter city. In the practice of cameo cutting the shell is first cut into pieces the size of the required cameo by means of diamond dust and the slitting mill, or by a blade of steel fed with emery and water. It is then shaped into a square, oval, or other form on the grindstone, and the edge finished with oil stone. It is next cemented to a block of wood, which serves as a handle to be grasped by the artist while tracing out with a pencil the figure to be cut on the shell. The pencil mark is followed by a sharp point, which scratches the desired outline, and this again by delicate tools of steel wire, flattened at the end and hardened, and by files and gravers for the removal of the superfluous portion of the white enamel.

The careful manipulation necessary in this work can only be acquired by long experience; the general shape must first be wrought, care being taken to leave every projection rather in excess, to be gradually reduced as the details and finish of the work are approached. Throughout the cutting great caution must be observed that in removing the white thickness the colored ground is not damaged, for the natural surface of the dark layer is far superior to any that can be given artificially.

In order that the finished cameo may posess a distinct outline at all points of view, it is desirable to adopt the system followed in antique cameos, viz., to leave all the edges of the figure quite square from the ground, and not gradually rounded down to the dark surface; for should the latter practice be followed the outline would be found to be undefined in many places, owing to the color of the white figure in relief gradually merging into that of the dark ground. The surface of the cameo is finished as nearly as possible with the cutting tools, as all polishing with abrasive powders is liable to remove the sharp edges of the figures and deteriorate the cameo by leaving the form undefined. When, however, the work has been finished as smoothly as possible with cutting tools, the final polish may be given by a little putty powder used dry, upon a moderately stiff brush, and applied with great care, and rather to the dark ground than to the carved surface. This is the concluding process, after which the cameo is ready for removing from the block prior to mounting.

The various styles in which these works of art are mounted depends a great deal upon the country where they are to be worn. There are tricks in this business as well as in most others; a fraud is frequently practiced by cutting away the engraved part of old shell cameos, and attaching this to a base of agate, by means of which an appearance of onyx is obtained.—*Read at the Saratoga meeting of the American Association for the Advancement of Science.*

IS STOREKEEPING EASY?

Many a man is carried away by the apparent ease of a shopkeeper's life, and by what he hears of the profits obtainable in a country store. It is plain sailing, he thinks, for, "all I have to do is to make from ten to fifty per cent. upon everything I sell, and that I can surely do." Let us see whether this is so:—

A storekeeper buys a book for 75 cents and sells it for $1; he makes 25 cents profit. But he cannot put that 25 cents in his pocket; he has to pay rent, taxes, clerk-hire, fuel, &c. out of his profit.

If he could sell 50 such books a day, representing a profit of $12.50, he would make money over and above expenses, but he can sell only two, which means fifty cents profit. Take an article yielding a smaller per centage; say tobacco, at a profit of two cents a plug; how many plugs must he sell to pay for the fire which warms the feet of the loafers who surround his stove? But there is tea, says a sanguine critic; he can make 15 to 30 cents per pound on that. Ah, yes; he will have to sell a chest of it every week, to pay his rent, and it takes a great many two ounce packages and quarter pounds, and half pounds to make up a chest. Dry goods, we are reminded by another, pay good profits, and are universally sold. True, some dry goods do pay a decent profit, even now-a-days, but grey and bleached cottons are hardly among them; all a country retailer would make in a year off these would not pay his taxes.

And so we might go on. Profits of 50 per cent. are rare; ten per cent. ones are

1847, Rogers Bros., A 1,

OR

1847, Rogers Bros., XII

MARK.

OBSERVE

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

more near the average, and unless the sum of these amounts to more than the running expenses of his shop, how is a shopkeeper to keep house and clothe his family? There are numbers of shopkeepers, in towns and cities, striving to make a living out of transactions whose aggregate profit will hardly pay pew-rent. And there are country dealers carrying a stock of $2,000 to $5,000. "To turn over" this stock once in a year, implies sales of $6.50 per day in the one case, and, say $16 per day in the other. An average profit of 20 per cent. on this, would yield daily, $1.30 and $3.20, respectively, out of which to pay for rent, fuel, light, household expenses and clothing! Suppose a livelier trade, turning over the stock twice a year, at a close profit, then 15 per cent. on $10,000 per annum equals $4.78 profit per day, to cover all the expenses of a business and a family establishment, interest, depreciation and bad debts. The man must be an economist who can lay by much out of even this performance. No; the life of a retail shopkeeper to-day is not, as a rule, either an easy or a prosperous one, and it is a mistake to encourage ignorant experimenters in it. Wholesale men as well as retail, may study with advantage, such analyses as these.—*Monetary Times.*

BUSINESS CHANGES FOR SEPTEMBER.

Brodrech & Feick, Hardware, New Hamburg, Ont., damaged by fire; L. Lewis Jeweler, Watford, sold out; J. W., Hastings, Jeweler Midland, burned out; Geo. Stratheron, jeweler Midland, damaged by fire; F. C. Paulin & Co., Hardware, St., Thomas, Ont., dissolved, Paulin continues alone; A. Jakeway, Hardware, Stayner, sold out to R. E. Bingham & Co.,; Wm. Nowry, Hardware, Palmerston, sold out to R. S. Shields.

BUSINESS NOTES.

We regret to learn that Mr. George A. Bray, eastern traveler for the firm of McNaught & Lowe, has been confined to his bed through sickness for the past three weeks. He is now almost convalescent and expects to be on the road again very soon.

In our last issue we said that Mr. Manning, formerly with John Segsworth & Co., had made an engagement to travel for Mr. Eves & Co., of Montreal. It seems that we were mistaken about this and that Mr. Manning is going on the road for Smith & Fudger of this city instead.

Mr. S. T. Culp, the wholesale jeweler of Toronto, has lately returned from Europe, where he has been spending his honeymoon, and we trust making money at the same time. He looks very much improved by his trip, and, if not too late, The Trader offers its congratulations and wishes him all the happiness incident to the occasion.

A Drummer's Cheek.—An original idea has been struck by a drummer. He has sent ahead to his customers postal cards reading as follows: "Dear Sir: I shall be in your town Aug. — with a full line of —. Please stop your ears against all comers with this cork until I have a chance to see you, etc." Attached to each card by a string is a small cork.

A well-executed photographic forgery of five dollar notes on the Port Hope issue of the Bank of Toronto has been detected in circulation. Eight of these forgeries found their way to the Port Hope agency, and one into the Standard Bank, Toronto. The counterfeit is not very well executed on the back, but the front has a genuine appearance, barring a certain greasy covering, which, however, makes detection harder.

A dealer in hardware at Goderich, J. A. Naftel is in trouble. In 1882 he began business by purchasing the stock of Geo. H. Parsons, at 57 per cent. Previously to this he was a retired farmer and was reputed to have considerable wealth, but evidently not much experience in business, as he has failed, owing $5,400. To pay this he has a stock valued at $7,600. His creditors have given him one week to obtain security and an extension will likely be granted.

We have heard nothing of late from Mr. Knox about either his Horological School or his Jewelers' League. We had hoped, in the interests of fair play that Mr. Knox would have come forward and given the jewelers of Canada an explanation of his scheme and its benefits. In the meantime, if the Jewelers' League is not to become an accomplished fact, what has become of the money Mr. Knox collected for it? We pause for a reply.

R. J. Quigley, the well-known watch manufacturer of Toronto, has just moved into his new and commodious premises on Adelaide Street, a few doors west of Bay. The new premises are very much larger than the old ones, and will give Mr. Quigley about double the capacity for turning out goods that he formerly had. In other senses than following Horace Greely's advice to "go west," Mr. Quigley's move seems to be one in the right direction.

It is stated on pretty good authority that the "Meriden Britannia Co." has bought out the Canadian business of the "Meriden Silver Plate Co.," and will shortly close up the plating rooms in Toronto and do the work at the Hamilton factory. The electro-plate business has heretofore been overdone, but now that the "Derby Silver Co." has closed up altogether and the "Meriden Silver Plate Co." is practically out of the race, there is an improved prospect for those that are left. As usual, it is the survival of the fittest.

The Way of the Transgressor.—Some time ago a man named Symond or Simmons, engaged with Messrs. Kriel & Bothgay, Yonge Street, jewelers, as traveler, while on the road got on a spree in Montreal, the result of which was that after spending all his money he sold and pledged a considerable quantity of his samples, and what remained he left as security for his board. A warrant was issued for his arrest, but when he got sobered up he entered into an arrangement with the firm to pay them back. He gave them a guarantee purported to be signed by certain parties, but afterwards, the firm allege, they discovered that the guarantee was a forgery, and a second warrant was taken out. The telegraph wires were put into requisition, and a few days ago the "crooked" traveler was arrested at Beachville, near Woodstock. He will probably be committed for trial.

The competition in Silverware at the Toronto Exhibition was very keen, both the "Meriden Britannia Co." and the "Toronto Silver Plate Co." having put forth every effort to win the coveted honors. We don't know who the judges were, but they seem to have been under the impression that "honors were easy," as they awarded each of them gold and silver medals. In both cases the exhibits were exceedingly handsome, and reflect the highest credit upon the manufacturers. We understand that in both exhibits, all the goods were made from the metal in their respective factories. This branch of manufacture has certainly made great strides in Canada since the advent of the N. P.

Sensible.—The Africans do not believe in long-winded essays even in their diplomatic treaties. The extradition treaty between the King of Ethiopa and the Khedive of Egypt is as follows, and embraces every criminal case;—"His Majesty the Negossa Negust and His Highness the Khedive engage to deliver up, one to the other, any criminals who have fled to escape punishment from the dominions of the one to the dominions of the other." This is just about the kind of a treaty Canada wants with the United States. If it were made we would have fewer burglaries and embezzlements and absconders on either side.

We cannot too strongly impress upon Canadian jewelers the importance of looking thoroughly into the question of protection against burglary. From fire they can be protected by adequate insurance, but protection from the midnight mechanic can only be secured by exercising every possible precaution. It is said that "Eternal vigilance is the price of liberty." and it is also the price that our trade have to pay for the security of their goods from the clutches of the burglar. Take The Trader's advice on this matter and get a first-class safe and employ all the other precautions that we have suggested, and you will lessen this risk very materially.

Some ten thousand dollars has been subscribed by the citizens of Windsor, Ont., to maintain the E. T. Barnum Wire and Iron Works branch in that town. For several weeks the managers of the new works have been making arrangements with Mr. Eason to get the works out of the hands of a stock company. Last week the Managers, F. S. Evans and G.G. Booth, agreed with Mr. Eason that if those who held stock in the concern would take back their subscriptions the three would run the works in partnership, Mr. Eason to furnish the capital which would be required. This was agreed to, says the London *Free Press*, and the concern is now solely in the hands of the

American Watch Company.

THE LARGE increase of our plant during the last three years, and the economies resulting therefrom, enable us to make a substantial reduction in some of the grades of our goods, and to give the benefit of it to our customers and the public, without sacrifice to ourselves or the standard excellence of our productions.

We do not, however, intend to pursue the policy adopted by some other companies, of selling any grade of our goods at a loss, for the purpose of inducing the sale of higher grades which, although giving good value for the money, yet, from their higher price, must naturally meet with a limited sale.

All our prices are regulated by cost and intrinsic value, and an experience of nearly thirty years has so far satisfied watch buyers and watch wearers of this and other countries of the superior quality of our watches as timekeepers, that we are enabled to maintain a slightly higher range of prices throughout our entire list than any of our competitors, with entire satisfaction to ourselves and the public.

We disclaim any intention or desire of making a watch to compete in lowness of price with the cheapest grade of goods steadily poured upon the market. On the contrary, as we never, under any circumstances, intend to put other than good timekeepers on the market, we consider the constant reducing of prices below the cost of really good work, as practiced by certain watch companies, to be prejudicial to the permanent good name of American watches.

We could, of course, by the employment of cheap and unskilled labor and the use of inferior materials in manufacture, make goods for as low and no doubt much lower prices than other companies, but the tendency of lower prices reached in this way is not consistent with the uniform excellence we wish to maintain, and, if persisted in, must inevitably result in a general deterioration of workmanship and of product, by which the public and ourselves would be, in the end, the great losers.

We challenge competition in the price and quality of our WATCH CASES if gold is weighed against gold, but not if our gold is weighed against steel springs and other base metal which our competitors weigh in and sell at the price of gold. Our movements are often sold by dealers in cases of other make than our own, and it frequently happens that a good movement is used to sell a bad case, or that a badly made inferior case throws discredit upon a good movement. In either case purchasers are warned against the results of this practice. We intend, in the future, as we have largely in the past, to case our own product, and thus avoid all question as to the character of either the watch case or the watch movement.

To reiterate :—The WALTHAM WATCHES are deservedly popular, because the purchaser as a rule, gets the best value for the money expended. The dealers are enabled to sell the goods with comparatively little trouble, and, at the same time, please their customers and make a profit for themselves.

AMERICAN WATCH COMPANY,

above-named gentlemen, Mr. Evans being manager, Mr. Booth Secretary, and Mr. Eason Treasurer. The works will be immediately removed to the new building near the ferry landing.

IT IS SAID that one of the recent jewelry seizures in Winnipeg for evasion of Customs' duties were the result of a deliberately put-up job. It appears that a well-known jeweler was induced to smuggle by a Government official, in the pay and confidence of the Customs' Department,and when the seizure was made there was a division of the spoils. Now that the thing is over it seems that the small fry complain that they did not get their fair share of the plunder, but that those "higher up" gobbled the most of it. In this connection some interesting developments may shortly be expected. It is also rumored around Winnipeg that sundry persons in Her Majesty's service, and supposed to be gentlemen, are sporting around watches and other jewelry that were never either bought or paid for. It seems to us that it would be in order for some member at the next meeting of parliament to move for all the papers and particulars of the Winnipeg jewelry seizures, and of the management of the affairs of that port generally. If this were faithfully done we think there would be a general cleaning out to the very great benefit of the public in that region.

WORKSHOP NOTES.

COPYING INK.—Fine writing on glazed paper will give one or two fair copies without calling in the assistance of a press or water if use is made of a writing solution of three parts of good jet-black ink and one part of gelatine.

LUMINOUS PAPER.—A luminous water-proof paper, which may be of use in places not well adapted for the application of the so-called luminous paint, may be made from a mixture of 40 parts pulp, 10 parts phosphorescent powder, 1 part of gelatine, 1 part of potassium bichromate, and ten parts of water.

MAHOGANY STAIN.—A wash of one part nitric acid in ten parts of water will impart a stain resembling mahogany to pine wood that does not contain much resin. When the wood is thoroughly dry shellac varnish will impart a fine polish to the surface. A glaze of carmine or take will produce a rosewood finish. A turpentine extract of alkanet root produces a beautiful stain which admits of French polishing. Asphaltum thinned with turpentine makes an excellent mahogany color on new wood.

TEST FOR GLUE.—The following simple and easy test for glue is given in the *Tichler Zietung:* A weighed piece of glue (say one third of an ounce) is suspended in water for twenty-four hours,the temperature of which is not above 50°. The coloring material sinks, and the glue swells from the absorption of water. The glue is then taken out and weighed ; the greater the increase in weight the better the glue. If it then be dried perfectly and weighed again, the weight of the coloring matter can be calculated from the difference between this and the original weight.

HARDENED CAST IRON.—The *Manufacturers Gazette* says that cast iron may be hardened as follows: "Heat the iron to a cherry red then sprinkle on it cyanide of potassium and heat to a little above red, then dip. The end of a rod that has been treated in this way could not be cut with a file. Upon breaking off a piece about half an inch long it was found that the hardening had penetrated to the interior, upon which the file made no more impression than upon the surface. The same salt may be used to case-harden wrought iron.

OTHER NOTES.

THE PESKY MOSQUITO.—Yellow fever is said to be propagated by the sting of the mosquito, on the authority of Dr. Carlos Finlay, of Havana, who has seen under the microscope spores and filaments of a particular nature on the sting of one of these insects that had just bitten a patient suffering from yellow fever.

WATERPROOF CLOTHING.—Waterproof clothing which allows a free passage for respiration can be prepared by dipping in a solution of acetate of alumina. The latter is made by adding a solution of acetate of lead to a solution of alum, and decanting the mixture from the sulphate of lead which is precipitated. The articles are dipped into this liquid and allowed to dry without wringing them.—*Rundschau fur Pharm, etc.*

THE BEAUTIFUL SNOW.—The first snow fall examined by Floegel gave in the purest melted snow water nine forms of diatoms, confervæ, spores, alive or apparently alive, fourteen forms of pollen or other parts of animals and plants, and five forms of mineral substances. The subsequent snow fall, however, besides these forms of dust invariably gave iron, and the total amount of the latter was in one can about 1,830,000,000th of the volume of freshly fallen snow.

TESTING WATCHES.—A great Swiss marine and pocket chronometer competition is now going on at Geneva, to last over eighty-three days. A special stove in which an invariable temperature can be maintained for several consecutive days, was built. For five days the chronometers placed therein will be placed at one temperature, which will afterwards be raised by degrees at a time from 5° to 35° Centigrade, and then reduced in like manner from 35 to 50 per cent.

Editorial.

THE OUTLOOK.

There is no use of disguising the fact that trade is comparatively dull for this season of the year, and there are not wanting croakers who would fain have us believe that the country is going to the dogs, and that we are on the verge of national bankruptcy. It is true, as we have said, that times are dull, but we cannot see any great reason for alarm; in fact, we regard the prevailing dullness of trade as an evidence rather of mercantile soundness and caution than of impending ruin.

Our merchants are buying cautiously, and for their immediate wants. This, coupled with the fact that grain is low in price, and their own trade consequently not so brisk as it usually is at this time of the year, makes things appear duller than they really are. This state of trade, however, is a healthy sign, and is very much better for the country generally than if orders were plentiful in spite of the present depression. We regard the prospects ahead as encouraging rather than discouraging Our crops are very much larger than usual, and although prices are low, still Canada will, in spite of all this, obtain a good many millions of dollars more money from the products of the soil than last year. This increase of resources on the one hand, and our apparent self denial in making purchases (for that is what dull trade means) on the other, must have the effect of placing the country in a sounder financial position than it occupied last year. The outlook, as far as we can see, is hopeful, and if our merchants only combine energy with prudence, they may certainly look forward to a fairly prosperous year. In this connection we cannot help quoting the remarks of Mr. Workman, President of the Molsons Bank, at their late annual meeting. After referring to the prosperity of the institution over which he presided during the past year, Mr. Workman said:

"We enter upon another year with a clean sheet, strong reserves, a moderate demand for money at paying rates, and a hopeful feeling among our customers. The farmers throughout the Dominion have secured an abundant harvest in prime condition, and are now bringing their grain, root crops, butter, cheese and cattle to market, thus creating an active demand for currency. Our circulation has lately gone up rapidly, a certain proof of increasing prosperity and great activity in business. Profits are doubtless not so large as in former years, and I do not anticipate another boom such as then prevailed, yet I believe the worst has been passed, and every change will be for the better. It is too true that severe losses and great depression have been experienced by our merchants and manufacturers the past eighteen months, and some time will yet be required to overcome them. A prudent economy now pervades all classes, our foreign imports have decreased very considerably, and a general reduction of indebtedness is going on. These will soon produce better times and a more active condition of trade, in which our banking institutions will participate."

The Molsons Bank has long been known as one of the most conservative institutions in Canada, and a forecast so hopeful as this coming from such a source is therefore entitled to additional weight.

A WISE PRECAUTION.

We would like to impress upon every jeweler who reads THE TRADER, and that ought to be every jeweler in Canada, the advisability, not to say the necessity, of keeping an accurate and reliable list of his stock. Many if not most of our jewelers when taking stock content themselves with simply taking down the name of the article and its cost. It is of the utmost importance that not only these particulars, but description and numbers should be taken down whenever it can be done. In articles such as watch movements and gold and silver cases, that are each stamped with a number of their own, this is easily managed, and should never be neglected. Every jeweler should keep a stock book for watches and cases, and enter in it regularly the number of every watch or case he receives, and opposite to it when sold the name of the party buying it. By this means he would have an exact account of his watch business; and in case of a burglary, or robbery by employees, the goods could be more easily traced. Detectives tell us that if all jewelers kept such a record as this, and sent the numbers and description of such goods broadcast at once, that in more than half the cases the goods would be recovered. As it is, they might and often do come into the possession of the officers of the law, but not having anything to guide them they remain in ignorance of their ownership. Nearly every watchmaker keeps such a list of his watch repairs, why not introduce the same system for keeping a record of new goods bought and sold? In this connection we notice a letter from Mr. F. K. Jenks, of Hagerstown, Ind., in the *Jewelers' Journal*, which commences as follows:—

"On the night of August 19th, myself and wife were chloroformed and robbed by burglars, who entered my house and stole between forty and fifty watches, besides my wife's gold watch, an Elgin stem-wind, lever movement, and my pocket book, which contained the last cent I had. I sent that day all the money I had, previous to closing the mails, to the E. N. Welch Clock Co., of your city, or my loss would have been greater. The watches of which I have a record are as follows."

Then follows a list of the numbers of the watches he had kept. Robberies and burglaries are going on around us every day. We can scarcely pick up a paper that we cannot read of something of the kind. This being the case, our jewelers should take every precaution in their power not only to keep these midnight mechanics out, but to catch them afterwards if they are successful in getting into their premises and securing their stock. Precaution is always better than cure; but if such things occur in spite of all preventive measures, it is wise to be in a position to make the best of it.

ACCOMMODATION PAPER.

The failure of James Campbell & Sons, Wholesale Stationers and Booksellers, of Toronto, although affecting only their line of business, is one of the most disastrous and far reaching in its effects that has ever occurred in Canada. The amount of liabilities is placed at about $300,000, and from present appearances it would seem that the unsecured creditors will not receive more than ten cents on the dollar, if they are lucky enough to get even that. The worst feature of this failure, and the only reason why we go out of our usual course to moralize upon what concerns another line of business almost exclusively, is that most of the disaster attendant upon this failure will result from the fact that this concern, which has been financially rotten for years, has been bolstered up by accommodation paper obtained from their customers. The result of this system of financial juggling is that the assignment of this firm alone will probably be the immediate cause of the failure of some sixty of those customers who had sufficient confidence in their integrity and sound business standing to put their names to paper merely to oblige them, and for sums they never owed, and that the accommodation paper discounted by them will aggregate nearly $100,000.

A more practical comment than this upon the folly of any merchant ever giving accommodation paper it would be hard to imagine, but we very much doubt whether this warning will deter merchants from asking and granting such dangerous and unbusiness like favors.

It is a well known fact that a good many firms are in the habit of getting notes from their customers for which no value has ever been received, and thus bolstering up a rotten business, long after it has become practically bankrupt. When the after clap comes and the firm is declared insolvent (which, in fact, they may have been for months or years previous), people read the list of victims of this kite flying system and say they have their sympathy. If they were bluntly told that they had been a parcel of fools, and that the result was but a certain consequence of their own folly, it would be but the truth, and probably do these victims of misplaced confidence more good than the pleasant but misdirected sympathy of which they are generally the recipients.

"But," says one of the victims, "although we knew well enough that it might be dangerous, we couldn't very well help it; the wholesale house with whom we were dealing asked us to give them our note as a favor, and as we sometimes require favors ourselves from them, could not refuse, although we knew well enough we had never received value for it; besides, they assured us that it would never trouble us, as they would take it up themselves when due." A more absurd argument than this, when you come to analyze it, could hardly be imagined, for in the first place none but a weak house would ever ask or require to use accommodation paper. The very fact of a house being compelled to ask their customers to lend them their names on which to raise money, ought to be proof positive of its financial weakness, and in itself the very strongest reason for refusing it. It is true they may take up the note at maturity, so that their customers are never troubled about it at all, but this apparent security and freedom from risk only makes the danger greater by inducing recklessness on the part of the dealer, who argues that if he can put the wholesale house he deals with under an obligation to him by so "cheap" a favor as simply signing a note, it cannot be a bad investment. When the assignee is in possession of the estate and the dealer is officially notified by the bank that they look to him for one hundred cents on the dollar for the amount of his accommodation note, he begins to realize that he will have to pay pretty dearly for his whistle, but unfortunately for him the knowledge came too late to be of practical use to him, except as an experience not to be repeated.

The ease with which wholsale dealers in fair credit can discount even inferior paper, is often a great incentive for unfortunate or unprincipled men to make use of their friends and customers by obtaining notes to be used in this way, but the danger would be greatly lessened if all the retail dealers could be brought to understand and believe, that with the aid of a financier with plenty of cheek and a judicious use of accommodation paper, a business utterly rotten to all intents and purposes can be floated on for years. In the end it must go down in the maelstrom of bankruptcy around which it has been so long circling, but until the crash comes it presents to the unthinking outsider a fair but deceitful appearance.

Our advice to all dealers, whether wholesale or retail, and we cannot too strongly emphasize it, is to have a watchful care with whom you deal. Especially in this matter of accommodation paper, rest assured that a house that has to ask for it is a weak house, and should either be avoided altogether, or dealt with on hard business lines. In conclusion, we offer as a maxim to all traders, "*Never give your paper to any firm, unless you owe them the money and have received value for it.*"

Selected Matter.

WHY BUSINESS MEN FAIL.

Let me give your readers, says a correspondent of the *United States Economist*, the benefit of the replies I have received from leading men of our country to the question, "What in your observation have been the chief causes of the numerous failures in life of business and professional men?"

Governor St. John answers: "Idleness, intemperance."

Alexander H. Stephens answered: "Want of punctuality, honesty and truth."

Hon. Darwin R. James answers: "Incorrect views of the great end and aim of life. Men are not contented to live plain lives of integrity and uprightness. They want to go ahead too fast, and are led into temptation."

President Bartlett, of Dartmouth College, names as causes of failure: "Lack of principle, of fixed purpose, of perseverance."

President Eliot, of Harvard, replies: "Stupidity, laziness, rashness, and dishonesty."

Dr. H. M. Dexter, of the *Congregationalist*, answers: "1. Want of thoroughness of preparation. 2. Want of fixedness of purpose. 3. Want of faith in the inevitable triumph of right of truth."

Anthony Comstock's answers are: "Unholy living and dishonest practices, lust and intemperance, living beyond one's means."

Mr. H. E. Simmons, of the American Tract Society, replies: "Fast living, mental, spiritual, and bodily; lack of attention to the details of business."

General O. Howard answers in substance: "Breaking the divine laws of the body by vice, those of the mind by overwork and idleness, and those of the heart by making an idol of self."

Professor Homer B. Sprague, of Bos-

READ -:- THE -:- EVIDENCE!

THE MANUFACTURERS OF JAS. BOSS GOLD WATCH-CASES NOBLY UPHELD BY THE TRADE AND THE PEOPLE.

THE MOST CONVINCING TESTIMONY FROM ALL QUARTERS.

The Correspondents of the Keystone Factory vie with each other in unmistakable approval of the unequalled qualities of Jas. Boss Gold Cases. The aim of the manufacturers of Boss Cases being to make only first quality goods, and having facilities to that end possessed by no other concern in the world, it is in accordance with the fitness of things to have the almost universal support of the trade in that endeavor. From among hundreds of letters recently received at the Keystone Factory, all breathing unqualified praise of Boss Gold Watch Cases, the following are printed as showing the spirit which pervades the writers:

CADILLAC, MICH., Sept. 19, 1884.

I have sold the Boss case for twenty years, and have yet to find a poor one; in fact I swear by the Boss.

F. H. HUNTLEY.

WATER VALLEY, MISS., Sept. 1, 1884.

I have been selling the Boss filled cases for eight years, and take pleasure in saying they have given entire satisfaction to my trade. J. ALTER.

LITCHFIELD, ILLS, Sept. 15, 1884.

We sell no other filled case but yours because we believe them to be the best, and feel safe in recommending them.

NOTERMAN & HUBBEL.

SEAFORTH, ONT., Sept. 13, 1884.

The Boss is the Boss of all filled cases. The cheap Swiss gold cases are things of the past with me.

M. R. COUNTER.

TROUPE, TEXAS, Sept. 17, 1884.

I have been selling the Boss case, and think it the BEST filled case ever made. T. C. SAMMONS

MORRISON, ILLS., Sept. 19, 1884.

Your filled cases I have handled ever since I have been in business. F. E. HEWITT.

CENTRE, ALA., Sept. 12, 1884.

I strive to do good, and in selling Boss and Keystone cases I am serving my calling. They are the best. The doubting Thomas is converted. J. J. B. MCELRATH.

THAMES CROSSING, O., Sept. 11, 1884.

Boss cases sell better than any other kind, and give the best satisfaction. We handle but few of any other make.

McKEE & NETH.

MURRAY, KY., Aug. 5, 1884.

We take great pleasure in handling your goods, as they give universal satisfaction. We have never sold any other filled case than the Boss, and to parties desiring a first class silver case we always sell the Keystone. S. HIGGINS & CO.

ADRIAN, MICH., Sept. 11, 1884.

I sell no other case than the Boss, and will not as long as I can get it. J. WILL KIRKE.

PARIS, ILLS., Sept. 16, 1884.

We handle the Boss case and we think it the best. Perfect engraving, elegant, and appearance grand. We find no trouble in selling it, as its reputation is established.

REED & SWINFORD.

MARTINSBURG, W. VA., Aug. 7, 1884.

Your goods will stand on their own merits. I have a filled case of your make that has been in use seventeen years, and from appearances will last ten years more, having but very little of the engine-turning worn off. JOS. A. MESSMAN.

HAYWARDS, CAL., July 21, 1884.

Your cases give the best satisfaction of all I ever sold.

B. HAAS.

BONHAM, TEXAS, July, 24, 1884.

There is a case of your make (Jas. Boss) in this county that has been in constant use since 1858 and looks well yet. We consider the Boss the boss of all. The case referred to was purchased in Charleston, S. C., in July, 1858.

M. A. BRIDGES & CO.

WAYCROSS, GA., June 19, 1884.

I have been selling the Jas Boss Cases for the last ten years, and they always give perfect satisfaction. T. E. LANIER.

LISTOWEL, ONT., June 7. 1884.

We can honestly say that we do not know of one of your cases which we have sold that has in anyway failed to give satisfaction. BARKER & CO.

FREMONT, NEB., April 28, 1884.

I handle the Boss case to the exclusion of all other filled cases, and can assure you that among the 185 Boss cases I sold from January 15, 1883, up to April 20, 1884, I have yet to hear a single complaint. CHAS. MARSHALL.

DILLON, MONTANA, May 18, 1884.

I have handled Boss Cases for fifteen years, and have yet the first one to find that failed to give satisfaction either to the customer or myself. MRS. L. KUFFER.

SAN MARCOS, TEXAS, Aug. 8, 1884.

I have been in the business about fifty-three years, and believe the Boss case can't be excelled or equalled.

W. H. ROBBINS.

OAKLAND, NEB., Sept. 9, 1884.

I sell nothing but Jas. Boss and Keystone cases, and it is not overestimating or exaggerating to say they are the best in the world. J. W. BATTERSHALL.

FARMER, OHIO, July 15, e884.

I have carried one of your watch cases (80623) for two years and you cannot tell that it has been in use. I have a solid gold case, but prefer the Boss to it. R. E. FOOT.

ton, answers: "1. Ill-health. 2. Mistake in the choice of employment. 3. Lack of persistent and protracted effort. 4. A low ideal, making success to consist in personal aggrandizement, rather than in the training and development of a true and noble character."

Dr. Lyman Abbott answers: "The combined spirit of laziness and self-conceit that makes a man unwilling to do anything unless he can choose just what he will do."

Judge A. W. Tenney, of Brooklyn, replies: "Outside of intemperance, failure to grasp and hold, scattering too much, want of integrity and promptness, unwillingness to achieve success by earning it in the old-fashioned way."

The attorney-general of a neighboring State replies: "Living beyond income, and speculating with borrowed funds; unwillingness to begin at the foot of the ladder and work up. Young men want to be masters at the start, and assume to know before they have learned." And another reason in the same line: "Desiring the success that another has, without being willing to work as that man does. Giving money-making a first place and right-doing a second place."

Judge Tourgee, author of "A Fool's Errand," considers the frequent cause of business collapse to be: "Trying to carry too big a load." As to others he says: "I don't know how about a professional man's failing, if he works, keeps sober, and sleeps at home. Lawyers, ministers and doctors live on the sins of the people, and, of course, grow fat under reasonable exertion, unless the competition is too great. It requires real genius to fail in either of these walks of life."

Hon. Joseph Medill, ex-mayor of Chicago, answers: "Liquor drinking, gambling, reckless speculation, dishonesty, tricky conduct, cheating, idleness, shirking hard work, frivolous reading, lack of manhood in the battle of life, failure to improve opportunities."

Among the causes of failure given by my correspondents many may be classified under the general fault of wavering, such as "wavering purpose," "non-stick-to-it-iveness," "failure to grasp and hold," "scattering too much," "trying to do too many things, rather than stick to the one thing one knows most about." A young man spends seven years in a grocery store, and when he has just learned the business he concludes to go into dry goods. By failing to choose that first he has thrown away seven years' experience. Probably, after learning the dry goods business, he will conclude to become a watchmaker, and at last becomes a "jack-at-all-trades," good at none. A prominent merchant says: "Nearly all failures in legitimate business come from not serving an apprenticeship to it," that is, from leaving a business one knows for another which he does not understand.

Another cause of failure is the disposition to escape hard work, and get rich in haste—"desiring the success another man has, without being willing to work as that man does, and begin, as he did, at the foot of the ladder." How many who were in haste to get rich, to reap without patient industry in sowing, have learned the truth of the old proverb: "The more haste, the worse speed!"

THE STORY OF A WATCH.

One day I was passing through the Green Park. Let me recall that eventful day. I have been working hard all day to catch up lost time, am now walking slowly through the park, when a sight meets my eye which makes me forget fatigue and change my stroll into a sharp walk. A crowd. I am soon in it. What is the matter? Indeed! Then I must stop. One does not see a Sultan every day. This is something like. An Oriental potentate, in all his magnificence, is about to enter the palace of the great Queen upon whose dominions the sun never sets. Hark! Music! Here they come! Hurrah! A rush, a squeeze, a man pushes rudely against me; I glance around at him; he is working his way quickly through the crowd, very quickly. A suspicion flashes upon me. One touch of my hand to my side makes it a certainty. My watch is gone! I plunge fiercely after that man. I think of my wife's tears, of my own vexation; I think, with a tender regret, of winding up time; I feel like a father as I think of the times I have corrected my treasure by the church. I picture Blogg's pretended sympathy and secret glee. I imagine him flaunting his gold Geneva in my face, and myself without my good old forty guinea English lever to put him down with; and all because of that black whiskered vagabond now making his escape. These thoughts—the thoughts of a moment—give me the strength and energy of a lion. I dash and push and squeeze through the people, who give me no aid, but curse me volubly as I stamp on their toes and dig my elbows into their ribs. I make a clutch at him. Missed by a hair's breadth. Oh, if that man between us had been thin! Another attempt; I touch his coat. Once more—I have him! Oh, the ecstacy of that moment, mingled with the fear of his having passed the watch to a confederate! Before I can gasp out a word he turns half round, slips it into my hand, and as I place it in my pocket he makes off once more, this time unpursued, for I have regained my treasure and am satisfied. I do not venture to take it out of my pocket, but walk home at once, keeping my hand on the watch all the way. No one shall come near me till I reach home. I feel very hot, but at the same time a hero. Have I not had an adventure, and have I not come through it triumphantly? No tears now from my wife, no sneers from Blogg. How shall I enjoy winding my watch to-night! Its value is enhanced, it has a story! I wish I could go home on horseback or by steam. I am bursting to tell my wife all about it. At last I am home. I am sitting down. I begin my tale. I tell of the crowd, of the thief, of my loss. My wife tries to interrupt me, I won't allow it, I describe the deed, the chase, the capture, the restitution! I pause for my wife's word of admiration and congratulation, which I am sure will now follow. She says quietly: "My dear, you know you left in a hurry this morning. If you look on the mantelpiece you will see your watch, which you left at home." She was right. I have now two watches!—*London Society.*

GEORGE GRAHAM AND HIS WATCHES.

Under the above title we find a very characteristic anecdote of George Graham, the celebrated inventor of the anchor movement, in a German contemporary; whether true or not, at least it speaks of a man held in reverence by all watchmakers.

As it is well known, Graham was a quaker. He one day sold a watch to a stranger, and guaranteed its correct rate. The purchaser said he was on the eve of embarking for East India and desired to know how long he could depend on the good rate of the watch.

"My friend," said Graham, "I have constructed and regulated the watch myself; thee can wear it, whenever thee

OBSERVE

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

desires, and if thee comes after seven years and says that thy watch differed by five minutes, I will return thy money."

After the lapse of seven years, the purchaser really returned to the watchmaker, and said, with assumed sobriety, "Mr. Graham, I return you your watch."

"Ah, I remember," responded Graham; "let me see it; what objection has thee against it?"

"What objections have I against it? In the seven years that I have owned it, it deviated more than five minutes."

"Well I will return thy money—"

"How do you mean?"

"I will keep what I promised."

"Really?"

"I never speak otherwise."

"But I will not sell my watch," answered the owner, "and if you were to pay me ten times its value."

"And I," said Graham, "will not break my promise under any consideration. I promised to take back the watch for certain reasons. In consequence of this promise thee brings it back, and no power on earth can force me to break the contract."

And Graham kept his word, and the watch remained in his hands.

VANDERBILT'S VAULT.

"Mr. William H. Vanderbilt's treasure vault," says a New York correspondent, "in which he recently stowed away some $100,000,000 in securities, is one of the most redoubtable works of defense on the American continent, though you may not be entirely certain of that by surveying his mansion from the outside. Its foundations were blasted out of the rock; the front wall is five feet in thickness, and the side and rear walls are three feet, the materials used being pressed brick with brown stone trimmings. The beams, girders, and main pillars are iron, incased in fire-proof material. The doors, window-frames, and minor partitions are iron, marble and glass. No wood is to be found in the structure. The great vault, thirty-six by forty-two feet, of wrought-iron, steel, and Franklinite iron, is imposing in strength and proportions, and is situated on the ground floor. Its four outer doors weigh 8200 pounds each, and have every effective and known improvement in defensive devices. A massive wall of masonry surrounds the iron work. The vault, which is burglar, fire, and water-proof, constitutes a distinct building in itself."

PROPERTIES OF QUICKSILVER.

One of the most curious properties of quicksilver is its capability of dissolving or of forming amalgams with other metals. A sheet of gold foil, dropped into quicksilver, disappears almost as quickly as a snow-flake when it drops into water. It has the power of separating or of readily dissolving those refractory metals which are not acted upon by our most powerful acids. The gold and silver miners pour it into their machines holding the gold-bearing quartz; and, although no human eye can detect a trace of the precious substance, so fine are the particles, yet the liquid metal will hunt them out, and incorporates it into its mass. By subsequent distillation it yields it into the hands of the miners, in a state of virgin purity. Several years ago, while lecturing before a class of ladies on chemistry, we had occasion to purify some quicksilver by forcing it through chamois leather. The scrap remained on the table after the lecture, and an old lady, thinking it would be very nice to wrap her gold spectacles in, accordingly appropriated it to that purpose. The next morning she came to us in a great state of alarm, stating that the gold had mysteriously disappeared, and nothing was left in the parcel but the glasses. Sure enough, the metal remaining in the pores of the leather had amalgamated with the gold, and entirely destroyed the spectacles. It was a mystery which we never could explain to her satisfaction.—*Fireside Science.*

UNCERTAINTIES OF DIAMOND MINING.

We see by our Armsterdam exchange *De Diamant*, that there are blanks even, in diamond digging. In its *Coursblad in the Kaapsche Diamantmijners Maatschappigen* it gives a list of twelve companies at the Kimberley Mines, only four of which paid dividends last year, the highest 15, the lowest 3. 0. 4—but whether pounds, francs, marks or Japanese taels the paper does not state; presumably, pounds, being in the British possessions. De Beer's mine, with nine companies, has four dividend paying companies, the lowest with 0. 2. 0., the highest with 0. 10. 0.; Du Toit's Pan Mine, twelve companies, two of which with "divis," one 0. 3. 0., the other 0. 15. 0.; Bultfontein mine, six companies, two pay dividends, viz., 0. 4. 0., and 0. 10. 0., finally, the Jagersfontein mine, five companies all of which are blanks.

Considering the vagueness of not alone this, but also various other European statistical exhibits, we are compelled to state as a well known fact that although America may learn lessons in the industrial branches of Europe, still, when the question concerns business, an American primary school boy can lay the European statistician in the shade. There is always a vagueness, a lack of precision about European statistics that leaves room for the readers imagination. The very first act of the said school boy would have been to introduce somewhere in his tabular statement $ cts., or £ s. d., as the case may be. It is one of the rarities of literature to see a really well prepared tabular statement coming from the continent. —*Exchange.*

THE CITY OF LONDON.

London, says an exchange, is without a rival as regards size and population, not only in the present, but as far as is known in the past history of the world. London, or the Metropolis, as defined by the Metropolis Management Act of 1855, contains at present nearly 4,000,000 people, covering an area of 117 square miles, upon which are built 500,000 houses. Its population is equal to that of the whole State of Holland, is greater than that of Scotland, and double that of Denmark. At the same rate of increase, by the end of the century it would equal that of Ireland, as indeed outer London now does. Its population has quadrupled since 1801, when it numbered 950,000; and it is now increasing at the rate of 70,000 per annum, equivalent to the addition to London every year of a city as large as Geneva or of Plymouth. The ratable value of property in England has grown from £6,000,000 in 1841 to £28,000,000 at present, or nearly fivefold in 43 years. But the traffic through London has risen even more rapidly. The arterial lines of thoroughfare, wide enough half a century ago, are now altogether insufficient. Thus, although the Strand and Cheapside have been relieved by the formation of a new route between Charing Cross and the Bank, along the Victoria Embankment and Queen Victoria Street, and Holborn has been relieved by a new route from Oxford Street to Shoreditch, and new and widened streets continue to be made through the city and other

American Watch Company.

We desire to call the attention of the Trade to the fact that we have made A VERY MATERIAL REDUCTION in the prices of

OUR 18 SIZE FULL PLATE MOVEMENTS,

—— AND ALSO IN OUR ——

GOLD : AND : SILVER : CASES.

The reduction gives dealers handling our Movements and Cases a substantial advantage over all other competing goods. The improvements steadily being made in the quality of our productions render them more attractive and desirable than ever and insure a higher standard of perfection than hitherto attained, which the practical men in the Trade cannot fail to appreciate.

Our 18 Size Gold Cases, unequalled in Workmanship, Style and Finish, are being constantly embellished with new and taking designs that make them the most salable goods of the kind in the market.

In the manufacture of our new SILVER CASES the most improved methods are introduced, and their Style, Finish and Intrinsic Value have justly earned for them a wide-spread popularity, while the prices cannot fail to attract attention. A large and constantly changing variety of our productions can always be found in the stocks of the Jobbers in all sections of the country, so that dealers can have opportunities for selecting the newest goods made by the Waltham Company.

crowded local ties, the all lines of thoroughfare still remain congested by the traffic. There now pass over the Metropolitan bridges daily 384,000 pedestrians and 75,000 vehicles, the annual increase being at the rate of 4½ per cent. and 13 per cent. respectively. The traffic on three Metropolitan railways has risen from 79,000,000 passengers in 1871 to 136,000,000 in 1881, or to 373,000 daily.

BUSINESS CHANGES FOR OCTOBER.

Woltz Bros., jewelers, Toronto, assigned; D. R. McRae, hardware, Deseronto, Ont., assigned; A. Findlater, jeweler, Lucknow, dead; Grant & Sinclair hardware, Paisley, Ont., dissolved, A. Sinclair continues.

BUSINESS NOTES.

Another Robbery.—Some time on the night of the 13th Oct. burglars paid a visit to the jewelry establishment of H. Butterworth, No 42 Adelaide Street west, and carried off a large number of heap rings, chains, cuff buttons, etc. The thieves were evidently frightened away, as they left behind them all the jewelry of any material value.

We have waited a couple o months for a reply from Mr. Knox, founder of the Canadian Jewelers' League, as to how much funds he has received from members, and what has become of them. If Mr. Knox received all the money those in his employment represented he had, those paying it have a right to expect some statement of what has been done with it. A statement from Mr. Knox is now in order.

A Daring Attempt was made on the night of the 14th Oct. to burglarize the jewelry store of M. H. Sanders, King Street West. The occupants of the house were aroused by the partition between the store in question and the adjoining store, which is vacant, being smashed in. Failing to obtain admission by this means, the burglars descended to the cellars beneath, and obtained admission to Mr. Sanders' store by a trap door in the floor of the room behind his shop. The proprietor raised an alarm and scared the intruders away before they had time to secure any booty.

The Manufacturing Jeweler.—We are in receipt of the initial number of this new American publication, which, as it says, in making its bow to the public, is launched for the purpose of representing the interests of the manufacturing jewelers of the United States. This new journal is neatly printed, ably edited, and we have no doubt but that it will amply fulfil the mission for which it was intended. Without doubt, the jewelry trade is subject to more abuses than any other that we know of, and we heartily endorse a great many of the very pointed hits that "The Manufacturing Jeweler" makes in its opening number. We wish the new venture long life and prosperity.

Business in Canada, generally, has been quieter than usual during the past month, probably owing to the low price of wheat, and the idea our farmers have that by holding off they will get more for it. The probability is that they will get less instead of more, and the sooner they turn their crop into cash and pay their bills with it the better for the country. The jewelry trade has been no exception to the prevailing stagnation, and lacks the snap it ought to have at this usually lively season. The probability is, however, that next month will see things more flourishing.

In answer to an enquirer, regarding the advisability of our Canadian jewelers subscribing for stock in the "Aurora Watch Co.," of Aurora, Ill., U. S., and we may say that we can't give very much information about it, but we think such a course would be unadvisable for two reasons: 1. The history of watch making shows that every watch factory that has ever started in the United States has resulted in a loss to the original promotors, and it therefore looks like a poor investment for capital. (2.) Regarding any special inducements it may hold out in the way of price or agency, it certainly can't do any better than the well-known companies now before the public, and as its goods are yet in the womb of futurity and practically an experiment, we think we are safe in saying that our jewelers had better keep their money in their own business. We don't think they will have any trouble in getting all the American movements their trade requires for some years to come.

Never before, that we are aware of, since Canada was Canada, have our borders been infested with such a gang of scoundrels as they are to-day. We don't refer to bank managers and people of that ilk, who have come to Canada for the good of their health, but to ruffians of the lower class, such as burglars, pick pockets and confidence men of all descriptions. The jewelry trade, having valuable stock that can be easily carried off and disposed of, should take more than ordinary care that every precaution is exercised to keep it for themselves, in preference to letting these midnight mechanics get possession of it. Prevention is better than cure any time.

The failure of Woltz Bros., jewelers, King Street, Toronto, although not unexpected in some quarters, has caused considerable surprise amongst the jewelry trade here. The amount of their liabilities ranges, we understand, close on to $100,000, and with the exception of Mr. Culver, of Simcoe, whose account is 50,000 is unsecured. The Woltz Bros. have always been regarded in the city as honest and thoroughly honorable men, and a good deal of sympathy is felt for them here by those who know them best. Their failure seems to have arisen principally from the carrying a heavy stock of goods too fine for this market, the legacy, probably, left them by the old firm of Woltz Bros. & Co., of which the brother in Winnipeg was the leading spirit. The prospects for the unsecured creditors is pretty blue, as if forced to a sale *en bloc* it is hardly probable that the stock would realize much more than the preferred claims. This failure is but another proof of the folly of people engaging in any business for which they have not received a thorough training.

One of our young Toronto jewelers while down East for a holiday a few weeks ago, took it into his head to go camping along with a few other choice spirits. All went well until they left, when it was found they had neglected to thoroughly extinguish the small camp fire they had used for the purpose of cooking their meals. The weather being dry, the fire spread and very soon the whole neighborhood had to turn out *en masse* to repel the threatened calamity. The conflagration was finally extinguished, but not before it had done considerable damage, and our hero and his friends were very soon afterwards brought before the local cadi to answer for their breach of Her Majesty's laws relating to bush fires. As usual, the fellow who lit the match turned Queen's evidence, and although our enterprising jeweler and his chum pleaded their own case in such a manner as to draw forth the enconiums of the bench, the demands of justice had to be satisfied, and the magistrate, almost with tears in eyes, fined them $60.00 and costs. That fire cost them about $100.00. and now Charlie says that he knows all about the law relating to bush fires that he cares to.

Moral.—When you light a fire in a Canadian forest, be sure it is thoroughly extinguished before you leave it.

Daring Burglaries in Toronto.—On the evening of the 14th October, at about a quarter-past nine o'clock, Mrs. Ashall was sitting behind the counter on one side of the jewelry store occupied by her son, Mr. Wm. Ashall, at No. 262 Yonge Street, a sneak thief made his way in, and stealthily creeping along the floor succeeded in getting behind the counter on the opposite side of the shop from which Mrs. Ashall was sitting, and abstracted therefrom a tray containing 29 valuable gold watches, with which, in the same stealthy manner, he managed to regain the street. Mrs. Ashall fancied that she heard a noise about the time he was getting out at the door but paid no attention to it, deeming it impossible that anyone could effect an entrance without her perceiving them. On the thief gaining the street, however, he was espied by a young man named Dumelle, who lives on Church Street, who at once called on the robber to drop the tray, and gave chase to him. The thief being hard pressed dropped the tray, which was at once picked up and returned to the store with its contents intact, by a young man who was in company with Mr. Dumelle. That gentleman, however, kept up the chase, and succeeded in collaring his man in the vicinity of Trinity-square, when the ruffian, infuriated by the prospect of capture, drew a knife and made a desperate attack on his captor, cutting him severely across the back of the hand, and compelling him to release his hold. The scamp then made good his escape, while Mr. Dumelle returned and had his wound dressed. Whoever the thief was he was evidently well posted, as he chose a time for his raid when Mr. Ashall would be out, and no on but an aged lady in charge of the store. The detectives have the matter in hand, and it is expected, as usual, that the would-be thief will soon be arrested.

QUIGLEY CASES

is received from and guaranteed by the

U. S. Assay Office.

THE wholesale jewelry trade of Canada will, if things go on as they are doing at present, be compelled very shortly to tackle the safe question, in so far as it effects their own customers, and consequently themselves. Lots of jewelers, who are worth two hundred cents on the dollar to-day, would, if cleaned out by burglars be unable to pay anything like that amount, and the question of the security of their stock is one that affects the wholesale dealers who supply them even more vitally than themselves, because if any loss occurs from such a cause, it is the wholesalers who must ultimately shoulder it. Such is the dilemma in which the creditors of both Mr. W. J. Wagoner, of Cornwall, and Mr. A. M. Gilpin of Uxbridge, find themselves to-day, owing to this very cause. Both of these gentlemen are well known to the trade as honest, industrious and thoroughly honorable men, who have always made it a point to buy no more goods than they were able to pay for, and who have always paid one hundred cents on the dollar. In both cases their credit stood high; and they could not only buy all the goods they wanted, but found it difficult to keep people from pushing goods upon them. Both have been amongst the victims of the gang of midnight mechanics that has infested the country all summer, and are consequently—through no fault of their own—compelled to ask the forbearance of their creditors. This, we have no doubt, will be accorded them ungrudgingly, and they will we trust very soon be again in a fair way to retrieve the ground they have lost. We are sure both of these gentlemen, and also all others similarly situated, will have the sympathy of the entire trade, as no stain can rest on their reputation on account of their misfortune. We trust it may be a warning, however, to all the other jewelers in Canada either to make sure that their safes are burglar proof, or that they are so guarded as to make their burglary almost an impossibility. We have no doubt that if the rest of the trade were to profit by the experience of these gentlemen there would be fewer losses from burglary in the future than there has been in the past.

STILL THEY COME.—It has long been thought that a regularly organized gang of burglars infested central Ontario, but recent developments make the fact almost a certainty. During the past summer they have successfully operated in Aurora, Newmarket, Orillia, Uxbridge and Peterboro, and now Lindsay has had a visit from them. On Sunday morning, Oct 19th, about two o'clock, a daring and successful burglary was committed in Lindsay, the jewelry store owned by Mr. G. W. Beall being entered and the contents of one large safe carried off. The burglars were evidently well posted, and probably had a confederate on the ground for some time previous to laying out the work. The door of Mr. F. D. Moore's law office, immediately over the store, was forced in, and with tools which had been stolen from the carriage works of L. O Connor, a section of the floor was bored across and the boards taken up. The ceiling below was also cut through. By means of a rope the robbers lowered themselves to the floor below and attacked one of the large safes in which Mr. Beall kept his stock over night. The safe was a key-lock safe. A ⅜ inch hole was drilled near the lock, and the bolt shot back. The entire contents of the safe were taken, consisting of a large number of gold and silver watches, chains, and general jewelry. The value will probably reach $.3000, The drawers in which the goods were placed in the safe were, piled up in a neat heap, and the whole job gives evidence that skilful hands had executed the work. The robbery was discovered by Mr. Beall, who called at his store on his way to church to see if things were all right as was his usual custom. Previous to the burglary being discovered it was found that a horse and rig owned by Dr. Kempt had been stolen from his stable and driven off. During the afternoon the horse was found grazing in a field about eight miles south of Lindsay, on a road leading to the O. & Q. station at Pontypool. The rig was also found concealed in a clump of tamaracs on the farm of W. McGill. The robbers were evidently concealed in the woods all day, as on Monday morning word was brought to town that during the night a horse and buggy had been stolen from W. Ingram's stable, who lives close by, and driven off to the west or north. Constables were sent out in pursuit. The utmost excitement prevailed in Lindsay during Sunday night, and a strict watch was placed on the banks, jewelry stores, newspaper offices, and other places where large sums of money and other valuables were kept. No clue has so far been had to the perpetrators.

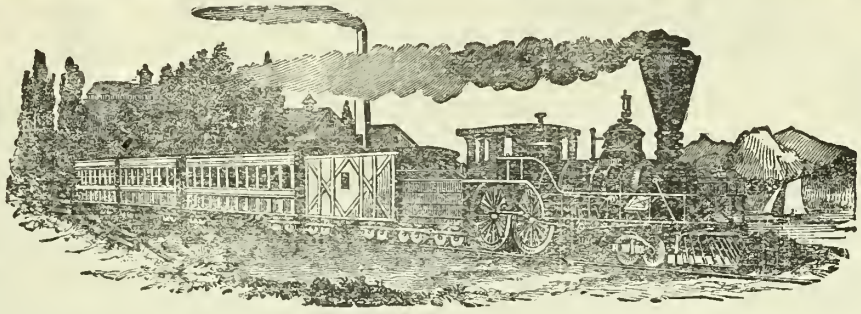
WORKSHOP NOTES.

VIOLIN VARNISH.—The famous Italian violin-makers used, it is said, the following sort of varnish on their instruments:—Rectified alcohol, half a gallon; six ounces of gum sandarac, three ounces of gum mastic, and half a pint of turpentine varnish. The above ingredients are put into a tin can by the stove and frequently shaken until the whole is well dissolved. It is finally strained and kept for use. If, upon application, it is seen to be too thick, thin it with an addition of turpentine varnish.

ESSENCES FOR CLEANING WATCHES.—Essences for cleaning watches are rapidly coming into custom. They are to be obtained at many of the material dealers and at all drug stores. The object is immersed and left in them for a few minutes, to permit all adhering matter to dissolve; not too long, however, since several qualities are apt to leave stains. The piece is to be dried on removal, and finish by passing a fine brush over that which has been charged with chalk and subsequently rubbed on a hard crust of bone. This will produce a brilliant surface on either gilding or brass. The following composition, the ingredients of which may be obtained in a drug store, has been highly recommended: 90 weight parts of petroleum and 25 parts of sulphuric ether. The object is immersed for several minutes, in fact may remain for a longer period without danger, and on the removal from the bath they are found to be clean and bright. It must not be forgotten that many of these essences are liable to ignite with the mere proximity of a lighted lamp.

REPAIRING CYLINDER WATCHES.—It frequently happens that the cylinder edges are worn off, and it does not pay to put in a new cylinder; the watch may, nevertheless, be put into keeping a good rate by altering the escapement. Look at the cylinder and see if there is room either above or below the old wears to shift the action of the wheel. If the wheel holes are of brass, make one a little deeper, and put a shallower one on the other side—this may perhaps be sufficient. This must be done according as you want your wheel up or down. If the holes are stone, shift your wheel on the pinion by a new collet, or turning away more of the old one, as the case may require. If you raise your wheel, see that it works free of plate and top of cylinder, and that the web of wheel clears the top of passage. This last fault may be altered by polishing the passage a little wider, if the rub is slight If shifted downward, see to freedom at the bottom of the cylinder, etc.

COLORING FOR SOLDER.—The following is a method for coloring soft solder so that when it is used for uniting brass the colors may be about the same:—First prepare a saturated solunion of copper—blue-stone— in water, and apply some of this on the end of a stick to the solder. On touching it then with an iron or steel wire it becomes coppered, and by repeating the experiment the deposit of copper may be made thicker and darker. To give the solder a yellow color, mix one part of a saturated solution of sulphate of zinc with two of sulphate of copper, apply this to a coppered spot, and rub it with a zinc rod. The color can be still further improved by applying gilt powder and polishing. On gold jewelery, or colored gold, the solder is first coppered as above, then a thin coat of gum or isinglass solution is laid on and bronze powder dusted over it making a surface which can be polished smooth and brilliant after the gum is dry.



OTHER NOTES.

ACCORDING to the Chinese, cask-making has been known to them for many thousand years. They labored, however, under this drawback. They did not know how to give the final touch by which the lid is fastened in; the only method that struck them as feasible being to place a boy inside whilst the cooper tightened the hoop, and secured the lid in position. But how was the boy to get out? This remained an unsolved problem for three thousand years.

THE astronomers at the Greenwich observatory have been making calculations as to the pace of the star Arcturus in his progress towards the earth. They find, as the result of twenty-one observations, that this beautiful, scintillating star is coming for us at the rate of fifty miles and seventy-eight one-hundredths per second. This amounts to about 3,000 miles a minute, 180,000 miles an hour, or 4,320,000 miles a day. If Arcturus makes a straight shot we will be probably knocked into smithereens, but not for 93,000 years yet.

grease is made in this way :—Take of washed hog's lard 1¼ pounds avoirdupois, melt it by the heat of a water bath, add of balsam of Peru 2 drachms, flowers of benzoin and bright palm oil 1 drachm of each, stir vigorously to promote solution for a few minutes, then remove the pan from the bath, and after repose for a short time pour off the clear portion from the sediment, and stir the liquid mass until it begins to cool.

FIRE FROM THE SUN.—A curious instance of the kindling of a fire by means of the concentration of the sun's rays by a globular water bottle through which they passed is related by a correspondent of *La Nature*. The day was cold, but the sun shone brightly; the bottle, an "onion-shaped" flask, filled with water so as to form a perfect lens, sat upon the table. The starting of the fire, which would have caused great damage if the relater of the incident had not been present to extinguish it, was revealed by the smoke. A deliberate experiment was made on the next day, with complete success, in kindling a fire by this means.

A LITTLE over a month ago a diamond was dug up at the Kimberley mines, South Africa, measuring 1⅞ inches in length, and 1¼ inches in diameter, weighing no less than 302 carats. This is by far the largest gem yet discovered in South Africa, or, in fact, elsewhere, if we except the "Pitt" and "Muttam" (of a flask shape) in their uncut state, and some diamonds of apocryphal history. It is a perfect octahedron in shape, and of the usual "Cape" or "off" color. Some years ago its value would have been simply enormous. At the present, however, it is reported that £3,000 has been refused for it in its uncut state.

COPPER AND HEALTH.—Both M.A. M.Houles and De Pietra-Santa confirm the belief of the salubrious action of copper on the health of persons engaged in the manufacture of articles into which that mineral enters largely or wholly. They base their conclusions largely on the history of the village Tarn, Durfort, which has statistics extending over at least a century, and they conduce to show that the whole of the individuals engaged in the copper industry, whether as smiths, forgers, braziers, etc., are, on the whole, as long lived, if not more so, than the individuals in the same district who may happen to be engaged in purely agricultural industries.

CHARLES Dickens once wrote to Sir John Bennett, the clockmaker, a letter which has just been published for the first time in the *London Daily News*. It ran thus: "My dear sir—Since my hall clock was sent to your establishment to be cleaned it has gone (as, indeed it always has) perfectly well, but has struck the hours with great reluctance; and, after enduring internal agonies of a most distressing nature, it has now ceased striking altogether. Though a happy release for the clock, this is not convenient to the household. If you can send down any confidential person with whom the clock can confer, I think it may have something on its works that it would be glad to make clean breast of.

Faithfully yours, Charles Dickens." Sir John Bennett replied, giving good hope of the clock's perfect restoration.

DR. Reinsch has found as the result of a long series of minute investigations, that the surfaces of silver coins which have been long in circulation are the home and feeding-ground of a minute kind of bacteria and vegetable fungus. An extended series of observations showed that this is the case with the small coins of all nations the thin incrustation of organic matter deposited upon their surfaces in the course of long circulation rendering them very suitable for this parasitical settlement. Dr. Reinsch scraped off some of these incrustations and with a small scalpel divided them into fragments which were subsequently dissolved in distilled water. The employment of lenses of very high power showed the bacteria and fungi distinctly. The revelation that bacteria have a chosen domicile in the most widely circulating medium which probably exists in the world presents us with a new factor in the spread of infectious diseases.

THE boomerang is a piece of thin wood about an inch and a half wide, an eighth of an inch thick, and perhaps twenty inches long; its shape varies, sometimes being like the segment of a circle, at others like a man's arm bent at the elbow; but the way of doing both these forms is exactly the same. The weapon is grasped at one end in the right hand, with the concave side uppermost and the black man takes a run, such as the ordinary Englishman does when he is throwing a cricket ball. On a sudden he stops, and away flies the boomerang, not straight as one might suppose, but revolving on its own axis so quickly that in the air it looks like a circular piece of board; this motion gives it the wonderful power of flight which must really be seen to be believed. At first the course is in a direct line from the thrower, and at such a height as he may require, but as it draws towards the limit of its distance it swerves slightly to the right and making a semi-circle coming back on an exactly opposite course to that which it took on the outward journey, falling within a few feet of the thrower. During the flight the revolving of the boomerang causes a peculiar purring sound, not unlike the hum of a top.

Editorial.

THE JEWELERS' SECURITY ALLIANCE OF CANADA.

Since our last issue the idea of forming a Jewelers' Security Alliance for Canada has assumed a tangible shape, and may now be said to be an accomplished fact. On Saturday, the 8th Nov., four Toronto merchants interested in the scheme met and discussed the subject for about three hours and decided that if in a week from that time, a canvass of the Jewelry Trade in Toronto developed the fact that such an Alliance was feasible in Canada, that they would at once proceed to organize and get it fairly in running order.

Two days' canvass secured fifty names of jewelers who agreed in case such an Alliance was organized to pay fifteen dollars the first year and five dollars per annum for every subsequent year. With such encouragement, a general meeting of those who had agreed to become members was called for Saturday, the 15th November, at which time the Jewelers' Security Alliance of Canada was organized, and the following gentlemen elected as its officers for the first year: *President*, John Segsworth, of John Segsworth & Co., Toronto. *Vice-Presidents*, R. Y. Ellis, of P. W. Ellis & Co., Toronto, E. Scheuer, of Levy Bros. & Scheuer, Hamilton, and John H. Jones of John H. Jones & Co., Montreal. *Secretary-Treasurer*, W. K. McNaught, of McNaught & Lowe, Toronto. *Executive Committee*, T. H. Lee, of Lee & Chillas, H. H. Fudger, of Smith & Fudger, J. Zimmerman, of J. Zimmerman & Co., Chas. Allen, of C. & J. Allen, C. H. Robinson, of Robinson Bros., Jas. Ryrie, of J. & H. Ryrie, and M. W. Trowern, of Welch & Trowern, all of Toronto. A Constitution and By-laws were adopted, and committees were struck to look after the printing, and to arrange with some first-class detective agency in the United States to do the work of the Alliance. The Secretary was authorized to send to every Jeweler in Canada a copy of the Constitution and By-laws of the Alliance, a blank form of application for membership, and a circular setting forth fully the objects of the organization and its claims upon the trade. The membership fees for the retail trade were reduced from $15.00 the first year, as originally intended, to $10.00 the first year, in order that no Jeweler in Canada could object to join on the score of expense. At such a price no jeweler can afford to stay outside the Alliance.

Since this meeting the officers of the Alliance have been working hard to get arrangements perfected, so that in case any of its members have their safes burglarized the detective help promised can be immediately rendered them. This Alliance is a long needed thing; it is a good thing; it is a thing every Jeweler in Canada should belong to, and we wish it every success in its mission, and trust that it will prove of more benefit to the members than even its promoters imagined.

A GOOD THING.

One of the greatest dangers to which the jewelry trade is exposed is the risk of loss by robbery and burglary. Dishonesty amongst employees may be avoided by employing only thoroughly reliable men—loss by fire may be met by having prudence and foresight enough to keep one's goods adequately insured; but against loss by burglary there is really no security and apparently but very little redress. As we have said more than once to our readers in the jewelry business, "The price of security is eternal vigilance," and on the ground that prevention is better than cure, they should exercise every precaution to keep their stock secure from the depredations of such rascals. We have pointed out at various times some of the inexpensive methods by which the trade can render themselves, if not absolutely safe, at least a very great deal more secure from burglary than they would otherwise be. In spite of all human precautions, however, it is a fact that burglaries will, and do occur, and then the next best thing is to make a vigorous effort to detect the perpetrators and recover the stolen property. Nothing that we know of is more disheartening to a person than to find the savings of a life time, it may be, swept away in a night, beyond the power of redress or recovery. Is it any wonder, in such a case, that the person robbed is so prostrated by his loss that he is almost incapable of grappling with the matter as energetically and promptly as it should be dealt with to be of any use? In order to overcome this difficulty and render effective aid in just such a pinch, our American cousins, in the jewelry trade, about a year and a half ago, organized a "Jewelers' Security Alliance," which, as far as we can learn, has proved itself exceedingly effective in accomplishing the purposes for which it was intended. The objects of this society, as we understand them, are very concisely set forth in the second article of its constitution:

"The object of this Alliance shall be to render to its members, whose safes may be robbed, efficient detective service and *determined* prosecution of thieves, aiming at the restoration of the property."

The idea that the founders of this league had, was that it would be beneficial to its members in two ways, first, as the constitution provides that "no member shall be entitled to the benefits of the Alliance except his certificate of membership is conspicuously displayed at his place of business." Such a display would act as a deterrant, and amount practically to a notice to burglars that the property was under the protection of a league who would pursue them to the bitter end, and convict them and recover the goods if such a thing were at all possible. Second, all burglars must know that such a league is wealthy enough to push such a matter through without regard to the expense, a thing that few if any private individual could afford to do, and for this reason the burglary of a league member's safe must of necessity be a very hazardous operation

The experience of the promoters seems

to have been very satisfactory on the whole, and we think that not only they, but the jewelry trade of the United States have good cause for rejoicing in the fact that since the organization of the league, burglary has become almost unknown amongst its members. The first annual report of the Alliance, issued last June, is very interesting, and we give it in full to our readers.

"During the months of March and April, 1883, the necessity of combined effort to prevent the frequent robberies of jewelers' safes became apparent to a number of the manufacturers and jobbers of New York, and after a number of preliminary meetings for discussion, and the appointment of Commitees to prepare Constitution, By-Laws, etc., THE JEWELERS' SECURITY ALLIANCE was organized at a meeting of the trade, April 25th, 1883.

At their first annual meeting, May 6th, 1884, the Executive Committee report having held 29 meetings for admission of members and the transaction of a large amount of routine work, inseparable from the complete organization and perfecting of such an institution.

While our growth was slow during the first three-quarters of the year, owing in part to the difficulty of making known to the trade the benefits of the Alliance in case of burglary, and also the fact that by many it was considered an experiment requiring time to determine its feasibility; the following exhibit of members for each quarter of the year we think most convincing proof of its ultimate success.

Members received quarter ending			Aug. 1st,	52
"	"	"	Nov. 1st,	71
"	"	"	Feb. 1st,	74
"	"	"	May 6th,	182

From the experience of the past year it has been satisfactorily demonstrated that the principles and mode of operation adopted by the Alliance are correct and entirely practical.

The conviction of the burglars concerned in the "Ellenville" robbery, and their sentence to States Prison for a term of five years, has been of immense benefit, not only to the Alliance, but to the trade at large; and, thus far, thieves have been very careful to avoid all safes protected by an Alliance Certificate.

The cost of membership is $15.00 for the first year, and $5.00 per annum thereafter.

The Executive Committee are authorized to levy assessments, but in view of the large and rapid increase of members, it is not probable that any assessment will ever be called for.

The Alliance is a strictly mutual organization. Its officers neither receive nor desire any compensation for their services.

All persons engaged in the jewelry or kindred trades are eligible to membership, and all such are urgently requested to join the Alliance. The readiness with which watches and jewelry can be converted into cash, make the safes of retail jewelers especially tempting to burglars, of whom so many have escaped punishment, that their numbers are rapidly increasing It is the purpose of the Alliance to put a check upon their depredations, by employing skillful detectives to ferret out and bring to punishment the perpetrators of every robbery committed upon its members.

The cost of such detective work and criminal prosecution will be borne, so far as is expedient by the Alliance, whereby the burden and expense will be transferred from the individual robbed to his many associates. It is intended by this means to so intimidate burglars that they will pass members of the Alliance by unmolested.

This cannot be done, however, without our united effort, and it is therefore earnestly urged upon the trade to send in their application to the Secretary as early as possible.

The Alliance will assume the cost of investigating any robbery of safes that may occur in places of business covered by certificates, and of prosecuting the thieves, as provided for in the Constitution and By Laws of the Alliance.

With a membership of nearly 400 for our first year, and not one of whom has been molested, we unhesitatingly recommend the Alliance to the trade, and solicit for it the support that it merits."

From this it will be seen that the "American Jewelers' Protective Alliance" has proved itself "a good thing," and knowing this, some of our prominent Canadian Jewelers have for some time past been trying to get that Alliance to extend its workings to Canada. After mature consideration, the American Alliance finally decided that it would be unadvisable to do this, but expressed their sympathy for their Canadian brethren, and their willingness to help them in any way that lay in their power. The jewelers of Canada were thus placed in such a position that they must organize a similar association of their own, or do as they have done heretofore, allow the burglar craft to work at will on them. After some consultation amongst several Toronto Jewelers, it was finally decided to call a preliminary meeting, and if things looked promising to form such an Alliance for Canada. At this preliminary meeting but four persons were present, but, feeling the importance of the undertaking, they decided on going ahead and making a canvass of Toronto, and if they met with reasonable success that they would put the thing through. The result of the canvass was, that in Toronto alone in two days nearly fifty names were secured as members, and the success of the scheme assured. A second meeting was called for the purpose of organizing the Alliance, the particulars of which will be found in another column, by which it will be seen that the JEWELERS' SECURITY ALLIANCE of Canada is now an accomplished fact.

So much for the history of the present undertaking. The Alliance having been organized, it now remains for the trade throughout the country to give it their hearty and loyal support. It is a good thing in itself, and it aims entirely to benefit its members in a direction in which they can hardly, as individuals, help themselves. What it wants now is members. Every jeweler who joins it, makes it a more powerful and dangerous opponent of burglars, and consequently a greater benefit to its members. The only jewelers in Canada who can afford to stay out of it, are those who have safes that are absolutely burglar-proof, (an impossible thing to get) or those who are so wealthy that they can afford to lose all the goods that the enterprising burglar is smart enough to secure. Outside of these, all others ought to join.

We trust that the trade will give a hearty response to the circular that the Alliance is issuing, and that before its first year closes, it can boast of, at least three hundred members.

CHEAP WATCHES.

The present is a phenomenal time in the history of American watch movements, because the supply of cheap movements is equal to the demand, although the demand, on account of last year's poor crop is greater than usual. The readers of THE TRADER will remember that more than a year ago we predicted this very state of things, simply because the price of watch movements, like everything else in the commercial world, is governed by the inexorable law of supply and demand. For the past few years trade has been good in the United States, and, as a result of this general prosperity, the demand for American watches exceeded the capacity of the manufacturers. The trade had to have watches, and this was the golden opportunity that the manufacturers were not slow to take advantage of. Being masters of the situation, they dictated terms to the trade which the latter were forced to accept, amongst the principal of which was, that they would only sell a limited number of cheap movements in proportion to the number of high priced ones used. Time, however has its revenge, and as soon as a bad year came, as last year undoubtedly was, the situation was changed, and business being generally dull, the trade could hardly consume more than half of the movements used by them in good times. The effect of this was to compel

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

the watch manufacturers to make concessions in order to induce and stimulate trade, that they would have scouted in more prosperous times. They were willing to supply all the cheap movements that their customers wanted ; prices were reduced by very decided cuts, and every facility offered in order to induce trade. As we predicted last year, these things are simply the outcome of the natural commercial law of supply and demand. At the present time the supply exceeds the demand and the trade can get all the concessions they need. When the pendulum makes its next swing, as it is sure to do, and the demand begins to exceed the supply, then the conditions will be reversed and get pretty much into the shape they were a couple of years ago.

Now, however, that cheap movements are plentiful and prices are down to hard pan with the manufacturers, there are not wanting many in this country who seem to think that because these things are so to-day they will always remain the same. This is a mistake that it is well to guard against, for we venture the prediction that inside of three years cheap movements, if not higher in price, will be as scarce as ever they were. The lesson to be learned from this fact is that although now these goods are to be had in plenty, the retail trade should not spoil their own trade by selling cheap movements where they can sell high-priced ones. If the public catch on to the idea that many retail jewelers seem to be trying to impress them with, that a cheap watch is just as good as a high-priced one and answer their purpose equally as well, they will find, when good times come and cheap movements are scarcely to be had, that they have been teaching their customers a very bad lesson, and one which will make it very much harder for them to do a good paying trade. We think a jeweler should always sell a good movement whenever he can force the sale of one. Instead of trotting out a plain jeweled movement at first, as many of them do, they should start out on their finest goods and come down only to common goods when they find that their customer's purse won't allow such an expensive luxury. A fine movement is just as easily and quickly sold as a common one, while the profits are better and the benefit to the seller's trade incalculably greater. We notice that most of the trade journals in the United States take a very similar position on this question to the one we have ourselves taken, and they are almost unanimous that the prices of both movements and cases are as low at present as they are likely to be for some years. We give below an extract from our esteemed Chicago contemporary, *The Watchmaker and Metalworker*, and commend it to the perusal of our reflecting readers :—

" Jewelers, whose memory serves them well, will remember the position of affairs just eight years ago—1876 ; they will recall the fact that the same programme now being pursued was then carried out by the two great watch companies in cutting prices and giving rebates to their customers. The Elgin Company cut the prices so very low that none dare compete, rebating to the jobber only. The Waltham made a corresponding cut, but did not go quite so low as the Elgin, and rebated to the retailer then as they are now doing ; so that all this might have been expected when the first move was made, and probably was expected by some of the more astute and far-seeing. the case business at that time had not assumed the proportions of the prominent factor which it now is, and in fact the American watch business looked very small in comparison to its present enormous output. Now, what may we expect for the future ? Simply that as the larger companies have settled down to a fair basis of values these values will be sustained, though they will not be advanced, and speculation will become rife again for some time. Still, the demand for good movements will surely exceed the supply after one or two years. Then will follow more improvements in machinery, greater simplicity in construction, and in four or five years another cut, rebates, etc. These are only reasonable surmises. As to immediate change in prices we are informed that it is hardly possible. Certainly it will not be profitable to indulge in any further cutting of importance. The case business has also arrived at a stage where prices cannot be materially lowered without a corresponding depreciation in quality, and therefore the jeweler is perfectly safe in putting in his regular stock, enough to keep his line of goods in first-class condition."

Dr. Blackwood, in a paper on minor dyspepsia, read before the Philadelphia Medical Society, states that a good deal of the malaria so fashionable with the fraternity and the laity is only one of the forms of indigestion.

Selected Matter.

STAGE DIAMONDS.

" Let me see," said he, smilingly, " Rhea is going to have a dress of Spanish lace next season, covered with the diamonds that she received from the Emperor of Russia, isn't she ? She's going to wear it in her great *role*, eh ?"

" Such is the meagre but inflaming announcement that I have seen in the newspapers."

" Well said he, " you ask Mr. Jimmy Morrissey to let you see the box that Mlle Rhea's diamonds travel in when the campaign opens.

" Why the box ? I dont want to see the box."

" Oh, yes you do. You want to look at it well and notice if it is made of mahogany, polished, with two heavy brass bands running around it with a crest engraved on them.

" And if I do notice all this ? "

"Why then you'll know that its the regular old box and stock of diamonds that have been doing service for six or eight years. Let me see. The jewels started with Modjeska.

"See here," said he, seeing that I looked incredulous, " you don't mean to tell me that you are not up to the diamond dodge ? Sit down there and I'll tell you something about it.

" In the first place, there are only two women familiar to American audiences who have got real diamonds enough to make an exhibition. One of them Mme Patti, the other is Mme. Janauschek, and they never do exhibit them.

" By the way speaking of Janauschek, I see that the announcements of Ristori's coming are supplemented in one or two of the dramatic paragraphs with the additional intelligence that she is the greatest histrionic artist America has ever seen. That sounds very much as if America had never seen Rachel and hadn't got Janauschek yet. I wish you'd do me the favor to say that in my opinion Ristori never was and never will be as great an artist as Janauschek. She hasn't got the versatility, the emotion, the intensity or the power of Janauschek. Why, they played simultaneously here in 1866, and in the same *roles*, and if you go back to the criticisms of the *World* you will find that Janauschek walked away with the honors. Certainly nobody supposes that Ristori could play *Hortense* or *Brunhilde*, and

American Watch Company.

We desire to call the attention of the Trade to the fact that we have made A VERY MATERIAL REDUCTION in the prices of

OUR 18 SIZE FULL PLATE MOVEMENTS,

—— AND ALSO IN OUR ——

GOLD : AND : SILVER : CASES.

The reduction gives dealers handling our Movements and Cases a substantial advantage over all other competing goods. The improvements steadily being made in the quality of our productions render them more attractive and desirable than ever and insure a higher standard of perfection than hitherto attained, which the practical men in the Trade cannot fail to appreciate.

Our 18 Size Gold Cases, unequalled in Workmanship, Style and Finish, are being constantly embellished with new and taking designs that make them the most salable goods of the kind in the market.

In the manufacture of our new SILVER CASES the most improved methods are introduced, and their Style, Finish and Intrinsic Value have justly earned for them a wide-spread popularity, while the prices cannot fail to attract attention. A large and constantly changing variety of our productions can always be found in the stocks of the Jobbers in all sections of the country, so that dealers can have opportunities for selecting the newest goods made by the Waltham Company.

AMERICAN WATCH COMPANY,

after seeing Janauschek play Mr. Edwin Booth into the wings with her *Lady Macbeth* I don't think Ristori's artificial handling of that *role* would amount to much. But that isn't what I was going to tell you."

"No, it isn't? It was something about a mahogany box."

"Yes. Well, when Mr. H. J. Sargent started in the Modjeska season he had a countess on his hands who, so far as the theatrical business was concerned, was destitute of diamonds.

"She had some very fine jewels, as became a Polish nobleman's wife, but she wasn't going to have them trotted out. This annoyed Sargent who knew perfectly well that in the Mississippi Valley there was an unassailable conviction that any foreign actress who had not received at least two diamond necklaces from the Emperor of Russia couldn't amount to much.

"One day when he had just got into —Buffalo, I think it was,—to play that night, he saw in a jeweler's window a very showy necklace of stage diamonds. He went in and found that it had been made for Mary Anderson to wear in *Pauline*, and she had refused to take it because her directions had not been followed with regard to the setting. 'How much do you want for it?' asked Sargent. 'Forty dollars,' said the jeweler. Give you thirty-five,' said Sargent. Then they compromised on thirty-seven.

"'Now, I want a box,' says the manager, and after running all over the town he got hold of a second-hand mahogany casket bound in brass. 'How long will it take you to polish this up and put two heavy handles on it?' he asked of the jeweler.

"'Have it done in an hour,' was the assurance of the obliging merchant.

"In an hour Sargent was on his way to the theatre with the box under his arm. He noticed with pensive care that the town had not thrilled much as yet under the glowing announcement that the Countess Modjeska would appear that night. Trade flowed on in its unbroken currents. Life was unperturbed. The great prosaic interests of the world did not appear to care whether Modjeska or Johannes had arrived.

"Mr. Sargent strode into the office of the theatre. He was flushed and excited. 'Where's your safe? he asked. They had not got any safe. He put the box down on the table and kept his hand on it. 'No safe!' he cried. What are you talking about? Do you know what's in that box? It's got jewelry in it worth $50,000. I'm not going to take the responsibility of the thing any longer. Here, send to the police station. I must have a couple of men to watch it while I go to the bank.'

"Then he got two officers to stay there and not take their eyes off the mahogany box, while he went off to the hotel and opened a bottle of wine. As he had shouted a good deal there was quite a group collected round the office. And in less than half-an-hour the Modjeska current began to stir along the sluggish street. He let it work. When the two policemen were relieved the entire force knew of the Emperor of Russia's gift and before six o'clock they had quadrupled the rumor by means of wives and sisters and sweethearts. At eight o'clock there was only one person in that city who had not heard of the Emperor of Russia's gift.

"That person was the Countess Modjeska

"The Mahogany box worked so well that Sargent began to look upon it as a sort of Aladdin's lamp, and he rubbed it up every day and got a new idea.

"The first inspiration was to have it stolen. Hitherto only the policemen had made obeisance to it. Now the telegraph and the night editors fell down. The wires flashed it through sixteen States. The Emperor's diamond necklace was gone. A heavy reward was offered. It must have cost Sargent something to hire detectives to work up the case. I believe the *Bellefountain Bugle* published the original despatch of condolence from the Emperor of Russia.

"When the sympathy for Modjeska had become national, and there was some likelihood of the emotional women of the country making up a fund to replace her diamonds, a rash reporter forced an entrance to her boudoir one day when Sargent's back was turned, and found that her distress at the unparalleled loss was altogether disproportionate to the circumstances.

"An infamous and suborned press then began to give way to ignoble doubts about the robbery, and the *Bellefountain Bugle* even printed an editorial throwing suspicion not only on the Emperor's gift, but upon the Emperor himself.

"Sargent was equal to the emergency. He took two of the most versatile and copious pressmen into his confidence. He pledged them to secrecy, that being the shortest cut to publicity. 'Now,' he said, 'I have a confession to make. I was so afraid that the Countess's jewels would be stolen that I had an imitation set made just like them for show purposes, and it was the imitation set that was stolen. The real gems are here.'

"With that he unlocked the safe and got out the mahogany box.

"'Gentlemen,' he observed, as he unlocked the box, 'you can examine those jewels. You can see for yourself whether they are of the first water. I'll send for an expert if you wish it.'

"The versatile and copious drew themselves up with dignity, 'As if,' they said, 'we are not experts enough to tell real gems like those from stage jewels!'

"This dodge worked very well for a few days. A new crop of stories broke out about the Emperor's necklace. But the original syndicate of night editors and local reporters who had sworn to the real robbery felt aggrieved. A committee waited on Mr. Sargent. 'See here,' said the spokesman, 'as we understand this thing, you agree to have the real necklace stolen, not an imitation one. It's an outrage on the public and the press. You're a fraud.'

"'Go slow, my dear fellows,' said Sargent. I don't think you've got the thing right. If you will not give me away, I'll tell you. The fact is, I set that story going about the bogus necklace having been stolen, in hopes that it would reach the thieves and make them send back the real one. Of course, you saw the real necklace two months ago, and would know it if you saw it again.'

"The committee remarked that they should smile.

"'Very well,' said Sargent; 'here's the only necklace I've got now.'

"Then out came the mahogany box.

"'If you think that that is the genuine article, all I've got to say is, you are not up in stage jewels. If you'd like one of those pieces of glass as a souvenir, just pull it off.'

"The American press was pretty equally divided by this time on the question of the diamond necklace, and the American managers were getting to have a superstitious regard for Sargent and his box.

"But Sargent had got enough of it, and he sold out the scheme to some other manager.

"I think it was six or eight months afterwards that Minnie Palmer lost her diamonds, and, meeting John Rodgers one day, he began to tell me about it.

A FEW OF THE ADVANTAGES

—OF—

QUIGLEY'S

INVISIBLE JOINT

—OVER—

THE REGULAR JOINT.

1st. The same thickness of metal around the Pin. In the Regular Joint there is half filed off the joint on the outside, in opening the case, and finishing the joint, and in many cases more, thereby making the joints weak.

2nd. In putting the joint or hinge inside the centre it closes the back or cover to the centre or rim of the case. In the regular joint, where the joint or hinge is placed between the back or cover and centre or rim, it tends to push them apart, and in case of the pin being forced into the joint or hinge it forces them more apart and leaves an opening for the dust to get into the works of the watch.

3rd. The joint or hinge being inside, the centre or rim is protected and being made heavier is stronger and will wear longer.

4th. The spring in the Hunting Case is made of a flat piece of steel and is not hardened as hard as the one in the Regular Case. It is guaranteed not to break.

5th. Both hunting and open face cases open like the Regular Case, and unlike the majority of Patent Cases, are not liable to get out of order.

6th. There are no joints or hinges on the outside to wear out the pockets, or admit dust.

7th. The outside surface of case being perfectly smooth, admits of continuous engraving around the centre or rim from the front to the back of case.

'The first thing the thieves took was a diamond necklace,' said he. 'But they left the casket.'

"Then out came the mahogany box.

"'John said I, I've seen that box before.'

"'Oh, well,' said he, 'I don't mind telling you privately that I have this made for show purposes'——

"John never got any further. We looked in each other's eyes and a dead silence reigned.

"Well, a year after, Kate Putnam began to be celebrated for her diamonds. I don't remember whether it was the Emperor of Russia or of Hayti who gave her a diamond necklace, but there was a great deal of anxiety observable in the press and the community for fear she'd be robbed; and Barron told me himself that the responsibility of it was undermining his health.

"'Let me see it,' I said.

"Then, by Jove, out came that mahogany box!

"'Never mind,' I said; 'you need'nt open it. I've seen the necklace. The Emperor of Russia showed it to me before he presented it.'

"That ended Putnam.

"Well the next one was Aimée. I suppose you know that Aimée at her last season in America, found it necessary to supplement her voice with a few diamond necklaces. I suppose Aimée had more Kohinoors than an Indian princess, and Grau asked me in one day to hear about it. 'Would you like to see some of thegems?'

"'Yes,' I said.

"By the eternal stones of Venice—out came that infernal mahogany box!

"'Look here, Grau,' said I, 'I can stand almost anything, but there's one thing that makes a fiend incarnate of me—it's a mahogany box. I'm surprised that you so far forget yourself.'

"He has never spoken to me since. Now, what I want you to do when you see Jimmy is to notice if the jewels that the Emperor of Russia gave Rhea are kept in a mahogany box, with two brass straps and a crest."

"I will."—(*New York Jewellers' Circular.*)

HOW TO FIND LOST KEYS.

People are very apt to lose a bunch of keys. They are amongst those things which possess peculiar facilities for disappearing just when most needed, and cause no end of annoyance. There is also a constant dread that if your name is attached to the bunch the finder may put them where they will do most good (to him) and relieve you of some additional property.

The Marvin Safe Company, of New York, has devised an ingenious plan to secure the return of lost keys. For the small sum of twenty-five cents they furnish you with a metal tag which can be attached to the ring holding the keys. Stamped on one side is a number, and the words, "Marvin Safe Company, New York." On the other side, "Owner will pay one dollar for return of keys." Your number is recorded on the books of the company opposite your name and address. The finder has no clue to the ownership of the keys, but notices that there is a reward for returning the same. Any one will be glad enough to pay a dollar to recover his loss, being saved the expense of advertising and being almost sure to find his keys on calling at the office of the company.

That the system is a good one and successful, is shown by the following conversation of a *New York Tribune* reporter with the originator of the scheme:

"Is the tag system well patronized?"

"Well, yes. We have been selling them for four years and have disposed of over 18,000. The advantage of the system is that there is no possibility of the finder ever learning to whom the keys belong. He therefore, even if he were so disposed, could not use them to his own advantage, and is glad to get a dollar for the trouble of bringing them to us. We keep them till the owner calls and pays his dollar.

"We have to be careful about giving them out, for there have been attempts to deceive us. The owner is required to indentify himself and give an accurate discription of the keys before we let them go. Then again parties have counterfeited the tags and attaching them to useless keys return them and get their dollars. The remedy for this is to refuse, on some grounds or other, to receive the keys until we can notify the owner of the corresponding number. If he has not lost his bunch we know that we are being imposed on by tho counterfeiter. Some men would not lose their keys for five, ten or twenty dollars, and we are often called upon to stamp tags with an agreement to pay those amounts to the finder. They cost no more than the one dollar tags.

"By our key system we discovered an assault and attempt at robbery some time ago. A merchant in Canal street had been doing some night work, and was locking his door to go home, when he was knocked senseless to the ground, and when he recovered, his keys were gone. He immediately informed us and requested that we arrest any person who should return his keys. Of course the store was closely watched after that, and the fellow had no chance to get in. Several weeks had elapsed when one morning, sure enough, a boy appeard with the keys and asked for the five dollars, which was the amount on the tag. We detained him and made him tell who had sent him. The man was arrested and dealt with accordingly. Of course he must have been a green hand or he would never have returned the keys.

"Keys are left in public places frequently and are found undisturbed. I knew a man who left his keys in the lock of his post office box for twenty-four hours and found them there—and his mail, too."—*Exchange.*

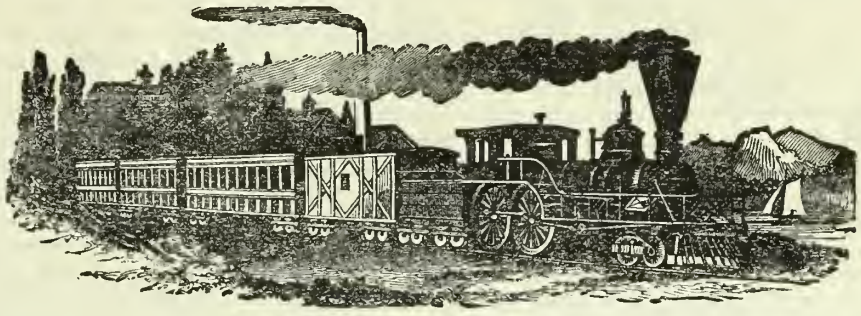
KAHN vs. FISHER.

It is related of a certain sharp trader that on going to visit his brother, one day, he found him about to be closed out on execution and bemoaning his ill-luck. The brother asked him for the details.

"Well, I owed the debt and couldn't pay it."

"But didn't you defend the case?"

"I had no defense," wearily responded the debtor.



"You fool, you," was the contemptuous comment, "couldn't you assert anything; say the account was not due, goods were bad, not delivered in time, not according to sample, or claim an extra discount? Couldn't you say anything?" And the smart brother indignantly left, with a very low opinion of the poor debtor's business ability and prospects.

No doubt the most valuable legal knowledge for a well equipped lawyer is to know, when necessary, how to evade or strain a direct application of law. But in mercantile law matters, this straining or evasion of laws is done at the expense of truth under oath.

BUSINESS CHANGES FOR NOVEMBER.

Fowler & Son, jewelers, Clinton, Ont., sold out to Robert Coats; L. N. Denis, hardware, Montreal, sold out to C. A. Nelson; C. Luxton, hardware, Ridgetown, Ont., sold out; W. R. Tudhope, jewelry and drugs, Orillia, sold out jewelry business to A. P. Cornell; C. E. Delano, fancy goods, Montreal, dead; Snowden & Co., hardware, Winnipeg, Man., giving up business; D. McMaster, jeweler, Sarnia, assigned in trust; Wm. Colwell, jeweler, Mitchell, trying to compromise; T. Michael, jeweler, Montreal, stock advertised for sale by bailiff.

ILLINOIS WATCH COMPANY.

FOR SALE BY ALL JOBBERS.

BUSINESS NOTES.

THREE YEARS IN PENITENTIARY.—A young man named Balzarreti, arrested for robbery from the jewelry store of Mr. C. Duquet, of Quebec has been found guilty, and sentenced to three years in the penitentiary.

Mr. D. TURNER, Jeweler of Sarnia, was in Toronto for a few days last month on his wedding trip. THE TRADER has pleasure in wishing Mr. and Mrs. Turner, long life and happiness.

Now that we have a Security Alliance every jeweler ought to join it, and then, if after exercising every precaution that he can think of, he is unfortunately cleaned out by burglars, he may rest assured that everything that is humanly possible, will be done by the Alliance to recover his property and convict the robbers. A word to the wise is sufficient.

CUSTOMS SEIZURES.—The Custom House officers, at Montreal, have been surprising smugglers on the lines and from the ships in port. A seizure was made last month of over $1,000 of smuggled jewelry, which an emigrant named H. Hobbs had brought into the country from England without paying the duty. Another capture was made of a man named George Clarke, near Stanstead, who has been continuously smuggling since May for a manufacturing company. Both culprits are in gaol.

PRUDENT.—A great many of our jewelers are changing their old fire-proof safes for others that are likely to give a burglar some trouble in opening. Any who may contemplate such a change we would recommend to see the improvements that J. & J. Taylor, the old and reliable Toronto Safe-makers, have recently made in safes. From them it is possible to get the maximum of security at the minimum of cost.

COMPETITION.—We are glad to know that the Canadian Pacific Railway has determined to run the express business over the lines they control on their own account, and that from this out the amalgamated American & Canadian Express Companies will not, as formerly, have things all their own way. The merchants of Canada have long wanted competition in this business and now that it has come we think that they will see that the new competitor has at least a fair chance to make a name for itself for promptness and civility.

THE past month has shown some small improvement in business generally, owing probably to the colder weather. From present indications we should say that December trade should be good and much ahead of November or the same month a year ago. In spite of the low prices Canada's grain crop this year is worth some twenty millions of dollars more than last year's crop, and it hardly requires that a person should be a prophet to predict that a healthy revival of trade is probable in the near future.

Mr. W. H. McCAW, the well known Jeweler of Port Perry, who with nearly every other merchant in that town, was burned out last summer, has just completed his new store, which promises to be one of the handsomest and best equipped of any in Ontario. We congratulate Mr. McCaw, on the energy he has shown in getting into his old shape again and we trust that in his future mercantile experience, no more changes will be necessitated on account of fire. We think the trade will heartily join with us in wishing him the success he deserves.

WE would direct the attention of our readers to the reward offered by Messrs. McNaught & Lowe, for the conviction of any person using their trade mark. "Sheffield Sterling" has for years been recognized by the trade of Canada as the best possible metal from which to make spoons and forks for use without plating. As usual when any firm has a first-class article, others want to help them out with it, and the result is that the market soon becomes flooded with inferior imitations of the genuine article. Such has been the case with "Sheffield Sterling," and the public are therefore cautioned against buying any goods of this kind without the manufacturres genuine trade mark.

OH YES, OF COURSE.—The epidemic of burglary does not seem to have abated very much if we can judge from the accounts which reach us from day to day. The fact is that Canada is at present flooded with all the Yankee scoundrels who find the climate of the United States too hot for them at present. The result of this state of affairs is that these scallewags of the burglar profession have been for some months back reaping a rich, and apparently, secure harvest, as our detectives so far seem utterly powerless to cope with them. At the expense of being thought cracked on this subject we would warn all our readers that they cannot take too many precautions to protect their property from burglars. The risk is greater than many imagine, and it is all the greater because the blow invariably falls just where and when it is least expected. In this kind of thing a jeweler's worst enemy is his false sense of security.

MESSRS. C. N. THORPE & Co., manufacturers of the Boss & Keystone Case, write us to say that many of our jewelers have, perhaps, received a copy of an undated circular, issued from New York by a case manufacturing company, cautioning jewelers against using or inserting a separate winding arbor such as is now generally supplied with watch-cases, unless a royalty has been paid to the company therefor. Jewelers who handle Boss and Keystone cases should attach no importance whatever to the circular in question, as they are satisfied that the use of that arbor can furnish no ground for legal proceedings, and they will fully protect them in the event of legal proceedings being attempted on that account, no matter by whom.

ANOTHER BURGLARY.—The post-office and registry office at Milton, Ont., were burglarized on the night of the 12th November. Entrance to the post-office is supposed to have been effected by means of a skeleton key. The safe was drilled and about a hundred dollars worth of stamps and a number of registered letters taken therefrom. The letters were opened, the money taken out, and the letters left in the office. At the registry office the doors, which are made of iron, were pried and twisted until the lock gave way. The burglars made a careful search, not for deeds and mortgages, but for money, and broke every lock in the office, and got about three dollars and twenty-five cents in stamps and silver.

MORE OF IT.—For some time past a number of stores in Port Perry, have been entered by burglars, and large quantities of goods stolen, but no trace of the parties could be found. On Saturday night the hardware store of W. C. Parish was entered for the third time. The matter was placed in the hands of a Toronto detective, with the result that the probable thief was captured. The detective, after an investigation, obtained a search warrant against a man named Reuben Young, in whose house he found some goods which Young acknowledged having stolen from Curry's store. He also found a chest of carpenter's tools which, there is every reason to believe, have been stolen, as the marks on every tool were cut out. Young was arrested and brought before Mr. Roberts, J.P., and was committed for trial. Others who who are supposed to have been concerned in the robberies with Young have left town.

THE WOLTZ BROS. FAILURE.—In our November issue we noticed the failure of Woltz Bros., Jewelers of Toronto, in such a way that many of our readers might think it complementary rather than otherwise. Recent developments, however, show that things are not so good as they then seemed, and that while the members of the firm may have acted as they thought for the best, they certainly have put things in a very bad shape for their creditors. In looking over the catalogue of the stock and fixtures advertised for sale *en bloc* by the assignee in trust, we find that of actual stock in the store there is only $19,659.25, and fixtures $4,690.00, making in all $24,349.25, of available assets. In addition to this, however, it appears that goods to the value of about $18,000.00, have been hypothecated, (another name for pawning them,) and the sum of $12,800.00, advanced on them by the high class pawn brokers who now hold them. This hypothecating business looks very bad to say the least, and it seems to us that as soon as the Woltz Bros. first found themselves forced to pawn their creditors stock, for it was certainly, not their own, not having been paid for, they should have called a meeting of the creditors and asked their advice and assistance. If this had been done the general creditors would have had some show for their money, as it is they have none. The Messrs. Woltz Bros., as we said, may have been perfectly honest in this matter, if so it was an unfortunate mistake, and only proves the truth of the theory that a person must be educated to a business before he can expect to succeed in it. The sale of this stock has been delayed by legal squabbles amongst the creditors, and it is still uncertain whether it will be sold on the 27th as advertised.

WORKSHOP NOTES.

RUBY PIN.—If it is necessary to tighten a ruby pin, set it in asphaltum varnish. It will become hard in a few minutes, and be much firmer and better than gum shellac, as generally used.

TEMPERING BRASS.—Brass is rendered hard by hammering or rolling; therefore, when you make a thing of brass necessary to be tempered, you must prepare the material before shaping the article. Temper may be drawn from brass

by heating it to a cherry red, and then simply plunging it into water, the same as though you were going to temper steel.

POTATO CELLULOID.—According to a Vienna journal, a substance may be produced from potatoes possessing the properties of celluloid. For this purpose the peeled potatoes are boiled for 36 hours in a fluid consisting of 8 parts sulphuric acid and 100 parts water, then dried between blotting paper and relieved of the superfluous water by pressing. Pipe bowls are at present made therefrom in France that can barely be distinguished from real meerschaum, and billiard balls are likewise made from it by strongly pressing.

REPAIRING CYLINDER WATCHES.—It frequently happens that the cylinder edges are worn off, and it does not pay to put in a new cylinder ; the watch may, nevertheless, be put into keeping a good rate by altering the escapement. Look at the cylinder and see if there is room either above or below the old wears to shift the action of the wheel If the wheel holes are of brass, make one a little deeper, and put a shallower one on the other side—this may perhaps be sufficient. This must be done according as you want your wheel up or down. If the holes are stone, shift your wheel on the pinion by a new collet, or turning away more of the old one, as the case may require. If you raise your wheel, see that it works free of plate and top of cylinder, and that the web of wheel clears the top of passage. This last fault may be altered by polishing the passage a little wider, if the rub is slight. If shifted downward, see to freedom at the bottom of the cylinder, etc.

CHAIN RUNNING OFF FUZEE. In the first place, you must look and ascertain the cause of the difficulty. If it results from the chain being too large, the only remedy is a new chain, if not too large and yet it runs off without any apparent cause, change it end for end, that will generally make it go all right. In cases where the channel in the fuzee has been damaged and is rough, you will be under the necessity of dressing it over with a file of the proper size and shape. Sometimes you will find the chain naturally inclined to work away from the body of the fuzee. The best way to remedy a difficulty of this kind is to file off a very little from the outer lower edge of the chain for its entire length ; this, as you see, will incline to work it on, instead of off. Some workmen, when they have a bad case, and a common watch, change the standing of the fuzee so as to cause the winding end of its arbor to incline a little from the barrel. This, of course, cannot do otherwise than make the chain run to its place.

OTHER NOTES.

THE silver ore of Nevada mines is so intimately associated with lead that nearly one-half of the miners who handle it become afflicted sooner or later with wrist-drop, palsy, or half paralysis.

SMOKE will soon be at a premium. From 2,800,000 cubic feet of smoke given out by say 1,000 cords of wood, it is said 12,000 pounds of acetate of lime, 200 gallons of alcohol, and 25 pounds of tar may be obtained.

THE Western Union Telegraph Company has estimated the durance of telegraph poles as follows :—Cedar, 16 years ; chestnut, 13 ; juniper, 13 ; spruce, 7 years. Cedar, chestnut and spruce are used in the Northern States; juniper and cypress in the Southern States, and red wood in California. Poles cut in the summer will not last as long as those cut in the winter by five years.

THE *Mechanical Engineer* tells a curious story of the effect produced on wrought iron forging by a human hair. The forging was in a powerful cold press for finishing, where it is subject to a pressure of 200 tons to the square inch. A hair taken from the head of a bystander was placed on the face of the forging and the full pressure applied. The result was that the hair was driven into the forging and imbedded in it, the hair itself remaining uninjured and being readily removed.

It has been discovered that the best disinfectant for sewer-gases is the washings from gas-works. This serves a double purpose, that of annulling the poisonous effect of the sewer-gas, and at the same time enabling persons having defective traps to detect it by the strong pungent odour arising therefrom, while sewer-gas alone, almost odourless, permeates the building, carrying sickness and death with it. The washings from water gas-works, at least, will not clog or obstruct even the smallest of sewers, while their presence, as above stated, might save valuable life.

SPECIAL.

For the next month we will give our customers special net prices on our stock of

SWISS SILVER WATCHES.

These goods are all of first-class quality, and, at the reduced prices we now quote, are lower than watches of similar quality ever before offered to the trade in Canada.

We are also offering big bargains in Black Goods, and our cut prices on

Editorial.

THE COMPLIMENTS OF THE SEASON.

"A Merry Christmas!" "A Happy New Year!" "The Compliments of the Season!"—such are the expressions that seem to have been upon the tip of everybody's tongue for the past few days. It is a season of festivity, good wishes and fun, and THE TRADER may not only be pardoned, but commended if, following the custom which prevails throughout broad Christendom, it metaphorically takes its myriad of readers by the hand and sincerely wishes them one and all, "all the compliments of the season."

The year that has just closed has been a hard one for many of our readers in the jewelry trade; their goods being luxuries are of course the first to feel the effects of dull times and the last to get over them. That the past year has been a dull one, no one will venture to deny, but we think that the jewelers of Canada may congratulate themselves upon the fact that, as a trade, they have outridden the gale of commercial adversity as safely as any other branch of business in the country.

Although the past year has been disappointing, the future looks brighter, and gives promise of better things to come. The country is better off by twenty millions of dollars than it was at this time last year, and, although the price of wheat is low, there never was a time when a bushel of wheat would buy a larger quantity of manufactured goods than now. All that is wanted is confidence in the future, and an energetic turning over of the resources we have now on hand. If our farmers could be induced to sell their grain and get the money into circulation, a decided revival of trade would be an almost immediate result. For this end every merchant should work with all his might, for upon this one thing very much of our prosperity in the near future depends.

We enter upon this new year of 1885 with gratitude for the past and hope for the future. We have unbounded faith in the resources of Canada, and believe that she has a destiny before her that shall crown her in the near future with the honors derived from peaceful conquests. Canada will be exactly what her own people make her, and we have pride enough in them, and confidence enough in them to believe that, as a people, they are second to none in the world.

HOW IT GOES.

The Jewelers' Security Alliance of Canada has so far proved itself a much more decided success than even its promoters expected. Already nearly one hundred jewelers have joined its ranks. From all parts of Ontario the Secretary has received letters of approval, accompanied by applications for membership. The fact is that the Alliance has been organized to meet and grapple with real danger, and our jewelers have not been slow to perceive that only in mutual help by some such organization as this can they ever hope to protect themselves against burglars.

We are glad to say also, that the Alliance has completed arrangements by which, in case of burglary, its members will have the services of one of the best detectives that the United States can furnish, in addition to that of one of the best Canadian detectives. By this combination it is expected that whether the burglar be American or Canadian he will be exceedingly lucky if he escapes a term in our penetentiary. The funds of the Alliance are subscribed for the purpose of detecting and convicting thieves, and the Directors propose to give such characters the full benefit of the law.

Since our last issue there have been several burglaries of jewelers' safes, and so far, from want of efficient detective service, none of the burglars have been captured. In the case of Mr. John Brodie, jeweler, of London, a traveller for a Toronto jewelry house pointed out to him the danger of burglary, and tried to induce him to join the Security Alliance only the day before the midnight mechanics had got in work. Had Mr. Brodie at once availed himself of the protection of the Alliance, they would have placed first-class detectives on the job free of expense to him, and the probability is, that not only would the thieves be captured, but the goods recovered. In such matters as these delays are dangerous, and unless a jeweler is entirely independent of his business he cannot afford to run such a risk.

Every jeweler ought at once to join the Alliance, and so strengthen its hands that it will become a real terror to evil doers. Remember that it is entirely a mutual organization, and that the more who join it the more powerful it becomes, and the better able to render effective aid to its members.

We are requested by the Secretary to say that jewelers desirous of becoming members should fill up the blank form of "application for membership," that has been sent to them all, and send this along with their membership fee. Some have sent their fees in a letter without the application; this is not correct, as the information asked for in the application is essential to the detectives, should the applicant be unfortunate enough to be robbed.

Some again send the "application" properly filled up, and say we will remit him in a few days. This will not do. The Alliance does not recognize any but cash in advance transactions, and should a person have their safe robbed before their money is paid, they can receive no help from the Alliance. All fees must be paid in advance.

The Secretary-Treasurer also desires us to say that he will take it as a favor if the trade will render him all the assistance in their power by conforming strictly to the rules laid down in the Constitution and By-Laws, and thus save him a lot of unnecessary work which he has not the time to look after.

THE ABUSE OF THE CREDIT SYSTEM.

Every few weeks we are reminded of the abuse of the credit system in Canada, by letters from valued correspondents, whose lives seem at times to be made miserable by the dilatory business habits of some of their customers who seem to look upon the protection of their own credit as a thing of little or no moment. Nearly four years ago we took occasion to write up this subject, and we do not think that a repetition of the gist of the article would be out of place at this present juncture.

The business of Canada, as a general rule, is conducted on a credit basis,which, of itself, is not an alarming fact,because, if kept within proper and legitimate channels, the effect of credit is to extend the volume of trade without adding materially to the risk.

As we have frequently pointed out, on account of the immense amount of competition in this country, "credit is by far too cheap," and in the fact that even strangers and comparatively weak men can obtain goods on credit, lies one of its chief sources of weakness.

In Canada, houses with unlimited capital are few and far between, and for this reason the majority of our wholesale men and manufacturers have to raise money by discounting the notes received from their customers in payment of their accounts. The simple giving of a note does not make the debtor pay any more for his goods, nor cause it to be paid a single day sooner than it would otherwise be due. Some merchants, however, and we are glad to say they are but few in number, adopt a kind of dog-in-the-manger policy, and are peculiar enough to refuse either to give a note or pay the cash ; in fact they imagine the wholesaler ought to feel honored in being permitted to sell them goods and wait for the money until they are ready to pay it, which, in most cases, is a pretty long time, as such people are usually long winded.

The true way of doing business, however, is for a merchant to buy no more than what he can pay cash for, or what his judgment tells his trade requires and he thinks he can pay for when due. He should arrange with the jobber at the time he buys whether he will pay cash and take advantage of the cash discount, or let the account run for the period of credit agreed upon and close the transaction by note. Having given his note he should conscientiously carry out his arrangement and do his utmost to pay it in full when due.

The system of closing accounts by note, while not prejudicial in any way to the interests of the retail merchant, is a great convenience to the wholesaler, and would, if the system were discontinued, put a stop to many of the industries carried on by its aid. So long as the givers of notes carry out their engagements the system cannot be considered dangerous, for good commercial paper is always in demand and has a recognized market value.

When a jobber discounts his customers' notes he simply sells them to the bank, and, by his endorsation, guarantees that in case the makers of the notes fail to meet them at maturity, he will. Good notes are the next best thing to cash to the wholesaler, because he can at any time convert them into cash. Notes given by his customers therefore constitute a part of his capital, so that when their notes are protested he not only loses so much of his capital, but must draw upon his resources to make good the amount, which is often a very serious inconvenience.

When a merchant's paper has been protested several times, it becomes of very little value to himself or anyone else. No bank or wholesale dealer cares to keep discounting the same paper over and over again, and it is only by promptness on the part of his customers that the credit system can be made of any material benefit either to him or them.

When a retail dealer gives a note in settlement of an account he should make up his mind that he will pay it in full at maturity. If he has to renew any part of it, it should be an exceptional, and not a common thing for him to ask from his creditors. He should remember that renewing a note does not pay it, and in very few cases does it make it payable at a more convenient season. It generally only puts off the evil day, and often leaves him worse off than before.

A merchant who invariably meets his notes promptly can go into any market and buy at close figures and best terms, for the simple reason that the seller knows that when the note matures it will cause him no trouble in protecting it. A dealer who, on the contrary, is notorious for his want of punctuality in this respect, never can nor should expect to receive the same terms as a prompt paying man.

Although a merchant should pay every note he gives in full when due, it sometimes happens that, owing to unforseen circumstances, he finds himself unable to do so. Then his best plan is to take time by the forelock and arrange with the jobber about it before it matures. If he can't pay in full he should notify the jobber at least a couple of days beforehand and get permission either to draw back on him at sight for what he is short, or remit what he can on account of it and get the note recalled. *Whatever course he adopts, however, it should be done before the note is due, and not after it.*

Some merchants have a bad habit of leaving these things off until the last moment, or neglecting them altogether—both bad enough, but the former infinitely preferable to the latter mode of doing business. If people desire to obtain credit they should see to it that they meet the obligations they have voluntarily incurred ; if they cannot do so in full they should make an effort to do so, and not simply shift the burthen on to the shoulders of the wholesale merchant without any warning.

Mercantile credit is a delicate plant, and every merchant doing business upon a credit basis, should make it a point to see that he does nothing of his own accord to affect it injuriously. If a creditor sees that a debtor is doing his level best to meet his obligations, it is very seldom that he refuses to give him all the accommodation he can reasonably desire.

Selected Matter.

TOO MUCH WHEAT.

"Too much wheat!" So the dealers say,
Millions of bushels unsold
Of last year's crop ; and now, to-day,
Ripe and heavy and yellow as gold
This summer's crop counts full and fair ;
And murmurs, not thanks, are in the air,
And storehouse doors are locked, to wait,
And men are plotting, early and late.
"What shall save the farmers from loss
If wheat too plenty makes wheat a dross?"
"Too much wheat!" Good God, what a word!
A blasphemy in our borders heard.
"Too much wheat!" And our hearts were stirred,
But yesterday, and our cheeks like flame.
For vengeance the Lord his loins doth gird,
When a nation reads such a tale of shame.
Hundreds of men lie dying, dead,
Brothers of ours, though their skins are red ;
Men we promised to teach and feed.

American Watch Company.

We desire to call the attention of the Trade to the fact that we have made A VERY MATERIAL REDUCTION in the prices of

OUR 18 SIZE FULL PLATE MOVEMENTS

—— AND ALSO IN OUR ——

GOLD : AND : SILVER : CASES

The reduction gives dealers handling our Movements and Cases a substantial advantage over all other competing goods. The improvements steadily being made in the quality of our productions render them more attractive and desirable than ever and insure a higher standard of perfection than hitherto attained, which the practical men in the Trade cannot fail to appreciate.

Our 18 Size Gold Cases, unequalled in Workmanship, Style and Finish, are being constantly embellished with new and taking designs that make them the most salable goods of the kind in the market.

In the manufacture of our new SILVER CASES the most improved methods are introduced, and their Style, Finish and Intrinsic Value have justly earned for them a wide-spread popularity, while the prices cannot fail to attract attention. A large and constantly changing variety of our productions can always be found in the stocks of the Jobbers in all sections of the country, so that dealers can have opportunities for selecting the newest goods made by the Waltham Company.

AMERICAN WATCH COMPANY,

WALTHAM, MASS.

ROBBINS & APPLETON,

GENERAL AGENTS

New York Chicago Boston London, Eng Sydney, Australia.

Oh, dastard nation! dastard deed!
They starve like beasts in pen and fold!
While we hoard wheat to sell for gold.
"Too much wheat!" Men's lives are dross!
"How shall the farmers be saved from loss?"
"Too much wheat!" Do the figures lie?
What wondrous yields! Put the ledgers by!
"Too much wheat!"

Oh, summer rain,
And sun, and sky, and wind from west,
Fall not, nor shine, nor blow again;
Let fields be desert, famine guest
Within our gates who hoard for gold
Millions of bushels of wheat unsold,
With men and women and children dead
And daily dying for lack of bread!
"Too much wheat!" Good God, what a word
A blasphemy in our borders heard.

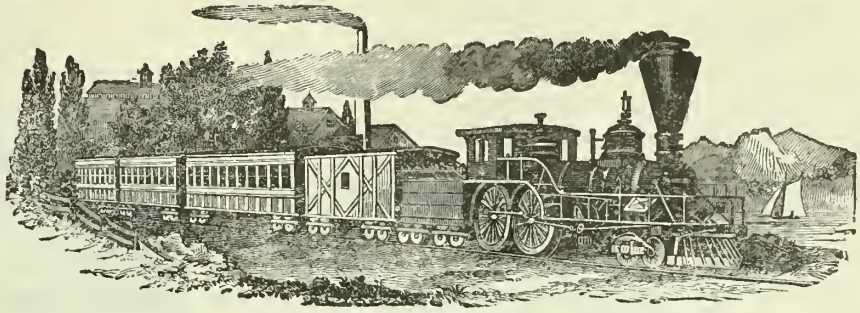
—Helen Jackson.

JOHN DORN'S SON.

The tide was out in Great South Bay, Long Island; east and west, like wavy fields of green and brown, the Bellmore marshes stretched away in unbroken loneliness to meet the dim beauty of the horizon. The wind had gone down, leaving the broad bosom of the water as still as a mirror upturned on the level sands. The sun, shining through countless leagues of haze, cast tremulous shadows toward the east, and, rising up with shaded brows to meet its rays, John Dorn, a cheery fisherman, stood out in silhouette against the sky. Fast mingling with the purple and gray of the leeward rim of sea and sky, a lazy schooner winged its southward flight, and when the dusky distance closed upon it John Dorn and his weather beaten old boat alone broke the changeless monotony of marsh and meadow. Left high and dry by the receding tide, the old boat lay bolt upright in the soft mud, as taut and trim as though moored in her moss-grown berth at Bellmore landing. Her sails hung limp and motionless against her mast, and about her shining deck a brown-haired little girl romped and laughed in childish glee.

It was unspeakably lonely out on the wide-reaching marshes, but as honest John Dorn shaded his eyes with his rough brown hand and gazed seaward he gayly whistled a tune that he had learned up in the little white-steepled meeting-house in Bellmore village. It did not seem lonely or dreary out there, for to him it was home. The blue sky above him and the dimpling shallows before him spoke only of home; the marshes had been his playground in youth, and the meadows behind him were as well known as the little garden back of his own modest cottage among a clump of distant trees. Even though the marshes had not been as familiar as the stubby fingers on his weather-beaten hands, and had the sky been black with clouds and driving rain, John Dorn would have been just as happy and free from care, for up in the little house among the trees a son had been born to bless his approaching old age. A daughter he had already, and another slept beneath the sea grass in his garden, but until this day a son had been denied him.

It would not be fair to say that John Dorn had grumbled at fate when grave middle life came and saw no sons in his family, but somewhere down in the depths of his stout heart he argued that, although girls were good enough in their way, and perhaps were necessities in an all-wise scheme, yet only a boy could stand his trick at the wheel or reef the mainsail in a gale of wind. John Dorn wanted some one to bear him company in his silent pilgrimages to the fishing grounds and the oyster beds, and in turn to guide the old sloop out to sea when he himself should in the course of time be kept ashore by the accumulated rheumatism of many years of active life. And so, on this soft Summer day, when a little, mewling red headed son had taken possession of the household, John Dorn lifted up his honest soul in thanksgiving, and went away to his work in the marshes as blithely as though his wedding day was not a score of years behind him in the dead but unforgotten past.



The world was bright and fair to John Dorn that day, for in the future he saw his son, strong, sturdy-limbed and ruddy, steering with heavy hand the laboring vessel, pulling merrily the weary oar, and on the Sabbath day trudging manfully to church with a swarm of rosy children. John Dorn smiled and hummed a solemn hymn, and in the height of his contentedness stooped down and imprinted upon his daughter's wavy hair a forgiving kiss. Henceforth the innocent little girl should not be denied the love which disappointment had withheld for so long a time. As he guided his sloop through the serpentine channel leading out to the bay his heart became as water, and in the ennobling influence of that feeling he seemed to lose his sunburn and his wrinkles and to grow young again.

Quickened by the breath of awakened love, the vague ambition of early life came back, and in the mirage that somehow loomed up above the blue surface of the bay he saw his son, and incidentally himself, crowned with all the honors that a grateful, respecting local community could bestow. Unquestioning assumption of the probability, or even the possibility, of future social or political preferment for his son was proof positive that no such distinction was likely to be accorded him, the argument in the matter being, in effect, that nothing but the most disheartening of native plodders could come of such a combination of dullness and unreasoning hope. Had John Dorn's ambition taken definite form and sought by such means as lay within the narrow circle of the life along shore to carve out the way to the coming man's ennoblement, there might have been grounds for hope, but at its best John Dorn's ambition was as formless as the night, and as discouraging as his wife's inferiority.

Clams were plentiful that day, and John Dorn's broad, flat feet churned them out of the thick mud with more than usual rapidity and ease. Again and again the wicker basket returned to the waiting boat, piled high with captured shells, until, when the tide ceased to run out and the western sun dipped angrily toward the hazy west, John Dorn drew his brown arm across his heated brow and said that he had done enough. Smiling contentedly at the sleepy little girl, he said he would go home with the new tide. To go home? To whom? To the baby; to his son! Perhaps by this time his wife, remembering previous conversations on the subject, had named him. And would he answer to the plain, old-fashioned name "John?" Perhaps so. It was old-fashioned, no doubt, to have the paternal name descend through many generations, but it was a good, honest way, and to one honest, plodding woman in the little house among the trees it would give deep satisfaction.

Waiting for his boat to float, John Dorn spattered the advancing tide merrily with his bare feet and played hide-and-go-seek with his little girl. All resentment over the birth of a daughter had vanished now, and the father was happy and proud in having both daughter and son. It made things even, he thought, and who could tell what the future would bring? Then, as he stood there aimlessly swinging his foot to and fro in the cool water, an idea seemed to enter into and take possession of his

mind. He realized, awkwardly enough, it must be confessed, that on this day he ought to carry an offering to the cradle of his child, an offering from the sea. In that moment, it is true, his patient, hard-working wife was almost forgotten, and his first-born son filled his newly awakened imagination with a radiance like the glow in the western sky. This seeming neglect of his wife appeared to him excusable, for the hard-headed reason that it was through the instrumentality of his son, and not his wife, that his desultory ambition was to be realized.

An offering from the sea surely was not hard to find, and yet he hesitated. Shells there were in prodigal profusion, and shells always have been considered the time-honored trophies of the sea. Shells, were good enough in their way, and suitable for all occasions of ordinary interest, but as the birth of the first son seemed to be an occurrence of more than usual importance John Dorn's ambition demanded something more. Just what to select as an additional offering puzzled John Dorn for some time. At length his wrinkled face beamed with satisfaction. He had it now. It was flowers !

"Be a good girl, Patty, an' keep the sloop till I come back," said he, straightening the kinks out of his body and turning his face toward the meadows. "Don't be afraid, Patty ; I won't be long."

Then he went across the marshes alone, turning back his head from time to time to see that little Patty came to no harm. Soon he forgot Patty, however, and walked on, looking neither to the right nor to the left. His preoccupied manner, his unswerving course toward a cluster of bright flowers on a neighboring bank told, as plainly as the day, his sudden and narrow devotion to one all-absorbing object. Between him and the cluster of wild flowers was Dead Man's Creek. At low tide it was an oozy bed of soft mud, with a tiny stream of water trickling down its centre ; at high tide a schooner might have floated in it in perfect safety. It got its name from the fact that a man was drowned there several years before.

Upon the slimy bank of Dead Man's Creek John Dorn neither stopped nor stayed. With his eyes fixed confidently upon the cluster of gay blooming flowers he strode down through the eel grass and out into the mud. Had he been less occupied with thoughts of his first-born son and vague speculations concerning the career likely to open up before him, he would have noticed at once, with the experience of an old fisherman, that the mud was soft and heavy. Almost at a run he pushed onward.

In the middle of Dead Man's Creek he stopped. A shade of vexation crossed his face, for he found it impossible to cross the mud so near the main channel. He stood still a moment, trying to think of a better crossing further up the brook. He turned to retrace his steps. What was this ? The heavy mud held him fast ! With a mighty effort he wrenched free one of his legs and tried to struggle out to firmer ground. It was impossible. He but sank the deeper. Then like a tidal wave the blood rushed back upon his heart, leaving his cheeks and lips like ashes. It was fear. Then he laughed aloud, a hard, hollow laugh. Why should he fear ? Did he not know every foot of sea and shore along the Great South Bay, and was it likely that any harm should come to him in sight of his own home ? It was weakness to think of such a thing. The long-delayed arrival of his son had unnerved him for a moment —that was all. He would put forth his strength and wrench himself free. With the energy of desperation he tried it—once—twice—three times—and stood still, exhausted. Fear shone in his eyes, and the lines of unexpressed anxiety deepened across his pale face, yet he would not cry out. People might laugh to know that he was stuck in the mud, and he was proud in his way—proud of his knowledge of sea and shore, proud of his ability as a sailor. He would wait a while and try again.

But what was this creeping up from the channel ? It was water. The tide was coming in. Instinctively he sought the high-water mark on the bank and measured it with his eye. It was fully six inches above the top of his head. In a sudden frenzy of terror he beat the soft mud with his hands and shrieked aloud. Like a madman he glared at the little sheet of water waving in from the swift channel like an unrelenting fate. It seemed to mock him. Sea birds circling overhead heard his cries and soared away ; little Patty cowered down in fear

It was not a quicksand. He did not sink inch by inch. He stuck fast, and became as immovable as the bed of mud itself. Cries, tears, prayers, alike were in vain. No one heard, for although the little house among the trees was in plain sight, yet it was beyond the range of the human voice.

The tide came in slowly, and after a while it touched him and climbed up his helpless legs and threw the radiance of the sinking sun into his bloodshot eyes. It jeered at him and with tremulous fingers reached up to grasp him by the throat. He struggled and screamed until his strength was gone. Then he stood still and waited. Higher yet climbed the green tide. Dumbly he saw a slender line of smoke rise up from among the trees. Supper was being prepared for him—for him who would need it never again. He saw the flowers nodding in the breeze. They might wither and die. His hand would never place them upon his baby's cradle. Faintly he heard his daughter Patty calling, "Papa, papa !" Did he hear his wife humming an old tune, or was it the water gurgling in his ears ? He raised his arms, still struggling feebly. A moment later the only object on the still surface of Dead Man's Creek was a tangled tuft of brown hair, mingled with drifting seaweed.

It was high tide in Great South Bay.

—*Am. Cultivator.*

A WORD WITH THE COUNTRY DEALER.

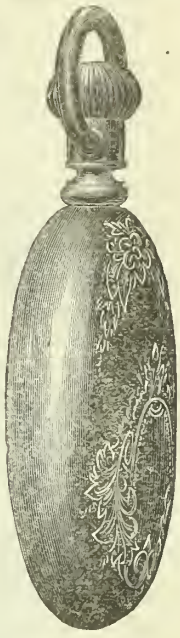
We make no apology for calling to the memory of the retail store-keeper certain matters which, if he attends to them now, may make a great difference in his balance sheet when the New Year comes:—

Are you a holder of grain, of wool, of butter, of furs ? and are you asking Montreal or Toronto importers for time on your notes until you can sell this produce at a profit ? If you are, would it not be better to realize upon it *now*, and so ease your account ?

Are you tempted by some genial commercial traveller to give him an order this week for a line of cottons on which seven months' time may be had ? If so, would it not be wiser to refuse to speculate on future prices ? Better stick, we should think, to four months' terms and buy *what you need*, only.

Have you many outstanding accounts? If you have, let nothing delay your making them out and pressing for payment. It is desirable at the time of low prices for many staples to have cash in hand so that you may buy to the best advantage

A FEW OF THE ADVANTAGES



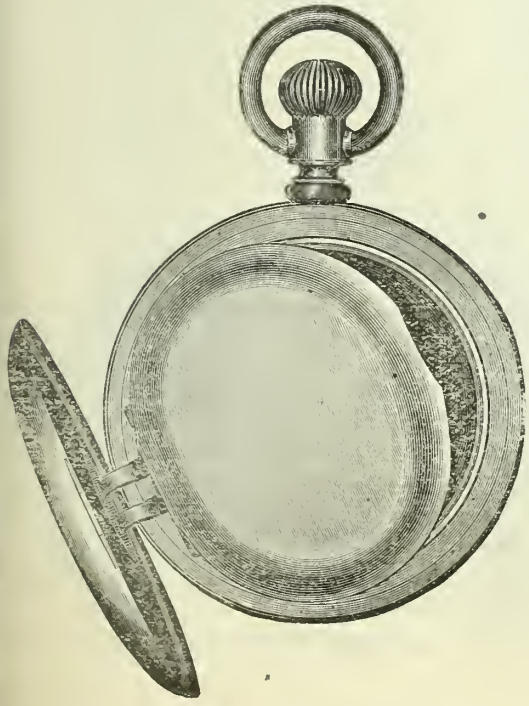
—OF—

QUIGLEY'S

INVISIBLE JOINT

—OVER—

THE REGULAR JOINT.



1st. The same thickness of metal around the Pin. In the Regular Joint there is half filed off the joint on the outside, in opening the case, and finishing thejoint, and in many cases more, thereby making the joints weak.

2nd. In putting the joint or hinge inside the centre it closes the back or cover to the centre or rim of the case. In the regular joint, where the joint or hinge is placed between the back or cover and centre or rim, it tends to push them apart, and in case of the pin being forced into the joint or hinge it forces them more apart and leaves an opening for the dust to get into the works of the watch.

3rd. The joint or hinge being inside, the centre or rim is protected and being made heavier is stronger and will wear longer.

4th. The spring in the Hunting Case is made of a flat piece of steel and is not hardened as hard as the one in the Regular Case. It is guaranteed notto break.

5th. Both hunting and open face cases open like the Regular Case, and unlike the majority of Patent Cases, are not liable to get out of order.

6th. There are no joints or hinges on the outside to wear out the pockets, or admit dust.

7th. The outside surface of case being perfectly smooth, admits of continuous engraving around the centre or rim from the front to the back of case.

when you see prices begin to rise.

Are your expenses too large in proportion to the business you do? Do rent, taxes, fuel, light, clerk-hire, and family outlay exceed the profit you make on your annual turn-over? If they do, you may fairly begin to ask whether, as a merchant, your usefulness is not gone.

Do you know how much stock you have in your store? Are there not dark corners, neglected drawers, dusty shelves, whose contents your clerks know little of and yourself nothing? Ah! the live storekeeper is the one who has the fewest old, fusty, tossed and neglected goods. Better *get rid of such stuff* at one third of its cost than deceive yourself swelling your stock sheet with it, year after year.

Are you arranging for stock taking at the end of the year? Be sure you don't take it in at prices beyond its value.

Are you insured?

Do you keep a record of your notes?

Do you check your invoices?

Do you keep an order book?

Are you trying to sell for cash?

Is there any fire protection in your place?—*Monetary Times.*

THE MECHANIC.

A man who is a thorough master of a trade carries his capital in his head. He is independent, and should be self-reliant, as his services will always be in requisition, unless, perchance, he has drifted into some section of the world where trade and manufactures are in a state of decadence. It may be an excellent thing to endow a youth with a splendid education, but often we find such young men failures in a business way. But there is no excuse for a first-class mechanic or engineer ever being found in such an unfortunate plight. The man possessing a good scientific or mechanical education who cannot make his way successfully through life must be composed of very poor material. The good mechanic needs no golden ladder to aid him in rising to success, nor is there occasion for his reliance on social standing, or on the good offices of influential friends to open a path to fortune. Indeed, instead of seeking for friends they will seek him. An expert galvanizer, a few weeks since, was thrown out of employment, and scarcely had the doors of his mill been closed ere there came a telegram from a mill 1,000 miles away urgently requesting his services there. A representative of an extensive manufactory, in speaking of good mechanics, recently said: "We still have difficulty in obtaining all the expert help we need. This matter sometimes assumes a serious aspect, and we fear often that we cannot run our works to their best advantage for lack of the proper assistance."

We hear speak of the higher grade of workmen—of men who are proficient and who have mastered their calling; but mechanics who have not risen to eminence, but have acquired a good reputation, are in most favorable positions far better than the horde of ill-paid clerks, salesmen and collectors, who have chosen a calling that will save them from begriming their hands with dirt and permit them to wear good clothes. The Boston *Commercial Bulletin*, in speaking of the importance of the position of the mechanic, very forcibly remarks:

Each ensuing day makes more prominent the fact that we have come upon the time when the mechanic is master. We have crowded professions and ill-filled trades. The chance to fill the position of sub-assistant clerk in a wholesale house is eagerly grasped at by a hundred applicants, though the wages received be scarcely more than "a chance to learn the business." Let a master workman try to obtain an apprentice at three times the salary offered the clerk, and his applicants will be poor alike in quantity and quality. A skilled workman in any trade need never want for hire; he is eagerly sought after by a hundred employers; he is independent of the condition of the market; the skill and cunning of his hand and eye are too valuable to lose, and must be paid whether the products are slowly or rapidly consumed. If business ceases, the master hand is eagerly seized by some rival house, which knows and values the product of his skill. He who would crush down the obstacles to success in our own days must have, as well as the wit to see the crevice, the strength to deal the blow. This is an age of the steam engine, and it is the engineer, not the conductor, who is master.

The man who can do a piece of exact mechanical work, or who can invent a successfully working machine, or plan its erection, is a valuable member of society. He is a producer, and the world is both richer and better for his presence. His calling demands a fine development of intellectual thought, and, although the mental conception requisite to do a fine bit of mechanical work may not be of the same high order as that required of a sculptor or painter, yet it is of a high degree of merit, and may equal, in special circumstances, the efforts of the best artist in any of the various schools. It is a narrow-minded man who despises the mechanic because of the surroundings of his labor. Those who look down on him are generally men of inferior intelligence, who possess a poor conception of what is worthy of admiration, and whose esteem would be of little credit to any one.—*Ex.*

PREVENTION OF NOISE.

To those who carry on any operations requiring much hammering or pounding, a simple means of deadening the noise of their work is a great relief. Several methods have been suggested, but the best are probably these: 1. Rubber cushions under the legs of the work bench. *Chamber's Journal* describes a factory where the hammering of fifty coppersmiths was scarcely audible in the room below, their benches having under each leg a rubber cushion. 2. Kegs of sand or sawdust applied in the same way. A few inches of sand or sawdust is first poured into each keg; on this is laid a board or block upon which the leg rests, and round the leg and block is poured fine dry sand or sawdust. Not only all noise, but all vibration and shock is prevented; and an ordinary anvil, so mounted, may be used in a dwelling house without annoying the inhabitants. To amateurs, whose workshops are almost always located in dwelling houses, this device affords a cheap and simple relief from a very great annoyance.

BUSINESS CHANGES FOR DECEMBER

McIntyre & Davidson, Jewelers, Portage La Prairie, Man., closing up their branch at Minnedosa; Woltz Bros., Jewelers, Toronto, succeeded by Woltz & Co.; Canada Clock Co., Hamilton, in liquidation; E. C. Delano, Fancy. Goods, Montreal and Ottawa, assigned in trust; Dickinson & Cranston, Stationery and Fancy Goods, Woodstock, burned out; Kay & Co., Jewelers, Mitchell, damaged by fire.

BUSINESS NOTES.

The Trader has to congratulate Mr. Charles Ellis, the well-known jewelry traveller, on the fact that his family has lately been increased by the addition of a very handsome pair of twins. Charlie has made a good beginning anyhow.

Caution.—If you haven't joined the Jewelers' Security Alliance yet, lose no time, but do so at once. Delays are dangerous, and if you should get cleaned out before you become a member, it would be but poor consolation to think you had saved your entrance fee anyway. Join at once.

PATENT SNAP BEZEL CASE.

This Patent Snap Bezel Case is desirable for Railroad Purposes, or wherever a Dust Proof Case is needed. And there being no Springs or Cap, it enables us to make a Case of Better Proportions than is possible in a Regular Case.

22

Back View of
PATENT SNAP BEZEL CASE.

Company, of Lancaster, Pa., is offered for sale by the assignee, including real estate, buildings, machinery, tools, finished and unfinished watches, drawings, patterns and patents, the total value being estimated at $300,000.

It is estimated that 40,000 persons are employed in the watch and clock trade in Switzerland, and that the total annual production of watches in that country averages 1,600,000, equal in value to 88,000,000 francs, or nearly seventeen millions of dollars.

The Waltham Watch Company at Boston has given notice that a large reduction will be made immediately in the working force and wages. Those remaining will be reduced 10 to 20 per cent. The number to be discharged is from five to nine hundred. The company employs 2500.

Mr. Chas. B. Alexander, who for several years past has held a position of trust in the jewelry store of Mr. Robert Cuthbert, Toronto, has recently shifted his quarters to Portland, Maine, U.S. where he will occupy a similar situation in the store of Mr. A. M. Wentworth, of that place. Charlie's many friends in Toronto will wish him the success he so richly deserves.

The Bookseller.—We are just in receipt of *The Bookseller*, a journal devoted to the interests of the book, stationery and fancy goods trades. The paper is owned and edited by Mr. J. J. Dyas, and seems to be admirably suited for the purposes for which it was intended. Its editorials are short, crisp, and to the point. We wish it success.

The Xmas trade in the jewelry business, although lacking the snap and volume of the past three or four years, has been on the whole fairly satisfactory. Fair profits seem now to be the order of the day, and the jewelers who select carefully and well of holiday novelties have not much cause for complaint. The grumbler is one who is usually behind our age.

We were sorry to learn that "Ryrie, the Jeweler," of Toronto, has been ill with typhoid fever for the past couple of weeks. Sickness never comes in a good time, but it couldn't have struck James in a worse period, as his sales about this season are generally something enormous, and take his own best efforts as well as those of his assistants. Mr. Ryrie, we are glad to say, is now almost well again.

Mr. Thomas Fitzsimons, the well-known jeweler of St. Catharines, has also been under the weather, we are sorry to say, and was compelled to stay at home for about a week. His was a case of typhoid fever also, and was, we are glad to hear, attended with no serious results. We trust Mr. Fitzsimons will be as well as ever before this meets his eye.

Still Another Warning.—The jewelry store of Napoleon LeFebre, on Notre Dame street, Montreal, within a stone's throw of the head police office, was burglarized early on the morning of the 18th Dec. The safe was blown open with powder and $10,000 worth of diamonds, gold watches, and jewelry carried off. In addition $8,000 of promissory notes and certified cheques were appropriated. No clue to the perpetrators. This is another case where membership in the Jewelers' Security Alliance would be of infinite service to the person robbed. In the face of so many burglaries, comment is almost unnecessary.

The business of the Canada Clock Co. of Hamilton, Ont., is being wound up, as it has been unsatisfactory for some time and has apparently proved but a poor investment. As this is its second collapse it will probably not survive it. It is thought that the available assets will pay about 60 cents on the dollar. Evidently this country has no use for a clock factory of its own

The Assignees' auction sale of the stock in trade of Woltz Bros. took place during the last week of November, and attracted quite a number of buyers. The bidding was spirited and the lot was finally knocked down to Messrs. I. Joseph & Sons, of Montreal, at 41 cents on the dollar. The purchaser has since disposed of it to Mr. Culliver, one of the largest creditors, and the business will be continued in future under the style of Woltz & Company.

A rather unexpected failure is that of W. W. Beckett & Co., of Sherbrooke, Que., extensive hardware dealers, and one of the oldest and most prominent business firms of the town. The failure has been brought about through complications with and endorsations for C. G. Beckett & Co., of New Mills, N.B., large manufacturers of spools, formerly of Sherbrooke, which endorsations, to the amount of $30,000, the hardware firm has been called upon to make good. An assignment has been made to Thos. Darling of Montreal.

Says a Stayner exchange in a late issue: "A jewelry drummer struck this village last Friday and after victimizing our local jewelers for large bills set about buying poultry, and at about 4 o'clock was seen with a ten cent grain bag stuffed with turkeys, geese and chickens and a pig-tail protruding from his coat pocket." We congratulate this enterprising drummer upon his success and trust that he may enjoy them in their gay and festive season.

A Warning.—An impudent case of sneak thieving was reported to the Toronto police on Saturday, the 13th Dec. George Gowland keeps a jewelry store at No. 174½ King Street east, and kept in a large case on the counter a large assortment of ladies and gents' gold and silver watches, chains, etc. On Friday evening just as it was getting dark, Mr. Gowland had occasion to go down street, and he left his wife in charge. A few minutes afterwards Mrs. Gowland paid a visit to the basement, leaving the front door unlocked. She was not absent five minutes, yet in that time a sneak thief entered the store, opened the case and abstracted seven gold watches and several valuable chains, the whole being worth about $700. Mrs. Gowland did not hear the door open or shut, and saw no one hanging about the window, but there is no doubt that the thieves had been watching for a favorable opportunity. Subsequently detective Cuddy arrested "Duckey" Walsh, one of the notorious Garner gang who proved to have three of the stolen watches in his possession. It is probable that Walsh will be entertained at the public expense for some time on account of this job, but it should be a warning to all jewelers to look very carefully after their stock.

Since the above was put in type, Walsh has been sentenced to three years and an accomplice to two and a half years in the penetentiary.

The Mendelbaum.—Everybody will remember reading about Mrs. Mendelbaum, the greatest receiver of stolen goods New York ever produced. For years she plied her infamous trade, ruining hundreds of young men and growing enormously wealthy. About the middle of the summer the New York police raided her establishment, and despite tremendous influence brought to bear in her favor she was committed for trial, heavy bail being accepted for her appearance. About two weeks ago the old harridan jumped her bail bonds and fled to Canada. She is now in Hamilton and will probably make Canada her headquarters for some time. Burglars in Canada have had a soft thing for some time, their only drawback being the want of suitable "fence" with whom to conceal or sell their plunder. The Mendelbaum being the "queen" of "fences" they will probably induce her to open business in Canada and transfer her headquarters to Toronto. If so, jewelers may look out for squalls. Canada is unfortunate. The absconding bank cashier is bad enough—"Shoe-Box" Miller was a bitter pill, John C. Eno is a heavy load, Charles W. Lee was fortunately sent back, "Bucket-Shop" Fleming was bad—but Mrs, Mendelbaum; good Lord, deliver us!

Our old friend J. W. Jackson, the well-known jeweler of St. Catharines, is not only a first-class workman, but is able to take a front seat along with most of our native aspirants in the poetic line. Mr. Jackson's muse is of a very versatile turn and is equally at home in singing of love, war, or politics, but when it gets right down to hard pan and puts in its work on commerce, it makes things hump. For this year's Christmas circular J. W. J. takes up the agricultural and mercantile aspect of the present depression and couches in rhyme some very common sense and practical ideas. From his poetic nosegay we cull three of the fairest flowers:

What though some mourn the price of grain,
Shall I not wake a joyful strain,
When Christmas and the glad New Year
Are nearing with rare gifts and cheer?
Yes, yes, I'll sing, though wheat be low,
For it will rise—and that I'll show.
The wheat is good; t'will rise, I said,
When kneaded and made into bread.
This my first note of joyful strain
For Christmas as it comes again.

O, farmer, sell your golden grain,
Nor haply spoil my joyful strain
Far better sell at present price
Than store it up for rats and mice.
Our Neelon's waiting at his mill
With cash your pockets well to fill
And Norris says he'll buy some too,
And bids me sound my loud kazoo;
Each joins my song that wheat may rize
In bread, in pudding, and in pies!

And now I'll blow some Christmas chimes:
The farmer's pockets filled with dimes;
The farmer's taken good advice,
He heard the note I sounded twice;
The product of large yield of grain
Has wreath'd his face with smiles again;
He comes to town and largely buys;
Lo! smiles light up the merchant's eyes;
Each joins my song of Christmas cheer,
"And many more—a glad New Year!"

A Burglary with a Moral.—Early on the morning of Dec. 3rd, burglars effected an entrance into the jewelery store of John Brodie, on Richmond street, London, and succeeded in blowing open his safe and carrying off its contents, to the value of $500. The burglary was not discovered until the opening of the store at 9 o'clock. The affair seems to have been most deliberately carried out. The burglars after prying up the rear window and getting in dragged the safe from the store, where it was in full view of the street, to a rear room, and then pinned a coat across the glass door that intervened. Holes were drilled into the door of the safe near the lock and powder placed therein. The amount of powder used must have been considerable, as the heavy iron door was wrenched from its hinges and torn in pieces, the inside of it parting from the remainder, and the screws and bolts in every part being rent in two. As a result of the explosion inside only a few shattered shelves were left. Once inside the burglars helped themselves to the booty. Eighteen gold and silver watches belonging to customers were secured, together with $63 in cash and a lot of gold jewelry, consisting of chains, etc. A desk in the place was also carried into the back room and ransacked. The cheap lines of jewelry left in the show cases were passed by. There is an amusing side to the affair. The police knew the burglars were in the city, knew when they arrived, and were laying for them. The men were warned to lay low on their beats for these fellows, and did so. But in spite of this one of the neatest burglaries ever committed in London was perpetrated.

A strange thing in connection with this is that only a day or two before he was robbed, Mr. Brodie was canvassed by a jewelry traveller in order to induce him to join the Jewelers' Security Alliance. Had Mr. Brodie joined at once, although the robbery might still have occurred, still he would have had the best detectives in the U. S. and Canada after them at once and a fair chance of getting the goods back, and all this at the expense of the Alliance. As matters stand, the Alliance is some hundreds of dollars in pocket by his not having joined, as its benefits are only for paid up members.

WORKSHOP NOTES.

Aluminum Silver.—The following alloy is said to receive a high lustre and polish: Copper, 70 parts; nickel, 23; aluminum, 7.

Solder for Aluminum.—The following alloys are recommended for the purpose: Melt 20 parts of aluminum in a suitable crucible, and when in fusion add 80 parts zinc. When the mixture is melted, cover the surface with some tallow, and maintain in quiet fusion for some time, stirring occasionally with an iron rod; then pour into moulds. 2. Take 15 parts aluminum and 85 parts zinc, or 12 parts of the former and 88 parts of the latter, or 8 parts of the former and 92 parts of the latter; prepare all of them as specified for No. 1. The flux recommended consists of 3 parts balsam copaiba, one of Venetian turpentine, and a few drops lemon juice. The soldering iron is dipped into this mixture.

Aluminum Silver.—This is made by smelting together 1 part of silver with 3 or 4 parts of aluminum, and is very valuable for articles in which one of the main objects is to obtain lightness, such as the instruments used for marine observations. Octants and sextants of this alloy have been received with great favor by practical navigators. Those parts of such instruments which, if made with other metals, would weigh 4 pounds will, when made of the above alloy, only weigh 1 pound. Mechanics like to work this alloy, as it can be turned and filed away, which is not the case with pure aluminum, it being too soft, and, as no doubt all know who have worked this interesting metal, it has the objection-property of sticking to the file.

To Polish Aluminum.—Emulge equal parts of rum and olive oil, by shaking these liquids together in a bottle. When a burnishing stone is used the peculiar black streaks first appearing should not cause vexation, since they do not injure the metal in the least, and may be removed with a woollen rag. The object in question may also be brightened in potash lye, in which case, however, care must be taken not to make use of too strong lye. For cleaning purposes, benzole has been found best. Objects of aluminum can be electroplated without any difficulty, and a bright white lustre can be imparted to them by passing them successively through a weak bath of hydroflouric acid and aqua fortis. The effect obtained is quite surprising, it is said.

Gold Black Pickle for Brass.—All hitherto known black and grey pickles possess the defect that they give different colors with different copper alloys, while in the case of certain alloys they refuse to act altogether. For instance, carbonate of copper dissolved in ammonia gives to brass a handsome, dark-grey color, while it does not in any way attack various other alloys; therefore it is little suitable for instruments. A dark-grey pickle, which almost indiscriminately stains all copper alloys a handsome grey, resembling in color the costly platinum, is composed by dissolving 50 grams arsenic in 250 grams hydrochloric acid, and adding to the solution 35 grams chloride of antimony and 35 grams finely pulverized hammer scales. The articles to be pickled are rinsed in a weak, warm soda solution, prior to, as well as after immersion, to be followed by continued rinsing in water. The receipt is simple, and has been repeatedly tested with uniformly good results.

WANTED!

TRADE-MARK AND GUARANTEE.

The fact that several Canadian jewelers have been imposed upon by conscienceless jobbers who sold as Boss cases those of another make, having first abstracted the guarantee, impels us to say, for the benefit of the trade, that every genuine Boss gold case contains the trade-mark a CROWN and SCALES stamped in the cap.

The design of the trade-mark and the shape and phraseology of the guarantee are herewith illustrated. It seems incredible that there are jewelers who are so indifferent or indolent as not to be familiar with these distinguishable features of

Boss cases. The trade-mark and guarantee are easily understood and remembered, and if either is absent from a case claimed to be a Boss, a rigid investigation is immediately in order. Always look for the crown and scales and guarantee. They are the Boss case credentials.

Editorial.

A GOOD SIGN.

The recent advance in the price of wheat is a good sign, and gives promise of better things for Canada and the United States in the near future. A substantial rise in price such as the market has just experienced means, or ought to mean, that all of the wheat yet unmarketed will, at once, find its way into the hands of the grain buyers, and that the money it represents will soon get into circulation amongst our merchants and manufacturers. The effect of this will be to stimulate all lines of business and lift things out of the rut of depression into which they appear to have lately fallen.

The latest advices from the United States show that where a few weeks ago the tendency was to shut down factories and restrict business operations generally, that a decided revival has set in and industries of all kinds show greater activity than they have for months past. The prosperity of the Dominion of Canada and the United States are so closely interwoven that it is almost impossible for the latter to have a revival of trade without our being benefited by it. For these reasons the prospects are, we think, very much better than they were a month ago, and although the winter's trade may be late it will not run far short of its usual volume. With an unusually large crop and the fair price that produce now commands, we see no reason why the prevailing stagnation should not almost at once give place to activity and prosperity.

WELL PUT.

We have on more than one occasion pointed out to our readers the folly of any merchant who buys from a number of wholesale houses, giving any one of them security over another. No matter whether the rest come down on him at once or not the effect of it is to seriously impair his credit, and in nine cases out of ten to ruin him.

The following extract from an editorial article in the *Monetary Times* on the subject of chattel mortgages is so apropos at this time and contains so much sound common sense that we gladly give it a place and recommend it particularly to the careful perusal of our readers:

"It appears to us that among the retail trade generally there is an ignorance of the law relating to chattel mortgages, which enables unscrupulous creditors to inflict a positive injury not only upon their fellow creditors, but upon the common debtor as well. Frequently these instruments are procured on the express representation, or the tacit understanding, that none but the parties will know anything about their existence. It is important that every one should be made aware that these instruments, to be valid require to be recorded, and that they are then in due course published to the trade by the mercantile agencies. The result is that almost invariably the giving of such a mortgage security means the immediate suspension of business of the trader giving it. The whole transaction becomes known to the trade within a week or ten days at the most after its consummation, and the inevitable result must follow. If debtors as a class knew that this must inevitably be the result there is no doubt that it would in a measure prevent the consummation of some of the preferences with which the moral sense of the business community—and we believe it has a moral sense left—is so often shocked.

Let our readers know that these instruments must necessarily become known, else they are of no value, and let every honest man determine whatever the state of the law may be, to meet his creditors fairly and treat all alike when he finds himself unable to continue without placing a chattel mortgage upon his stock. By so doing he will in nine cases out of ten be best serving his own interests, as well as performing his simple duty. A general dealer who gives a chattel mortgage to some one creditor, seriously, if not permanently, damages his own credit and works manifest injustice to his other creditors. Doubtless many are coaxed, or pressed to do so. We have heard of cases where agents or solicitors of a house made promises to a trader to induce his compliance, promises which could not be kept. Some again, who get behind, are threatened with dire results if they refuse. All such may understand that their better course, when such a demand is made upon them, is at once to consult the whole of their creditors, and give undue preference to none."

WARNING.

As usual, when times get dull, there is a tendency on the part of some merchants to try and get a compromise from their creditors on terms very favorable to themselves. The usual method of procedure in such cases is to give security to some creditor who is a relation, or failing that, to some creditor who is "a friend of Barkis," and then with so much of their estate put securely out of their creditors' reach, they come forward and try to show the latter that it's about Hobson's choice with them, what they offer or nothing.

In too many cases it has unfortunately happened that self interest has made the creditors accept the alternative of settlement offered them by the debtor, and thus it is that they have often unwittingly become parties to breaches of commercial morality that none of them would care to encourage.

In addition to this evil, which, however, only can effect those creditors who are thus cheated out of part of their money, another and a greater wrong is practiced upon innocent parties. If there are two jewelers in a town and one of them gets a settlement at say fifty cents on the dollar, the result is that the goods only cost him one half the price that his opposition pays for his. In other words it is simply a premium of fifty per cent. on account of dishonesty. It lets the schemer off at half price, while it makes the honest jeweler pay one hundred cents on the dollar, and at the same time takes away his chance of doing it by putting a weapon of unfair competition into the hands of his sharper opponent, so that he can undersell him whenever he likes and still make a hundred per cent. profit.

THE TRADER has always held that such settlements are not only suicidal to the wholesale trade, but unfair to the retail trade as well, and the sooner they

are put a stop to the better for all concerned.

We are glad to know that at a meeting of the wholesale jewelry trade held in Toronto last month, this conclusion was unanimously arrived at. Toronto wholesalers with one voice say they will protect themselves and their honest customers, but as far as those are concerned who want to make a haul out of what may be their misfortunes, they will bring such wares to a very bad market.

This spirit is to be commended, and in this connection we might say that no merchant who comes before his creditors for the purpose of getting a settlement, whether by compromise or extension, has any right to give any *one* creditor security in preference to another. He should treat all his creditors exactly alike, and if he does not, the very fact that he has not done so, but has secured the claims of one or more of them should be taken as proof positive of a deliberate intention on his part to defraud them by forcing them into a settlement they would not otherwise be inclined to give. We say in *every* such case where a merchant gives preferential security and then wants to make a settlement, that the interests of commercial morality and the creditors own interests if they did but know it, demand that such a merchant should be made an example of and put out of business. His offence and his punishment should alike receive all the publicity that they deserve, not only as a punishment to himself, but as a warning to others.

This may appear harsh, but it is just, and we think in saying it we shall receive the sanction and support of the great mass of Canadian jewelers, who often under discouragement and always with great labor are forcing their way upward and honestly paying their way as they go. Nor is this intended to be anything in the way of an honest though unfortunate merchant getting a favorable settlement with his creditors. If such a person, and unfortunately there are some honest insolvents, has to meet his creditors and ask their leniency, let him meet them with clean hands, show a clean sheet and say, "Gentlemen, here is everything I have in the world, it is yours, dispose of it as you like," we say *should* such a man come before his creditors with such a record, that they will cordially extend to him the help he requires, and do all for him they possibly can.

Did merchants but know it, the wholesalers from whom they buy, instead of being enemies as many regard them, are really their best friends. And if any of our readers should at any time be unfortunate enough to become involved beyond their depth, our best advice to them is, don't give any one creditor security over another, but at once call a meeting of your creditors and frankly place your affairs before them. If any one can help you they will, and their interests and yours are identical and not antagonistic as many suppose.

That "honesty is the best policy" is an old truism, and in nothing is it more true than in the dealings between debtor and creditors such as we have written of above. While the honest unfortunate should have nothing but sympathy extended to him we hold that the schemer should not only be thoroughly exposed, but punished.

If our wholesale jewelers in Canada are wise they will see that this programme is faithfully carried out from this time forward, and if they do they will not only be better off in pocket themselves, but do a good turn to the great mass of honest merchants who justly glory in paying their debts in full and asking favors from none.

AN EXTRAORDINARY BUSINESS.

Mr. J. C. Diggins, jeweler, of Strathroy, recently notified his creditors that he was unable to meet his liabilities as they matured, and that he would be compelled to ask a compromise.

A meeting of his creditors was therefore called for the 10th January, which was attended by nearly every wholesale merchant in Toronto, Montreal and Hamilton. At that meeting Mr. Diggins, who was accompanied by his solicitor, made a statement, that owing to unforeseen dullness in business he had been compelled to ask his creditors to meet him, and consent to a compromise, and finally wound up with a provisional offer secured of thirty cents on the dollar of his liabilities. As Mr. Diggins' statement was neither full nor clear, the creditors declined to deal with his or any other offer until they had more information about the estate. They therefore requested Mr. Diggins to make an assignment to one of their number, which he declined to do, but agreed to do so to a Mr. Johnston of Strathroy. This the creditors stoutly objected to, and Mr. Diggins and his solicitor as stoutly contended for, until it became evident to the insolvent that if he wanted to have any chance of staying in business he should act according to the unanimous wish of his creditors. He thereupon assigned to Mr. R. Y. Ellis, of the firm of P. W. Ellis & Co., of Toronto, who at once proceeded to take possession of the premises, and collect full information regarding the business.

This done, the assignee called a second meeting of the creditors, which was held on the 19th January, at which the following statement, prepared by him, was presented :

LIABILITIES.		
General creditors	$5,296 43	
Mrs. Diggins	825 00	
Chattel Mortgage	967 00	
Rent	225 00	
		$7,313 43
ASSETS.		
Clocks	$ 664 71	
Silverware	1,028 44	
Jewelry	2,787 61	
Fancy Goods	625 43	
Material	100 55	
Shop Fixtures	627 70	
Accounts	74 70	
		$5,909 14
Apparent deficiency		$1,404 29

On the face of it, this statement is apparently straight-forward enough, but an investigation shows that either Mr. Diggins deliberately set about to swindle his creditors, or that he is woefully deficient in judgment, and utterly wanting in business capacity; which is correct we leave to the judgment of our readers.

A few years ago, Mr. Diggins carried on business in Strathroy, in company with a Mr. Cross, under the style of Diggins & Cross. Mr. Cross, however, wanted to retire, and Mr. Diggins bought him out. In order to do this and pay off his creditors, he borrowed money from his brother-in-law, Mr. McTaggert, of London, the present holder of the only secured account. Of course, when the existence of this mortgage became known to the trade, as it at once did, Mr. Diggins found it almost impossible for him to buy except for cash, and after some little delay the brother-in-law removed the mortgage on the understanding that it should be again put on if any of his creditors began to press him. When this mortgage was removed, the trade generally were under the impression that Mr. Diggins had paid it off, and the result was that his credit again became fairly good. Early in September of 1884, Mr. Diggins began to make preparations for his fall and Christmas trade. He bought most unselfishly from almost every firm who called upon him, and his purchases for the last three months of last year aggregate about $5,000. Now, Strathroy is

INSPECTION INVITED, PRICES REASONABLE. TERMS EASY.

not a large city, nor do its jewelers in general, nor Mr. Diggins' experience of Strathroy's fall trade in particular, warrant him in buying goods so unsparingly did he anticipate paying for them. He must certainly have known that if in an average year, when he bought $1,500 or $2,000 worth of goods, and found that amount all he could sell, that in the face of a dull year and low prices it was folly or worse to buy nearly three times his usual quantity of goods.

But this is not the worst feature of this failure. To at least a couple of firms who doubted the advisability of his buying so many goods, he represented that at that time, September, 1884, he did not owe a cent on his old accounts outside of his brother-in-law and his wife, and that he had at least $4,000 of stock, and considered himself worth at least $2,500 as clear of everything. If Mr. Diggins told the truth when he wrote the letters which stated this, then his business must have taken a singularly bad turn during the most paying quarter of the year. In that short time, not only has he lost his own $2,500, but $1,400 of his creditors' money. The fact is that Mr. Diggins' stock does not at the present moment show any more, if as much, goods as he bought last fall alone, to say nothing of any old goods. When these facts were placed before the meeting, they very properly decided that whichever horn of the dilemma Mr. Diggins chose to impale himself upon, incapacity or dishonesty, it was high time to put an end to his career if it had to be carried on at their expense. The fact that he had given a preferential security to one of his creditors they decided was *prima facie* evidence of a desire to defraud his creditors, and they decided not to entertain any offer from him at any figure short of 100 cents on the dollar. They further considered that if he had really lost the money in the business, which they very much doubted, he had not capacity sufficient to run a business of his own, and it was better he should work for someone else. If, on the other hand, the money had not been lost, then he had manifestly deceived his creditors, and they were not prepared to trust him any further.

With this decision THE TRADER thoroughly agrees, and we think it would be well for the wholesale trade always to go as thoroughly into the affairs of insolvents as they did in the case of the Diggins failure ; it would be better for themselves, and better for their customers who pay 100 cents on the dollar, and whose interests they shall be bound to protect.

Selected Matter.

GOSSIP ABOUT DIAMONDS.

CURBSTONE DIAMOND MERCHANTS.

Some one evidently in the interest of that pestiferous class of dealers in precious stones who carry their stock in trade in their pockets and either obtain their goods illegitimately or mysteriously hint at such a source of supply when attempting to effect a sale, perhaps one of the fraternity, has been "stuffing" a *News* reporter and at the same time "booming" the "racket" in the following neatly constructed interview :

"Personally I know of five or six men who make at least $5,000 a year selling diamonds on the streets of Chicago," said a good authority on such matters yesterday. "When I say 'on the street,' I mean that they ply their avocation without any store or office. These men go about among women of ill repute, among fast young men who love to possess the gems, and to the hotels, where getting acquainted with gentlemen of means, they are enabled to sell the stones."

"Are the gems of a good quality, as a rule ?"

"Yes. In fact, I believe these street merchants will sell a fine diamond for less money than a regular jeweler.

"How can that be ?"

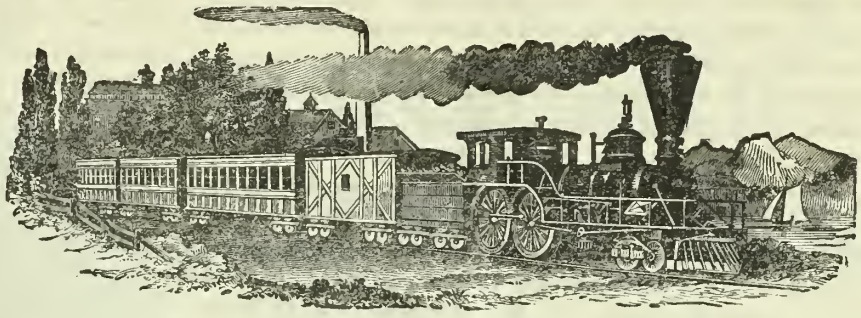
"Well, the point is this—and in telling you about it I give you the reason for not mentioning my name—most of the diamonds sold by these men are smuggled goods. They are brought to this country free of duty ; and, again, these street sellers, having no rent to pay, are enabled to sell closer."

"Do they carry large stocks ?"

"I have seen one of them with a hatful of the stones. I know of three of them that have a boxful each in the vaults of a safe deposit company. The stock in trade of each of them will easily schedule at least $4,000.

"There is another class of the same dealers in gems. They are friends of the more prominent pawn brokers. The latter give them one or two diamonds to sell. For example, the pawnbroker gives his friend a diamond worth $200. The friend goes out, and, by specious talk, sells it for $250. It may take him a week to make the sale, but the profit is good, as you can easily see."

Not many months ago a diamond dealer of the class spoken of came to this city, putting up at the Palmer house. He soon became known as the "Diamond mystery." He registered and introduced himself as Lieut. Somerville, U. S. N. He did not belong to the navy at all but his glib tongue enabled him to work his game for some time. It was his custom to carry from ten to twenty elegant diamonds loose in his pockets, and there is no doubt he did a thriving trade. The pseudo naval lieutenant disappeared as quickly and silently as he came, and it is understood that he did an immense business in his line.

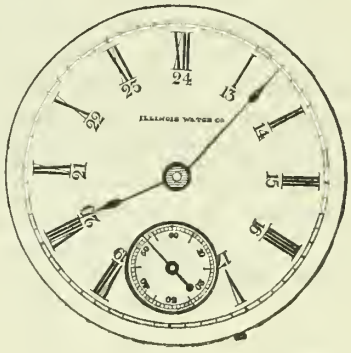


All of which is the veriest bosh, published in the interest of a class of irresponsible leeches upon legitimate trade. All sensible people know that in the purchase of valuable articles of personal property immunity from fraud and deception is only secured by confining one's dealing entirely to reputable and responsible business men, who cannot afford to deceive, and that in buying of strangers and irresponsible parties they invite deception. Illustrative of this is a case which came to our knowledge but a few days since. A reputable citizen, a regular patron of one of our largest retail jewelry establishments, fell in with one of these curbstone merchants, and deceived by his specious talk, actually bought of him a diamond which really belonged to the retail firm with which he regularly dealt, but had been entrusted to this shark for sale upon deposit of ample security (a practice by no means infrequent in the trade,) *and paid for it $200 more than the jewelry firm would have charged him.*

—"*Exchange.*"

"THERE IS NOTHING NEW UNDER THE SUN."

The very humorous statuette which may be seen everywhere, of a barefooted boy drawing a spine from his foot and making a very rueful face at the surgical operation, is a plagiarism of one of the rarest and most beautiful of the smaller art treasures of the world, a Greek bronze copy of the Roman "Spinario," known also as "Le Tireur d'Epine," which was sold in Paris several years ago. This statuette is probably a specimen of Greek art of the fourth century, and the figure



ON TIME!

Warranted by the

ILLINOIS WATCH COMPANY.

FOR SALE BY ALL JOBBERS.

as seated is nine and seven-eighth inches in height. It was bought by the firm of Rollin & Feuardent, of Paris, where its exhibition created much sensation in the art world, and was sold for 70,000 francs to Baron Edward de Rothschild, who carried it off while the authorities of the Louvre were debating about buying it, and those of the Berlin Museum were anxious to secure it.

If we remember right, it was found some twenty years ago at the Acropolis, on the site of Sparta, Laconia, and sold for a small sum to one Mr. Merlin, the English Consul at Athens. While on a continental voyage, which included Greece, the Duke of St. Albans saw the work and purchased it for $1,000. The duke, we believe, afterward sold it again to a member of the Paris firm of Rollin & Feuardent for $5,000.

The legendary story of the "Spinario" is as follows: A young shepherd, seeing the Latins enter in the night time the Roman territory, ran to the capital to tell the Senate. On the way he got a thorn in his foot but did not stop. He endured the pain on his continued course, and after having delivered his message sat down to extract the thorn. The Senate, in admiration of his heroism and to perpetuate his fame and patriotism, decreed that statues representing him taking out the thorn should be erected to his memory. The seated figure is that of a young man, and as he bends forward to extract the thorn from his left foot, which rests on the right by the knee, the expression of his face and the whole anticipatory shiver seen throughout his body, shows that he knows it will be a painful operation but that he intends to go through with it the youth's hair is short and the whites of his eyes are of silver.—*Exchange.*

THE MATRIX OF A DIAMOND.

Until the South African mines were discovered the diamond was always found in sands and gravels, different from the mineral in which it was believed to be formed. At Griqualand West, however, the consolidated eruptive mud of the mines was believed by some to be the true matrix of the diamond; but opinions differed on the question, and arguments were found on both sides. M. Chaper, a French geologist, has, however, during a scientific mission to Hindostan, succeeded in finding the diamond in its mother rock. At Naizam, near Bellary, in the Madras Presidency, M. Chaper has found the diamond in a matrix of rose pegmatite, where is associated with corundum. The tract of country is almost denuded of trees, bare and rocky, and the rains wasting the rocks every year expose fresh diamonds in the soil. The rock is traversed by veins of feldspar and epidotiferous quartz. Here the diamond is always found, associated with epidotiferous rose pegmatite. The diamond crystals observed are octahedral, but less distinct in line than the stones of South Africa, which seem to have been formed in a freer matrix. It follows from M. Chaper's discovery that diamonds may exist in all rocks arising from the destruction or erosion of pegmatite for example, in quartzites with or without mica, clays, pudding stones, etc.

BUSINESS CHANGES FOR JANUARY.

W. Stein, Jewelry, Hamilton, assigned; John McGrattan, Tins, &c., Wingham, assigned; C. C. Snowdon, Wholesale Hardware, Montreal, dissolved; John H. Morris, Hardware, Forest, burned out; Robt. Boyer, Jeweler, Ridgetown, sold out; Issac Shannon, Tins, &c., J. H. Vandusen, Hardware, J. H. Morris, Hardware, Tara, burned out; J. C. Diggins, Jeweler, Strathroy, McMahon Bros., Hardware, Kingston, Robert McMahon dead; Adams & Ryckman, Hardware, Glencoe, dissolved, Adams continues; W. Alexander, Jeweler, Toronto, assigned; Samuel Stern, Clocks and Fancy Goods, Toronto, assigned; J. J. Kelly, Stoves and Tinware, Orangeville, succeeded by A. & W. Johnson; H. C. Collamore, Jeweler, Forest, assigned.

A PSALM FOR THE TRADE.

Tell us not in doleful numbers
Trade is done for evermore,
That supply, demand outnumbers,
And the drummer's day's are o'er.

Trade is real—trade is active,
Better times again we'll see;
To remain stagnation's captive,
Is against all history.

Time is long—bills maturing
Must be paid without delay;
Such the only way insuring
Better trade at early day.

Shun this reckless competition.
Look beyond the moment's gain,
Learn that honest coalition
Is far better in the main,

Stop this scheme of future dating,
Ere it has become too late;
Act at once and cease all prating—
Leave consignments to their fate.

Lives of others all remind us,
If our dealing's just and fair,
That a better time will find us
Getting all our honest share.

BUSINESS NOTES.

H. C. Collomore, jeweler of Forest, Ont., after struggling against fate for years past, has at length assigned. The only wonder is that he managed to hold out so long.

We are glad to learn that Messrs. J. J. Blackmore & Co., of St. Thomas, have been awarded the contract for the heating apparatus of the Hamilton Post Office.

Business in Canada, during January, has been unusually dull, but on account of the rise in grain, the trade generally look forward to better prospects ahead. Reports generally indicate that the sales during the latter half of the month were far ahead of the first half.

S. T. Culp, Wholesale, of Toronto, and proprietor of Culp's Patent Motor, has gone with his wife to New Orleans to pass the winter. S. T. has a "big thing" in his patent motor, and the New Orleans Exposition should afford him a splendid opportunity to push it.

We direct the attention of our readers to the advertisement of Messrs. Goldie & McCullough's Safes, to be found on another page. This firm is thoroughly reliable and any person wanting to buy a safe, may depend upon their representations as being strictly correct.

If any of our readers have not yet joined the Jewelers' Security Alliance, they should do so at once. Procrastination is a dangerous thing, and some of our jewelers may remember when too late that had they taken the advice of The Trader they would have been in a much better position than they find themselves. The best men in the trade are joining, and we trust that ere the year closes every jeweler in Ontario will belong to it.

Mr. Walter Dickey, late accountant for Messrs. Smith & Fudger, Wholesale Jewelers, of this city, was banquetted a few evenings ago at the Rossin House by his fellow-employees and friends, the occasion being his leaving the service of that firm to go to Kansas City, U.S. A very enjoyable evening was spent. We wish Mr. Dickey success in his new sphere of labor.

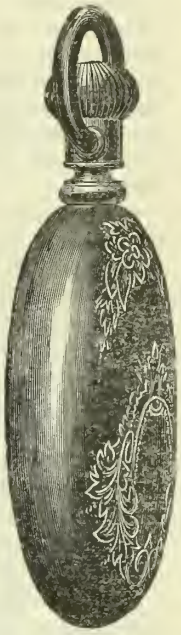
It is said that the Waltham Watch Company have reduced their force by six or seven hundred and cut the wages of those remaining about 20 per cent. This is the swing of the business pendulum with a vengeance, but we have faith in the Waltham company, and believe that it will not be long before they are running on full time again, and all hands at work.

Messrs. C. N. Thorpe & Co., the well-known makers of the Boss and Keystone Cases, have added a new Albata Cap Case to their already extensive line of goods. They have named these goods "The Leader," and we have no doubt but that they will find a ready sale for them. The reputation of the company is a sufficient guarantee that whatever they put upon the market is first-class.

The Customs Authorities in Montreal seem to be making some large hauls lately. The last development is of a prominent firm of custom brokers who, it appears, have been in the habit of passing goods for various firms in the city on fraudulent invoices of their own manufacture, and at about half of their real value.

It is probable that the Customs Authorities will make an example of this firm. So far as it

A FEW OF THE ADVANTAGES



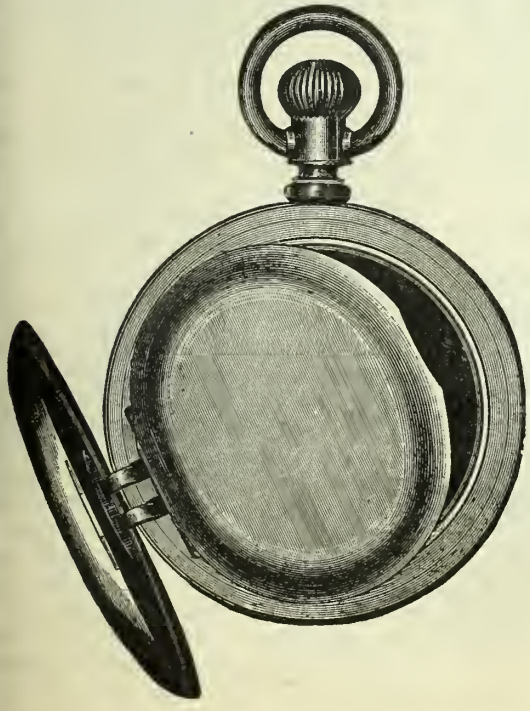
—OF—

QUIGLEY'S

INVISIBLE JOINT

—OVER—

THE REGULAR JOINT.



1st. The same thickness of metal around the Pin. In the regular joint there is half filed off the joint on the outside, in opening the case, and finishing the joint, and in many cases more, thereby making the joints weak.

2nd. In putting the joint or hinge inside the centre it closes the back or cover to the centre or rim of the case. In the regular joint, where the joint or hinge is placed between the back or cover and centre or rim, it tends to push them apart, and in case of the pin being forced into the joint or hinge it forces them more apart, and leaves an opening for the dust to get into the works of the watch.

3rd. The joint or hinge being inside, the centre or rim is protected and being made heavier is stronger and will wear longer.

4th. The spring in the Hunting Case is made of a flat piece of steel, and is not hardened as hard as the one in the Regular Case. It is guaranteed not to break.

5th. Both hunting and open face cases open like the regular case, and unlike the majority of patent cases are not liable to get out of order.

6th. There are no joints or hinges on the outside to wear out the pockets, or admit dust.

7th. The outside surface of case being perfectly smooth, admits of continuous engraving around the centre or rim from the front to the back of case.

can be ascertained, it appears that they have been acting entirely on their own hook, and none of the merchants for whom they entered goods were aware of anytbing being crooked about tbe transactions. We think if the Montreal appraisers were half as sharp or as well posted as tbose at the port of Toronto, such things could not long pass unnoticed.

The failure of Mr. M. Stein of Hamilton, in the jewelry business, is not altogether an unlooked for event. Failure as far as the creditors are concerned runs in the blood apparently. We sincerely trust that the Canadian creditors will fare better at their hands than their American creditors did on a former occasion.

Jeweler's Board of Trade.—The project has been mooted of starting a Jeweler's Board of Trade amongst Toronto Wbolesale Jewelers. Such an organization would be a good thing for the entire trade, and we thiuk it should receive the support of every one in the wholesale jewelry business. We trust to see this under way at an early day.

Bargains.—Owing to contemplated changes in their business, Messrs. McNaught & Lowe advertise great bargains in jewelry and other goods for the coming month. Tbey are changing the character of their business and going out of a lot of lines which they offer at about cost. This is a rare chance which we have no doubt many of our close buyers will take advantage of.

The failure and assignment of Thomas Phillips, junr., wholesale hardware, Montreal, is announced, with liabilities, direct and indirect, of from $60,000 to $70,000 as reported. It is not yet known how the estate will turn out. The business was formerly carried on by Elliott, Phillips & Co., and before that by Elliott, Sawtell & Co., none of which firms apparently met with any large measure of success.

We regret very much to learn of the death of Mr. Wm. Carrier of the civil service, Ottawa, father of Mr. W. F. Carrier, wholesale jeweler, Toronto. Mr. Carrier was well and favorably known both in Toronto and Ottawa, in both of which cities he resided for years, and he leaves behind him the memory of work well done, and a good name which is better than riches.

The Meriden Silver Plate Co., who removed their plating works to Hamilton last November, have leased the new warehouse ou 14 Colborne street, and fitted it up as a sample and salesroom. The establishment is under the management of Mr. H. R. Warren, and the Compauy purpose carrying a full line of samples, so that customers visiting Toronto can order without going to tbe factory. This is a step in the right direction.

The Watch Sign of McNaught & Lowe is more than a curiosity—it is a conundrum. Almost every day dozens of people may be seen looking at and wondering what makes it swing. To all such who come inside to find out how it is done (and their name is legion), the proprietors say: "We have a nigger down cellar who does the trick." If they won't take that in, then it is by electricity. Most of them will believe one or the other of these reasons, but none the simple truth that it's the wind which puts and keeps it in motion.

A New Jewelry Firm.—Another competitor for public favor in the jewelry trade, has just been organized in the firm of Thayer & Ellis. Both of these gentlemen have been long and favorably known to the trade, Mr. Thayer as bookkeeper for the old firm of J. G. Joseph & Co., and recently for E. & A. Gunther. Mr. Ellis has represented the latter firm on the Eastern Road for the past three years, and is one of the best known travellers in the business. The new firm has youth, energy and a thorough knowledge of their business, and they should soon establish themselves. The Trader wishes them success in their new venture.

A new competitor for public favor in the plate business is the Acme Silver Plate Co., of Toronto. This Company bought the plant and fixtures of the Meriden Silver Plate Co. when they removed their headquarters to Hamilton, and propose to carry on the plating business on the premises formerly occupied by that company. We understand that they have made satisfactory arrangements witb a leading American plate factory for goods in the metal, and expect in a very short time to have a complete line of goods ready for the market. The new venture will be under the management of Mr. Blackburn, late manager for the M. S. P. Co. in Toronto.

The failure of Samuel Stern, Wholesale Clock and Fancy Goods Dealer, of Toronto, was a decided surprise to the trade, as his has always been regarded as one of the strongest houses in the business. As far as we can learn at present, the failure is a very bad one, and the creditors are not likely to get very much out of his estate. It is rumoured that there is a considerable quantity of goods "hypothecated," but nothing definite is known yet. We shall have something further to say about tbis as soon as the facts come to light. In the meantime we can only say as old friends of Mr. Stern's, that we hope he can show a clean sheet and that he will come out all right.

The Square Man.—The following is Josh Billings' description of a "square" man in lumber parlance:—"The square man mezzures the same each way, and has no wainy edges or shaky lumber in him. He is free from knots and wont warp. He is clear stuff, and I don't care what you work him up into, be won't shrink. He is among men what good kiln-dried boards are among carpenters—he won't crack. It makes no difference which side you approach him, he is the same bigness each way, and the only way to get at him is to face him. He knows he is square, and spends no time in trying to prove it."

The Watchmaker and Metal Worker of Chicago in their last issue have the following:—"The Hampden Watch Company, of Springfield, Mass., make an announcement in this number of *The Watchmaker and Metalworker* that will interest the entire trade. Tbis company have had the good fortune, thanks to Mr. Rood's clever and conservative management, to feel the hard times only very sligbtly, having met the trade more than half way in changing the character of their productions in order to fill orders more promptly, and improving the character of their cheaper grades so that now they are enabled to "take the bull by the horns" and give tbe newly awakened trade a fine watch movement at a very low price. Their standard bas always been a very high one, and they hold it right up to the top."

Although business has been depressed for some time, it does not seem to have affected the plate companies very much. The Toronto Silver Plate Company report the largest business they ever did, in fact they were unable to keep pace with their orders. They are pushing ahead fast. The Meriden Britannia Co., of Hamilton, as usual, had more than they could do during the latter part of the year, and their customers felt like complaining, because goods were slow in coming. They report the volume of business for the past year as fully equal to any former year. The Simpson, Hall, Miller & Co. factory report the best trade they have ever had, and were full of orders from the start of the year to its finish. These goods are popular and low in price, and they say they are always bound to get their share of what trade is going.

A Growing Industry.—By the advertisement of Messrs. Hemming Bros. on another page, it will be seen that this enterprising firm have outgrown the chrysalis state of tbeir existence and obtained an enviable distiuction in their special line of manufacture. Their new premises on Adelaide Street East, immediately behind the *Globe* office, is one of the finest in the city, and their sample room will without doubt in future be one of the principal attractions to jewelers visiting the city. This firm have by prompt aud reliable dealing built up a very large busiuess and The Trader wishes them continued prosperity and success.

Mr. Wm. Alexander, Jeweler, of Toronto, called a meeting of his creditors on the 15th of January, to consider what they would do with his estate. Mr. Alexander's father, who had advanced him about $2,000 in cash, was secured to the extent of $1,100; the rest of the claims were unsecured. Mr. Alexander, sr., informed the meeting that although he held that security, he was willing to waive it, and rank along with tbs rest of the creditors. The estate thus being placed entirely in the hands of the creditors, they took a lenient view of the case and gave him a very favorable settlement. Mr. Alexander has been very unfortunate last year on accoumt of sickness, and the effect of his honest endeavor to do tbe very best for his creditors, not only gained him their good will, but will be of the greatest assistance to him in the future. They were all unanimous in promisiug him help whenever he required it.

Mr. H. B. Coates, Jeweler, of Stratford, writes most of his creditors, making them a proposition to pay 25% of their claims and get their receipt in full therefor. It appears that Mr. Coates bought his business from his uncle, Mr. Jones, of Stratford, who tbougbt fit to trust him without other security than a bad judgment, which he promised to hold until the business was paid for, and until various other wholesale houses had sold him goods to the amount of nearly one thousand dollars. This done, he steps in and takes a chattel mortgage to replace his judgment and secure his claim, and Mr. Coates having given this security, is told to cooly ask the balance of his creditors to accept 25 cents on the dollar for their claims. This is certainly about as cheeky a piece of business on the part of Messrs. Coates and Jones as we ever heard of, and we trust that the unsecured creditors will unite and try to break the mortgage and distribute tbe assets equitably, or failing that, to put Coates out of business. Mr. Coates must have known that

PATENT SNAP BEZEL CASE.

outside firms gave him credit because his stock was not seriously encumbered, and that his honest duty in the matter, when Mr. Jones pressed him for further security, was to have called a meeting of all his creditors, stated his case, and placed himself in their hands. The fact of his quietly securing his largest creditor, without consulting any of the others, and then trying to compromise with them at one quarter of what the goods cost, in our opinion, stamps Mr. Coates as a man unfit to be in business, and the quicker he is put out of it the better. The sooner a few examples are made of such merchants, the moral atmosphere of the jewelery business will breathe all the freer, and honest jewelers get a fairer chance to make a living. We will have more to say about this case as soon as developments justify us in exposing it more fully. Since the above was in type, we learn that Mr. Coates bought the business, he was utterly inexperienced, and has simply been made a tool of by Mr. Jones.

WORKSHOP NOTES.

Magic Polish for Brass.—Add to sulphuric acid half its bulk of bichromate of potash ; dilute with an equal weight of water, and apply well to the brass; rinse it well immediately in water, wipe dry, and polish with pulverized rotten stone.

Gold and Silver from Textiles.—Cut into pieces the gold or silver lace, tie it tightly, and boil in soap lye till the size appears diminished ; take the cloth out of the liquid, and, after repeated rinsings of cold water, beat it with a mallet to drive out the alkali. Open the linen and the pure metal will be found in all its beauty.

Tempering Brass.—Brass is rendered hard by hammering or rolling ; therefore, when you make a thing of brass necessary to be tempered, you must prepare the material before shaping the article. Temper may be drawn from brass by heating it to a cherry red, and then simply plunging it into water, the same as though you were going to temper steel.

Cleaning Dull Gold.—Dull gold may be cleaned in this way : Take 80 grams calcium hypochlorite. 80 sodium bicarbonate, and 20 sodium chloride, and treat the mixture with 3 litres of distilled water. It must be kept for use in well-corked bottles. Goods to be cleansed are put in a basin and covered with the mixture. After some time they are taken out, washed, rinsed in alcohol, and dried in sawdust. The articles then have the same appearance as if new.

Moulding-Sand for Brass or Iron.—The various kinds of good moulding-sand employed for casting iron or brass have been found to be almost uniform in chemical composition, varying in grain or the aggregate form only. It contains between 93 and 96 parts silex, or grains of sand, and from 4 to 6 parts clay, and a little oxide of iron in each 100 parts. Moulding-sand which contains lime, magnesia, and other oxides of metals is unfit for use, particularly for the casting of iron or brass. Such sand is either too close, will not stand or retain its form, or will permit the metal to boil through its closeness.

To Clean Brass.—The method prescribed for cleaning brass, and in use in all the U.S. arsenals, is claimed to be the best in the world. The plan is to make a mixture of one part common nitric acid and one half part sulphuric acid in a stone jar, having also ready a pail of fresh water and a box of sawdust. The articles to be treated are dipped into the acid, then thrown into the water, and finally rubbed with sawdust. This immediately changes them to a brilliant color. If the brass has become greasy, it is first dipped in a strong solution of potash and soda in warm water ; this cuts the grease, so that the acid has free power to act.

Coloring Copper.—To produce a dark brown color upon copper, take the white of an egg, beat it into froth, add a little boiled or rain water, and add to this mixture red oxide of iron color ; rub them well together in a mortar, and sufficiently thick until the color covers, and may be applied. The copper article is to be pickled and simply washed ; no sand must be used, else the color adheres badly. The latter is next applied with a brush until it covers the surface ; it is then dried by fire, the article is generally rubbed with a soft rag and red oxide of iron powder, and finally hammered with a hammer with polished face.

OTHER NOTES.

Six hundred freight car loads ($170,000,000) of silver dollars are piled up in the government treasury vaults, and the mints are still turning them out at the rate of $2,000,000 per month.

What is undoubtedly the smallest steam-engine in the world is the production of a resident of Arkona, in this Province. The dimensions of this miniature affair are as follows :—Diameter of cylinder, ⅛ of 1-16 of an inch ; stroke, 1-32nd of an inch ; weight, ⅛ of a grain ; bore of cylinder, .3125 of a square inch ; revolution, .1760 per minute ; horse-power, .12490 part of a horse-power. This engine is so small that it can easily be covered with the case of a 22 calibre cartridge.

The carriage in which the first Napoleon made his famous retreat from Moscow, and in which he as Emperor set out from Paris in the campaign which closed at Waterloo, is now preserved in London among the effects of the Duke of Wellington. It is a two-seated conveyance, and the top, or cover, is lined with thin sheet-iron. There is also a front curtain of iron, which can be lowered at will. The wheels are large and heavy, and the steps at either side silver-finished and of a curious design. The rear seat was the one used by Napoleon. Under the cushion of the seat he carried blankets and pillows.

An aide-de-camp to the Duke of Wellington had, at the peace preceding the escape of Napoleon from Elba, gone to Torquay for the benefit of his health, being in an advanced stage of consumption. On hearing that Bonaparte was again at Paris, the Captain sent for his medical attendant and asked him how long, with care, he might hope to live. "With care, several months," replied the doctor. "Several months only," said the poor invalid ; "then I may as well die in battle as in my bed." He joined his regiment, fought gallantly at Waterloo, received a wound which took away all the diseased part of his lungs, and lived many years longer.

this Trade Mark is stamped on all Hollow Ware of our manufacture.

TRADE MARK.

1847, Rogers Bros., A 1,

OR

1847, Rogers Bros., XII

OBSERVE

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

In compliance with an increasing demand, we have placed on the market a

NEW PATENT DUST-PROOF

SCREW BEZEL

Silver Open Face Stem Winding Case

embodying many of the excellent qualities of our original Patent Dust Proof Case, though offered at a lower figure.

The back and center of the new case are made of one continuous piece of solid silver, into which an Albata Cup is screwed identical in shape with the back, thus greatly strengthening it and efficiently protecting the Movement against dust.

THE NEW CASE WILL BE CALLED

ALBATA CUP SCREW BEZEL

We shall continue the manufacture of our popular Patent Dust-Proof Case with Screw Crown and Screw Bezel in all the styles as heretofore, plain and inlaid.

THE power of modern guns is illustrated by experiments made in Italy October 1, 1884. An Armstrong 100-ton breech-loading gun, having a calibre of 17 inches, was fired, with charges of 772 pounds of powder and forged steel projectiles weighing 1,841 pounds, against targets distant about 100 yards, one of which was a solid steel plate 19 inches thick backed by 20 inches of teak. The other targets varied only in material. Each target was perforated in the first round, the projectile passing through with a considerable surplus of power.

IN two recently excavated houses at Pompeii the paintings on the wall are as fresh as if just put on, and the halls are rich with decorations. Some of the marble tables are still standing the fountains in the atrium and peristyle, with their pretty little statues and mosaics, look as if they might begin to play at any moment; the kitchen hearths, built like ranges, seem ready for their pots and kettles; a few flower pots are still set in the gardens; in the storerooms are some oil jars and wine jars; it is as if one might begin house-keeping to morrow and invite one's friends to dinner the day after.

A machine is said to have been invented by a mechanic for the generation of heat in buildings where power is used, without fire. It consists of an iron cylinder about a foot long and a foot in diameter. The bottom of the cylinder is a hardened plate upon which another plate of the same diameter turns—the pressure being regulated by a screw, according to the power that is to be applied and the amount of heat desired. All the space not taken up by the wheel and shaft is filled with water. As soon as the wheel is set in motion the water is brought up to a high temperature, and the cylinder becomes a stove, which radiates heat from the whole of its exterior surface.

EACH of the various countries on the Continent where glass is manufactured produces an article peculiar to itself and unlike its neighbors, and one of the specialties of Austrian glass-making is the manufacture of various fabrics for ladies' wear from spun glass. The glass is spun into threads, like ordinary silk or cotton, and woven into different colored fabrics, sometimes entirely of glass and sometimes with a warp of silk or cotton. Collars, neckties, cords and tassels, fringes, pin-cushions, feathers, belts, etc., are all made of this material. At the Paris Exhibition in 1878 a bonnet made entirely of spun glass, with feather and ribbons lined with silk, was shown, as well as cloaks and other articles of wear. This spun glass is also used for watch chains, brushes, etc. Glass flowers are also made to a considerable extent, but it is difficult for these to compete with those made from china.

JEWELERS ATTENTION.

We are informed upon undoubted authority, that the greater part of the goods stolen from jewelers during the past year have been "fenced" in Canada, and are at present being disposed of by means of peddlers. While it is almost impossible to identify ordinary articles of jewelry, goods such as watch movements or cases, which have numbers stamped upon them, can always be traced, and are, therefore, very dangerous articles to dispose of. In order to overcome this difficulty and avoid detection, the receivers of this stolen property have hit upon the clever expedient of altering the numbers on such goods by engraving additional figures either in front or after the original numbers. Although such additions look all right to a casual observer, inspection with a glass will at once show any jeweler what additions have been made to the original numbers or marks. We have been requested by the Secretary of the Jewelers' Security Alliance to ask the trade generally to be on the look-out fo any alterations of this kind in goods offered them by travelling salesmen other than the accredited agents of regular wholesale jewelry houses. In any case where they find such a thing they should take a memorandum of the numbers and a description of the person offering the goods for sale, and at once forward them to the Secretary of the Alliance. By so doing they will make it more difficult for such persons to dispose of such goods in Canada, and the information thus supplied may be the means of furnishing a clue that will lead to the detection and conviction of the perpetrators of some of the late burglaries.

DISCHARGE OF INSOLVENTS.

We learn from a telegram from the Capitol that at one of the late meetings of the Committee on bankruptcy and insolvency the following resolution was adopted:

"That in the opinion of the committee it is expedient that provision be made for adequate protection against undue preferences, but that such provision should be accompanied by reasonable facilities for the discharge of debtors who had been guilty of no misconduct and have made a full disclosure of the state of their assets."

If this committee is supposed to voice the sentiments of Parliament, it looks at present as if any Insolvent Act that may be passed this session will have a discharge clause added to it as a rider. While it is but just that an honest insolvent should get a discharge, we think the committee should be extremely careful how they recommend such an addition. Without intending any disrespect to the luminaries who compose this committee, we may be permitted to express the opinion that the Boards of Trade in Canada, composed as they are of practical business men, know a great deal more about this subject than they can possibly do, and as they are unanimous in having the discharge of the Insolvent optional with the creditors, the committee should respect their wishes. The trouble with this, as with many other parliamentary committees, is that they are not practical business men, and they feel bound to try and improve upon the experience of business men, whether their tinkering is any improvement or not. What we want in our legislation is less law and more common sense, and the sooner that our legal M. P's. find out that all the wisdom in the country does not dwell beneath the protection of their Christy stiffs, the better it will be for all concerned.

THE DIGGINS' FAILURE.

In our last issue we commented at some length upon the extraordinary failure of Mr. J. C. Diggins, jeweler, of Strathroy, and stated that in our opinion the creditors should mark their appreciation of Mr. Diggins' course by putting him out of business. In saying this we were influenced by no personal animosity towards Mr. Diggins, but simply from a desire to protect honest "hundred cents on the dollar" dealers from the unfair competition, that favorable settlements with such insolvents are sure to bring about. Nothing that we know of takes the heart out of an honest dealer more surely than for him to find his creditors insist on his paying his liabilities in full to the uttermost farthing because they know he is honest and willing to pay, while perhaps his neighbor, in opposition to him, is allowed to get a settlement at forty or fifty cents on the dollar, simply because he is improvident in his habits, or deliberately goes in to swindle his creditors.

We said that the Wholesale Jewelers of Canada owed it not only to the "hundred cent in the dollar" dealer, but to themselves, to mark in such an unmistakable manner their opinion of such insolvencies that the moral atmosphere of the trade in the Dominion would be purified by their action.

The creditors of Mr. Diggins met in Toronto on Monday, the 16th February. Mr. R. Y. Ellis, the Assignee, in the chair. The chairman addressed the meeting at some length, in which he stated that they had been called together for the purpose of consulting them in regard to the disposition of the insolvent's business. He had, in accordance with the wish they expressed at their last meeting, advertised the stock in trade for sale and asked for tenders. In response he had received three tenders for it as follows: From Mrs. J. C. Diggins offering 63 cents on the dollar, cash; from A. W. Thompson, of Port Arthur, offering 63 cents on the dollar, one-third cash and the balance in three, six and nine months, secured, with interest; and from Mr. Dickinson, of Strathroy, offering 60 cents on the dollar at three, six, nine and twelve months, with interest, unsecured. In addition to the above credit tenders, Messrs. Thompson and Dickinson had also sent in cash tenders, the former offering 50 cents and the latter 51 cents on the dollar for the stock. From the above it will be seen

that Mrs. Diggins' cash offer was twelve cents on the dollar higher than the next highest cash offer, and the same as the highest credit tender. In times like the present an offer so much better than the others was certainly a most tempting inducement for a compromise with the insolvent, and all the more so, inasmuch as it was not made by the insolvent himself, and did not necessitate their giving him his discharge, but by his wife, who, for all the creditors might know, desired to carry on business on her own account. As we said, the offer was a most tempting one, and it must have taken all the moral courage that many of those possessed to have put it to one side and taken the lower offer. However, after a full and exhaustive discussion of the whole situation the following resolution was carried unanimously :

"*Whereas*, J. C. Diggins, of Strathroy, watch-maker, purchased within four or five months of the date of his assignment between $5,000 and $6,000 worth of goods without reasonable prospect of being able to pay for them, being an amount largely in excess of his ordinary business requirements and totally unwarranted by the record of his sales in previous years, and

Whereas, he obtained this credit in part by misrepresenting his position in a letter dated September 21st, 1884, in which he claimed to have a surplus of $2,400 in excess of his liabilities, and further obtained credit by virtue of the temporary discharge of a certain chattel mortgage, which chattel mortgage was replaced as soon as any demand for payment was made, and

Whereas, by the said chattel mortgage he has given an unfair preference to one of his relations over ordinary business creditors.

Be it Resolved, that this meeting recommend the Assignee not to accept the offer of the wife of the said Diggins to purchase the stock, nor to accept from J. C. Diggins or from any one on his behalf, any offer short of one hundred cents on the dollar, believing that the fact of the said Diggins being unable or unwilling to account for a deficit of some $4,000 since September last proves him to be unworthy of further confidence or credit, as he is utterly incapable of conducting his business or his attempt to defraud his creditors has been both deliberate and premeditated.

And this meeting further recommends the Assignee to accept the credit offer of Mr. A. W. Thompson of Port Arthur, as per the terms set forth in the advertisement of the sale."

In reference to the outcome of the meeting we need scarcely say, at this late day, that we fully agree with their action and with the resolution. In the interest of the wholesale trade as well as of honest retailers, we have not hesitated to advise the use of severe measures in order to abate, if it does not entirely remove an evil which, while it always exists in commercial life, is brought out more frequently and glaringly when times get dull and trade is hard to get. All honor, then say we to those dealers whether wholesale or retail, who take a pride in "owing no man anything," and also to the creditors of the Diggins estate, who preferred to lose money rather than establish a precedent that would affect the interests of their customers injuriously.

"WANTED."

"Wanted" by the Merchants of Canada an Insolvent Act, which will at once be just to the debtor and creditor alike. This is a real want that has been forced upon our politicians for some years past, but so far without effect. Sir John Macdonald, with his usual procrastination, has continued to put this needed measure from session to session until every excuse for delay has been answered, and he now finds himself face to face with the question which cannot be again shelved without raising a howl from one end of Canada to the other. When Sir John was in England, last fall, he was waited upon by a deputation of leading merchants in London, who pointed out to him how unfairly and unjustly the present chaotic state of the law, or rather, the want of any laws on the subject, acted against English exporters who traded with Canadian Merchants. They pointed out that as things are at present, on account of preferential and fraudulent assignments, creditors living a long way off, as they do, are entirely at the mercy of unscrupulous merchants, who can cheat them as they please, and if this state of things was allowed to exist that Canadian credit would be a thing of the past so far as the British market was concerned. Sir John, as usual, promised to give the matter his "best consideration." During the Premier's recent triumphal visit to Toronto, he was interviewed by the Board of Trade, and the necessity of an Insolvent Act pressed upon his attention, and again he promised to give the matter his "best consideration." During his more recent triumph in Montreal, the Board of Trade of that city waited upon him, and strongly urged upon him the importance of the Government at once taking steps to pass an Insolvent Act, and again Sir John promised to give the subject his "best consideration."

Our idea is that the Government don't want to pass an Insolvent Act; their excuse being in every case the same: that the country members of Parliament would vote against it. To any impartial observer such an idea would seem preposterous if the Government were really in earnest about it. Just try and imagine the Members of Parliament who voted for the Canadian Pacific contracts, and the additional subsidies to that Company, putting on their wreaths of virtue, and opposing the policy of the Government on this or any other question, we can't.

The cry that the interests of the farming community and those of the mercantile classes are antagonistic is the veriest bosh. Neither the cases nor their callings present any ground of comparison whatever. The merchant both buys his goods and sells them on credit, and the bulk of his debtors belong to the farming community. Did merchants all over Canada at once change from the credit into the cash system of doing business it would be almost a revolution, and it would press very much more upon the farmers than any other class. The farmers, on the contrary, do not sell on credit, no matter how much credit they may take when they buy. Everything that they have to sell they are able to get cash for or its equivalent, and if they do not it is their own fault.

It will thus be seen that the circumstances of the farming and mercantile interests are not at all analagous, and that while the merchant, on account of his peculiar circumstances, is entitled to some relief from his creditors, the farmer, who has none of these disadvantages to contend against, can not fairly use the same line of argument.

The feeling that we must have a fair and equitable Insolvent Act is now stronger than ever before, and we think the Government will commit a very grave error if they refuse to act upon the good advice which has been tendered them from England, and all parts of Canada alike.

To Tighten Ruby Pins : Set the ruby pin in asphaltum varnish. It will become hard in a few minutes and be much firmer and better than gum shellac as generally used.

USELESS LOCKS.

HOW AN EXPERT CAN OPEN THE MOST INTRICATE COMBINATIONS IN EXISTENCE.

"Locks? Locks won't keep burglars out. Why, I can open any lock that has ever been invented, without key or combination." The speaker was a close-shaved, clear-cut, penetrating-looking man. He stood in a locksmith's shop on four-and-one-half street, dangling the dial of a combination lock on the end of a bent wire.

"They open if he looks at 'em," said a youth, who stood by interestedly examining the bits of broken locks, old keys, drills, and odds and ends of wire, brass and steel which were scattered about the shop. The sign in front of the door read "Practical Locksmith and Safe-opener."

"Do you make a practice of breaking open safes?" asked the Star man.

"I open safes when nobody else can," replied the smith, giving the scribe a keen, inquiring look, which might have opened him had he been a lock. "That is, I open safes when the locks are out of order or the combinations lost. Sometimes a man will oil the lock of his safe and it gets gummed up so that the tumblers won't work, and he can't get it open. Some men are forgetful and lose their combination. Safes are sold at Sherriff's sale sometimes, and, the owner being mad, won't give up the combination. When anything of that kind happens they send for me.

"Do you blow them open?"

"No. If the lock is broken so that it won't work I drill a little hole alongside the dial and pick the lock with a small bit of wire. If the lock is all right, only the combination is lost, I go to work work to find it and don't deface the safe at all. It takes me from three seconds to six hours to open a safe, according to the kind and the method I employ."

"But how can you find the combination? Does it not take a long time?"

"By testing. As to time, it depends upon circumstances. If I know the man who set the combination I can find it in a very few minutes. If I don't it takes me longer. You see I study the character of the man. If I know him pretty well I can strike his combination through his character. When a stranger comes to me to say he has lost his combination I make a study of him, and in nine cases out of ten I can hit it the second or third trial. But if he did not set the combination himself it is more difficult. Then I study the lock instead of the man, and I am sure to get it open in a few hours. Oh, no! It wouldn't do to tell you how. Safe openers are dangers in a community. They are always watched by the police. They keep an eye on me all the time. I have them trying my door all hours of the night, and there's generally one somewhere around. No, I couldn't teach you to open safes. But you might not find it easy to learn. There is a kind of association between me and locks—an understanding, as it were. We have the same way of thinking."

"Could you open the burglar-proof time-lock?" I asked.

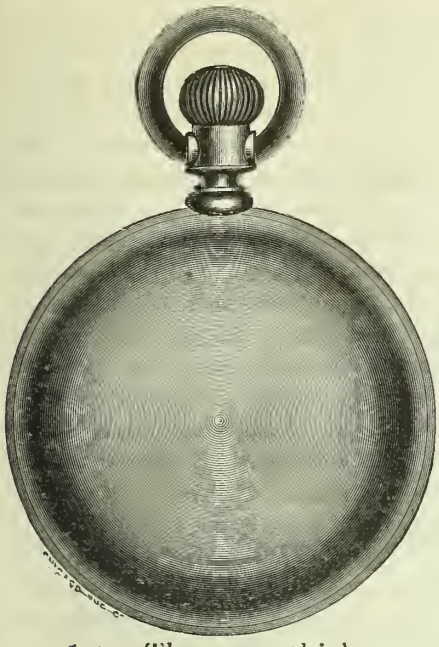
"I can open the best lock that was ever made in five or six hours. These little office safes I wouldn't put that much time on. They don't pay enough. I just take a hammer and break the knob off, and can get into the safe in about three seconds."

"What do you get for opening a safe?"

"For a little three-second safe I get $10. For larger safes, like they have in banks and brokers' offices, and where they don't want the lock injured, I get $250."

"Could you open the great safe in the United States treasury?"

"Easily. I could get rid of the time lock and everything in six or seven hours, and wouldn't make any particular fuss about it either. No safe was ever made but it had some weak point known to the maker, so he could get into it in case the lock should fail to respond. If there wasn't they would have to break the concern, all to pieces if the lock broke. Now, I know where to find these weak places. I can strike within a quarter of an inch of it every time. It is generally covered over by a thin sheet of steel or boilor iron, and by cutting away a block three or four inches, which is easily done, I could drill into the best safe that has ever been made. It would not be any trouble for burglars to get into the treasnry safe if they understood locks as I do."



"Has your knowledge of locks ever got you into any trouble with the police?"

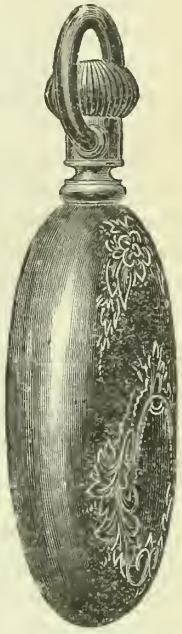
"No, not seriously, though, as I say, they always watch me. Down in Oil City, though, I created quite an alarm one night, and came near being captured as a burglar. Some fellows got to tampering with the safe in a large hardware store there, and somehow got the combination changed so that no one knew how to open it. The proprietor sent for me, and I told him I could open it, but as I was quite busy I should have to wait until evening. I closed my shop a little after dark, and went over to the store and got to work on the job. I had been working a couple of hours, when somebody banged at the door and called for me to surrender without resistance if I did not want to be shot. The proprietor was fortunately in the store at the time, and opened the door. There was a squad of policemen armed, and the house was completely surrounded. so I could not escape. The patrolman had seen me at work on the safe and gone off and roused the town, and the whole police force had been called out to surround the building. The proprietor explained, and I went on with my job."

"But locks don't do much good against experts," he continued. "A gang of burglars would find no trouble in robbing the treasury. It is strange they have never attempted it. As to ordinary locks, I could take an ordinary case-knife or a piece of stiff wire and open every door on the avenue from the capitol to the treasury. And it would not take me much longer than a couple of seconds. I can open any trunk by simply a little tap with a hammer, and won't injure the lock in the least. If you forget your combination come in."—*Exchange.*

SEA SHELLS AND THEIR INHABITANTS.

Wonderful and beautiful as the shells look, they are after all only the used-up homes of the still more astonishing things that lived within them and grew out of them. What marvel of nature is there that excels, for instance, the nautilus shell, and yet how much more interesting is the cuttle-fish creature that made it, adding room after room, and walling up the old one it had left. It lived three hundred fathoms under the sea upon little crabs and lobsters, and was itself one day murdered by an old one, its beautiful house burglariously entered, and its body dragged out. Lying on the ocean bed, comfortably attached to a piece of coral, it probably spread out its arms, as the anemones about it were doing, and waited there in the green twi-

A FEW OF THE ADVANTAGES



—OF—

QUIGLEY'S

INVISIBLE JOINT

—OVER—

THE REGULAR JOINT.

1st. The same thickness of metal around the Pin. In the regular joint there is half filed off the joint on the outside, in opening the case, and finishing the joint, and in many cases more, thereby making the joints weak.

2nd. In putting the joint or hinge inside the centre it closes the back or cover to the centre or rim of the case. In the regular joint, where the joint or hinge is placed between the back or cover and centre or rim, it tends to push them apart, and in case of the pin being forced into the joint or hinge it forces them more apart, and leaves an opening for the dust to get into the works of the watch.

3rd. The joint or hinge being inside, the centre or rim is protected and being made heavier is stronger and will wear longer.

4th. The spring in the Hunting Case is made of a flat piece of steel, and is not hardened as hard as the one in the Regular Case. It is guaranteed not to break.

5th. Both hunting and open face cases open like the regular case, and unlike the majority of patent cases are not liable to get out of order.

6th. There are no joints or hinges on the outside to wear out the pockets, or admit dust.

7th. The outside surface of case being perfectly smooth, admits of continuous engraving around the centre or rim from the front to the back of case.

light for the little crustaceans that went frisking about inquisitively among the deep-sea vegetation, and incautiously frolicked themselves into the grasp of the expectant tentacles. Or, tired of repose in one spot, what a curious sight it must be to see these shelled things pumping the water through their siphons, and jerking themselves at each squirt backward? Although the naturalist has found out many of their secrets, the whole story of the nautilus' life has never been told, since living specimens have been very few and far between. The shells are common enough, for when the crabs or lobsters have eaten the tenants, their residences, no longer anchored, float up to the surface, and the tide washes them on to rock and beach. Associated with them in fiction and fancy, though separated from them by many species of nature, is the huge tridacna, the shell in which the Greeks tell us Venus, the foam born, was found floating, and known to collectors as "the gigantic clam." It holds a sea-snail that weighs often twenty pounds, itself weighing five hundred weight, and has hinges of such strength that without battering it to pieces the man who once got his hand gripped within it would have no chance of extricating himself. The tritons, too, a superb family of shell-fish, are familiar in old world myth as the trumpets which the courtiers who surrounded King Neptune in his voyages used to blow to let the sea folk know that his Majesty was coming, and to summon the mermen and the mermaids to pay their homage to the monarch of the waves. They are still used, these large conches, as the war horns of savage tribes; and weird and wild are the sounds that come wailing over the water as the battle canoes shoot out from the bank in pursuit of enemy or victim.

The fountain shell, again, with its rosy lining, what a beautiful object it is, and how it conjures up to the mind the possible loveliness of those sandy plains and valleys, down, deep-down, at the bottom of the sea, where these and other ocean jewels lie scattered doubtless in endless multitude. As the material upon which most cameos are cut, this fountain shell is, in its fragments, familiar enough in Europe, while in other countries the savages delight in it, cutting bracelets out of it and grinding pieces down into beads, or shaping others into arrow and harpoon heads. Then there are the lovely cone hells, the graceful spires, the exquisite, elegant "olives," with their artistic blending of tints, the Janthenia, with its violet hues, and the apple shells that have as strange tenacity of life as the "rose of Jericho;" the whipping top shells with their wondrous front door lids, the chiton that rolls itself up like an armadillo and looks as indigestible as possible when anything threatens to eat it; the sea hare that stains the water purple to hide itself from pursuers, and the univalves that take their popular names from the objects they seem to resemble, "bubble," and "umbrella," and "watering pot." Then again, the cowries, admired all the world over for their bold coloring as the handsomest of shells, spotted or blotched, and barred like leopards and tiger cats; and the pecten and scallop family painted as beautifully as any flowers, and as brilliant when laid out in numbers together as a parterre of pansies. Or for pure beauty what is there to excel some of the cockles, or mussels, the surpassing isocardia, or the lantern shells? For delicateness of marking and intricate ingenuity of design, the wings of butterflies and moths will hardly compare with some of these works of the sea snails, while for fragile delicacy what can excel the paper nautilus? Then there exist some thin fairy bubble textures that on the water seem to be only water and light themselves, and taken up in the hand fill the mind with astonishment that fabrics so frail would ever have borne the washing of the waves or sufficed for the home of a living animal. Yet they are not all so innocently fragile, so helpless in their loveliness. The mugilus, for instance, started like its relatives the "augers" in being a respectable snail, living properly in a curly shell, but by and by it developed an appetite for coral insects, and set to work to bore through the block, always taking care, the fastidious wretch, to keep so near the surface that it was sure of its tiny victims being "all alive." The pholas, too, that manages with a tongue of velvet to drill through solid rock, and the dactylus, apparently as unfitted for such a life as can be imagined, that perforates stone, and the teredo navalis, which makes lace of woodwork and reduces a plank to the appearance of a piece of wasp's nest.

Many others, again, are remarkable, apart from their beauty, for their products; for instance, the colossal byssus, that throws out russes of silk so fine and strong in fiber that it can be worked up into articles of clothing, and the mussels, which if left undisturbed, will weave crumbling masonry together by filling all the crevices with the curious bunches of sea thread. Above all, however, ought probably to be ranked those shell fish that give man food, and, though these are legion, they are but few, the periwinkle and cockle, scallop, whelk, mussel and oyster, that are obtainable in any quantity to make the consumption of commercial importance and of all these the oyster deserves the prominence it has obtained. Nature has given it but a poor shell to look at. It is very wonderful, no doubt, the life of the oyster, as interpreted for us by such expert decipherers of natural secrets as a Sowerby or a Woodward, or as pleasantly translated by a Buckland or a Gosse; but when all its labors are ended, and the mature bivalve lies awaiting its destiny the shell in which the dainty morsel is ensconced is not much to look at. It has, therefore, been somehow the fashion to poke fun at the oyster. Yet no one should forget how splendidly it triumphs even in such a contest of rival beauties as the shell world offers, when the rough ribbed rind is forced open and that wonder of the sea is disclosed to view, the pearl. By itself it suffices to fill the ocean with an exquisite mystery, and through all ages has delighted the fancy of man. Such, most imperfectly suggested, is the world of marvels, of dainty color, and of fascinating elegance in which the conchologist carries on his studies.—*London Telegraph.*

"PALMING" COINS.

"That is a 20-cent piece," said a conductor on a street car, this morning, to an old gentleman who had just handed him a piece of money for his fare. As he spoke the conductor returned the coin. To the passenger's astonishment it was a 20-cent piece.

"Why," said he, "I am sure I gave you a quarter."

"Look at it," said the conductor.

The old gentleman put on his eyeglasses and examined it critically.

"You're right," said he. "Then take out a nickel and you will owe me 15 cents instead of 20."

The conductor returned 15 cents, and the old gentleman said: "Well! Well! I don't know how that happened. I could have sworn I gave him a quarter."

penetrating eye, who was sitting opposite, was a close observer of the transaction. Bending over to a gentleman who occupied a seat beside him, he asked: "Didn't you notice anything there?"

"No," was the reply, "except that the old man did give him a 20-cent piece."

"You are mistaken," said the bearded man, quietly. "He gave the conductor a quarter. I saw the whole thing. The conductor had a 20 cent piece 'palmed' in his hand. When he took the quarter he changed it, 'palming' the quarter and returning the 20-cent piece to the passenger. The trick is an old one, but it has only recently been applied on the street cars. It has become very common lately. I have watched several conductors, and I have had an eye on street arabs. They play the trick on old people, rustics, or people who look stupid. Passengers usually take their fare out and hold it in their hands. The conductor sees it, and at once slips his right hand into his pocket and 'palms' a trade dollar if the passenger holds a dollar; a 3-cent piece if he holds a dime, and a 20-cent piece if he holds a quarter. Then, when the passenger hands him his fare, he dexterously and rapidly changes the good piece for a bad one, or one of smaller denomination. He returns it at once with the statement that it is a trade dollar, a 20-cent piece, or 3 cents. People cannot understand how the thing occurred any more than the old man could, but they invariably take it back and give the proper coin. Of course, I do not say that the practice is general among conductors, but I have seen several play the trick. There are sharpers and dishonest men in all callings, you know."—*Ex.*

WILLING TO SHOW THE HANDS.

Entering an Austin watchmaker's establishment, a country negro produced the hands of a clock, and observed to the astonished watchmaker:

"Boss I want yer terfix up these han's. Dey jest don't keep no kerect time for moah dan six munfs."

"Ver haf you got de glock?" interrogated the German proprietor of the establishment.

"Out at de house on Injun Creek."

"Ven you bring him in?"

"Whaffor you want de clock?"

"I vants to fix dat glock mit der hand."

"Of course you fixes it wid yer han's. Who said you was gwinter fix it wid yer toes?"

"I must hab de glock?"

"Didn't I tole yer dar was nuffin de matter wid de clock, 'ceptin' de han's, and I have done brung 'em to yer. You jess want de clock so you kin tinker wid it, and charge me like the debble. Gib me back dem han's," and, taking them away from the designing German, he went out to hunt up another establishment.—*San Francisco Post.*

BUSINESS CHANGES FOR FEBRUARY

D. M. Turubull, watchmaker, Caledouia, burued out; Schwartz & Rheinhardt, jewel case mfrs, Montreal, burued out; Wood Bros., watches, Montreal, burued out; Bradley, Blair & Co., hardware, St. Thomas, dissolved; Nathan Forcimer, jeweler, Renfrew, assigned; McNaught & Lowe, jewelry, dissolved, W. G. H. Lowe continues; Kerr, James & Bro., hardware, Millbrook, sold out to R. Doak; Wall & Co,, jewelers, Torouto, sold out by bailiff; A. Turner, hardware, St. Bouiface, burned out; J. McDougall, hardware, Three Rivers, Que., assigned; Harry Bishop, hardware, Park Hill, burned out; McDougall & Bigg, hardware, Brockville, dissolved, E. A. Bigg & Co. continue; Etter Arthur, jeweler, Lunenburg, U. S., dead; S. C. Vick, jeweler, Winnipeg, given up business; Roddy & Son, hardware, Norwich, David Roddy, Sr., dead; Woodroofe Bros., jewelers, Woodstock, dissolved, S. J. Woodroofe continues; Stephens & Striuger, hardware, Chatham, dissolved, G. H. Stephens continnes; Thompson, Wm & Co., Toronto, suspended.

BUSINESS NOTES.

We are sorry to learn that Mr. Wm. Adams, traveller for the firm of J. Zimmerman & Co., has been obliged to go to the hospital on account of sickness incurred during his trip. At the present time of writing Mr. Adams shows but little improvement, and it will probably be some time before he will be fit to take the road again.

Messrs. Smith & Fudger have made a thorough reorganization of their jewelry department during the past month, and can now boast of having the most stylish jewelry sales room in Canada. The new counter of oiled native woods is extremely handsome and well worthy of the inspection of any jeweler intending to put new fittings into his store. Smith & Fudger evidently don't anticipate dull times, as they seem to be laying themselves out for a big trade.

A jeweler named A. P. Stuart, doing business on Queen Street West, Toronto, one night last month, left his shop in charge of his little son, only nine years old. During his absence a stranger came in to look at a watch. The boy showed him one. He liked it; so much, indeed, that he took it out to show it to a friend, and, strange to say, the friend liked it too, for the pair made off with it. Jewelers cannot be too careful with whom they leave their premises in charge. Sneak thieves are always on the watch and any carelessness on the part of the owner is sure to be taken advantage of by them.

A British Columbian named Forcimer, who had sent a valise containing jewelry valued at $1,000, by express, was fleeced out of it by two companions, to whom he gave an order to take it out of bond at Montreal and forward it to his home at Renfrew, Ont. The parties took the valise out and appropriated the contents to their own benefit. The detectives have the case in hand.

Business Changes.—As will be seen by an advertisement elsewhere the firm of McNaught & Lowe has been dissolved by mutual consent, W. K. McNaught retiring. Mr. W. G. H. Lowe, who has been favorably known to the jewelry trade in Canada for the past twenty years, will hereafter carry on the business under the style of W. G. H. Lowe & Co., and will, no doubt, make the future of the business as successful as it has been in the past. Mr. Lowe is known in the American and European markets as one of the best judges of jewelry in Canada, and as he has done the buying of these goods for the past seven years for the old firm, it is hardly probable that he will, now that he is continuing the business on his own account, fail to give his customers the newest, most stylish, and best value goods to be had for their money.

Mr. Thomas McNaught, brother of the retiring partner, will, as heretofore, continue in charge of the financial and book-keeping department of the business. The Trader wishes the reorganized firm success.

Liked to Meet Him.—We clip the following from the *Arkansas Traveller*, and whether it is true or not the moral that the closer a business man collects up his accounts is all right:

"Let's cross the street and meet that fellow again;" said a man to a companion with whom he was walking.

"Why didn't you speak just now if you have business with him?"

"I have no business with him."

"Then why do you wish to meet him again."

"Well, you see, I used to owe him and, in consequence would avoid meeting him. Recently I paid him up and now I like to meet him. It's like Mark Twain's story of the boy who found a dime. He kept throwing it out in front of him to find it again. Come on, I want to meet him. I wish I had nothing to do but meet him all day."

Consummate Coolness.—We give the following despatch in reference to the "Aurora Watch Co." of Aurora, Ill., U. S. for what it is worth. If it unfortunately proves true it will verify the correctness of the advice we gave to some of our readers who were solicited to take stock in it "to let it alone." "The directors of the Aurora Watch Company allege that Maurice Wendell, secretary-treasurer and chief stockholder, has spent $206,000 of the company's funds in a little more than two years. In one bill for machinery, etc., he alleged he paid $124,000 while the actual outlay was $40,000. In other ways he has misappropriated funds. Wendell confessed and asked the directors what they proposed to do about it, saying he went into the company for the purpose of speculating on the stockholders' money."

The American Watch Case Company of Toronto.—It will be news to most of our readers to learn that a new Watch Case Company

SIMPSON, HALL, MILLER & CO.,

WALLINGFORD, CONN.

—MANUFACTURERS OF—

Artistic and Useful Hollow Ware,

ELECTRO-PLATED UPON FINE HARD WHITE METAL.

There is nothing in Designing, Ornamentation or Manufacturing which our artists and workmen cannot produce.

in each Pattern in Geneva, St. James, Countess, Windsor, Oval Thread, etc. Made under the supervision, and quality guaranteed and controlled by Wm. Rogers,formerly of Hartford and Meriden. (Wm. Rogers, Sr., died 1873.)

WM. ROGERS,

Wallingford, Conn.

No connecti n with any concern in Waterbury,Meriden or Hartford using name of Rogers in any form.

FACTORIES: WLLINGFORD, CONN., U.S., AND MONTREAL ,CANADA.

has been organized in Canada for the purpose of manufacturing watch cases of all kinds. The new company propose to buy out the present plant and business of Mr. R. J. Quigley, and to add to it sufficient machinery of the latest pattern to enable them to turn out goods equal in construction and finish to anything manufactured on the continent. With ample capital and a pick of skilled workmen from the leading case factories across the border we do not see why this cannot be done, and we feel sure that if such a thing can be done at all, the promoters of the new company are the men to do it. Quite a number of the leading Canadian jobbers have become stockholders in it, and the company looks forward to a large trade in the near future. The company have secured four very valuable patents in cases which they will control in this market, and they propose to turn out nothing but first-class goods, and combine in them all the latest improvements. In a future number we may have something to say about some of these patented specialties, but in the meantime we congratulate the country upon this latest addition to its manufactories and wish it all the success that such an enterprise deserves.

THE STERN FAILURE.—The failure of Samuel Stern, wholesale dealer in jewelry and fancy goods, has passed the stage of being a nine days' wonder, and has ceased to be the general talk amongst the trade. The able report made by Mr. Charles Grant upon the business shows that it has been suffering from the "dry rot" for the past five years, having averaged an annual loss of about $5 000 during that period. Mr. Stern's last stock-taking was five years ago, and he has neglected to take stock, balance his books, until the assignee was called upon to assist him. His non-success appears to have been brought about from two causes, extravagance, caused probably from want of knowing his exact financial position, and the erection of the block of stores, one of which he occupied for his business. Five years ago Mr. Stern showed a surplus in his business of $25,000, but the interest he has paid on the money borrowed in order to erect his buildings, seems to have eaten this surplus entirely up. In addition to these things, Mr. Stern's business was not large enough in volume to make it a paying concern, and had he had an interest account around his neck, like a mill stone, it is scarcely possible that he could have held out for very much longer. So far as the creditors are concerned, the estate is likely to turn out a very unprofitable one, and if it pays twenty cents on the dollar it will do better than we anticipate. At a meeting of creditors, held last month, the creditors decided not to accept Mr. Stern's offer of twenty cents on the dollar for the stock, but to sell it off and put him out of business. They do not charge Mr. Stern with anything criminal whatever in the conduct of his business, but generally agree that he showed but little business sagacity or foresight in his conduct of it, and in view of these circumstances decided to act as they have done. In regard to this we may say, with all deference to the assignee, that his course in disposing of this stock is neither practical nor business like. We think that in justice to the wholesale trade, he should put up the stock *en bloc* and sell to the highest tenderer. His present course of slaughtering the goods to anybody disturbs the market, and does the wholesaler harm without doing the retailer any good.

"EVER ALERT."—The following rich incident, which is true in every particular, occurred in Toronto about a fortnight ago: "A well-known jewelry manufacturer, who resides in Chicago, arrived in this city. The object of his visit was to ascertain the state of the jewelry trade, as it was his intention to start with another gentleman a factory in Toronto for the manufacture of jewelry and other fancy articles. Some of the wholesale firms in that business were visited, and a very encouraging report was received. He then telegraphed to his intended partner in New York that prospects were good, and requested him to meet him in Toronto. Brief visits were then paid to Montreal and Hamilton with satisfactory results. On Friday the gentleman from New York arrived in Toronto, and together the two visited every wholesale jewelry house here. Saturday was also occupied in this way. The matter came to the ears of the astute detectives. It is shrewdly suspected that some designing person who knew that the detectives could be easily duped, pointed out the two visitors to them as "crooks." At any rate during the two days they were in Toronto both the men were "shadowed" and watched to the utmost capacity of the Toronto detective force. They were followed to every jewelry warehouse they visited and their actions were watched intently. Their scheme, to the minds of the detectives, was a bold one. They were evidently taking surveys of the places where the most valuable goods were stored, in order to break into them all in one night, take possession of the goods, and make of to Uncle Sam's dominions. The fact that they had come from New York and Chicago was additional evidence against them. It did not seem necessary to the detectives to ascertain the business of the gentlemen in their native cities or at Toronto, for they honestly supposed that no honest person could come from such places. On Saturday morning the perseverance of the detectives met with a most disastrous check, and their hopes of making a big haul were dashed to the ground. The two American gentlemen, after having interviewed the members of a jewelry firm on Yonge street, near Wellington street. left the premises and were leisurely walking down Yonge street. Detective Burrows and another detective were on hand, and proceeded to shadow them. A city jeweler who happened to be passing was called aside by the detectives. "Hist," said Burrows, "we're Toronto detectives." The jeweler histed. "Them two men," remarked the detective, "are from the States. They've been around to all the wholesale jewelry houses to get the lay of things, and are going to try to make a big haul. We've got on to 'em and we'll arrest 'em before they work their little game." The jeweler was almost convulsed with laughter at the absurdity of the statement, and on recovering informed the detectives that the gentlemen were reputable persons, and told them their business in Toronto. "Be jabers," said Burrows, "is that a fact? Don't give it away on us, but we've been watching these two men night and day since they came to the city." Thus ended the little episode.

Just Issued—Copyrighted 1885.
DIAMONDS, CRUDE & POLISHED, AND OTHER GEMS.
Points for dealers, on flaws, colors, shapes, cut and polish. Engravings showing surface, depth, weight, and price of the gems. Diamond Merchants and the Mineralogist's tests, and method for calculating the price. "Old Mine" and "New Mine" explained.
Rubies, Sapphires, Emeralds and other imitations worth a hundred times its price to any dealer. Endorsed by the great diamond expert, Mr. C. Gysi, who says: *"It is just the thing for dealers, and will post them on so many points I find so few aware of."* Sent upon receipt of price, U. S. & Canada, 50c., Great Britain, 60c.
Diamond Pub. Co., 527 Chestnut St., Philadelphia, Pa., U. S. A., P.O. Box 1311.

WORKSHOP NOTES.

To Oxydize Silver: Dissolve one ounce of sulphuret of ammonia in one pint of hot water. Dip articles for a few seconds, lay them in water, scratch, brush well, and rinse.

Cement for Porcelain and China: Make a paste of fresh cheese mixed with silicate of potassia, or the white of an egg mixed with powdered lime. Apply immediately.

Silver Solder–Soft: Two parts of fine silver and one of brass wire. Three-quarters of a part of arsenic is sometimes added at the close of the operation to make the solder whiter and more fusible.

Black Lacquer for Iron and Steel: Boil together one part sulphur and ten parts oil of turpentine. Paint the metal with this liquid, and hold in the flame of a spirit lamp until the lacquer turns to a handsome black.

To Restore Discolored Pearls: Set pearls which have become discolored by wear, may often be improved by placing in a covered vessel with a mixture of whiting, ammonia, and water, and permitting them to remain a few hours.

Cementing Labels to Metals: If the tin or other bright metal is first rubbed with a mixture of muriatic acid and alcohol, the operator will find it an easy matter to cause the labels to adhere by using a very thin coating of paste.

Oil for Lathes, Etc.: This oil can be prepared by mixing one pint of best sperm oil with four ounces best kerosene oil. If the odor of the latter is objectionable, add one drachm of oil of rose geranium. This is a most excellent lubricator for lathes, sewing machines, etc.

A Good Lacquer for Brass: One quart alcohol ninety-eight per cent., one and one-half ounces best orange shellac, one-quarter ounce gum sandarac, one quarter ounce gum elemi. Mix and keep gently warm for two or three days, stirring occasionally, and strain; give it a wine color with dragon's blood. Warm the articles before applying lacquer.

To color brass Steel-gray or Black: Add one part of hyposulphate of soda and two parts of sulphate of copper to one hundred parts of water. Cleanse thoroughly the object to be colored, place it in the mixture and heat it. A darker tint is procured by adding more hyposulphate of soda, while a larger quantity of sulphate of copper will produce a bluish or steel-gray color.

To Remove Stains from Watch Dials: To remove black or cloudy stains from porcelain watch dials which are generally caused by the tin boxes they are shipped in, wet a piece tissue paper in nitric acid and wipe the dial. This will instantly remove them. After applying the acid the dial

OR

1847, Rogers Bros., XII

MARK.

OBSERVE

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

should immediately be washed thoroughly in water and then be dried in boxwood sawdust.

To Whiten Ivory That Has Become Yellow: Slake some lime in water. After pouring off the water from this deposit, boil the ivory in this water until it has become white. To polish put the article in the lathe, if it is a piece that can be turned, and if not, first rub it by hand with powdered pumice stone and water, and then polish with a soft rag or leather dipped in olive oil mixed with whiting.

New Method of Cementing Metal upon Glass: Mix two parts of smoothly pulverized litharge with one part white lead; add to this three parts of boiled linseed oil with one part copal-varnish; the powders must be stirred into the oil until it becomes of the consistency of a thick paste. Spread this cement on the surface of the metal, press the glass upon it, and wipe off the superfluous cement. This cement dries rapidly, and is extremely tenacious.

Cheap and Effective Cement: Simple pure white lead ground in oil, and used very thick, is an excellent cement for mending broken crockery ware; but it takes a very long time to harden sufficiently. The best plan is to place the mended object in some store-room, and not to look after it for several weeks or even months. After that time it will be found so firmly united that, if ever again broken, it will not part on the line of the former fracture. It resists moisture and a heat not exceeding boiling water.

OTHER NOTES.

ALL IN THE IMAGINATION.

"What's that? Great Scott! Eighteen below,
Please hand me my hat, I guess I'll go."
And with a shiver "Granny" Brown
Rushed for his home, just out of town.

Broadcast the awful news was spread—
"Another cold wave comes," he said,
"And it will reach eighteen below,
The weather man has just said so."

At home the frightful tale was told
Until they all were blue with cold;
They plugged each crevice and keyhole,
Then carried up a ton of coal.

And never yet was seen such sight
As Brown when he retired that night—
He wore a cap, ear muffs and boots,
An over coat and two old suits.

And dreamed all night of polar bears,
Of icebergs vast and freezing airs,
And as he trod the Arctic show,
He ever moaned "Eighteen below!"

Three days elapsed—he went to town—
"Why—ha, ha, ha—here comes old Brown,
The weather man was off you dunce—
It never got to zero once."

—Pittsburg Chronicle-Telegraph.

Scarcely twenty-five years ago the most powerful piece of artillery was a sixty-eight pounder, throwing its projectile with a velocity of 1,600 feet per second. Now the weights of guns have been increased from 5 to 100 tons, the velocities from 1,600 to 2,000 feet per second, the energies from 1,000 foot tons to over 25,000, and the projectiles from 68 pounds to 2,000 pounds.

Fish torpedoes, now manufactured by the English Government at Woolwich, are said to have a speed of twenty-four knots an hour through the water and are relied upon to strike with absolute accuracy at a range of six hundred yards. A year or two ago similar accuracy could not be guaranteed at a distance of two hundred yards. Trials recently made at sea prove that neither cross-currents nor rough water has any disturbing effect upon the torpedoes, the high speed at which they travel overcoming such obstacles.

Yf Crystemas day on Thursday be,
A wyndy wynter se shalle yee,
Of wyndes and weders all wrecked,
And harde tempestes strong and thycke,
The somer shalbe good and drye,
Cornys and bestes multyplye;
That yere ys good londes to tylthe,
And kyng's prynces shall dye by skylle.
What chyld that day borne bee,
He shalle have haype ryght well to the,
Of dedes he shalbe good and stabylle,
Of speche and tonge, wyse and rhasonabylle,
Who so that day any thifte abowte,
He shalbe shente wythowtyn dowte;
And yf sekenes on the that day betyde,
Hyt shal sone fro the glyde.

A PARIS JEWELER has been prosecuted for illegally practising surgery. He had pierced the ears of a child two years old for ear-rings, for which he charged half a franc. The ear became inflamed, the inflammation spread to the neck, and the child died, the doctor attributing death to the ear having been pierced too high up. The defence was that all jewelers pierced ears, and that the mother must have used some injurious lotion. The jeweler was fined 50 francs for homicide through imprudence, with 150 francs damage to the parents.

THE paper shirt has been introduced, and is thus described by the dry goods *Bulletin:* "The bosom of this novel garment consists of several layers, of which one can be torn off every day, on the blotting pad principle, exposing a clean white surface in its place. A still more enterprising inventor is now trying to perfect a plan for printing instalments of a sensational novel on the back of each of the layers. He expects that, having once commenced the thrilling tale, the wearer of the shirt will be unable to wait a day for the next instalment, and so be tempted to peel off the successive layers of his shirt front at more frequent intervals to loan to his best lady friend.

IF anybody had ventured the assertion five years ago that carrying incandescent electric lights on the heads of political or any other kind of street paraders was easy enough to be done, says the New York *Graphic*, such a person would have been considered a good deal "off" or a victim of lunacy. But during the past week such a thing has been demonstrated by Mr. Edison as perfectly feasible. It was the first time a display of this kind was ever seen in the streets of the metropolis, and the sight was a marvellous one to the eyes of a multitude of spectators. This is truly an age of progress in electricity as in everything else.

Knowledge describes the receiver of a new telephone, which is based upon the principle that when an iron wire or rod is magnetized it suffers a slight increase in length with a compensating decrease in cross section. The inventors claim "the construction of a telephonic receiving instrument consisting of a magnetic wire attached to a sonorous disc or plate, and wound with a primary coil connected to a local battery, and with a secondary coil connected to the telephonic line wire as described." *Knowledge* anticipates very satisfactory results from the new instrument, which even in its crude form, it says, reproduces sounds with remarkable clearness.

A NEW story is told of Artemus Ward, when travelling on a slow-going Southern road soon after the war. When the conductor was punching his ticket Artemus remarked :—"Does this railway company allow passengers to give it advice, if they do so in a respectful manner?" The conductor replied in gruff tones that he guessed so. "Well" Artemus went on, "it occurred to me it would be well to detach the cow-catcher from the front of the engine and hitch it to the rear of the train. For you see we are not liable to overtake a cow, but what's to prevent a cow strolling into this car and biting a passenger?"

Editorial.

THE LATE JOHN ZIMMERMAN.

In the death of Mr. John Zimmerman, the jewelry trade of Canada has sustained a heavy loss. Probably no one in the jewelry business was better known, certainly no one was better liked or more deservedly popular. Genial in disposition, whole souled, liberal even to a fault, and with a kind word for everybody, it was no wonder that John Zimmerman's friends were legion, and that while health lasted he was one of the most successful jewelry travellers that ever canvassed the Canadian trade.

Mr. Zimmerman has been identified with the wholesale jewelry business of Canada for nearly twenty years, having learned his business in the warehouse of the late Robert Wilkes of Toronto, and subsequently entered into business on his own account some eight years ago. For the past two years Mr. Zimmerman's health has been in a very precarious condition, so much so that his doctor had prohibited him from travelling. Owing to the illness of one of his travellers however, he decided on taking a short trip, and it was while doing business in Harriston that the fatal attack reached him. The immediate cause of his death was the bursting of a small blood-vessel in the brain. This occurred about 9 o'clock on the morning of March 2nd, (Monday,) and from that time until his death he remained unconscious to everything around him. Everything that kind nursing and medical skill could do, was done, but without avail, and on Sunday morning, March 8th, he passed quietly away.

Mr. Zimmerman's many good qualities were appreciated by the general public, and they will miss him from his accustomed place in their midst, but to those who knew him best and amongst the inner circle of his friends, his loss will create a gap that cannot possibly be filled by any one else. If John Zimmerman had his faults, as who has not, they were like the tiny flaw in an otherwise perfect diamond scarcely discernible, and were completely overshadowed by his many sterling qualities of head and heart. A better or truer friend never lived, nor one whose many acts of kindness will linger longer in the memory of those who knew him best.

He was a devoted husband and loving father, and his sorrowing widow and family have the heartfelt sympathy of the community in their bereavement. In the presence of such an affliction, words seem weak and meaningless, but if it is any consolation to his family to know that he was loved and appreciated, they should not be allowed to remain in ignorance of it. May the God of the widow and orphan sustain and comfort them, is the heartfelt prayer of every one who knew John Zimmerman in life, and respects his memory now that death has removed him from their midst.

A SENSIBLE STEP.

We notice that the book dealers have decided to cut down the limit of credit from four to three months, discourage renewals, and do away with the practice of dating ahead. Their example we think might be profitably followed by the jewelry trade in some particulars, for there can be but little doubt in the mind of any person that ever took the trouble to investigate the matter, that the present depression in the jewelry business proceeds largely from an abuse of the credit system. The sooner that all lines of trade get back to shorter credits and the regular methods of doing business, the better it will be for the country. We can see no reason why Canadian merchants can't pay as promptly as do American merchants across the border; they have got the idea ingrained into them that they can't do business profitably unless they buy and sell on long dates, whereas facts prove more fully every year that as a rule the successful business man is the man who buys and sells strictly on a cash basis. A great deal of the blame of the present depression seems to us to belong rightly to the farmers who are holding on to their grain with a tight grip, and the result is that country storekeepers cannot get the money with which to meet their engagements. If the farmers would only let go their hold on the grain bags, money would begin to circulate more freely through the various channels of trade and commerce would soon feel the benefit. But long credits, renewals and datings ahead have had much to do with producing the present unsatisfactory state of affairs. The book trade has taken a wise step. There has been too general a disposition to get away from the old-fashioned modes of doing legitimate business.

OUR CANADIAN ELEPHANT.

The readers of THE TRADER have never, we think, had any cause to misunderstand the position we have taken in regard to the Canadian Pacific Railway. Without doubt it is the greatest public work that the Dominion of Canada has ever undertaken, and on its construction on common sense business principles the future prosperity of this country in a great measure depends.

We have always contended that while the construction of the C. P. R. was necessary to enable us to colonize our magnificent prairie lands in the North-West and hold its trade afterwards, that the outlay should be in some measure commensurate with the benefits received. We did not hesitate to say when the contract with the present C. P. R. Syndicate was first talked of, that the bargain then contemplated was not in the interest of the people at large, and, that looked at purely from a business point of view, we were "paying too dear for our whistle." Subsequent events have fully strengthened this view, and when the Syndicate came to the government a second time and succeeded in bulldozing the government and their subservient majority into granting them a loan of $30,000,000 of additional money, we characterized it as as cool a piece of legal highway robbery as we had ever heard of. This was to have been the last time of asking, and the money then obtained was to have finished the road and thoroughly equipped it for efficient traffic.

It seems, however, that the end is not yet, and like the horse leach's daughters the cry of the C. P. R. Syndicate is evermore "give," "give." Although Sir

John Macdonald has solemnly declared from his place in parliament that he has received no proposition from the C. P. R. Syndicate asking for a further loan or anything of that nature, it has been evident for some little time that the preliminaries have all been cut and dried months ago, and that the object of the Premier was to leave its announcement off until near the close of the Session and then spring it upon parliament and rush it through before it could be thoroughly ventilated.

That this view is correct is amply borne out by the following despatch to the government's chief organ here, which by the way was completely surprised to receive such a confirmation of its own astute prediction :

" Hon. J. J. C. Abbott, the legal adviser of the Canadian Pacific, said to-day that the directors of the road were about to make a proposition to the government to the following effect: (1) That the lien of the government upon the line and all its belongings for the $30,000,000 loan, be changed into first mortgage bonds for $30,000,000. (2) This done, that the government accept lands in lieu of $15,000,000 of these bonds, the remaining $15,000,000 of bonds to be disposed of by the company, and the proceeds applied to the completion and equipment of the line. "By complying with this offer," said Mr. Abbott, "the government will not have to contribute any more money. Every dollar realized by the sale of the bonds will be applied to the completion of the road and its equipment, thereby enhancing the security. This will also advance the price of the stock, as the government will have no preference. The line from Winnipeg round Lake Superior to this city will be finished in three weeks and opened shortly after."

This despatch we think lets the cat pretty thoroughly out of the bag, and shows plainly to the Canadian tax payer what they have to expect in the near future. It is about as cool and cheeky a demand as could well be formulated by any company, unless they absolutely owned every acre of Canada, and were entitled to the earnings of every man in it. Cheeky and all as this proposition is, we have not the slightest doubt that it will be accepted by the present parliament before the session closes, and once more the interests of a gigantic monopoly whose strength will soon be a menace to our commercial freedom will overweigh the rights of the Canadian public out of whose pockets the entire expense has got to be met.

So far as our humble judgment goes we think the government should not grant the C. P. R. Syndicate one single concession more. They have already drawn out of the venture in the shape of dividends on stock almost as much as they ever put into it, and if it is just one half as good a thing as they would have people believe, they should not hesitate to put their own money into it in real earnest and thus show their faith by their works. As long as they can coerce the government into giving them all the money they like to ask for they will never risk any of their own, and their position in regard to the country now is, and always has been, pretty much like that of the fellow who wanted to toss his comrade for a drink on the understanding of " heads I win, tails you lose." What the country really wanted and what the company started out to build, was a transcontinental railway, which in conjunction with the Intercolonial Railway, owned by the government, should stretch from ocean to ocean, and not only link our scattered provinces together in the pursuits of commerce, but exercise a beneficial influence in building up that spirit of nationality without which no country can be either contented or prosperous. This was the original idea and it was for this that the people's money was voted. The original idea has not been carried out however, and the money thus entrusted to this company has been utilized by them in gobbling up existing lines of railway for the purpose of crushing out the Grand Trunk. Had the money voted the first time been as fairly and honestly expended as would have been done had the Syndicate been paying for the work out of their own private means, it would, we think, have amply sufficed to complete the road, and we should never have heard of the second call, let alone this new demand to stand and deliver.

In the face of all this, we think the duty of the government is plain, and it is what the country will expect of them. They should refuse any further aid to the C. P. R. Syndicate, and if the latter refuse to go on and complete the work the government should forclose their mortgage, take immediate possession of the road and at once vote a sum of money sufficient to enable them to push it to completion themselves without any delay. The country would then at least own the road, and what is more, they would know that it was being built at something like its real cost and not have its contracts filtered through the sticky fingers of a construction company composed of its owners. If there were any jobs in connection with its construction by government a parliamentary investigation would bring them to light; as things are at present the C. P. R. Syndicate refuses either to show their books or to make any authentic statement in regard to the cost of construction that the public can have the slightest chance to verify.

Sir John Macdonald by a firm stand in the interests of the country at the present time has it in his power to render an immense service to the people, and to assure his party of victory at the next general election. On the other hand if he neglects this chance of putting country before monopoly he may find that the Canadian Pacific Railway may a second time prove the means of hurling him and his party from power and relegating them to the cold shades of opposition for years to come.

With all Canadians who put country before party, we trust that the Premier will take a firm stand in this matter and see that the people have justice done them, no matter what the Syndicate threaten or do.

Selected Matter.

DEAD IN THE DESERT.

Frederick Gustavus Burnaby, killed in Egypt, Jan. 17, 1885.

" Close up in front, and steady, lads ! " old Stewart cries, " They're here : "
And distant Cheops echoes back our soldiers' answering cheer :
One moment's pause—a year it seems—and swift the Arab horde
Pours forth its mingled tide of hate and spear and scythe-like sword :
As demons fight, so fight the children of the desert plain.
Their naked breasts defy our steel again and yet again :
But steady as the granite cliff that stems a raging sea
Above the van of battle looms our " Bayard "—Burnaby.

Broken ! The square is pierced ! But only for a moment, though,
And shoulder-strap to shoulder-strap our brave lads meet the foe ;
And on this day the Bedouin learns, in the Mehdi's shatter'd might,
With what a God-like majesty the island legions fight.
But, oh ! the cost, the bitter cost ! for ere the set of sun
The bravest heart of Alba's isle its earthly course has run.

And Britain weeps sad, bitter tears whilst flush'd with victory,
For on Matamneh's blood-red sand lies noble Burnaby.

Avenged! Behold what hecatombs around the dead man lay;
(The royal paw is heaviest when the lion's brought to bay)
And as the shades of even fall upon this day of strife
That heap of slain exceedeth far the foes he slew in life.
And when a sneering alien tongue shall speak of him with scorn
Or hint at our decaying might, the child as yet unborn
Shall beard the dastard to his teeth, and tell exultingly
How like the Israelite in death was "Samson" Burnaby.

Intriguing Russia's prestige waned in far-off Persia's State
When England's lonely horseman stood at Khiva's guarded gate;
Aye! Bruin of the Northern steppes, roll forth thy fœtid breath;
Exult, since now that lion-heart is still'd for aye in death,
And strut, and crow, thou Gallic cock, beyond thy northern shore,
Perfidious Albion drapes her halls for one who is no more.
Vale! the last and brightest star of England's chivalry,
'Neath Orient's skies thou sleepest well, O gallant Burnaby!

A DIAMOND DRUMMER.

MEN WHO CARRY BIG FORTUNES IN PRECIOUS STONES IN THEIR VEST POCKETS.

"My life is anything but a life of ease and pleasure," said a veteran traveling salesman for one of the largest diamond houses in America, seated in an easy chair in an uptown club. "I have been on the road for over twelve years, and have traveled all over America and Europe," continued he. "It is sometimes a wonder to myself to think of what I have been through and lived. I spend ten months out of twelve on the road, and I live nearly always on the train or boat. I seldom stop at a city longer than two or three days. I must stop at the best hotels, on account of the valuable property I carry. I start out on my trips twice a year, from New York, in May and November, taking $150,000 to $200,000 worth of stones with me each trip. I have a regular route that I go over once a year. I take the West in on my May trip, and go South as far as Mexico in November. I am treated much more courteously than the ordinary jewelry salesman by the people to whom I sell. In the first place my having such an enormous amount of property in my pockets commands a certain kind of respect. There is a curious fascination about diamonds that few men can resist. Nearly everybody loves to look at them and watch the different effects of light on them in various positions. When a diamond drummer enters a store and makes known his business he is generally invited back into a private room and asked to show his stock. If a stone suits a customer, instead of ordering so many by sample, he buys at once, gives his note and the transaction is complete."

"How do you carry your diamonds?"

"In cases like this," replied the salesman, taking out a Russian leather case shaped like a common envelope. It was about six inches long, by four broad, and sewed together with strong silk thread. It was lined with oiled silk, and fitted on the inner back with two compartments, also envelope shape. When folded up two heavy bands of elastic held the laps. It looked like an ordinary pocket-book. "that little book" continued he, "will carry about $30,000 worth of diamonds. Nice pile, eh? I have my vests especially made to accommodate these cases. I have seven of them and pockets for each one. All the pockets are on the front of the vest and strongly protected from pickpockets. An effective protection against the knife of the pickpocket is a fine gauze of steel sewed next to the cloth of the vest. Very few can go through that in the short time they have to work. I never take my vest off, even while I am sleeping. I have never lost a dollar's worth by robbery or otherwise."

"Of course you go armed?"

"Well, slightly," replied he, with a quiet smile, reaching back of him and bringing out an improved Colt's revolver, 38 calibre. "I carry two of these with me or two Colt's derringer pistols when on the road. I practice shooting regularly, and I think I can hit a five cent piece at fifty paces.

"I can tell you the life of a diamond broker is one that requires nerve and a great deal of sharpness. In the West last summer, on my way from Denver to Chicago, I discovered that I was followed by a man who had got wind of my vocation and the diamonds I carried with me. I had an alligator-skin traveling bag, which I had put up in the rack over my head in the railroad car. He evidently thought I was fool enough to put my diamonds in that bag, by the way he eyed it. At a little way station, about 200 miles this side of Denver, we had 20 minutes for dinner. I went out with the rest, leaving the bag in the rack. Instead of going to the dinner-table I took up my stand by the window looking towards the cars. I saw the fellow walk up to the rack, take down the bag and throw the strap of it over his shoulders. With a satisfied smile he walked down the steps of the car, and started out through the station. A shot from my revolver caused him to stop and nearly frightened him to death. He gave up the bag, which only held some soiled linen and such things, and I let him go. I have some adventures every time I go out, and some day I suppose some one will kill me," and he laughed lightly and turned to other subjects.—"*Exchange.*"

JEWELS OF THE ORIENT.

The history of gems in the East is the history of the governing princes, for so often has the course of history in the Orient been affected by intrigues about precious stones that they assume a State importance. The traditional diamond in the East is the Great Mogul. The original weight of this stone was 787 karats, but by cutting it was reduced to 297 karats. The stone disappeared at the last Tartar invasion, when treasures to the value of $350,000,000 were captured by Nadir Shah. It is believed to be at present hidden away in some obscure fortress in Asia Minor, and it may be recovered at some future time.

Some idea of the abundance of precious stones in the East may be gained from the fact that when Mahmoud, in the eleventh century, captured Sumnat, an idol statue was broken open and found to contain three bushels of diamonds, rubies and emeralds. Ala-ud-deen obtained from the Rajah of Mahrattas fifty pounds of diamonds and rubies and 175 pounds of pearls. Shah Jehan, the greatest of the Mogul sovereigns, left a treasure of incalculable value at his death—a throne valued at $30,000,000 and a crown worth $12,000,000. The throne was the celebrated peacock throne, so called from the images of two peacocks which stood before it, each made of precious stones so matched in color and position as to resemble the natural color of the bird. The throne was six

No Step Backward ! Every Advance a Triumph !

JAMES BOSS GOLD CASES BETTER THAN EVER AT

REDUCED PRICES !

THE character and magnitude of the plant of the KEYSTONE FACTORIES are unrivaled. Improved and patented machinery of the most ingenious description occupies every floor of two of the most massive and stately buildings in Philadelphia, while hundreds of operatives, selected for their commanding skill, and drilled in special and original methods, assist in giving shape, construction, and finish to the most complete and serviceable Watch Cases ever produced.

Celebrated as JAMES BOSS GOLD CASES were heretofore, they have now an additional claim to fame and popular favor. Notwithstanding their reduced price,

Every Style of Jas. Boss Gold Case is Made Better Than Ever.

It will particularly repay every jeweler on the alert for new, fresh, and reliable goods at prices that *MUST* sell them, to examine the

DOUBLE | PEERLESS | BOSS | GOLD | CASES.

It is, of course, impossible to illustrate, through a print, the graceful roll of the curves, delicately executed rope knurling, and exquisite vermicelli engraving of these cases. No description can do them justice. They are literally superb, and are sold as low as any first quality goods known to the trade.

Every Case has the Dust-Proof Band, is close-fitting to a nicety, interchangeable, and is guaranteed for Twenty Years.

The greatest recommendation of Jas. Boss cases is that their guarantee is *bona fide,* and that they give universal satisfaction.

Keystone Watch Case Factories,

19th and Brown Streets,

PHILADELPHIA, PA., - - - - U. S. A.

feet long and four feet wide, of solid gold and crusted with diamonds, rubies and emeralds. Steps of silver led up to it, while a canopy of gold, fringed with pearls, supported by twelve pillars, emblazoned with gems, surmounted the whole. On each side was a sacred umbrella made of velvet, embroidered with pearls, the handle being of gold inlaid with diamonds. It was the most costly work of art ever made. Its only rival was the cerulean throne of the house of Bahmenee, in the Nizam. This was built in the seventeenth century, was nine feet long by three feet wide, was made of ebony, covered with plates of gold crusted with gems, and was valued at $20,000,000.

A late traveler gives an account of the magnificence of the Persian crown jewels. In the jewel room he found treasures valued at $35,000,000, among them the crown, a mass of diamonds surmounted by a ruby as big as a hen's egg. The king's belt is a wonder of barbaric magnificence, weighing about twenty pounds and composed of a solid mass of diamonds, rubies and emeralds. As Persia is the native land of the turquoise, it is but natural that the finest stone of this description is to be found in its collection. This royal specimen is four inches long, perfect in color, and without a flaw. When the Shah was in Europe, some years ago, he wore a variety of diamonds and other precious stones that kept the detectives in a constant fever of fear lest he should be robbed of some of them, for one, even of the smallest, would have been a fortune for a half-dozen thieves. The buttons of his coat were five in number, and each button was a diamond larger than the Koh-i-noor, while every part of his clothing seemed to be useful, not as a covering for his body, but as places to hang diamonds on.--"*Exchange.*"

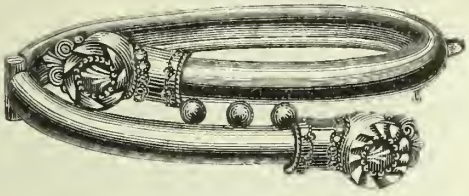
A SAD MEMENTO OF THE PAST.

Among the many objects of curiosity preserved at Queen Victoria's Windsor Castle is a clock with a sad historical memento attached to it. This is no other than the actual time-piece presented by King Henry VIII., the amorous, the lustful, to the fair, but unfortunate, Anne Boleyn, on their marriage in November, 1532. As far as the appearance of the case and dial go, it certainly is the most artistically built article of the kind that can be well imagined. It is an upright, square timepiece, standing on a bracket having a sloping, triangular support in front, resting against the wall. The top of the case is surmounted by a carved dome of highly-wrought ornamentation. What might be termed the platform of this dome is made prominent by pinnacles terminating the four pillars supporting the sides, these pillars, too, being quite in keeping with the other work. On the left-hand side is the door to the interior, having carved upon it the royal arms and crown. The dome is open-work, and at the summit is the royal shield, held in place by the forepaws of the heraldic lion, whilst the head of the kingly animal itself is keeping "watch and ward" high over all. There is only one weight, apparently lead-cased in brass, and even that is engraved. Around it at the upper end is the royal motto, "Dieu et mon droit." Below that is a circle enclosing on the upper part a true lover's knot; the letters, H. A. (Henry, Anne), and another true lover's knot below in the same circle; down to the end of the weight is more ornamentation. The front of the bracket has medallions of both male and female heads let into sunken panels. There is only one hand, and that for the hours, the pointer end being of the *fleur-de-lis* pattern. The hour circle is in Roman numerals, such as are used now, and enclose some elaborate flower engraving. The circle rests on a square plate, which is also elaborately wrought at the four corners.

Such is that famous clock; and it is lamentable to think that, in four years, the doomed queen, who was crowned with great pomp and public manifestations, was led to the block and beheaded by the order of the cruel, lustful and savage man who had made her such a right royal present. Her Majesty, Queen Victoria, must feel melancholy and heart-stricken when she looks at that mournful memento of such an unjustly ruined sister in dignity—a sister whose eyes often gazed with loving fondness upon that same hand and dial. The size of this clock is, from the base to the cornice above the face, five and one-half inches, and from thence to the lion's head five inches more; the sides are each four inches square.

It is a pity that the name of the maker of the clock is not known. It has been modernized by the application of a pendulum, and may now, for many years to come, show the beautiful workmanship of the period in which it was made; but the case remains unaltered in all its splendid originality, to show us what that class of workmen could turn out in the sixteenth century. Many of those old clocks, down to the beginning of the last century, have been adapted to modern requirements.—*Jewelers' Circular.*

ODDITY IN DESIGNS.



The demand for bric-a-brac and novelties in household decoration apparently does not abate, and there is such a pressure for novelties that designers in all parts of the world, from Boston to Yokohama, are kept busy pushing their inventiveness to the last degree to turn out new combinations. Every manufacturer who caters to this taste in any way keeps a designer, whose ears are burdened with the demand for something new. An old shoe or an old hat gives an idea for a bon bon case. Every animal in the menagerie is employed by various artisans. Botany as well as zoology is ransacked for designs, and all the combinations apparently possible are made. Nevertheless, there seems to be no limit to the fertility of the designers. In referring to this subject, a bric-a-brac dealer, with an idle quarter of an hour on his hands, conducted a reporter through his collection, and as he went along his counters he said:

"There is a lamp that has the form of a white owl, from whose head rises the stem of an immense rose with closely folded leaves, which entirely conceal the globe. There is a stork in flight, with its wings spread out and its legs extended. It is ornamented, and is to be suspended from the chandelier by invisible threads. There is a candlestick, with a gold grape leaf for its base, and with a light receiver of crystal painted in gold. There is a work basket in the form of a skiff, and another with a moss-covered top full of artificial plants is in the shape of a flower pot. There is a big elephant of porcelain, with an opening in its back for begonias, and there is a porcelain vase representing a tree trunk overgrown with climbing plants. There is a mirror to be bordered with cut flowers, and to represent a miniature lake in the centre of a dinner-table. That crystal ball mounted, upon a spiral pedestal, is for a centre table ornament, to catch and reflect the light. That glass screen has, you observe, pond lilies painted upon it, so that they seem to be floating in water. The curiously twisted

horns in that smoking set come from Eagle Pass, Texas, and are lambs' horns. The other horns are from the heads of buffalo. They are mounted in Paris and sent back here. That dagger is a paper-cutter, and its sheath forms a thermometer. That cat is an inkstand. The head in a flaring bonnet is the same; lift the face and there is the ink well. That gold-umbered ship, with silver sails and a cargo encased in Austrian glass, is a liquor set. Here is a baby carriage that represents a slipper lined with plush, and here is another shaped like a canoe. That tree of gold, with a nest for eggs is for next Easter. This paper weight contains a Geneva timepiece, and this one has a clock on one side, a barometer on the other, a thermometer between, and a geographical globe above. That stork, raising itself within a lotus thicket to seize a frog, supports a thermometer; and that setter dog, with a bird in his mouth, holds up a barometer. This gilded key, with a pair of brazen dragons in the ring, is a common and popular fancy for a thermometer now. Those three Turkish pipes form a newspaper rack. Here are designs for open fireplaces; for, after all, there is no bric-à-brac to compare to a bright open fire. And so the variety increases. There is no end to the designs. The designers are chiefly Europeans, who are worked at high pressure all the time."—*Jewelers' Circular.*

THE TEMPERING OF SMALL DRILLS.

Much has been written on this subject, and still it is never exhausted; new methods for hardening this small tool, so useful to the watchmaker, are recommended every little while.

Small drills for drilling holes in arbors, staffs, etc., which are frequently very hard and difficult to be perforated, are tempered in the following manner: After the drill has been filed to its proper size (the cutting-face must not be flattened with the hammer), it is only moderately warmed, avoiding that it does not become red, when it is run into borax. The drill is thereby coated over with a crust of borax and secluded from the air. It may now be hardened by heating it only cherry red, after which it is inserted into a piece of borax, or what is still better, plunged into mercury; care is to be taken in the latter case, however, not to breathe the mercury fumes. The borax accommodates itself to the heat of the drill, melts and cools it off. Various experiments, made by cooling in water, petroleum, etc., after the drill had been coated with borax, were not followed by results as favorable as when the drill was plunged into borax or mercury; it becomes exceedingly hard, without being brittle, and the watchmaker is able to drill articles which cannot be perforated with a drill tempered in the ordinary manner.

Many watchmakers make use of broken brooches for these small drills, in the belief that they are made of the best steel, which is not always the case, however, because the steel used for them is frequently burned, and of course, the steel is thereby rendered unfit for such small tools. In order to be certain of the quality of their drill, let them take a new piece of round steel.—G. L., in *Schwez. Uhrm.*

JEWELRY REPAIRING.

Probably there is not anything upon which the reputation of a keeper of a jewelry store is more easily built up than the neat and substantial repairing of the jewelry of his patrons. The instrinsic value of a filled ring may be almost nothing, but to the owner it is surrounded by a halo of associations which give it priceless worth, and if broken by accident, its neat repairing is very highly appreciated. So also the cleaning of jewelry, which, through discoloration has lost its beauty, is often looked upon with delight as marvelous.

Perhaps a few hints on this subject may be of use to some who have met with difficulty in making repairs to their satisfaction.

It is of first importance that the use of soft solder be avoided as far as possible in repairing articles made of gold or silver, and even filled and plated jewelry may be repaired with hard solder.

To repair a ring, the shank of which requires soldering, bury the head in a crucible full of wet sand, place a small piece of charcoal against one side, coat the break, previously cleaned by filing or scraping, with borax, and charge with solder; blow a flame against the ring and charcoal until the solder runs in. For articles which require to be protected from discoloring in the process of soldering, coat them with a mixture of burnt yellow ochre and borax, adding a little dissolved gum tragacanth to make it lay all over, allow it to dry, then charge with borax and solder and heat sufficiently; boil out in weak pickle made of nitric or sulphuric acid. One important point is to wash the piece well in hot water with a little ammonia in it before attempting any repairs; this removes all dirt and grease, which, if burned on, cannot be removed.

If the article be of colored gold, boil out in pickle made of muriatic acid, and never coat with any protecting mixture. The solder must vary in regard to fusibility according to the quality of the article. For repairing most filled work, very easily melted solder is required, which may be made of 1 ounce fine silver, 10 pennyweights hard brass wire, adding 2 pennyweights zinc just before pouring; or, to make it more fusible, use bar tin instead of zinc; or, for strong silver solder, use only the silver and brass. For repairing most bright gold work, use gold coin, 3 pennyweights; fine silver, 3 pennyweights: fine copper, 2 pennyweights. For colored work, fine gold, 1 pennyweight; silver, 17 grains; copper, 12 grains; hard brass wire, 2 grains.

A good solder for repairing spectacles or other steel work is made by melting together equal parts of silver and copper. In soldering steel, plenty of borax should be used.

Very often the want of a rolling mill is a great obstacle to the making of solder, but it may be flattened very thin, although not with great regularity, by pouring on to a flat piece of wood, and putting the flat surface of a piece of iron, while it is still in a melted condition; a piece of cigar box is good to pour it on, as the odor emitted is not very disagreeable, and the solder may be melted in the hollow of a piece of charcoal, by using gas and a blowpipe.

For cleaning colored gold, a mixture of 1 pound sal soda, 1 pound chloride of lime and 1 quart of water will be found useful; it should be placed outside the building after mixing, and when settled, the liquor poured off and the sediment thrown away; with great care this may be used for cleaning gilt bronzes, and cheap gold, and plated jewelry, but caution is necessary, as it will corrode brass very rapidly.

To remove lead solder from badly repaired jewelry, place the piece in muriatic acid and leave till the lead is eaten away. It is best always to heat the piece gently and brush off the lead, while melt-

EVERY JEWELER

Should ask his Jobber to show him the latest thing that has been Patented in Watch Cases.

—THE—

INVISIBLE CENTRE CASE

Is the NEWEST, the CHEAPEST and

The Best Watch Case in the World

FOR THE MONEY.

This Case which is practically Dust Proof, is not made like other (so called) cheap cases, by springing a back and front on to a centre without joints, but is similar to an ordinary watch case except that it has only one seam, and the centre is invisible when the case is closed. It has only one (gold) joint, opens at the front and back alike, is the lowest priced case made in silver, and in gold can be sold as cheap as an ordinary filled case. Pronounced by experts to be the best Cheap Case ever made.

EVERY RETAIL JEWELER SHOULD HAVE THEM.

FOR SALE BY ALL THE LEADING JOBBERS.

ed, before subjecting the piece to the action of the acid, as too long a steeping is not desirable.

Set pearls, which have become discolored by wear, may often be improved by placing in a covered vessel with a mixture of whiting, ammonia and water, and permitting them to remain for a few hours.

A good powder for cleaning jewelry, silver watch cases, etc., is made by mixing about four parts of whiting with one of rouge, using with alcohol or water; this it will be found, is easily brushed out of crevices, engravings, etc.—*Jewelers' Circular.*

ELEVENTH HOUR MEN.

Some men appear to have been born behind time, and their business methods impress one with the idea that they have never been able to catch up. They are always just a little behind their neighbors, and come to be known among their business associates as eleventh hour men. If they want goods, instead of buying promptly at the appropriate season, they put it off from week to week until their competitors have secured the cream of the markets, and they must take what is left or go without; if they have engagements they are always late; if they have a note coming due, they fail to take proper measures to protect it in time, and their paper goes to protest simply because they put off till the eleventh hour their efforts to protect it. Their motto appears to be "never do to-day what can be put off till to-morrow." This habit of procrastination brings many a man to grief; with some it is constitutional, due to the fact of their having been born behind time, but with others it is the outgrowth of a spirit of indifference or carelessness. We often hear it said of a man that he is peculiar, that he has not acquired business habits, and excuse must be made for him. No man has a right to be peculiar at the expense of his neighbors, or to expect them to excuse his laches because he chooses to be different from other men. The fact of living in a civilized age and community imposes obligations upon every individual enjoying that blessing, the chief of which is to conform to the customs and usages approved by the majority. Peculiar men are a nuisance, and should be relegated *en masse* to the lunatic asylums, where so many others similarly afflicted already enjoy the hospitality of the State.

The eleventh hour men are, of all peculiar persons, the most aggravating, and their lack of promptness is made all the more inexcusable by the knowledge that it is unnecessary. There was Brown, of Michigan, who had business with Jones, of New York, and telegraphed "meet me at the Astor House 10 A. M. to-morrow." At great inconvenience and possible pecuniary loss, Jones postponed a trip to the east, and was at the hotel promptly at the hour designated. But there was no Brown; he had not arrived nor had he sent any message. Jones fumed and fretted all day, and in the evening went off on his proposed trip, having lost a whole day waiting for Brown. Next day Brown came along leisurely, and was greatly disappointed at not finding Jones. His excuse for the delay was that he got engaged in some business and thought twenty-four hours wouldn't make any difference to Jones. But it did, and to Brown, too, for he had to telegraph to him to meet him in Boston, and incur the expense of going there. Jones ought, also, to have charged him for his lost time, but, of course, he did not. We met Robinson in the street a day or two since, looking troubled; he said he had just had a draft on one of his customers returned dishonored, and he had got to make it good at the bank. "Why do you do business with men who do not honor your drafts when they are due?" we asked. "Oh, this fellow is good," he replied, "but he is infernally slow; always putting me in a hole, but he pays eventually." The next time Robinson had an opportunity to make that customer pay for the trouble he caused, it is very certain he availed himself of it. This man, although notified that the draft was made, failed to provide for it in time; probably the money was ready next day, but the banks do not wait two or three days to give a man an opportunity to get his wits together. Time and tide are said to wait for no man; neither do the tides and currents of business; the business man who expects to be successful must get in the swim and keep up with his fellows; if he dallies and dawdles, or demands special consideration for his peculiarities of temperament or habit, he will be very apt to find himself stranded, with prospects for very little salvage.

The eleventh hour man is most trying to the manufacturers and jobbers in the jewelry trade, at the busy season in the spring and fall of the year. These enterprising gentlemen spend much thought, time and money in preparing attractive stocks of goods for their customers; they advise the trade regarding their preparations by circulars and advertisements, soliciting early orders that they may gauge their production accordingly. The prompt business men respond according to their requirements, obtain their supplies and have them on the market as early as possible; then the eleventh hour man wakes up, goes over his stock to ascertain what is wanted, and finally forwards his order. But the early birds have captured the attractive worms, and the order is filled, minus the seasonable novelties that would have aided so much the sale of his standard goods. Frequently an order for goods calls for certain things that the manufacturer does not carry in stock; he must send to the factory and have them made, and this takes time; as a consequence, the entire order must be delayed, or two packages made and the cost of transportation thereby doubled. Such a transaction makes all parties to it dissatisfied. All trouble and annoyance of this kind could be avoided by sending the orders promply when the manufacturer is stocked up with his full line, thus giving him time and opportunity to fill them properly. The advertising pages of *The Circular* contain the announcements of all the prominent houses in the trade; these are changed from time to time to suit the conditions of their business; here will be found a complete enumeration of the novelties and choice goods that each has to offer, and by keeping watch of these, buyers will have a full and trustworthy guide as to what goods are desirable and available, with full directions as to where they can be obtained. Following these as a guide, there is no excuse for any dealer being "left out in the cold" when novelties are introduced, or when his stock needs replenishing in any line. Promptness in everything that pertains to business is an absolute essential to success; the eleventh hour man, who is always dilatory and procrastinating, may drag out a precarious and even a prolonged existence, but he will never achieve eminence in his calling, or be anything more than an incubus, clinging, like a veritable old man of the sea, to the shoulders of his more enterprising neighbors and business associates. Procrastination is the thief of time, but a prompt business man is the noblest work of God. —*Jewelers' Circular.*

In compliance with an increasing demand, we have placed on the market a

NEW PATENT DUST-PROOF

SCREW BEZEL

Silver Open Face Stem Winding Case

embodying many of the excellent qualities of our original Patent Dust Proof Case, though offered at a lower figure.

The back and center of the new case are made of one continuous piece of solid silver, into which an Albata Cup is screwed identical in shape with the back, thus greatly strengthening it and efficiently protecting the Movement against dust.

THE NEW CASE WILL BE CALLED

ALBATA CUP SCREW BEZEL

We shall continue the manufacture of our popular Patent Dust-Proof Case with Screw Crown and Screw Bezel in all the styles as heretofore, plain and inlaid, with Lever and Pendant Setting.

FOR SALE BY ALL JOBBERS.

ROBBINS & APPLETON,

GENERAL AGENTS OF THE

American Waltham Watch Co. of Waltham, Mass.

NEW YORK, BOSTON, CHICAGO,

LONDON, SYDNEY.

TO FIT A BOUCHON.

After repairing the pivot, a bouchon is selected as small as the pivot will admit. Open the hole of the plate or cock so that the bouchon, which previously should be lightly draw-filed at the end, will stand with a slight pressure upright in the opened hole of the plate or cock; then, with a knife, cut it across at the part where it is to be broken off so that it may break very readily when required to do so. Press it in the plate on the side the pivot works, break off, and then drive it home with a small center punch. In every repair of this nature, notice should be taken of the amount of end shake of the pinion, and allowance made by leaving the bouchon so that any excess may be corrected. To finish off the shoulder end, a small chamfering tool should be used. It has a hole smaller than the pivot one to receive a fine brass wire, serving as a center to prevent the tool from changing its position while being used; or the wire may be put through the bouchon holes, and then the hole of the tool may be left open. The above is a far more expeditious way than using the turning lathe.

TO RESTORE THE COLOR OF NICKEL MOVEMENTS.

A correspondent of the journal *Suisse d' horlogerie* recommends the following method: Take 50 parts of rectified spirits of wine, 1 part of sulphuric acid, and 1 part nitric acid. Dip the pieces for about 10 to 15 seconds in this composition, then dip them in cold water, and afterwards in rectified spirits of wine. Dry them with a piece of fine linen, or in sawdust. Nickel and the greater part of those metals liable to tarnish, may be restored to their primitive color by dipping in the following bath: Dissolve in a half a glass of water, 6 or 7 grains of cyanide of potassium; plunge the pieces in this solution and withdraw them immediately. As the cyanide mixes well with water, it is sufficient to rinse them once in the latter to destroy any trace of the cyanide. After, this, dip the pieces in spirits of wine, and dry them in boxwood dust, in order to keep them from rusting. The balance even together with its spring, can be subjected to this operation without any danger. If the pieces to be restored are greasy, they must be cleaned with benzine before being dipped in the cyanide, because it will not touch grease. Cyanide of potassium, being a violent poison, great care has to be exercised, and the operation should be performed in a well ventilated place. The same bath can be preserved in a bottle, and serves for a long time.

PERPLEXITIES OF THE CLOCK WINDER.

The principal of a college had charged an old man with the care of the steeple clock of the seat of learning. In a short time afterward, the later presented himself before the principal with a woe-begone face. "Well, my man, why do you complain—is it too much work to wind up the weights?" "No, not that," he replied; "if the clock don't go fast enongh, especially at noon, I have all the students of the college swearing at me, and in order to content them, I move the hands forward; but the townspeople, on the other hand, complain that the clock goes too fast, and I set the hands back to satisfy them; so betweeen the two I am always in hot water, and I would prefer some other job." The principal in trying to console him, said: "I will give you one piece of sound advice. Let the clock go of its own accord, as the watchmaker has regulated it; do not try to suit everybody and you will live in peace."

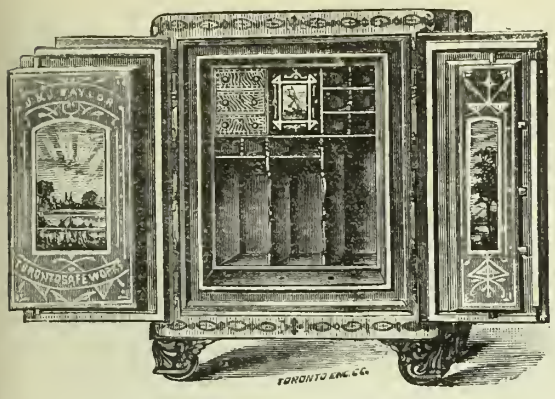
BRONZE POWDERS.

"It is perhaps, little known," says the *Chemische Zentral Anzeiger* "that the celebrated inventor of the Bessemer steel preparing process, Sir Henry Bessemer, invented in early youth a method of manufacture, and the most remarkable fact is that he kept the process a secret for more than 40 years. The different bronze powders were in the first third of this century sold at enormously high prices, in spite of the cheapness of the material from which they were manufactured. The process, according to which it was manufactured in Germany, was unknown in England, and Bessemer, after two years' work, built machinery for manufacturing it, of which five produced as much as 60 skillful workmen could. The machines were built in pieces in various shops, and by Bessemer himself put together in nine months. No one beside the inventor himself and five trusted workmen has ever entered the working-room, so that even to-day, after 40 years, no one has yet witnessed how the bronze powders are manufactured. Three of his assistants have died, and Bessemer a few years ago, presented the factory with all its business to the two survivors as a reward for their fidelity.

EAR DISEASES.

In a recent nunber of the *Archive fur Ohrenkeilkunde*, Dr. Buskner gives an interesting result of inquiries made by himself and other aural surgeons, as to the statistics of ear diseases. They may be summed up as follows: One out of every three persons in middle life does not hear so well with one ear as with the other. An examination was made of 5,905 school children, of whom 23 per cent. presented objective pathological smyptoms of ear disease, and 23 per cent. a diminution of hearing power. The liability to disease in the ear increases from birth to the fortieth year of age, and decreases from thence to old age. Men are more subject to ear affections than women, in the proportion of three to two. The external ear is affected in 25 per cent. of sufferers, the middle ear in 67 per cent., and the inner ear in 8 per cent. of total diseases. The left ear is more frequently affected than the right, in the proportion of five to four. Acute affections of the middle ear occur less frequently in summer and autumn than in spring and winter, and of the total number of cases in the ear clinics, 53 per cent. are cured, 30 per cent. are improved, 7 per cent. are unimproved, and three-tenths of 1 per cent. end fatally.

SPECIAL NOTICE.



Jewelers throughout Canada will oblige the Editor by sending in to this office for insertion in these notes any items of news pertaining to the Jewelry business that they think would be of interest to the Trade generally.

BUSINESS NOTES.

Mr. John W. Campbell, buyer and traveller for the firm of Rothschild & Co., of this city, called on us the other day. He reports trade fairly good, and looks forward to something better in the near future.

We learn by circular that the business formerly carried on by Messrs Schwarz & Reinhardt, of Montreal, as manufacturers of jewelers' cases and supplies, has been bought by the Reinhardt Mnfg. Co., who will carry it on in future.

The Firm of Messrs. E. & A. Eaves, wholesale jewelers, of Montreal, dissolved last month by mutual consent. Each of the part-

P. O. BOX, 1054.

(AGENTS FOR THE CELEBRATED BARNES' PATENT EYE-GLASS.)

We beg to call the attention of the Trade to our FIRST ANNUAL CATALOGUE comprising the largest assortment of

SPECTACLES, EYE-GLASSES, CASES, &c., &c.

ever offered in this country. As we are manufacturing a large proportion of our goods on our premises in Montreal, we can execute all special orders, Oculists' prescriptions, &c., with promptitude. Send for our Illustrated Catalogue and Price List before purchasing.

MONTREAL OPTICAL & JEWELRY CO., Limited.

ners will, in future, carry on business on his own account in Montreal.

Messrs. E. & A. Gunther advertise elsewhere a new watch glass cabinet, that is both cheap and good. No jeweler should be without one.

The Invisible Centre Case.—The sales for this newly patented case are something unprecedented, and it bids fair to become the most popular case in the market, as it now is the best value for the money.

Mr. Wooley the General Agent of the Elgin Watch Co. at New York was in the City last week. He reports his Company as running on full time and only waiting the good times ahead to put on more steam and double up.

Mr. Charles Maughan, representing the firm of Smith & Fudger, has again paid a visit to the "Prairie City," and no doubt has emptied his trunks of their accumulated riches ere this. Charlie's genial face makes him a welcome visitor wherever he is known.

Mr. H H. Fudger, of the firm of Smith & Fudger, sails for Europe early in April for the purpose of buying goods in the best markets there, for their fall trade. The Trader wishes him a successful trip from a business point of view, and personally a pleasant voyage and safe return.

Mr. Jackson, formerly with E. & A. Gunther, has made an engagement as traveller with the firm of W. G. H. Lowe & Co. He expects to cover the ground west of Toronto, and the trade in that part of Canada may, therefore, expect to see Mr. Jackson's genial face pretty regularly every quarter.

We had a visit last week from Mr. Charles D. Rood, President of the Hampden Watch Co. of Springfield, Mass. U. S. Mr. Rood reported the sales of the Hampden this year as being the largest they ever made in the same time, and was sanguine of a decided revival in business in the near future.

Messrs. P.W. Ellis & Co. report sales fairly good for the time of year. We had the pleasure of inspecting their factory last month and were really astonished at the perfection to which they have brought many of the lines they make. They employ about eighty men at present and are running on full time.

The American Watch Case Co., of Toronto, to which we made reference in our last issue, is now fairly organized and under way. They are making large additions to their plant and machinery, and expect in a few weeks to be turning out goods equal to any made in America. At the first annual meeting, held on March 4th, the following gentlemen were elected as officers of the Company: President, John N. Lake; Vice-President, W. M. Cooper; Secretary-Treasurer, W. K. McNaught; Manager, R. J. Quigley.

Mr. A. G. Funk well and favorably known to the jewelry trade in Canada, has recently been appointed to the position of manager of the New York office of the Illinois Watch Co. Mr. Funk is a first-class salesman, and courteous withall, and we can only express the wish, that under his management the Illinois Company's business will grow and prosper.

We had a visit from Mr. A. C. Anderson the well known wholesale jeweler of Hamilton the other day. Mr. Anderson, as usual, seems well satisfied with his share of what business there is going, and is quietly laying his plans for a considerable expansion of trade before the summer is over. He deserves his success.

The Messrs. Hemming Bros. have now got thoroughly established in their new quarters, and feel themselves in a position to supply any and every requirement of the trade in the way of jewelers' trays and cases, on the shortest notice. The large business built up by this young firm is but another proof that honesty and enterprise are as fully appreciated in Canada as anywhere else.

A Good Riddance.—The Montgomery gang of safe breakers were sentenced by Judge Ramsay, at Montreal, last month. Montgomery, Blondin, Willard and Dwyer got 15 years imprisonment each, and Munday the carter, was let off with six years. The police have discovered that Willard hails from Toronto, being a son of the old man Johnson who was convicted a few years ago of having counterfeiting plates in his possession.

More Smuggling.—Rumors were rife in commercial circles last week regarding a heavy seizure of jewelry in connection with which several well-known names are mentioned. From what could be learned it appears that C. Wade, a coal dealer of Sarnia, was yesterday arrested on a charge of smuggling, his operations having been very extensive, and embracing watches and jewelry of every description, cigars, clothing, etc. After the arrest it was discovered that Wade had shipped a consignment of goods to Toronto, and a customs officer from the frontier was sent to Toronto, and seized the goods, their value being about $2,000. An investigation is going on.

The Death of one of Europe's greatest Horologists, Moritz Grossmann, of Glashutte, occurred suddenly at Leipzig, Saxony, on Friday evening at 10 o'clock, Jan. 23rd. He died of paralysis of the brain, after having delivered an erudite discourse on the subject of "Universal Time and its Introduction into Civil Life," before the Polytechnic Society of Leipzig. The gentleman was so well known in the horological world that a lengthy notice would at the present time be out of place. The horological fraternity throughout the world will concur with us in saying that the departed was a luminous star in the horological firmament, who, by his intellectual capacities, his keen and untiring diligence, as well as by his willingness to devote his energies to the best interests of the art, had earned for himself an imperishable fame.—*Jewelers' Circular.*

Rolled Plate Chains, as every retailer knows, are not only to be classed amongst the staple goods in any jewelry store, but they are a class of goods that help very largely to make or mar a jeweler's trade and reputation for honest dealing. In these days of keen competition when to some people one rolled plate chain is as good as another because they can make a little more profit on it, it is worth while the far-seeing business man to ask himself "what goods will it pay me in the long run, to sell best, "Snide" goods or "reliable" goods". Experience has proved to the honest, clear-headed jeweler that nothing pays him so well as "goods he can warrant." When he has made a sale of such goods, he feels that he has given his customer value for his money, and is not afraid to look him in the face again. In no line of goods is this more true than of rolled plate chain, and it is therefore with pleasure that we ask the special attention of our readers to the well known and thoroughly reliable goods stamped "R. F. S. & Co." that are now being sold by the leading jobbers in Canada. A few of the leading styles of the goods made by this firm are illustrated in this member of The Trader.

The S. E. F. & Co. stamp on rolled plate goods has long been regarded in the United States as an absolute guarantee to the purchaser that the goods so stamped were first-class in every respect. They say there's nothing new under the sun, and it's just as true to-day as it was in Solomon's time that "a good name is better than riches." The manufacturers of the "S. E. F. & Co." brand of goods evidently believe in this doctrine, as they have always gone upon the principle that the way to build up a prosperous business and acquire riches, was by getting a good name for doing exactly as they promised. The "S. E. & F. Co." goods are sold by all the leading jobbers in Canada, and the manufacturers propose that, for the next year at least, the jewelry trade of Canada shall have an opportunity through the pages of The Trader of having brought before them, in elegant wood engravings, the newest and most taking styles of bracelets made in the American factories. This is a new departure, and should have the reward such enterprise merits.

A Cool Thief.—Shortly after ten o'clock on the night of the 19th March, the attention of a street car driver was drawn to the jewelry store of Charles Davies, 59 King Street West, by the breaking of glass. He observed a man running away from the store, and on driving as far as the corner of King and Yonge streets he told a policeman of the affair. The policeman went along to the store, and found the side portion of the window facing the entrance broken and the wire guard lying against the wall. He immediately aroused Mr. Davies, who stays up-stairs, who, on making an examination, found that two nickel-plated watches had been stolen from the window, valued at about $10. The thief had evidently been scared away by the approaching car before being able to make a bigger haul. It appears that the thief had broken off the nut which held the wire guard in position, and then pulled the guard away, broken the glass with his fist or knee, thereby enabling him to secure whatever articles he thought fit from those displayed in the window.

A Clever Capture.—Detective Rogers of the Ontario Government force has just brought to punishment one of the most dastardly gangs of burglars that ever infested Canada, and should have the thanks of every jeweler in the country. The immediate cause or their punishment was the brutal outrage inflicted upon a Jewish pedlar named Max Simosky, hailing

FACTORIES: WALLINGFORD, CONN., U.S., AND MONTREAL, CANADA.

from Toronto. It appears that on Christmas he was driving along the road near the village of Arthur when he was stopped by three men, two of whom covered him with revolvers and ordered him to get off his waggon. The pedlar obeyed, and after gaging him and tying him to a tree the highway robbers carried off all the jewelry and money which Simosky had, which amounted to nearly two thousand dollars. The victim shortly after released himself and gave the alarm. The robbers, however, had decamped. When arrested they gave their names as George Buck and Joseph Armstrong. When before the Magistrate, Buck made a clear breast of the whole affair, and said that the third party implicated was Little, the same man who shot the constable in Toronto. At their trial a few days later these men were both convicted and were each sentenced to fifteen years in the Penetentiary. Little is still at large.

The Waltham Watch Company recently applied to the Massachusetts Legislature for permission to increase its capital stock to $2,500,000. Had the application been made to the New York Legislature, the probability is that it would have been "hung up" till some lobbyist had "struck" the Company for a "boodle." The Massachusetts Legislature, however, sent a committee of eleven members to inspect this great industry, of which the State is so justly proud, and Messrs. Robbins and Fitch showed them through the factory. The members studied with great interest the machinery and methods in use, and were astonished with the magnitude of the business, full details of which were given to them. They were shown that fully one-third of the product of the Company went to foreign countries, and that the sales for the month of October amounted to $354,000. A statement of the financial condition of the Company was also presented to them. At the conclusion of the visit the committee was unanimously of the opinion that men who had built up this business to its present magnificent proportions, to the honor and glory of the State and nation, had carried it through periods of war, pestilence and financial panics, were fully competent to handle any amount of capital they might be entrusted with. Accompanying the committee was Lieutenant-Governor Ames, who has long been a stockholder in the Company, but had never before seen the factory. He expressed himself as highly delighted with all he saw, and became more in love with his stock than ever.—*Jewelers' Circular.*

WORKSHOP NOTES.

To Write in Silver.—Mix 1 ounce of the finest pewter or block tin and 2 ounces of mercury together till both become fluid, then grind it with mucilage water, and write with it. The writing will then look as if done with silver.

To Tighten a Canon Pinion.—The canon pinion is sometimes too loose upon the center arbor. Grasp the arbor lightly with a pair of cutting nippers, and by a single turn of the nippers around the arbor, cut or raise a small thread there-

To Remedy Worn Pinions.— Turn the leaves or rollers so that the worn places upon them will be toward the arbor or shaft and fasten them in that position, If they are "rolling pinions," and caunot be secured otherwise, it will be better to do it with a little soft solder.

Artificial Dimantine.—Dimantine consists of crystalized boron—the basis of borax. The *Techniker* says, that by meltiug 100 parts boric acid and 80 parts aluminum, crystals are obtained—the so-called bort, which even attacks diamond. Diamantine sought in commerce is less hard.

To Engrave on Steel.—Slightly heat the piece to be engraved; then rub it with beeswax, so as to obtain a thin layer when cold; engrave on the wax so as to reach the metal; soak in strong vinegar; then sprinkle corrosive sublimate over the engraving; wet it with vinegar, and in five minutes wash and melt off the wax.

Composition Files.—These files, which are frequently used by watchmakers and other metal workers, for grinding and polishing, and the color of which resembles silver, are composed of 8 parts copper, 2 parts tin, 1 part zinc, 1 part lead. They are cast in forms and treated upon the grindstoue; the metal is very hard, and therefore worked with difficulty with the file.

Cement for Rubber and Metal.—For cementing rubber or gutta percha to metal, Mr. Grossmann says to take pulverized shellac, dissolved in ten times its weight of pure ammonia. In this way the mixture will be of the required consistency. The ammonia penetrates the rubber, and enables the shellac to take a firm hold; but as it all evaporates in time, the rubber is immovably fastened to the metal, and neither gas nor water will remove it.

Sharpening Tools.—*Tichler Zeitung* states that a razor recovers its edge if left for half au hour in water which contains sulphuric or muriatic acid in the proportion of one part by weight of acid to nineteen parts by weight of water. The razor is carefully wiped on being taken out of the aciduated bath, and passed over an oil stone. The acid bath is not said to hurt the blade; on the contrary, the quality of the metal, in some cases, improves by immersion.

Poising Tool.—A very good poising tool can be made by adapting to one end of the ordinary depthing tool two new centers of steel wire, about one-half inch of the inner end of each of which is filed away somewhat beyond the diametrical line. Harden and polish these ends, and they will present, when properly fastened in the tool by the set screws, a very nice sharp angle on which to poise the balance; the adjustment for the leugth of staff is of course made by the screws, which open the tool.

OTHER NOTES.

Population of Paris.—The Prefect of the Seine has just published the returns of the last census, from which it appears that Paris then had 2,239,928 inhabitants, of whom 1,113,826 were males, and 1,126,602 females. When the previous census was taken, in 1876, the total was 1,988,806, so that there has been an increase of 251,122. There were 68,126 inhabited houses, and 2,075,800 of the inhabitants were French by birth, the foreigners numbering 91,872 males and 75,542 females, consisting of 45,281 Belgians, 31,190 Germans, 21,547 Italians, 20,110 Swiss, 10,789 English, 5,987 Americans, and 65 Chinese.

Magnificent View.—The translator of this "Gossip" sees an item floating around in the European press that might be unknown to many of our home readers. It says that the Grand Canon of the Colorado, 160 miles east of the Needles, on the Atlantic and Pacific Railroad, was recently visited by Professor Davidson, who says that he saw vertical walls 2,700 feet high, and 6,200 feet above sea level, where the Colorado River was 190 feet deep, and cannot imagine anything grander than the effect of sunset shining on these walls only ten degrees from vertical, composed of different colored rocks, red sandstones and the black overhanging rocks. The temperature was 136° F.

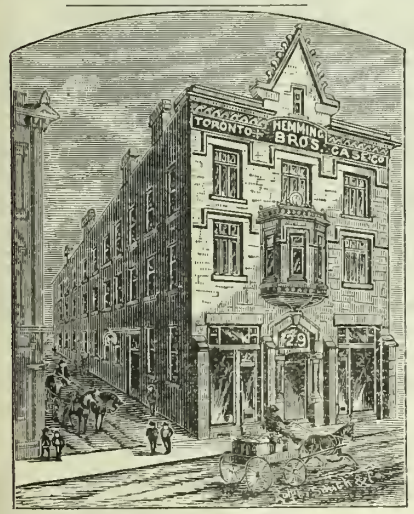
THE WORLD MOVES.—The progress of the Japanese is simply marvelous, and it is impossible to say when or where they intend to "check up with a short turn." A bill will, at an early day, be offered, making it legal for any citizen of the realm to appropriate—to pirate—the invention of any foreigner, and patent it in Japan.



EXTERMINATION OF WOLVES.—Thirteen hundred and eight wolves were killed last year in France, mainly on the border lands of Belgium and Germany. The rewards paid by the French Government for these animals vary from $10 for a a wolf who has attacked a human being, to $8 for a cub, and amounted to $20,750. France is making vigorous efforts to keep the wolf from its doors.

PATERNAL.—We see by our late Russian exchanges that the Czar has promulgated a ukase forbidding the circulating libraries from issuing the works of Darwin, and a more recent imperial decree puts those of Agassiz, Huxley, Lubbock, Adam Smith, Lewes and Spencer on the same list. (The latter is, perhaps, ostracised for his uncomfortable opinions expressed of us—the U. S.) The new list is not confined to English and American authors, for Moleschott, Büchner, Vogt, Reclus and others are considered unsuitable for Russian readers.

CURIOUS WATCH.—The museum of Lord Londesborough contains a curious watch, formed after the semblance of a duck. It is of fancy silver, with feathers chased, and is of the time of Queen Elizabeth. The lower part opens, and the dial plate, which is also of silver, is encircled with a gilt ornamental design of floriated scrolls and angels' heads. It has no maker's name. It is preserved in the original case of thin brass, covered with black leather, and ornamented with silver studs, forming, altogether, a very unique specimen of the early ingenuity of the watchmaker.

FRENCH PATENT LAWS.—Article 6, of the Law of July 5, 1844, concerning patents, requires that the designs accompanying applications for patents, shall be traced with ink and according to the metric system. In place of these designs, inventors have generally accompanied their applications with photographs, or designs produced by photographic means. These photographs or designs are liable to become indistinct with age, and the Minister calls attention to several clauses of the law, one of which says that a patent shall be refused to any applicant not complying with the provisions of the law.

THE TRADER

TORONTO, ONT., MAY, 1885.

The recognized organ of the Jewelry and kindred Industrial Trades of Canada.

Published on the first of every month, and sent free to every Jeweler and Hardware Merchant in the Dominion of Canada.

Our rates for advertising will be found very low, and will be made known upon application.

We shall be glad to receive correspondence from all parts, and will publish such letters as will be of interest to the Trade. The name and address must invariably accompany the communication, not necessarily for publication, but as a guarantee.

All business and other communications should be addressed to

THE TRADER PUBLISHING CO.,
57 *ADELAIDE STREET WEST,*
Toronto, Ont.

SPECIAL NO ICE.

To ensure insertion, changes or new advertisements must be sent to the office not later than the 20th of each month.

Editorial.

OUR SUPPLEMENT.

With this number of THE TRADER we are enabled, through the kindness of Mr. Lowe and a few other friends, to present to our readers a faithful and life-like portrait of the late Mr. John Zimmerman, wholesale jeweler, of Toronto.

We need not say that we trust it will be appropriated and preserved by Mr. Zimmerman's many friends in the jewelry trade throughout Canada, because we feel certain that every one of them who had the pleasure of his acquaintance will be only too glad to have so appropriate a souvenir of one whom they esteemed so highly. The supplement is left loose so that those who desire to frame it may be able to do so without damaging the portrait.

THE INSOLVENT ACT.

At the present time of writing it is hard to say whether the government intend to make the Insolvent Act at present recommended to the House by the special committee appointed to consider it, a government measure or not. One thing is certain, and that is that if the government do not bring it in as their own measure it may as well be withdrawn for it will never carry. Sir John Macdonald has already "damned it with faint praise," and it will take more than his promise that he will not oppose it to make it take favorably with the members from the rural constituencies. The merchants all over the Dominion are anxious for it to become law, and if the Premier again allows it to be set aside as was done last session, he will find he has made a bad mistake.

Traders are tired of being humbugged by the excuse that the government are afraid that their followers would not support it if they introduced it. They needn't be alarmed in the slightest about the action of their followers if they really want it passed. All that Sir John has to do is to say that he wants it to become law, and the servile majority that have voted away millions of the people's money without any reason whatever will toe the scratch like men. Most of them would vote for a yellow dog as Attorney General if Sir John only said the word, and to think of such members refusing to vote for a government measure because they didn't believe in it. The idea is so absurd that we can't realize it. This being the case the Premier had better make up his mind to give our business men what they want in the way of Insolvent legislation, and if he does so he may save himself a good deal of trouble in the near future.

Such an Act would would not only be just and popular in Canada, but it would put our credit on a firmer basis in foreign countries as well as improve things at home.

WHY TIMES ARE DULL.

Times are dull, at least everybody says so, and of course it must be true. Why they are so is a question that will stand some explanation. One very important reason why times are dull is that there are altogether too many at present engaged in every line of business. The jewelry trade is no exception to this rule, and we think that the present so-called stagnation in trade is as much from this cause as any other. Fifteen years ago there were only some five wholesale jewelers in the Dominion of Canada—to-day there are over forty. Of course this country has increased in wealth and population, but it has not increased at anything like the same ratio as the number of jobbers. Had the population increased in proportion to the jobbers there should now be a population of 20,000,000 in Canada instead of 5,000,000 as there is to-day. The fact is that the jobbers in jewelry have increased eight fold, while the population has only increased three fold. The effect of this over-competition is, that as there is only a certain amount of trade to be done in this country, and no house can stand by and see its competitors gobble up its share, that every house does its level best to get all the trade it can, and through this endeavor the average volume of trade is reduced, although the aggregate is no doubt very much in excess of former years. The Custom House returns indicate plainly that more goods are being every year imported into Canada, to say nothing of our own growing manufactures, and it is evident that if this trade were confined to as few houses as formerly, or to a number proportionate to the increase of our population, that trade would not be considered as dull as it now is. For this state of things there is no remedy however, for no jobber now-a-days is quixotic enough to retire from the competition simply for the purpose of benefitting his opponents. Trade is a battle, and as in all other things, it is the survival of the fittest. In the long run those houses having the largest supply of brains and money are sure to come out ahead, so that the only thing to be done by our jobbers is either to grin and bear it or to retire from the business and go into one more profitable and congenial.

HOW TO SEND AN ORDER.

Anybody can send an order, but very few of those who have never had a thorough business training ever send their orders so that they are at once concise and intelligible. It was only the other day that, while on a visit to a wholesale jeweler's office in this city, we picked up the following notice from an American manufactory, which is so much to the point, and contains so much practical advice in so small a space, that we reproduce it here for the benefit of our readers:

"In ordering our goods please state *Number* of the article wanted, otherwise we cannot fill the order. No attention paid to orders reading, 'Same as last; same as we have usually had,' &c. To save time, in every case give us the *Number.*"

The man who wrote this notice knew what he was writing about, and had evidently learned by experience that if an order was properly given, the chances of making mistakes in it were very much reduced.

Every jobber in Canada can recall

hundreds of instances—indeed they are of every day occurrence—where orders are received by letter from customers whom they are only too anxious to oblige, but which are so obscure that it is only one chance in half-a-dozen that they can be properly executed without communicating with the sender in order to find what he really wants.

Thus, take a few of the most common things in the trade and let us see how they are often ordered: Mr. A wants a particular kind of watch case to suit a good customer who is in a great hurry, so he at once wires to his jobber as follows: "Express immediately one 4 oz. case." His jobber gets the message in due course, but is at once met with the query, "What kind of a case does he really want?" The writer knew exactly what he wanted, and he evidently thought that the jobber would know all about it too, for the only bit of explanation he vouchsafes is that it must be 4 oz. Whether it is to be open-faced or hunting, key or stem wind, plain or engraved, or silver or albata cap, he says nothing, and the jobber, in a quandary, has either to fill the order at random, send him a complete assortment on approval from which to select one, or write to ask him for full particulars. The jobber is not always in a position to send every such bungler a full assortment of the goods he orders, and is therefore compelled to resort to either the first or the last method mentioned of overcoming the difficulty and is not unfrequently rewarded for his prudence by receiving a letter from the offender, telling him that he has bungled the order and don't know his business, or that his delay in waiting for the explanation of so plain an order, has lost a sale as his customer wouldn't wait, or some similar tirade on the jobber's incompetency and the writer's own smartness.

The ordering of a watch case is only one solitary instance of how orders, even for simple things, may be, and are bungled, and the instances could be multiplied almost indefinitely did the occasion demand it. Another and very common thing in ordering, is to say "Send me such an article—the same as I had before," or "the same as I had last time." This is not quite so bad as the former method of ordering, but if the person is in the habit of getting goods frequently it is not only puzzling to the jobber, but takes up a great deal of his time to find out from his books what his customer did really have on a previous occasion. Life is too short and profits in the wholesale jewelry business too small to allow of such a system of ordering coming into general use, not to say anything of the liability to make mistakes that such a system must necessarily produce.

There are a few simple, common sense rules that should always be observed in ordering, the observance of which would make things run far more smoothly between the buyer and seller.

1. Never mix an order and a letter together. Write your letter the same as if you had no order at all, and put your order on a separate sheet, or on another part of the same sheet. Don't mix your order and letter up like the materials for an omelette.

2. Always order goods by number, when there is a number to order by, and don't forget to give the price at the same time.

3. If the goods are not known by numbers, give a full description of what you want, mentioning size, style, make, material, quality and price.

4. If the style is very peculiar, a rough sketch is oftentimes a great help to the jobber, and insures your getting pretty near what you want.

5. Don't be afraid of giving too much description; a long description is far better than none and will at least give the jobber an insight into your wants.

6. Write plainly, and always copy your orders, so that if any mistake occurs you will know for sure on whom to saddle the blame.

Selected Matter.

CULLED PHILOSOPHY.

You may notch it on de palin's as a mighty resky plan
To make our judgment by de clo's dat kivers up a man;
For I hardly need to tell you how you often come across
A fifty dollar saddle on a twenty dollar hoss;
An' wukin' in de low groun's you diskiver as you go
Dat de fines' shuck may hide de meanes' nubbin in a row!
I neber judge o' people dat I meets along de way
By de places dat dey cum fum and de houses whar dey stay!
For de bantam chicken's awful fond o' roostin pretty high,
An de turkey buzzard sails above de eagle in de sky;
Dey ketches little minners in de middle ob de sea,
An' you fin's de smalles' possum up de bigges' kind o' tree. —*The Century.*

CONFESSION OF A BRIC-A-BRAC DEALER.

"A word as to buying cheap imitations of articles which are not susceptible of being fairly reproduced," said the old dealer in bric-a-brac. To purchase an imitation of *cloisonne* ware, for example, is to make a bad error in taste, for its beauty depends, not upon its form or color, but on its exquisite handiwork, a quality of which no imitation can give the least idea. Here is a piece of imitation Japanese *cloisonne*. It is of copper, like the genuine, and, for cheap enamel, has a rich appearance. Now examine it beside an original piece. The imitation, you observe, becomes dull and tawdry looking, and the colors do not appear fresh or distinct. It is, however, in its base imitation of tracery that the thing shows out really false and abominable; the lines of gold or brass are daubed on with a brush. In the genuine article the markings between the colors and all of the traceries are firm and clear, for the point in *cloisonne* is to tool little gutters of metal in the copper, and press in the fine wires, golden or brazen. No imitation can give any idea of the effects to be gained in this way.

"The bit of imitation *cloisonne* I have shown you is of home manufacture, and is bad enough to protect the buyer; the really dangerous imitations are made by the Japanese themselves, for it is a sad fact that the American demand for cheap art goods has demoralized the best artists in the world in this kind of work. Beware of *cloisonne*. The most deceptive thing in bric-a-brac I ever saw was a so-called *cloisonne* vase sold as damaged. The injury consisted of a break in the metal only half an inch long, but sufficient to disclose the fine threads of the tracery, which had in fact been torn from their beds. As the break was susceptible of perfect repair, the object brought a high price. On examination it was found that apart from the threads laid bare there was not a single *cloisonne* wire in the vase: all the rest of the tracery had been painted on, the break having been especially made to show a construction which did not exist in fact. The article was worthless.

"There is one point in the purchase of bric-a-brac in which we Americans are egregiously deceived. We import large quantities of several kinds of Japanese and Chinese art goods which had pre-

viously been imported into those countries from the manufactories of Birmingham, England. The fact does not speak well for our vaunted acuteness. Even the hammered bronzes of China and Japan are often but clumsy specimens of English stamped work. Birmingham manufacturers do not object to helping one-half the world to deceive the other half, provided the material part of the work is done in their shops.

"As for Sheffield manufacturers, they show a boldness in the manufacturing of sham art work which exceeds all their proverbial impudence in turning out sheet-iron razors. Some of our young "bloods" acquire in Paris a taste for old arms. A few years ago they ransacked New York for them, and many an old Dutch carving knife under a fancy name found its way to the glittering circles of cutlery over their mantlepieces. The Sheffield manufacturers noted the demand, and we were soon flooded with an unseemly lot of polished iron. I was obliged to keep some of it. We had terrible looking corkscrew swords, Turkish scimitars weighing twelve pounds, flashing cutlasses, Spanish daggers, Italian stilettos, French foils, and Damascus and Toledo blades in abundance. They were mere toys, harmless things that would hardly penetrate cloth, but they sold at high prices. Let me show you a true blade. Here is a fine Toledo dagger, exquisitely engraved and Damascened. It is small and light, running down to a long, fine point; yet when I place this English penny piece on the table—so—I can drive that point down through it, and—see—the point remains unmjured. A blow like that would bend up those Damascus daggers from Sheffield like so many fish hooks. This fashion has now given place to a passion for collecting bad firearms—guns which never seem to hit anyone except when they go off by accident. Some of the old Sheffield 'arms' may still be seen in the Bowery accumulations of pawn shop bric-a-brac.

"Ivory goods?" The old dealer's eyes twinkled. "I just happened to think," said he, "of an order I had three years ago for half a dozen ivory diptychs and an assortment of Etruscan carvings. That was about the most preposterous order I ever received. I was irritated at first, but grew amazingly cheerful as I thought of my customer's greenness. Some men imagine that money will buy anything, old or new, in existence or out of it. It is true that some fine specimens of ivory taken from Etruscan tombs are still preserved. The British Museum has a dozen of them, and some are extant which were known to be in existence at the time of Moses. But as to buying them as you would a bootjack—

"A diptych, you know, consists of two carved ivory covers, each from eight to fourteen inches long and proportionally wide. The Greeks used them for writing tablets, and the Romans gave them to Consuls for presents; that is how the fashion arose of giving portfolios to Cabinet Ministers. They were rare even in their day, and as the iconoclasts destroyed all the ivory carvings they could lay their hands on, you may imagine how scarce they are at the present time. Even European Museums count themselves fortunate when they possess half a one; so the six diptychs ordered by my customer would have made a bad hole in his fortune.

"I think it was in the spring of '76 that a greatly dilapidated fellow called on me and pointed to my private office. He locked the door and took from under his coat a fourteen inch diptych which he offered to sell for $1,500. Had he offered me the Vatican or St. Peter's for a like sum I shouldn't have been more surprised. I knew there was something wrong, but could not say where. The marks of age, etc., were perfect, and the work stood the magnifying glass wonderfully well. When at last I determined to take off the frame and backing, the man went down on his knees and begged me not to expose him; he had stolen it from a Pavian monastery, he said. It proved to be carved on new ivory, ingeniously pieced out and fairly well cut; it had been manufactured in a garret in Pisa by a man who makes a business of it. I let the fellow go; he did not lie any worse than dealers are often obliged to do, and was only like us, selling goods for something else than what they are. The rascal also had two replicas in his pocket; the three articles worth only about $50. Five years afterward I saw one of them in a well-known private library in Thirty-fourth street, but made no sign.

"There are many methods of making imitation ivory carvings. Sometimes the material is sawed into thin sheets, steamed in softening vapors, and pressed into moulds. It is then stained for age, cut, filed or otherwise tortured into shape, and, after being filled in with cement, is backed with an ivory veneer and offered for sale. Relief figures are made from a composition of ground bone and gum, and then cast and polished. But lack of luster and grain betrays them to careful observers. If you buy 'Japanese' cabinet work, ornamented with raised ivory carvings, handle it carefully, for a sharp rap will often powder the bogus ivory. Look out too, for imitation mother-of-pearl. It is a comparatively new sham in ornamental art, and liable to damaging accidents upon very small provocation."—*Jewelers' Circular.*

PECULIARITIES OF BUYERS.

Buyers all have their peculiarities, and when they come to New York, it is the business of the jobbers to "size them up," and humor their peculiarities while selling the largest amount of goods possible. There is the vacillating buyer who wants to replenish the stock of his little store out in Squedunck, but don't quite know what he ought to buy. His market is a slow one, and he is in doubt as to what will best call forth the shekels from the pockets of his close-fisted customers. Last year he had quite a run on big silver watches and wedding rings, but is fearful that the "boys" have got all the watches and all the wives they want, so that he can't count on them for this year's trade. The lumber business wasn't very profitable last winter, and the young men, he is afraid, won't feel like buying bracelets and pins for their sweethearts; the old folk will want a few spectacles, but they run mostly to steel bows, and eye glsses are not fashionable in his locality. What to buy is with him a weighty problem, that can only be solved by visiting all the manufacturers, overhauling all their goods and still being doubtful as to the few he finally selects. Such a buyer does not appreciate novelties, wants standard goods, and so the jobbers exert themselves to work off old stock on him. All the way home he is in doubt whether he can find a customer for that 1½ dozen of fancy bracelets he bought and that cost him $50 a dozen. While in the city he was fearful of being imposed upon; he had read of the tricks of New York sharpers, and looked upon every person he met as a "bunco steerer" or a "capper" for a gambling house. He would deal only with the old established firms lest the younger houses should impose upon him.

1406

He spent a week going the rounds before placing his little order, and afterwards was sure he could have done better somewhere else. This is not a profitable customer, for he consumes too much time and gives too much trouble, by his vacillating indecision.

Then there is the nervous, impulsive buyer who is "business" all through. He comes in with a bustle and rush, is in a great hurry to get away, must catch a train and conveys the impression that the business of the universe is dependent upon his movements. "Show me something new" is his cry as he rushes from house to house, and he will not waste time looking at things he has seen before. He buys sparingly, but finds out everything so he can send orders as he wants more goods. Wherever he goes, he is lively, brisk, sharp and always in a hurry, so that when he departs he leaves an impression that a small-sized cyclone has passed through the store. This buyer is a desirable customer, gives little trouble, pays his paper promptly at maturity and is counted as good for all he will buy. His greatest fault is that he doesn't stop long enough to let any one get acquainted with him.

The pompous, self-sufficient, hypercritical buyer is one that salesmen do not care to be brought in contact with. Indeed, he always asks for the head of the firm and doesn't feel quite satisfied unless he is waited upon by that personage. His principal business seems to be to impress upon every one a due sense of his importance, the buying of goods being a secondary consideration. The fact that he is an alderman in the flourishing village Quohog he conceives to be something worthy of national recognition, and he feels quite flattered if his political influence is alluded to. He knows all about the jewelry business; no one can teach him anything; the goods shown are tolerable but not up to his standard; if he were a manufacturer he would make goods that were attractive—something artistic and elegant; he questions the quality and workmanship of everything, objecting to this ornamentation and to that decoration, finding fault with whatever is shown him, and wondering if he hadn't better look further before ordering. The great "I" and the little "u" figure conspicuously in his conversation, and he wants everybody to understand that he is conferring a great favor on the firm by accepting credit from it. He expects to be invited out to lunch, to have a bottle of champagne opened in his honor, and to be regaled with a good cigar after it—toothpicks he will provide himself. Such a buyer is a standing subject for bad jokes among salesmen, and if they ever see an opportunity for puncturing his pomposity they are very sure to avail themselves of it. He is, notwithstanding his manners, a very good customer to have on one's books; he buys with a fair degree of liberality, and his self love impels him to take care of his paper with commendable promptitude.

Then there is the hail-fellow-well-met buyer. He is always jolly and good-natured, is well posted on sporting events and news of the day, rejoices in a good joke, laughs appreciatively at bad puns, is a good feeder, enjoys a good cigar, and if you ask him out to lunch will not be happy unless he is permitted to spend as much as you do. He generally has good taste and buys judiciously, making his selections of goods between stories and jokes, takes suggestions kindly, asks advice unhesitatingly, buys what he wants and no more, is up to all the tricks of the trade and can't be caught napping; he is a man of good business principles, abhors meanness, has some fixed prejudices regarding men and things which he expresses vigorously. He buys early in the day so he can go to Coney Island in the afternoon or the theatre in the evening, but his motto is "business before pleasure;" he has come for business but don't object to the pleasure. Fall in with his ways and he is a good customer, but his ways do not savor of the Sunday School in the least; he is of the world worldly, hating cant and hypocrisy, and nothing pleases him better than to spend a jolly evening with half a dozen jolly fellows, not in debauchery, but in having a pleasant social time. Salesmen always like these customers, and the head of the firm seldom has occasion to regret courtesies shown them, for they are usually good business men and take care of their creditors.

The very precise buyer, who knows just what he wants before he leaves home, and has his memoranda all made out, buys promptly and gets through quickly, is a desirable customer. He is all business and does not waste time doing it. He is well posted as to manufacturers and jobbers, and knows just where to go to get what he wants. It is useless to urge him to buy what he doesn't want, for he will put you aside in an emphatic but not impolite manner. He doesn't know what a joke is, and one would as soon think of fooling with the business end of a wasp as to play a practical joke on him. He wants every courtesy or advantage that other buyers have, but no favors. He will decline the lunch tendered him, preferring to be under obligations to no one, paying his way and being wholly independent. He is proud of the fact that he pays his bills promptly and is respected in his own community. The only objection to him is that he is too intent on getting rich; he is "business" all through day and night, and does not know what it is to have a holiday, and never gives his mind a rest. He is one of the kind that will be old at fifty and either rich or bankrupt before that time.

It takes all kinds of men to make up jewelry trade as well as the world, and the hasty sketch we have given of a few types is only an illustration of the various characters to be met in Maiden Lane daily. We don't know that there is any particular moral to be drawn from this glimpse at the peculiarities of buyers, but will conclude by advising all who desire to purchase goods to first understand their market, learn what they can sell to advantage, then buy it at the best market rates.—*Exchange.*

POLITENESS.

Politeness is one of the cheapest things a man can deal in. It costs nothing to be pleasant and cordial, or to extend agreeable courtsies to our fellow pilgrims in this world of work and worry. It is just as easy to greet a person with a pleasant "good morning" and a smile as with a surly grunt and a scowling countenance, and it is certainly much more agreeable to him who receives it. Politeness and courtesy are twice blessed, like charity, blessing him who receives and him who gives, for no man can be pleasant and cordial with others and surly and cross with himself. Therefore it pays to be good natured, cordial and polite. But there are men in the trade who seem to think the reverse of this is true, and take pleasure in cultivating an abrupt, coarse, cross manner, and displaying it on all possible occasions. Travelers for jewelry houses often meet with great discourtesy at the hands of the dealers whom they are striving to serve. There are several kinds of men who thus cultivate their

In compliance with an increasing demand, we have placed on the market a

NEW PATENT DUST-PROOF

SCREW BEZEL

Silver Open Face Stem Winding Case

embodying many of the excellent qualities of our original Patent Dust Proof Case, though offered at a lower figure.

The back and center of the new case are made of one continuous piece of solid silver, into which an Albata Cup is screwed identical in shape with the back, thus greatly strengthening it and efficiently protecting the Movement against dust.

THE NEW CASE WILL BE CALLED

ALBATA CUP SCREW BEZEL

We shall continue the manufacture of our popular Patent Dust-Proof Case with Screw Crown and Screw Bezel in all the styles as heretofore, plain and inlaid, with Lever and Pendant Setting.

FOR SALE BY ALL JOBBERS.

ROBBINS & APPLETON,

American Waltham Watch Co. of Waltham, Mass.

NEW YORK, BOSTON, CHICAGO,

LONDON, SYDNEY.

ingrain ugliness till it becomes second nature to them, and they find it almost impossible to be civil to anyone. They pass for men, but act more like certain kinds of animals—give them bristles and there would be no difficulty in classifying them. A traveler enters the store of one of these gruff, bristly animals, and presents the card of his employers. He is met with a rebuff at once. "Don't want anything—am bored to death with drummers—hate the sight of them," etc. He will not even look at samples, and the traveler takes his departure in disgust. There is another class, comprised of purse proud upstarts, who, having made a little money, think all the world should be subservient to them. Many of this stamp delight in keeping a traveler dancing attendance upon them. They know the traveler is expected to call upon them, and would be loth to leave town without an interview, so simply to gratify their pure cussedness, they invent excuses to make him possibly miss his railroad connections and so lose a whole day. If these men knew what a reputation they get in the trade by their discourtesy, they would reform their manners. Travelers report to their employers the kind of customers they have to deal with, and many a buyer has been treated with coldness on his visits east when he could not account for it. The secret of it lay in a previous discourtesy to traveling men. Discourtesy not only leads to a cool reception at the home offices, but injures a man's credit with those of whom he has to ask favors. Travelers give the man with bristles a generally bad reputation, speak of him as a cross, surly brute, and give such a report of him that the word passes among their fellow travelers that he is a man to avoid. Give a dog a bad name and it will stick to him, and he will be charged with sins of which he is not guilty, so the solvency of these gruff and grum dealers falls under suspicion, as the result of the severe censure cast upon his objectionable personal characteristics. It is true that there are a lot of drummers in the business who are a nuisance to the dealers and ought to be suppressed, but they are no more to be compared to respectable commercial travelers than the men they represent to the solid responsible houses in the trade. When a traveler presents to a retail dealer the card of a well-known and responsible house, he is entitled to be treated as a gentleman; he is the representative of the firm that employs him, and any indignity shown him is sure to be resented by the firm in some way. The traveler is trying his best to accommodate the patrons of the firm, and to this end brings to their doors samples of the latest styles of goods and of the popular novelties, and is prepared to take their orders at the same prices they would have to pay if they came to New York to buy them. They are the means of saving the retail dealers many dollars of expense, and as a matter of self interest they should treat them with courtesy. It does not take long to examine the samples a traveler carries, and to look at them does not constitute an obligation to buy. No dealer of intelligence can run through the sample trunk of a traveler without getting ideas that are valuable to him, and it ought to be a pleasure to him to do so. Fortunately, most dealers so regard it, and the gruff and grum sort are few in number. If they consulted their own interests these few would change their tactics, and accord to all respectable travelers such courtesies as they would like to receive under similar circumstances. It costs nothing to be polite at all times, and genial, pleasant manners are worth money to any man. *"Jewelers' Circular."*

HOW TO SEPARATE THE GOLD FROM GOLD-PLATED ARTICLES.

The gold is removed from articles of iron and steel, without injuring them, by immersing them in a bath consisting of 10 parts potassic cyanide and 100 parts of water, and connecting them with the positive pole of a battery. A wire or sheet of platinum is fixed to the negative pole. The position of the poles is hereby inverted, whereby the gold coating upon the iron and steel is dissolved in the cyanide solution, and partly deposited upon the platinum anode; it is then removed in a regular gold bath. Should there be only a film of gold upon the iron or steel, its removal may be effected by the cyanide solution alone, without the aid of electricity; the process is slow however. Also silver, copper, and their alloys may, by this process, be ungilt, but the cyanide dissolves the silver and other metals at the same time; it is better, therefore, to effect the ungilding as follows: for the purpose of ungilding silver, heated to a cherry red, and immediately throw it into a pickle of more or less diluted sulphuric acid. The gold will peel off and fall to the bottom in the shape of spangles. Repeat the operation until all the gold has disappeared from the surface of the silver, which will then appear white and frosty. Light and hollow articles cannot be treated by this process; the preceding one is better adapted for them. For small articles of copper and its alloys, such as thinly gilt false jewelry, prepare the following bath:

Sulphuric acid	parts,	10
Nitric acid	"	1
Muriatic acid	"	2

The large quantity of sulphuric acid promotes the solution of the gold, while only slightly attacking the copper or its alloys. The sulphuric acid is to be placed into a stoneware jar by itself, after which the mixture of muriatic and nitric acids, kept in well closed bottles, is gradually added, in tenor with the advance of the operation. The same sulphuric acid, if well covered, may be used for a long time, and its dissolving action stimulated by successive doses of nitric and muriatic acids. The operation must be watched by frequently withdrawing the articles, and when no more gold is visible it may be deemed as finished, and the copper has acquired a uniform blackish-gray color.

The nitric and muriatic (hydrochloric) acids may be replaced by saltpeter and common salt, both of which must be finely pulverized and stirred with a glass rod.

For large objects, such as clocks or chandeliers, concentrated sulphuric acid, of 66° Beaumé, is placed into a glass or stoneware vessel supporting two brass rods. One of these rods is connected by a conducting wire with the last carbon of a battery of two or three Bunsen's inverted elements, and supports the objects to be ungilt, which are entirely covered by the sulphuric acid. The other rod supports a copper plate facing the object, and is connected with the last zinc of the battery. The electric fluid traverses the sulphuric acid and carries the gold from the positive to the negative pole; as the copper plate is not prepared for retaining the gold, it falls to the bottom of the bath in a black powder, which is easily recovered. So long as the sulphuric acid is concentrated, and even under the action of the galvanic current, it does not sensibly corrode the copper, as it rapidly absorbs the moisture of the atmosphere. The

—THE—

INVISIBLE CENTRE CASE

Is the NEWEST, the CHEAPEST and

The Best Watch Case in the World

FOR THE MONEY.

This Case which is practically Dust Proof, is not made like other (so called) cheap cases, by springing a back and front on to a centre without joints, but is similar to an ordinary watch case except that it has only one seam, and the centre is invisible when the case is closed. It has only one (gold) joint, opens at the front and back alike, is the lowest priced case made in silver, and in gold can be sold as cheap as an ordinary filled case. Pronounced by experts to be the best Cheap Case ever made.

EVERY RETAIL JEWELER SHOULD HAVE THEM.

FOR SALE BY ALL THE LEADING JOBBERS.

vessel in which it is contained should be kept perfectly closed when the ungilding process is not in active operation, and the pieces for ungilding should be placed in perfectly dry. If it is intended to sacrifice the gilt articles of copper or silver, let them remain in pure nitric acid, which dissolves all the metals except gold, which either floats at the surface of the liquid as a metalic foil or falls to the bottom as a blackish powder. If the liquor is diluted with distilled water and filtered, all the gold will remain in the filter, while the solution contains the other metals.—*Jewelers' Circular.*

TALKED TO SLEEP.

Our old-time friend, John Rose, of Bay City, sends us the following item of experience which he met with recently, while a scribe of the Bay City *Tribune* was present. If John is seeking sympathy in his trying role as the leading jeweler of his town, doubtless many of our readers can give it him in abundant measures for they have all "been there," and been talked to death, to sleep or really mad: "There is a good deal of exaggeration these days, and people are apt to smile incredulously when they hear of a man being 'talked to death.' The scribe was a doubter all his life, but the doubts were dispelled the other day by an actual demonstration of the power of talk. The scene is in a prominent jewelry store on Center street. Enter a lady fashionably clad. She bows most pleasantly to the ready salesman and begins:

"'Have you any good gold pens?'

"'Yes ma'am,' replied the salesman, producing a large show tray filled with the article.

"'Well, now, I want to be sure that these are real good gold pens. I know a friend of mine who bought a gold pen and it was perfectly useless in two weeks. Now my uncle had a gold pen he used for twenty-five years constantly and it kept as good as new. My uncle used it for fifteen years, and when he died he gave it to my cousin and he used it to my knowledge fifteen years and I am sure it is in use yet. It was a real, genuine gold pen and never corroded, and my uncle often said he would not part with that pen for any amount of money. He bought that pen in San Francisco when gold was cheaper and got it very cheap, and yet he used it fifteen years, and my cousin used it after him ten years to my knowledge, and I want to be sure that when I buy a gold pen it will be a good gold pen, for a good gold pen will last a long time as my uncle said when'—

"'Did you want to buy a pen to-day?' stammered the confused salesman, who had been frantically trying to get a word in.

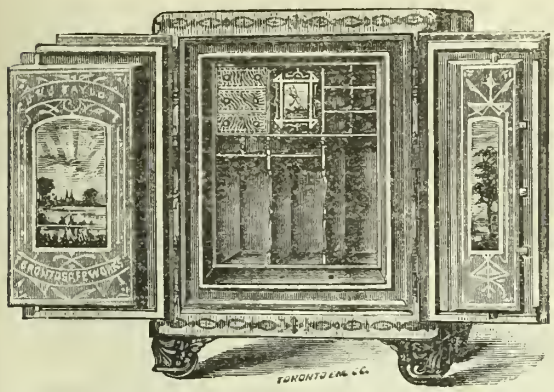
"'Oh, no, I don't want to get a pen to-day, but I thought I would just step in and see if you had any real good gold pens like my uncle's, for I don't want to get a poor pen when I do buy one. Have you any silver thimbles?

"'Yes,' said the despairing salesman as he placed two or three trays of silver thimbles on the show case.

"'Well, now, are you sure they are real silver thimbles? A lady friend of mine bought a silver thimble and in less than two weeks it had turned black on the inside and she only used that thimble two or three times. Now my cousin had a silver thimble presented to her on her thirteenth birthday and she is using it yet and it never turned black and she is forty years old. It was a real silver thimble and my cousin says she believes that thimble will last as long as she lives, and it only cost fifty cents and my cousin will probably have it on her finger when she is buried he! he! he! and my friend who bought the silver thimble that turned all black inside felt real angry about it while my cousin uses her silver thimble every living day and never thinks of doing any work without it for she says she has used it so long now that it seems part of the family and I would like to be sure when I buy a silver thimble that it is a real genuine silver thimble for my cousin's silver thimble'—'Did you want a thimble to-day?' asked the despairing salesman looking helplessly at his tormentor. 'No, not to-day, I simply thought I would call and see if you had any real good silver thimbles for when people buy silver thimbles they don't like to be deceived. Now if it is not too much trouble I would like to look at some of your gold watches, a friend of mine bought a gold watch in Chicago and it stopped a dozen times in two weeks, while my brother had a gold watch that he bought eighteen years ago, and it has never stopped or lost a second's time, and—'

"But the salesman had gone to sleep, and the scribe, feeling that the only hope of living was in flight, fled from the place. If any doubt this, let them ask John Rose."—"*Exchange.*"

HOW NOT TO DO BUSINESS.



In what a happy-go-lucky style much of the retail store business of Canada is done, may be gathered from the following instance: An insurance appraiser was requested to adjust the loss by fire upon a certain general stock of merchandise in Ontario recently. Going to the shopkeeper, who was a respectable man, with some productive real property, he asked how much stock had been in the place when the fire broke out. The reply was made, about seven thousand dollars'worth. "Will you allow me to see your books," said the appraiser. "Certainly," replied the storekeeper. The books, being produced were found to contain debits only, whoever had bought goods on credit was duly charged with them, but there were no accounts opened with the man's creditors—no Merchandise account—no Bills Receivable account—no Profit and Loss account—no Invoice book—no Cash Book—no record of last stock taking, he had not taken stock for some years—no balance sheet, even. So the insurance man was obliged, in order to get at the burned stock even approximately, to write to the houses from whom the shopkeeper had bought, a list of them being given from the memory of the debtor. He thus learned how much had been purchased from each during the previous twelve months, and how much was owing to each. Going carefully over the merchandise saved from the fire, it was learned after a week's work that the amount of stock this unsystematic dealer had on hand could scarcely have been over $4,000, instead of $7,000, which he in good faith, claimed. And the insurance obtainable, instead of being, as the retailer expected, about $4,000, did not exceed $2,000.

How many country storekeepers are there who, if put in like circumstances, could make up an accurate claim, and substantiate it by evidence? How many are there who know, in other words, how they stand? What proportion of our retail dealers keep track of their transactions in such a way as is legally necessary to establish their position in case of unforeseen difficulty or disaster? Can we truthfully say fifty per cent.? Would it be safe to conclude that even one in four does so? We fear that the experience of insurance adjusters and official assignees must compel us to the conclusion that not even one-fourth of our retail merchants

take these essential precautions for their creditors' satisfaction and their own safety. An iron safe is considered a necessity to every merchant who keeps accounts ; and so it is, if the man wishes to keep his cash, or the record of his outstanding assets safe from burglars, or from fire. But one half the sum he pays for a safe is wasted if he does not keep in that safe a proper record of his position, from year to year, or from month to month. Even a person who sells for cash, and therefore needs to keep no account of credit sales, may well consider the $100 or $300 he pays for a good safe as wasted, if that strong box do not contain such a record of his position as to merchandise on hand or current indebtedness, as will suffice, in case of robbery or fire, to satisfy the insurance companies who protect him or the wholesale merchants who supply him.

There is no more essential part of a merchant's duty to himself and his creditors than systematic stock taking at least once every year, but even his stock taking is a waste of time and labour if he neglects to make up a proper balance sheet, and neglects to take proper care to preserve all his stock sheets, stock book and balance sheet. In too many instances where these are needed to refer to, they have either been destroyed as useless, or lost. Another matter made unpleasantly clear by the investigations of an expert after a fire loss, is the often indefinite or mistaken notions of retail dealers as to the rate of profit upon goods sold. In a case in question, the country merchant was asked what rate of gross prefit he sold goods at, and replied from fifteen to twenty-five per cent. on invoice prices, and on some lines thirty-three per cent. It was a revelation to him to have it proved that he was not making more than ten per cent.; and that instead of making $5,000 clear, upon a turn-over of say $25,500 yearly, he was in fact making less than $2,500.

How is this ? some shopkeepers may ask. The reason is that no allowance was made for the items of freight ; depreciation ; interest ; bad debts ; cost of selling ; insurance, taxes, and other matters which require to be added to the invoice cost. Wholesale houses estimate that the expense of selling goods through travellers adds from three and a half to seven per cent. to their cost. And the retail merchant must not imagine that because he keeps no travellers the sale of his goods therefore costs him nothing. Clerk-hire costs something ; and even if no clerks be kept, but the store is conducted by the shop-keeper and his family, rent, fuel, light, packing, taxes, carriage, expenses to the markets to purchase, and a dozen other seemingly trifling matters go to swell the cost price beyond that put down in the successive lines of wholesale dealers' invoices.—*Exchange.*

REPAIRING WATCHES.

The bad rate of a watch may frequently be traced to its imperfect jewels. The repairer should always carefully examine every jewel in a watch taken down for repairs, and if he finds one with hole too large, or " out of round," that is, much wider in one direction than in another, it should be replaced by a good one, to be done as follows : If the depth is correct notice whether the jewel is above or below the surface of the plate ; if it is either, then knock it out and cement the plate or bridge on a chuck in the lathe, being careful to get it on true by the hole lately occupied by the jewel ; by means of a burnisher raise the burr that holds the other jewel in, and if the jewel can be found of the proper size and thickness, and the hole not too large, it can readily be " rubbed in " with the burnisher ; if the hole is too small it can be opened. The chuck on which the article is cemented should have a hole from a quarter to a half an inch deep in its centre. If no jewel can be found of the right size and thickness, select one a little too large, enlarge the hole sufficiently to fit the jewel in, and then proceed to fasten it. If the jewel is broken, of course the same remarks apply to replacing it with a good one as to an imperfect one.

One difficulty that the watchmaker has to contend with in selecting a jewel from the indifferent lot supplied by some dealer is to find one the hole of which is in the centre of the jewel. If a jewel is not true, or, rather, if the hole in it is not in the centre, it must be cemented into a chuck in the lathe, trued up by the hole, then turned off with a diamond cutter, the chamfer carefully trued up and polished again ; while in the lathe it can be turned down to fit the hole in the setting or plate ; the shellac is to be removed from the plate with alcohol. In many instances a chuck will have to be turned up to suit the particular job to be done. Care must be taken in opening, or the jewel will break or chip around the hole. The corners must be carefully rounded by a piece of wire larger than the hole, the end of which is conical. It will take but a moment to do this, but if care is not taken too much will be taken off.—*Exchange.*

CHEAP CREDIT.

"The Silly Way People give Credit," is the appropriate heading of an item in an English journal. One day, a man named Eyres, called on the Clydesdale Iron Co., in London, said he was a builder and wanted some iron railings for houses he was building at Acton. On being asked by the managing man of the iron company if he was the Eyres who had been building at Harlesden, and "left there after going all wrong," he denied it. So he got £30 worth of goods by paying £10 and promising £20 when his houses were up. Afterwards he got more goods on credit till he owed nearly £30 when it was discovered that he *was* Eyres of Harlesden, whom the Co. would not give credit to. So the Clydesdale Co. had him arrested for getting goods on false pretences. The lawyer who opened the case remarked that the obtaining of goods in that way by builders was an evil which was increasing. The Lord Mayor said he could tell him a greater evil, namely, *the silly way in which people gave credit.* Replying to the Court, the prosecutor stated that inquiries were not made before the goods were supplied. The Lord Mayor remarked that " it was an amount of Arcadian simplicity which he could not conceive to be possible. When persons parted with their goods on such slender representations it was a premium to dishonest men to swindle others."

It is evident that credit is too cheap in Britain as well as on this side of the water. Very often we find that merchants are ready to give credit loosely because they get it so easily. If a man has given cash for his goods, or if he is under strict agreement to pay for them on short and exacting terms, he will be unlikely (unless he is a born fool) to give them to Tom, Dick or Harry, on easy credit and without careful enquiry about his debtor. But the slender basis of information on which millions of dollars worth of goods are given away nowadays is amazing. A single enquiry made of a neighboring merchant, a rating in a mercantile Reference Book, the recommend-

ation of a green and sanguine traveller (on commission) suffices for the shipment of $200 or $500 worth of merchandise to an utter stranger. Surely this is not business-like.

It is often said by wholesale men in cases of this kind, "if we do not fill this order, X, Y, or Z will fill it and we shall lose the sale." Very well, let others make the sale, and take the risk. It used to be stated by Mr. Wiman in his circulars twenty years ago, "Mercantile Agencies are only one of the means of enquiry which it is the duty and the privilege of merchants to make about their credit customers. No wholesale dealer can have too much information about his clients." This is as true to-day as then. We should not have had to grieve over nineteen millions of indebtedness by failed Canadian merchants in 1884, if proper enquiry had been made about the capital, capacity and chances of success of the 1,308 traders whose liabilities made the aggregate we have named.—*Monetary Times.*

SPECIAL NOTICE.

Jewelers throughout Canada will oblige the Editor by sending in to this office for insertion in these notes any items of news pertaining to the Jewelry business that they think would be of interest to the Trade generally.

BUSINESS NOTES.

E. M. Blakely, jeweler of Trenton, has assigned. While Mr. Blakely lived in Picton he was well liked and apparently made money, but since his removal to Trenton things seem to have gone badly with him, and the result is an assignment for the benefit of his creditors.

Dissolution of Partnership.--Messrs. Inglis & Picard, the well-known watch importers, of Montreal, dissolved partnership last month, Mr. Inglis retiring from the partnership, but we understand remaining with the new firm. The business will be carried on as formerly, by the remaining partner Mr. C. T. Picard under the style of C. T. Picard & Co.

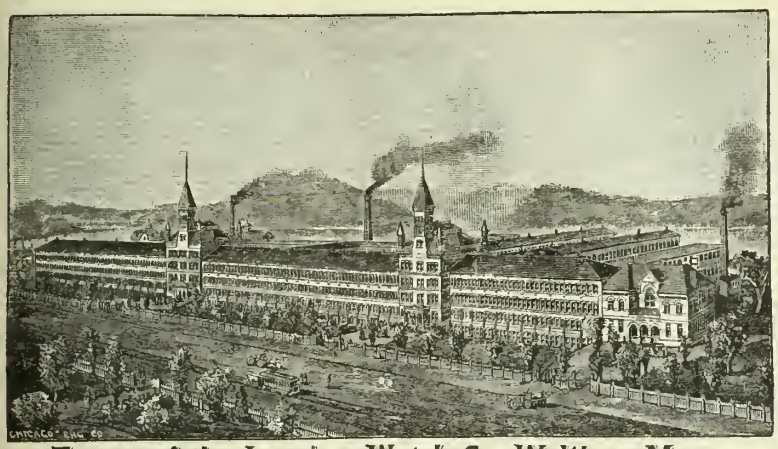
The Late Mr. George Pringle.—We are sorry to have to announce to our readers the death of Mr. George Pringle, jeweler, of Cobourg, Ont. Mr. Pringle was one of the best known retail jewelers in Canada and had for many years been identified with Cobourg as one of its principal merchants. George Pringle was one of the most popular men in the Canadian jewelry trade, genial and whole-souled in private life; and a synonym for integrity in business. His death creates a gap that will not be readily filled in the town in which he lived.

Reliable Show Cases—The show cases made by Millichamp & Co., are well and favorably known in Canada, this firm having been in this business for nearly twenty years, and having shipped their goods into every part of the Dominion. It is the largest of its kind in Canada, and its reputation for doing only first-class work is such that they have no difficulty in keeping their immense factory running on full time even in the present depressed condition of trade. This is a natural recognition of honest and liberal dealing and we can recommend any merchant in want of show cases or shop fixtures of any kind to patronize Millichamp & Co., in the full assurance that they will get not only the best in the market but full value for their money.

The Jewelry Stock and fixtures belonging to the estate of the late John Zimmerman were advertised by the executors by tender last month, and bought by Mr. F. Block, of Toronto, the highest tenderer at a price of 67½ cents on the dollar. A good price we should say, taking everything into consideration. The book debts and the Estate's interest in the Acme Silver Plate Company, of Toronto, were also offered for sale by tender, but we understand were not sold.

Changes Everywhere.—Our readers will no doubt be surprised to learn of the retirement of Mr. J. A. Watts from the Presidency and Management of the Toronto Silver Plate Company, of which Company he was the promoter and founder. Mr. Watts who we understand has retired definitely from the silver-ware business in Canada, was the pioneer of the American electro-plated ware trade in this country, having as the agent of the Meriden Britannia Company introduced the goods here some twenty years ago. He is succeeded as manager by Mr. A. Gooderham, of this City. a prominent stockholder who has been in the employ of the company ever since it commenced business.

William Wharin, one of the oldest established jewelers in Toronto, and who years ago stood almost at the top of the tree, has been recently compelled to assign for the benefit of his creditors. As showing how much a good name is worth it may be mentioned that although Mr. Wharin's stock has been heavily mortgaged for years, he has, judging from the number of creditors and the amounts due them, had no difficulty whatever in getting all the goods he wanted on the ordinary terms of credit. As Mr. Wharin is likely to get a settlement favorable to himself, it is probable that some of these gentlemen will regret the violation of a very good rule of business, "Never to sell a merchant goods on credit whose stock is mortgaged, unless you have perfect security."



The North-West rebellion has affected the jewelry trade in other than a pecuniary manner. Mr. W. H. Smith the well-known traveller for the firm of Smith & Fudger, and a son of one of the partners, has gone with the Queen's Own, in which regiment he is a non-commissioned officer, to the North-West to aid in putting down the rebellion. During the terrible march along the North Shore Mr. Smith (or Willie, as he is called among the boys) was unfortunate enough to sprain his ankle; we are glad to learn, however, that it is now all right and he has rejoined his Company which is now *en route* for Battleford. His many friends will wish him a safe return home, and if he is able to put a bullet through Riel and bring that worthy's scalp-lock back with him, he will be the most popular and successful jewelry traveller on the road for the balance of his natural life.

A Model Price List.—We are just in receipt of a price list from the Montreal Optical and Jewelry Company, of Montreal, whose advertisement will be found elsewhere in *The Trader*. This catalogue is elegantly printed on fine toned paper, and is a first-class specimen of typographical skill. Its illustrations are numerous and of a high order of merit, and convey a very accurate impression of the goods they represent. This Company are the largest manufacturers and dealers in optical goods in Canada, and the great success which has attended their efforts so far goes to show that in their special line they stand at the head of the Canadian trade. Their new catalogue, is, we should say, an indispensable reference book that should be kept by every merchant dealing in optical goods, and the Company will be glad to send it free of charge to any legitimate dealer in such goods.

W. C. Allego, of Hamilton, the jeweler who cleared out of that city in 1880 and went to the States, leaving behind him a lot of lamenting creditors and dupes, turned up in Simcoe recently, where he was promptly arrested by Chief Stewart of Hamilton, and brought to the scene of his former triumphs. Unfortunately for the creditors, and fortunately for Mr. Allego the information in the warrant was based upon the Insolvent Act which was subsequently found to have been annulled previous to the time it was issued and nothing therefore could be done regarding it. Such cases as this show the need of a good insolvent law such as is proposed by the Board of Trade, and were such a law in force it would be possible to punish people who deliberately set out to swindle their creditors. Chief Stewart is to be commended for his prompt and energetic action in this matter and we are only sorry in the interests of honest dealing that the case could not have been pushed.

If there is any hardware traveller, who ever drummed the Western road and don't remember R. B. otherwise known as Genial "Bob" Harstone, hardware merchant of St. Marys, their memory must be sadly deficient. R. B. has been for some years connected with the Canada Pacific R. R. in the North-West, and from a letter from a volunteer on the active service we learn that he has done his level best to help the troops on their way west and render their journey pleasant. When "Bob" lays out to do anything you can bet your bottom dollar it is thoroughly well done and we were therefore not at all surprised to learn that he had won golden opinions from the troops who have gone to the front. The boys say that if the Government don't give R. B. a testimonial they will do so themselves; if they should decide to do so, a lock of Riel's hair would suit R. B. probably about as well as anything.

The Advance in Watch Cases.—Everybody knows that watch cases have been cheaper during the past year, but few would believe that it was because competition had become so keen

as to force the makers to sell at and below cost. This was the fact however, and it is because they have got sick of this foolish and losing game that they have formed a combination and have advanced the prices to such a rate as will at least save them from loss on the goods they sell. The Association is a very strong one and embraces the Waltham, Keystone, Faheys, Dueber, and Blauer Companies. This advance is a step in the right direction, and now that the manufacturers have set such a good example the jobbers and retail dealers should see that they also make the profit that they should reasonably expect from the sale of such staple goods. There's no more use of selling goods for the fun of selling them, and the sooner the trade gets back to sound profits the better for everyone in it.

Trade Watch Repairing.—We direct the attention of our readers to the announcement of Mr. C. W. Coleman in another column. Mr. Coleman is one of the most experienced workmen in Canada, and guarantees satisfaction.

WORKSHOP NOTES.

Engravers' Cement.—Resin, 1 part; brick dust, 1 part; mix with heat.

Engravers' Border Wax.—Beeswax, 1 part; pitch, 2 parts; tallow, 1 part; mix.

Cement for Marble.—The following is a good recipe for preparing a cement that will unite marble, etc.: Melt together 8 parts resin and 1 part of wax, and mix the solution with 4 parts of Paris plaster.

German Silver.—An excellent German silver is prepared by smelting in a crucible 55 parts copper, 23 nickel, 17 zinc, 3 iron and 2 tin. This composition is in every respect equal to silver in appearance, fully as hard and not as vitreous.

Liquid for Cleaning Silver.—The following solution will be found to produce a high brilliancy in silver work: Cream of tartar 30 parts; sea salt, 30 parts; sulphate of alumina and potash, each 39 parts; water 1,500 parts. Boil the article in this mixture.

Cleaning Silver Filigree Work.—Anneal your work over a Bunsen flame or with a blowpipe, then let go cold (and this is the secret of success), and then put in a pickle of sulphuric acid and water, not more than five drops to one ounce of water, and let your work remain in it for one hour. If not to satisfaction, repeat the process. This is undoubtedly the best process that can be used.

Enameling on Brass and German Silver.—The adhesion of enamel to brass and German silver it is said, may be most perfectly effected by first engraving or pressing the design to be enameled into the alloy, and then coating the whole object, or only the depressed design, galvanically with copper. The enamel can be fused upon this surface as usual, and may then be bronzed, or silvered, or treated in any usual way.

Charcoal.—The charcoal used in soldering nor, in fact, any other charcoal used by the goldsmiths should not possess the evil habit of viciously snapping and cracking. Coal burned from oak, or any other course grained wood, will snap and crack, while a close, fine-grained, soft wood coal will not. The underlay coal may have its snap taken out by being heated very hot in an oven or by blowing the flame with a blowpipe upon it.

Mirror-like Designs on Glass.—An ingenious method of obtaining mirror-like designs on glass has been devised by Leclerc. The glass, having been silvered by the chemical process, is coated with a thin and uniform layer of sensitive bitumen, and this is exposed under a transpareucy, the next step being to wash away the unaltered bitumen with oil of turpentine, so as to leave the bitumen design on the silvered glass. The application of moderately strong nitric acid removes the silver, excepting where it has been protected by the bitumen, so that the metalic design shows like a mirror from the reverse side of the glass. The plate may be backed by paint or any other suitable material.

OTHER NOTES.

Effects of Different Kinds of Illuminations.—The tallow candle is the most unhealthy kind of illumination, while the electric light is the best. The latter produces only one-thirteenth part of the heat generated by a tallow candle and emits no carbonic acid or water. One gas flame is said to vitiate the air of a room as much as six persons do with their corporeal exhalation and breath.

Topazes.—A remarkable discovery of topazes was made lately in New South Wales. A portion of a large bluish-green crystal, of the weight of several pounds, was found in Mudgee and sent to the Colonial Museum. Several crystals of 2 to 3 inches were found in Uralia. One specimen of topaz, found in Guudagai, weighed more than 11 ounces, and another one, found in Gulgong, weighs 18 ounces.

German Pearl Fisheries.—The German pearl fisheries of Saxony and Bohemia, which were formerly very remunerative, are barely worth mentioning at present, as they are rapidly destroyed both by the natural cupidity of man and the filthiness of the streams. The department of the interior lately called the attention of the officials charged with the preservation of these grounds to existing laws, and exacts of them to energetically oppose the wholsale destruction.

Standard Meridian.—It is rather to be deplored that the international conference for establishing the prime standard meridian has adjourned without coming to any agreement. The meridian of Greenwich being almost universally used in the civilized world, and the basis of nearly all the meridianal calculations was proposed, but the French representation "kicked" against it, and, therefore, no satisfactory results were obtained. The world could not well get along without a body of scientific men, but it is rather sad to contemplate that each one of them has some pet theory of his own which he cherishes with all the love and devotion bestowed on a "hobby." When a lot of business men met in 1874 at Berne, and established the international postal union, the grandest piece of international fraternity, they transacted their business in a business-like manner; not so a body of savans, however; each one of them has some hypothetical theory, upon the recognition of which by all he bases his glory everlasting, and hence the difficulty of uniting them to act in harmony.

Editorial.

THE REBELLION.

With the gallant bayonet charge and the capture of Louis Riel and his followers at Batoche, the rebellion is practically ended. It is hardly probable, now that Poundmaker, White Cap, Beardy and half-a-dozen minor chiefs have surrendered unconditionally, that any serious difficulty will be found in disposing of Big Bear and his warriors.

Our citizen soldiers are to be congratulated upon their splendid behaviour ever since the campaign opened, and whether on the march or in the storm of battle, they have borne themselves in such a manner as to add new lustre to the Dominion of Canada. Of course everyone expected them to do their duty, but very few ever thought that they would, as they have done, prove themselves to be equal to any emergency and to face death with as much coolness and heroism as any veterans the world has ever seen.

Our soldiers have nobly and cheerfully done their duty in suppressing the rebellion and capturing the rebels, and while it is our privilege to honor them and welcome them back again to their homes, it is also our duty as true patriots to see that the leaders of the rebellion at least, are punished as justice demands. Of the guilt of the rebel chief, Riel, and his council, there can be no doubt, and there should be no unseemly delay on the part of the Government in bringing them to a speedy trial, and if found guilty, as they assuredly must be, to a speedy execution.

It is already more than hinted that the dominant French influence is bestirring itself to secure Riel's pardon, or at least his incarceration in some lunatic asylum on account of his alleged insanity. If this is so it is high time that the English speaking majority put their foot upon the neck of this political viper that the servility of both political parties has warmed into life and crush it at once and forever. Riel has been sane enough to foment two rebellions which have cost Canada much blood and treasure, and he is therefore a "sane" enough subject for the hangman, if convicted.

Those in power may as well understand that the English speaking people of Canada are in no mood to be trifled with. They ask justice, not revenge, and they are bound to have it if it cost the political life of the present Government and every French supporter (or master) of theirs to boot. The blood of our gallant heroes who died in the North-West demand it, and if it is denied by the chicanery of those in power, the very stones upon the streets will cry aloud for vengeance.

THE JOBBERS' ASSOCIATION.

The most of our readers will probably know by the time that this reaches them, that an association of Canadian jobbers in American watch cases has been formed for the purpose of regulating this important branch of trade and making a settled price on watch cases and movements. That such an Association was urgently needed, nobody who has any knowledge of the jewelry trade in Canada will for a moment deny, for during the past year and more it has been an open secret that prices have been slaughtered in such a manner as to make it next to an impossibility for a dealer to tell whether he had been buying at bottom prices or not. This feeling of uncertainty, coupled with the fact that some of those who bought "drives" in such goods were slaughtering them to the public has had a very bad effect, and it was only by firm and united action such as has been taken by our jobbers and manufacturers that confidence and prosperity could be restored. As things now stand no jobber can buy goods from the manufacturers unless they are members of the Canadian Association and agree to sell strictly at the uniform prices and on the terms fixed by the Manufacturers' Association. Any violation of these rules will deprive the jobber of his standing in the Association, and will cause him to forfeit his right to be considered a jobber. The manufacturers of both movements and cases are bound to refuse to supply him with goods and he will thus be practically out of the American watch business. The effect of this arrangement will be to establish a strictly uniform price for these goods and to enable the cash buyer to make certain that he is really getting the advantages his money entitles him to. Another very important feature about the arrangement is the curtailing of the terms of credit and bringing it down strictly to four months. According to the contract of the Manufacturers' Association, the terms henceforth to be allowed on such goods will be, list prices, four months net, or five per cent. discount for thirty days, or six per cent. discount for cash in ten days from date of invoice. Any violation of these terms will be construed by the Manufacturers' Association to be a violation of their contract, and force them to cut off the jobber violating them. The retail trade will thus see that as far as terms and prices are concerned, things are now on a much firmer and more satisfactory basis than they have hitherto been, and what they want to do is to form a league themselves for the purpose of protecting their own interests. Of this matter we propose to say something in a future issue.

The manufacturers in the agreement are as follows: Movement Manufacturers, American Waltham Watch Co.; Elgin National Watch Co.; Hampden Watch Co.: and Illinois Watch Co. Case Manufacturers, American Waltham Watch Co.; Joseph Fahys & Co.; C. N. Thorpe & Co.; Dueber Watch Case Manufacturing Co.; Blauer Watch Case Co.; Duhme & Co.; and the American Watch Case Co., of Toronto. The Canadian Association of Jobbers in American watches embraces all the bona fide dealers in these goods in Canada, and at their first annual meeting held in Toronto on Friday, the 22nd May, they adopted a constitution and by-laws and elected the following officers: President, M. Schwob, of Schwob Bros., Montreal; Vice-President, E. Scheuer, of Levy Bros. & Scheuer, Hamilton; Secretary-Treasurer, Geo. Chillas, of the firm of Lee & Chillas, Toronto; Directors, John H. Jones, of John H. Jones Co., Montreal, and John Segsworth, of

John Segsworth & Co., Toronto. This meeting was numerously attended and the utmost harmony prevailed, and it is thought by those most interested in the American watch business in Canada that this new departure (as far as this country is concerned) will have the effect of putting this very important branch of the jewelry business upon a much sounder basis than it has hitherto occupied.

ATTEND TO YOUR PAPER.

Readers of THE TRADER are not in ignorance of our views regarding the duty of every merchant who has respect for his credit and reputation in the matter of looking after his own business paper as it matures. We have tried repeatedly to impress upon our readers the vital importance of promptly attending to this matter and the evil consequences which must necessarily result from the violation of this business principle. There are scores of merchants in Canada to-day who are in bad repute and are almost entirely without credit, simply because they are careless about attending to their paper when it matures. They pay probably a fair amount on their notes, but it is like drawing their teeth to get it out of them, and as a consequence they don't get credit for what they do. On the other hand there are scores of others who do not pay any larger per cent. of their notes when matured, but they do it so promptly and with such good grace, that the wholesaler almost feels himself in their debt for their efforts to pay their own honest debts. We are satisfied that if merchants only knew how much wholesale men dislike dilatory and unsatisfactory settlements, and how much they appreciate prompt business-like transactions, they would be very careful in all such matters to do their business in a thorough business manner. A merchant's credit is a delicate plant and should be carefully shielded from any and everything that might tend to blight it. No man can guard it so effectually as the merchant himself and no person can injure it so easily as he can. Speaking of this very thing the *Winnipeg Commercial* says: "One of the worst characteristics of a poor business man, is a carelessness about attending promptly to his paper falling due, which is simply the worst development of want of punctuality." This is only too true and the worst part of it is that unless checked in the start it gets to be chronic and as a rule the person practicing it is the heaviest loser by his own folly.

It is just as easy and certainly more business like to attend to such matters promptly, and while it makes less work for everybody it promotes harmony and good feeling and leaves a disposition to oblige in the mind of the wholesaler where careless dealing causes distrust and disfavor.

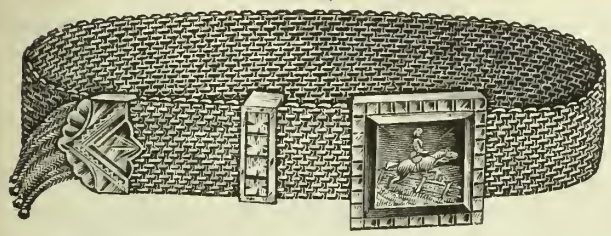
Selected Matter.

THE CITY COMPANIES.

REPRINTED FROM *Chambers' Journal.*

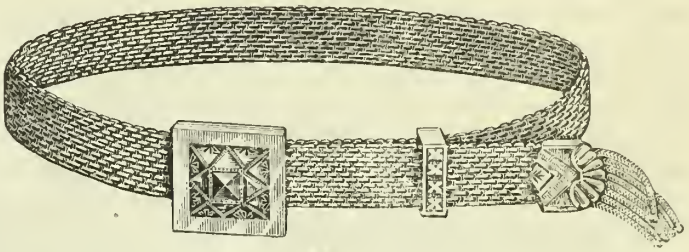
Some ponderous but interesting volumes have recently been issued in the shape of a series of blue books containing the Report of the Royal Commission which, under the presidency of the Earl of Derby, has been inquiring into the manner in which the estates and funds of the various Guilds and Companies of the City of London are administered. All the world has heard of the great wealth of the City of London, a sight of the shops in which, even so far back as the commencement of the present century, caused a famous Prussian general to exclaim in the midst of his astonishment: "What a city this would be to plunder!" The revelations made, however, before the Commission are such as will put into the shade all speculative calculations of the wealth of the "great city." The capital or the Livery Companies of London is now known to be about twenty million sterling, bringing in an income of seven hundred thousand pounds per annum! Owing to the increased value of houses and land, a great augmentation in the wealth of the Companies has taken place during the past ten or twelve years, in one case alone (the Drapers' Company) the increase reaching the handsome total of twenty thousand pounds in nine years.

The foundation of this vast fortune originated for the most part in charitable bequests, which have long since been diverted from the particular purpose which the donors had in view; and although the Companies have of late years given considerable sums for the promotion of technical education and other objects, yet the whole of such grants put together are an insignificant dole compared with the magnificent inheritance of which they are the custodians.



The Mercers' Company is the richest of them all, its income in 1880 being ninety thousand pounds per annum, which shows an increase in nine years (1871-80) of fifteen thousand pounds. In 1874 the Mercers spent in "court fees" over ten thousand pounds; but in 1880 only about nine thousand. In the management of their estates they spent in 1880 nearly eight thousand pounds, while salaries absorbed about six thousand. In "entertainments" they spent in 1880 five thousand pounds, as against seven thousand in 1874. Their charities, however, if they may be deemed so, including St. Paul's School, Mercers' School, the Whittington Almhouses, Trinity Hospital, Greenwich, and the grants they make in support of the Technical Institute and other London charities, amount to fifty thousand pounds per annum.

The Grocers had in 1879 upwards of forty thousand pounds a year, as against thirty thousand in 1870. They spend very little in court fees; and in salaries their expenditure in 1879 was three thousand six hundred and seventy-two pounds. In entertainments, etc., six thousand pounds were absorbed in 1879. They give away about twenty thousand pounds per annum for charitable purposes, and support, amongst other charities, the London Hospital.



The Drapers almost equal the Mercers with an income of about ninety thousand a year, as against seventy thousand in 1879. Of this large sum, "court fees and dinners" cost in 1879 some five thousand pounds; salaries four thousand; public entertainments, six thousand; rates and taxes, etc., nearly four thousand; and "public works in Ireland," furniture, plate, etc., nearly thirteen thousand, as against fifteen thousand in 1875. They spend about forty thousand pounds per annum on their charitable trusts and other public objects; their chief trusts being Bancroft's Hospital, a middle-class school, Orphanages for Girls at Bow and Tottenham, and the Greencoat Hospital at Greenwich. Beside which, they support the Technical Institute and other charities in London.

The Fishmongers have an income of fifty thousand a year. Court fees, salaries, and office expenses are stated to be in the aggregate about seven thousand pounds; while entertainments, etc., come to about nine thousand three hundred. Repairs and improvements in their famous Hall amounted in 1877 to nearly thirty-eight thousand pounds. Amongst the Fishmongers' trusts are St. Peter's Hos-

pital, Wandsworth, exhibitions at Oxford and Cambridge universities and the Technical Institute, to which, with donations to the London charities and to the poor-boxes in police courts, they devote from twenty to twenty-five thousand pounds yearly.

The Goldsmiths come next with about sixty thousand a year. Their Hall cost them, between 1870 and 1879, about thirty-five thousand. Their court fees are about fifteen hundred pounds; entertainments, seven thousand; and they spend on good objects some thirty thousand pounds a year.

The Clothworkers have between fifty and sixty thousand pounds a year. Their court fees in 1880 were three thousand five hundred; salaries, three thousand; entertainments, nearly four thousand; and repairs and expenses, etc., about seven thousand. They spend on charitable objects, such as the relief of the blind, their schools at Sutton-Valence, the Technical Institute, the Technical College, in Yorkshire, and the London charities, about thirty thousand a year.

It may be here explained that the "court fees" so freely mentioned in the above items of expenditure, are payments made to the members of the courts which govern the City Companies every time they attend business meetings. In fact, to use plain English, it is a division of a large part of the income of a Company among the members of the (so-called) executive body.

It will be seen that something like two hundred thousand pounds of their income is disposed of by the Companies in accordance with certain trusts; and the administration of these trusts will doubtless form the subject of another enquiry before thorough legislation can be attempted. Some of these trusts are in the shape of "doles," such as gifts of bread and fuel to the poor of certain parishes, loans to young men starting in business, portions to poor maids, etc., but these objects absorb but a small portion of the immense fund in question, and which, if well and properly administered, would make a grand addition to the educational resources of the whole community.

To join a London Company costs a good deal; but the investment carries with it some wonderful privileges. For instance it not only secures to the investor a life-long share in the dinners and entertainments of the Company, but in the case of a reverse of fortune, a room in a neat almshouse or a handsome pension. And strange to say, these benefits become hereditary, and are enjoyed by the investor's descendants, provided they choose to perform certain ceremonies. "Heredition" is carried out to such an extent that the Companies have their hereditary poor, hereditary diners, clerks, surveyors, chaplains, etc., and even cooks and beadles. Salaries, expenses, and entertainments cost about two hundred and seventy-five thousand pounds a year; and the almspeople and pensioners about eighty or ninety thousand pounds.

The Companies claim that these immense incomes are all their own, and that they have, therefore, a perfect right to to do with them as they think proper, even to the extent of dividing the spoil, as a certain legal community did a few years since. The government, however, think otherwise, and hence the appointment of the Commission whose report and recommendation we have before us.

The chief recommendation of the Commissioners is to apply to the City Companies the law of "restraint of alienation" which will place them under the control of the Treasury, and without whose permission they will be unable to convey land, sell out stock, or otherwise dispose of their property. The Commissioners also propose that, in future, the account of the annual expenditure of the Companies shall be published, in the same manner as municipal corporations and joint stock companies, and even the universities of Oxford and Cambridge. This measure of reform will certainly be a very necessary one, for until the Report of the Commission was issued, no members of the City Companies, except the chosen few who form the "courts," had any idea as to what their respective guilds were worth, where their property was, or how they spent their money.

The fancy "Livery Franchise" is to be abolished, and there is to be a redistribution of the various revenues, and an allocation to objects of public utility of a considerable percentage of the immense sums already described. To carry this out, however, it is proposed to appoint a special Commission, with power to inspect and inquire into the title deeds, etc., of the various trusts, and to create new trusts in the place of those which have become obsolete. It is also proposed to put a fifty years' limit to the "hereditary" business, and that compensation should be given to all persons who may be injuriously affected by the carrying out of the Commissioners' proposals.

Thus a great reform is about to be instituted, which will at last enable the people of London to enjoy the benefits arising from a splendid inheritance, which is theirs by right, and which will be productive of great good in the future. When this change has been carried out and the London Municipal Bill has passed into law, the inhabitants of the great city will be able to congratulate themselves on the fact that at last London has become in reality what it has long been in name only, namely, the finest and best governed metropolis in the world.

WATCH LORE.

"Fine time-keeping," recently remarked a well known up-town jeweller, "is not confined exclusively to the higher-priced style of watches. Many of the cheap movements rival their more costly competitors in the matter of reliability. Few men care for very accurate timepieces. With the exception of railway engineers, upon whose punctuality often depends the lives of hundreds, a watch which records the time within a minute a week is as valuable as any other. In 1876 a cheap grade of nickle-cased watches were made, which at once became very popular. The works were made of brass, with as little money spent on finish as possible—only the parts requiring polish received it. They were sold from $6 to $12, and, like new newspapers, they filled a want long felt. Since then the manufacture of these watches has increased a thousand fold, and now no timepiece finds a readier sale.

The jeweller fished out of a dazzling array of timekeepers a few of the most valuable ones. One was encased in a gold shell with the crystal set flush with the rim. It was about the shape and as smooth as a thin polished biscuit. This timepiece was a split-second chronograph or horse-timing watch. Around the dial there were sixty figures instead of twelve, one for each second. These were all subdivided into four divisions by delicate hair-line marks. Upon the pressure of a convenient spring in the rim of the watch, the one hand is instantly divided into two hands, one of which pursued the circular journey alone, while the other remained to record the distance already gone over. Another touch upon a sim-

In compliance with an increasing demand, we have placed on the market a

NEW PATENT DUST-PROOF

SCREW BEZEL

Silver Open Face Stem Winding Case

embodying many of the excellent qualities of our original Patent Dust Proof Case, though offered at a lower figure.

The back and center of the new case are made of one continuous piece of solid silver, into which an Albata Cup is screwed identical in shape with the back, thus greatly strengthening it and efficiently protecting the Movement against dust.

THE NEW CASE WILL BE CALLED

ALBATA CUP SCREW BEZEL

We shall continue the manufacture of our popular Patent Dust-Proof Case with Screw Crown and Screw Bezel in all the styles as heretofore, plain and inlaid, with Lever and Pendant Setting.

FOR SALE BY ALL JOBBERS.

ROBBINS & APPLETON,

GENERAL AGENTS OF THE

American Waltham Watch Co. of Waltham, Mass.

NEW YORK, BOSTON, CHICAGO,

LONDON, SYDNEY.

ilar spring, stopped the hand, and still another pressure, and the two hands instantly re-united and flew back to their original place on the dial. The hour and minute of the day were recorded by a brace of hands on a sunken dial about the size of a dime at the right of the centre of the large dial, and a stubby hand told off the seconds on a similar dial at the left. This watch was valued at $600, and contained many, but by no means all the latest inventions in watchmaking. There was another watch in a case of a far more elaborate pattern, fabricated out of a rich copper-alloy gold, and highly polished. Its rim was corrugated with knobs and springs. This was not only a chronograph, but a repeater as well. Near the hinges was a small slide. When this was moved, there followed a low buzzing sound like a distant swarm of bees, and a deep-toned silver bell struck the hour, while a smaller one rang out the minutes. At night this is a valuable feature, and often saves many fruitless and profane searches, over unexpected and unheard of obstructions ; for matches, which are never where they ought to be, and for gas fixtures which have invariably and mysteriously shifted their places after the light has been extinguished.

Another watch had, in addition to the chronographic and repeating attachments, a perpetual calendar. This was the gem of the collection, and was worth 1,200 dollars. It had split second hands, but the hour and minute hand travelled the same course as in an ordinary timepiece. There were three little sunken-dials below the centre of the large dial. In one a short second hand pointed out the day of the week, which was indicated in small red letters. In another was told the month, and in the remaining one the day of the month was denoted. Directly under the figure "12" was a crescent-shaped dial with a black background, in which rose and set a golden moon. By this watch the phases of the moon, the time of the day, the day of the week and month, and the name of the month were all told, leaving the fortunate owner only the year of our Lord to remember. In addition to these horological and astronomical accomplishments, the bells struck the quarters of the hour as well as the minutes, by a combination of the two bells making an embryo chime. The tone of these silver bells was so sweet, that an appreciative owner might at first be tempted to lie awake half the night to hear them strike. There was a vast variety of other fine watches, telling everything that a man should have any right to expect from one single timepiece, and ranging in prices from $200 to $1,200.

"These," resumed the jeweller, "are all made by our firm, at our Swiss factory, and rival the most celebrated works of the European makers. The calendar watches have such complicated machinery that they are very liable to disorder. Extreme care must be taken with them, as there are probably not a dozen men in this city who could repair one when it needs a watchmaker's attention."

The cases of some of the watches shown were of fanciful designs. One was of red gold with a dull finish, and made to perfectly represent alligator leather. Another was of yellow, hammered gold, equally as rich as the former, but not as durable. One of the most curious patterns was a racing scene. The figures were done in gold and platinum and riveted to the case, where they stood out in bas-relief. The crown of the stem was a golden jockey's cap. As might have been imagined, this was a horse-timing watch. A very handsome one was made of small gold and platinum squares like a checker board. The blocks were of the same metal clear through and were welded together.

"The watches having the greatest reputation," continued the jeweller, "are made in England and Denmark, but our own American makers and some Swiss watches are equally as reliable timekeepers. Watchmaking is not a secret art, and the names of good watchmakers are legion. Some of the foreign jewellers are shrewd advertisers. They often leave some of their better grade of watches in the great astronomical observatories to be regulated by the planets, as it were. The attendant who winds them daily and records their variations is not a jeweller, and understands nothing whatever about timepieces. After leaving them there for several months, their records are sent with the watches back to their owners. This trial is supposed by some persons to lend an additional value to the watches, but in reality it does nothing of the sort, for the variations of a watch which is kept in a cool room in a perfectly stationary position is not at all similar to the record the same movement will make in a gentleman's waistcoat pocket. A man doesn't buy a watch to hang it up like a clock. It must, therefore, be regulated for his use personally. A watch which accurately records the time for a bank-president would be little good for a railroad conductor until it had been regulated to suit its new ownership.

" 'What is the finest time I ever knew a watch to keep?' We sold ex-Corporation Counsel William C. Whitney a watch which ran from one December until the next May—five months—and only varied seven seconds during the entire time. Our ordinary fine watches are only guaranteed to keep time within a second a day."—*New York Graphic.*

THE SHAKESPEARE BROOCH.

The Shakespeare brooch is formed of a narrow band of silver bent into the shape of a heart, about an inch in length and a little less in width. It originally contained twenty-two crystals, three of which are missing, and above is a coronet of three red and two blue stones, two of the settings being filled with solder, and the third is open without a stone. It was found in the year 1828 by Joseph Smith, a laboring man, who was engaged upon some excavations on the site of the house in which Shakespeare passed the last sixteen years of his life, New Place, Stratford. Smith gave it to his children to play with, and presently, when the dirt had worn off, he found the name W. SHAKESPEARE upon it, and another word, which on scraping to make it plain, became quite obliterated. Captain Saunders, and also Mr. R. B. Wheeler, of Stratford, both eminent antiquaries, wanted to buy it, Captain Saunders offering £7 for it; but Smith, although so poor, would not sell it. Saunders wrote a notice, accompanied by two engravings of it, for the *Mirror* of September 26th, 1829, in which he stated that "the brooch was considered by the most competent judges and antiquaries, in and near Stratord, to have been the personal property of Shakespeare.' Smith occasionally made money by showing the brooch to visitors, but having ten children, and being very poor, he once claimed parish relief, which was refused while he possessed so valuable a property as the brooch. He then left his family for a fortnight, and on his return underwent three months imprisonment for desertion, which would have been remitted had he consented to sell the brooch. A resident of Stratford, a Mr. Harborne, advanced money to Smith

AN OPEN LETTER OF SPECIAL INTEREST TO THE RETAIL TRADE OF CANADA.

TORONTO, May 28th, 1885.

GENTLEMEN,

The manufacture of Fine Gold Watch Cases is one of the most intricate as well as the most exact of mechanical operations. If not properly constructed and fitted in every part, it is practically useless, and certainly far from being "a thing of beauty and a joy forever." In a perfect watch case, three things are absolutely necessary, viz., (1) first-class material, (2) tight jointing and fitting, and (3), a perfect finish. The American Watch Case Company, of Toronto, claim to combine in the Cases of their manufacture all these essentials, and to produce as perfect a Case as any in the world. We have fitted up our new factory with the latest and most improved American machinery, use only pure gold from the U. S. Mint, and employ the most skilled workmen that can be had in the best U. S. factories. This being the case, we have no hesitation in asking the Trade of Canada to purchase our Cases on their merits, feeling satisfied that as far as quality of material and perfection of finish is concerned, they are equal, if not superior to any similar goods imported into this country.

As regards price, we claim that our goods can be sold fully twenty per cent. lower than any imported goods of equal quality that are honestly entered through the customs and pay the usual duty demanded by Government. Three-fourths of the value of a gold case is in the material. Importing it as we do in the form of bullion direct from the mint, it comes in free of duty, but if manufactured before it is imported, a duty of twenty-five per cent. is levied upon it by the customs authorities. The Trade will thus see that we offer them Cases equal to any imported, on which this expenditure for duty is saved, and that by handling our goods they will be enabled to sell an equally good Case at a very much lower price than they have been formerly compelled to charge for the imported article. We have laid down the following platform in regard to the manufacture of our goods, and shall not depart from it on any consideration. 1st. We manufacture no goods without our own Trade Marks. 2nd. We stamp no goods of higher quality than they really are. 3rd. We guarantee the quality of every Case we make to be as stamped upon it.

GUARANTEE OF QUALITY.—The AMERICAN WATCH CASE COMPANY OF TORONTO guarantees every Case manufactured by them and bearing any of their Trade Marks as above to be of the quality stamped upon it according to the U. S. Standard.

Dealers and the public can therefore buy Goods bearing this Stamp with the full assurance that they are getting the quality exactly as represented and no other, a great point in these days of stamped up Goods, and one we feel sure that they will not be slow to appreciate. We have just sent out to every Retail Jeweler in Canada a complete list of the Gold and Silver Cases of our manufacture, and the prices and terms at which they can be had from the Jobbing Trade. We sell no Goods direct to the Retail Trade ; but they can be procured at our Catalogue Prices from any of the leading Jobbers in Canada. Assuring you of our best desire to give you honest goods at honest prices, we are,

Yours very truly,

American Watch Case Co., of Toronto

SPRINGFIELD ILLINOIS WATCHES

MANUFACTURED BY

THE ILLINOIS WATCH CO.,

SPRINGFIELD, ILLINOIS.

ESTABLISHED 1870.

KEY AND STEM WINDERS OF ALL GRADES.

FULL DESCRIPTION AS FOLLOWS:

18 SIZE GILT.

"**STUART.**"—Adjusted D. S. dial, 15 jewels (4 pairs in settings), exp. bal., tempered hairspring, patent regulator.—STEM.

"**No. 108.**"—Engraved "Illinois Watch Co." same as Stuart.—STEM.

"**BUNN.**"—Adjusted D. S. Dial, 15 jewels (4 pairs in settings), expansion bal., tempered hairspring, patent regulator.—KEY AND STEM.

"**MILLER.**"—Adjusted, S. S. dial, 15 jewels (4 pairs in settings), expansion balance, tempered hairspring.—KEY AND STEM.

"**No. 5.**"—Adjusted, engraved "Illinois Watch Co." S. S. dial, 15 jewels (4 pairs in settings), expansion balance, tempered hairspring, pa- regulator.—KEY AND STEM.

"**No. 4.**"—"Railroader." Locomotive engraved on plate, S. S. 24 hour dial, 11 jewels in settings, expansion balance, tempered hairspring, patent regulator.—STEM.

"**CURRIER.**"—S. S. dial, 13 jewels (3 pairs in settings), expansion balance, tempered hairspring.—KEY AND STEM.

"**No. 3.**"—Damaskeened plates, engraved Illinois Watch Co., S. S. Dial, 11 jewels, expansion balance, tempered hairspring, polished bright screws, raised silver index.—KEY AND STEM.

"**No. 2.**"—Engraved "Illinois Watch Co." S. S. Dial, 11 jewels, exp. balance, tempered hairspring.—KEY AND STEM.

"**I. W. CO.**"—S. S. dial, 7 jewels, expansion balance, tempered hairspring.—KEY AND STEM.

18 SIZE NICKEL.

"**No. 105.**"—Full Nickel. Adj., engraved "Illinois Watch Co." in gilt letters, D. S. glass enamel dial, 15 jewels (4 pairs in gold settings), expansion balance, Breguet hairspring, patent regulator.—STEM.

"**No. 106.**"—Adjusted, engraved "Illinois Watch Co." D. S. dial, 15 jewels, (4 pairs in settings), expansion balance, tempered hairspring, patent regulator.—STEM.

"**No. 102.**"—Engraved "Illinois Watch Co." S. S. dial, 13 jewels (3 pairs in settings), exp. bal., tempered hairspring.—KEY AND STEM.

"**No. 101.**"—Engraved "Illinois Watch Co." S. S. dial, 11 jewels, exp. balance, tempered hairspring.—KEY AND STEM.

8 SIZE STEM WINDERS.

"**No. 156.**"—Full Nickel. Adj., engraved "Illinois Watch Co." S. S. glass enamel dial, 15 jewels (4 pairs in settings), expansion balance, tempered hairspring.—STEM.

"**No. 154.**"—Full Nickel. Engraved "Illinois Watch Co." S. S. dial. 15 jewels (4 pairs in settings), expansion balance, tempered hair- spring —STEM.

"**No. 152.**"—Gilt. Engraved "Illinois Watch Co." S. S. dial, 11 jewels in settings, exp. balance, tempered hairspring.—STEM.

"**No. 150.**"—Gilt. Engraved "Illinois Watch Co." S. S. dial, 11 jewels, expansion balance, tempered hairspring.—STEM.

All movements have patent pinion, and all are quick train. All Stem Winders made to fit hunting and open face cases, the latter bringing figure XII at the pendent.

Orders for movements with special engraving in grades above I. W. Co., received in lots of 5 and upward without extra charge.

Special attention is called to our I. W. Co. which is the ONLY low priced movement in the market having ALL the following improvements: SUNK SECOND DIAL, PATENT PINION, DUST BAND, QUICK TRAIN, EXP. BALANCE, TEMPERED HAIRSPRING.

Our No. 5 is the CHEAPEST ADJUSTED, FULL JEWELED, PATENT REGULATOR movement MADE.

Our No. 150 8 size Ladies' Watch is of superior finish, low priced and guaranteed the BEST CHEAP LADIES' WATCH ever produced.

FOR PRICE LISTS AND FULL PARTICULARS, send to the following JOBBERS who carry a FULL LINE of ILLINOIS WATCHES:

HAMILTON.—A. C. ANDERSON & CO.

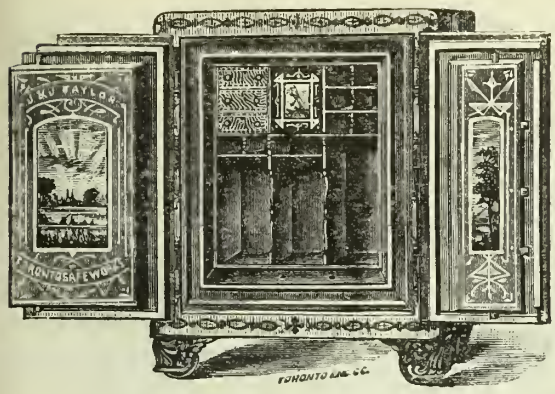
STRATFORD.—WM. E. JONES.

from time to time upon it, and it was exhibited for their joint benefit at his house, the Coach and Horses in Henley Street. On one occasion a lady, an actress, called to see it, and pressing it enthusiastically to her bosom, exclaiming, "Oh, my Shakespeare!" she broke it into two pieces. It was clumsily soldered by a tinsmith, of Stratford, as is now apparent. Smith never being able to repay the loans, eventually gave up all claim to it. After lying quiet for some years it was bought by its present possessor, Mr. John Rabone, of Birmingham. Besides the fact of the brooch having been found on the site of Shakespeare's house, New Place, the peculiarities of some of the letters engraved upon it tend to show that it was coeval with his time. The letter W with the middle members interlaced, as seen on the brooch, was very much in vogue in the sixteenth and the beginning of the seventeenth centuries. Shakespeare's signet ring in the Stratford Museum has this interlaced W. At the same period it was a common custom to join two letters together, as T and E or H and E, and in the lines on the stone over the poet's grave invoking protection for his dust and malediction on those who disturb his bones, occur two cases of this kind where T and H are joined, having but two perpendiculars between them. On the brooch the three letters H. A. K. are joined together, the second member of the H and the first one of the K doing duty, each for its own letter, and standing for the two members of the A as well. An example of three letters being joined together occurs in the lines under the bust of the poet, commencing, "Stay, passenger, why goest thou so fast?" and there the T H E are joined together, the upright members of the T and E standing also for the two of the H. It is curious that these instances of triple letters should be on the brooch and on the tomb, both be connected with Shakespeare. In 1864 the brooch was submitted to Mr. J. H. Pollen, then of the South Kensington Museum, who wrote that he "saw no reason to doubt its antiquity or the description which accompanied it." And recently, on its acquirement by its present owner, Mr. J. W. Tonks, of the firm of Messrs. T. and J. Bragg, of Birmingham, who has had frequent opportunities of studying specimens of of ancient jewelry and decorations, said of it: "The 'cutting' is French, and of a primitive mode not generally practiced after the Restoration, and the style of the 'setting' is that of the sixteenth century. The brooch has every appearance of an antiquity bringing it at least as early as the time of Shakespeare." Confirmatory evidence of the antiquity and the period of the brooch is afforded by a number of specimens of silver brooches marked "Luckenbooth Brooches of the sixteenth Century" recently added to the Museum of the Society of Antiquaries of Scotland, Edinburgh. They are mostly in the form of a heart, or contain a heart within their lines, and to some of these the Shakespeare brooch bears a striking resemblance. There is no doubt of the antiquity of these brooches. The Luckenbooth brooches were of French manufacture, the sale of them being chiefly in Edinburgh at the Luckenbooths, or wooden shops closely surrounding St. Giles's Cathedral, whence their name. It is noticable that all those, so far as is known in the possession of private individuals, came from Scotland. A clergyman in the neighborhood of Birmingham, the Rev. W. K. R. Bedford, rector of Sutton Coldfield, has one of the same pattern, and with the same number of stones as the Shakespeare brooch. It was formerly possessed by Charles Kirkpatrick Sharpe, Esq.. an intimate friend of Sir Walter Scott, by whom it was always regarded as a valuable specimen of a Lookenbooth brooch. Shakespeare in the second part of King Henry the VI., Act 3, Scene 2, makes Queen Margaret, in recounting her dangers on the sea, say—

> I took a costly jewel from my neck—
> A heart it was bound in with diamonds.

That Shakespeare was acquainted with this particular form of the Luckenbooth Brooch is clear from the above quotation, and what more likely than that it should be a description of the "jewel" he himself possessed. The brooch has been publicly exhibited but twice, once at the Shakespeare Show in the Albert Hall this year, and a few weeks ago at a soiree of the Birmingham Natural History and Microscopical Society, and on each occasion it was regarded with great interest. The council of the Shakespeare show requested Mr. Rabone to allow them to make a fac simile of the brooch to be worn as a badge by the officials. He refused to allow the back to be copied, but an enlarged copy of the front was made and worn at the show with good effect. At the soriee in Birmingham, above referred to, there was another of heart-shaped Luckenbooth brooches worn by a young lady present, it being described as an heirloom from Mary Beaton, one of the "four Maries" of Mary Queen of Scots.—*Exchange.*

THE FIRST LOCOMOTIVES.



A correspondent of the "Railroad" sends the following interesting letter to Winnipeg, Manitoba:—

Mr. Whitehead is the oldest active railway man alive: the last living link that binds the marvelous present to an antiquated past. As such his story is an interesting one, especially to all railroad men. He was born in an age when the stage coach was the only means of overland travel, and when even the motion of six miles an hour was considered dangerous to human life. Robert Stephenson was at that time the engineer of the stationary steam engine in a Newcastle-on-Tyne coal mine, and day-light was just dawning on an invention which will make his name famous in all coming ages, and which has already proved so great a blessing to the world. About this time application had been made to Parliament to construct a canal between Darlington and Stockton, on Middleboro, a distance of 25 miles. Mr. Stephenson went to Darlington, saw Edward Pease, and unfolded to him the idea of a railway. Mr. Pease was fully convinced of the practicability of the scheme, and through his influence it was decided to apply to Parliament for a charter to build a railway. It was four or five years before the charter was obtained. It was a new thing and many were opposed to it. Another objection was that the inventor was only a poor coal miner. Stephenson was examined and asked how fast his new fangled machine would run. When he replied from 10 to 12 miles an hour, they regarded him as a lunatic.

"Suppose a cow should get on the track," said a noble lord, "what would the consequence be?"

"It would be a bad job for the cow," replied Mr. Stephenson.

Meantime Robert Stephenson had made considerable headway in perfecting his invention. He built the first one himself at Newcastle, and called it "Locomotion." It weighed about eight tons, had four wheels, and walking beams like a lake or river steamer. A large wooden

MONTREAL OPTICAL & JEWELRY CO., Limited.

hogshead was fixed on the tender for a water tank. In due time the first railway was completed and a day fixed for its formal opening. It was the 27th of September, 1825, over 58 years ago. It was a beautiful warm day.

"I remember it as if it were yesterday, though I was then only a boy of 12 years," said Whitehead. "Everybody was talking about the great event, at that time; the greatest discovery of the age. The Iron Horse was on everybody's tongue. Telephones, telegraphs, and the penny postage were unknown, but women, and men too, for all that, gossiped as lively then as they do now; and indeed, more so, for they had more time.

The first appearance of the "Iron Horse" on the grand race course of human achievement, was witnessed by thousands of awe-stricken spectators. I was among them. All England was represented there. The first reverberations of that thunder from the iron way, much feebler then than now, but which has startled a world into new life and aroused the nations of men into new energy, struck terror into the hearts of many of the great multitude present. Two trains started from Shipton that forenoon laden with coal. One was drawn by the "Locomotion," James Stephenson, engineer, a cousin of Robert Stephenson. The other was drawn by an engine named "Enterprise," Robert Morrow engineer. As they whirled by the spot where I stood, at the rate of ten miles an hour, the spectators were beside themselves with astonishment.

"They call it an "Iron Horse," ejaculated a lady, "but where are its feet?" That was a poser.

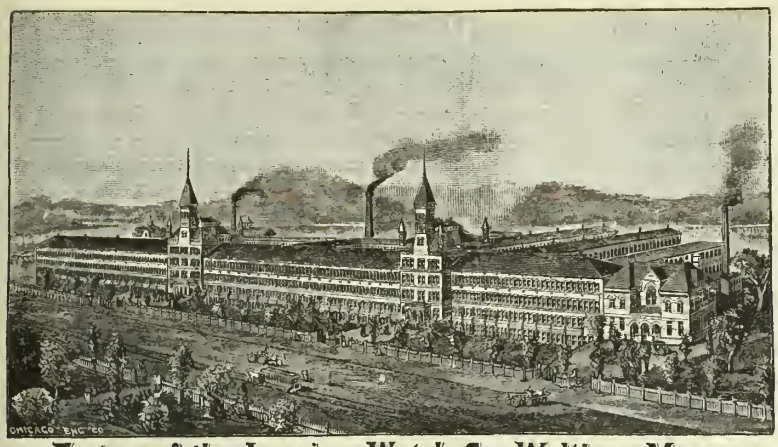
"From Shipton to Stockton, four miles, was down grade, and the engines were able to haul almost any quantity of coal down, but the trouble was to get back again. Three heavy grades were encountered on the return journey and the most the locomotives could do, was to haul back 12 or 14 empty cars, capable of carrying three tons of coal each, and when there was a head wind blowing the train had to stand still until it went down. The track was four feet eight and one-half inches wide, the standard gauge of to-day all over the world. The rails, fish-bellied in shape, were four feet long, laid on blocks two feet long. The ends of the rails were half-lap joints, laid in a chair. These were fastened by a nail driven through the holes in the end of the rail, and the chair.

"I rode up and down on the engine until I became quite a favourite with James Stephenson, the engineer, and when in 1827, the fireman was appointed to the charge of a stationary engine at the incline, I was appointed to the important position of fireman of the "Locomotion" (a big thing in those days) with a salary of 50 or 60 cents a day.

"But even at that time we had no idea of carrying passengers by steam. The body of an old stage-coach had been fixed on railway wheels, and passengers were hauled up and down the track by horse-power. Nobody dreamed of traveling by steam. Well, there was quite a number of old passenger coaches standing in the yard. One day when a new engine, the "Wilberforce," arrived, some of the spectators suggested that it would be a good idea to see if the "Wilberforce" could haul the passenger coaches. No sooner said than done. The spectators filled the coaches. The "Wilberforce" hitched on, and the first passenger railway was found to be a success.

"The old "Locomotion" is now standing up on the pedestal of brick at Darlington Station, the wonder of the tens of thousands of people who visit the historic spot.

"After firing awhile and running some, I was promoted to be general inspector of the railway, and later became a contractor and built a good many miles of road in England. In 1849 I came to Canada with my family and settled on a farm. But I did not care much for farming as it was done in Ontario at that day; and two years later I took a contract on the Great Western from Copetown to Harrisburg. After that I took several contracts on this and the Buffalo, Brantford & Goderich Railway. In 1874 I took a contract for grading the Canada Pacific Railway from Emerson to the points near Winnipeg. I afterwards built the branch from Winnipeg to Selkirk. In all I have built in Canada 350 miles of railway. I believe I am the oldest railway man living. There were others a few years ago, but they have all died, and I am the sole representative of the railway employes of 1825. Railways have not reached perfection, and I believe the improvements of the future will be as great over the roads of to-day as the railroading of the present is superior to that of 1825."



NOTE.—We think Mr. Whitehead is mistaken about the name of Stephenson's first locomotive. It was called "The Rocket," and is, as he says to be seen at the Darlington Station to this day.—*Editor Trader.*

BLEMISHES ON THE STANDARD DOLLAR.

Morgan, the English engraver of the die for the standard or "buzzard" dollar, animated perhaps by an ambition similar to that of the youth who fired the Ephesian dome, smuggled into his work in two places the initial letter of his surname. Although microscopic in size, these "Ms" are plainly discernible on the coin even to the naked eye after a careful search. An eagle-eyed Wall street man recently discovered one of the letters and started among his acquaintances the following puzzle: "Find three letter Ms on the standard dollar." Two are readily found—one in the word "unum" and another in "America," but the third is not so easily found. An interview with Chief Drummond of the United States Secret Service, showed that there are four Ms instead of three, and the fourth, hitherto unnoticed even by Wall street men, was pointed out to the reporter. Mr. Drummond laughed when his attention was called to the matter and said: "The presence of these extra letters on the standard dollar was first brought to my notice by one of my clerks. They were of course cut in the die by Morgan." The chief of the secret service acknowledged that they had not escaped the attention of the counterfeiter, who had placed them on the false coins.

Similar instances of the mutilation of dies are recalled in the case of English and French engravers' work. Wyon, the artist to the English mint, many years ago, placed on the plate of a postage stamp a "W" on so minute a character that for years the stamp circulated without a doubt of its perfection. The eventual discovery of the blemish created a sensation in England; the objectionable edition to the word was promptly erased, and a stringent law passed against the commission of a like offence. In the reign of Napoleon III, an engraver placed the initial letter of his surname on the plate for a stamp. This also was of such microscopic dimensions that it escaped detection for a long time. The discovery of the fact led to the same result as in the English case.—*Jewelers' Journal.*

WHITE ENAMEL.—There are many receipts for the making of cold white enamel; it is inseparable, however, from a yellowish sheen by taking simply white color and the usual ingredients. To obviate this, add an atom of black or blue, and the color will at once change to a lively, pure white.

BUSINESS NOTES.

Joseph Mowat, hardware merchant, Durham, Ont., after a long struggle has been forced to assign. Mr. Mowat deserved success and we are extremely sorry to have to chronicle his reverse.

R. H. Killaly, hardware merchant of Cannington, Ont., has also got into difficulties and called a meeting of his creditors. Mr. Killaly has been going back for some time so that this event has not been altogether unexpected in well informed business circles.

J. C. Diggins, lately in business in Strathroy, as a jeweler, and whom we had occasion a few weeks ago to write pretty plainly about, has left Canada and gone to Portland, Oregon, U. S. It is to be hoped that Mr. D. will do business there on sounder principles than he did in Strathroy.

Messrs. P. W. Ellis & Co., the well known manufacturing jewelers of Toronto, have just completed arrangements with the present owner of the building lately occupied by Samuel Stern, to fit it up for them as a warehouse and factory. When the contemplated alterations are completed this enterprising firm will have one of the largest and best equipped factories in America, and sales rooms and offices worthy of their large business.

Russel's Jewelry Store, at present run by Mr. Cuthbert, was entered by burglars on the night of the 13th May. The thieves ransacked all the show cases, taking with them gold and silver bracelets, earrings, lockets, spectacles, chains, silver cups and other goods, estimated at $1500. The watches were secured in the safe, and not molested. The robbery is regarded bold, as there is a policeman in close proximity all the time and a private watchman engaged on the premises. Since the above was in type we are glad to learn that the thieves have been captured and the stolen property recovered.

We were favored last month by a call from Mr. Perry, the general travelling agent of the Hampden Watch Co., of Springfield, Mass. Having a little spare time Mr. Perry thought it well to act as missionary and enlighten the Canadian brethren as to the merits of the "Hampden Watch." He says that to his astonishment Canadian jewelers know about as much about "Hampdens" as he did himself, so that his work was like carrying coals to Newcastle. Another proof that merit will tell.

H. F. Bohl, Jeweler, Brockville, has been sold out by some of his creditors. It appears that Mr. Bohl got involved beyond his depth and instead of calling a meeting of his creditors as he should have done and placing himself in their hands, he violated the commonest principles of justice and business by letting one of his largest creditors come in and help himself to the best of his stock in order to liquidate the account. Hearing of this some of the other creditors obtained a chattel mortgage from him and foreclosed a few days afterwards and so put him out of business. We do not think Mr. Bohl had any intention of being dishonest, but he certainly acted very unwisely in not treating all his creditors alike.

Our sanctum was also invaded by Mr. A. G. Funck, the general agent of the Illinois Watch Co., who was doing Canada "for the good of his health," and taking in a little business at the same time as is the usual custom of our live neighbors to the south of us. Mr. Funck, since his appointment as New York agent of this company has been pushing things pretty lively, and has proved himself to be the right man in the right place. This company is now making a strong bid for public favor by putting on the market an improved quality of goods and they point to their No. 5, and I. W. Co. movements as being the best value in the market to-day for the money. Mr. Funck reported sales in Canada large for this season of the year and expects to do big things in the near future.

Every one in Canada has heard about the robbery about a year ago of Mr. James Trotter, of Galt; Ont., and how the thieves got away with their booty and were never heard of afterward. Strange to say after all efforts to recover the stolen property had proved fruitless, the secret accidently came to light a few days ago and now Mr. Trotter stands a good chance either to recover the goods or get the money for them. It appears that they were "fenced" in Buffalo and the person who had charge of them being wanted for some other felony caused the discovery of Mr. Trotter's property. Mr. Trotter and his assistant went to Buffalo and identified his goods, and it is highly probable that he will get them or the money very soon. We trust it may be so.

We direct the attention of our readers to the removal of the Toronto office and Warerooms of Messrs. Goldie & McCulloch, of the Galt Safe Works, to new premises at No. 56 King St. West, next door to the *Mail* building. We were glad to see this old established and reliable firm opening out in Toronto about a year ago, and must now congratulate them upon their so soon finding it necessary to increase their accommodation. This branch of their extensive manufacturing business has grown so rapidly that they have been constantly compelled to increase their producing facilities until they now have one of the most extensive and complete safe works in the Dominion. Their business here has, under the able management of their Toronto representative, Mr. Geo. F. Bostwick, grown to such an extent that the removal to the above large and commodious premises became, not a matter of choice, but of necessity, and we trust their business will still continue to increase and give them that reward which is due to sterling integrity and honorable dealing.

Enterprise—We had the pleasure last week of being shown through the immense establishment of Messrs. Hemming Bros., fancy case manufacturers of this city, and were delighted beyond measure at the enterprise and taste that this young firm have shown. Standing conspicuously in their show room is a model jewelers window (the joint product of Mr. Millichamp and themselves,) that every dealer visiting Toronto should call and see if they wish to attract the public by the maximum of elegance at the minimun of cost. It is one of the most tastefully decorated windows we have ever seen and might profitably be adopted by plenty of our retail dealers who desire to have something new and attractive. Messrs. Hemming are now making a specialty of new set jewelry fittings for show cases by means of which a dealer can show his stock more advantageously and safely and save time and money in doing so. Their factory is very complete in every detail and they have evidently spared no pains to get to the very tip top of their business. Such enterprise merits success and it seems to us to be only a question of time when the "Horseshoe" trade mark which this firm have adopted will be as sure a passport to favor as the stamp of Joseph Rogers & Son on a pocket knife.

WORKSHOP NOTES.

To Take Spots off Gilding.—Boil common alum in soft, pure water and immerse the article in the solution, or rub tho spot with it and dry with sawdust.

Black Varnish For Iron.—Asphaltum, 1 pound; lamp black, ¼ pound; resin, ½ pound; spirits of turpentine, 1 quart; linseed oil, just sufficient to rub up the lampblack with, beforo mixing it up with the other ingredients. Apply with a camel's hair brush.

Gilding Without Battery.—Articles which do not require much handling, may be quickly gilt without battery as follows: One part of chloride of gold and 4 parts cyanide of potash are dissolved in boiling distilled water, and the gilding fluid is ready; the articles are hung into this hot solution, tied by a fine copper wire to a strip of zinc, scratched clean, left in it for a few minutes, and they will be handsomely gilt.

Varnish for Brass Instruments.—An excellent gold varnish for brass objects, surgical or optical instruments, etc., is prepared as follows: Gum lac, in grains, pulverized, 30 parts; dragon's blood, 1 part; red sanderswood, 1 part; pounded glass, 10 parts; strong alcohol, 600 parts; after sufficient maceration, filter. The powdered glass simply serves for accelerating the dissolving by interposing between the particles of gum lac and opal.

To Recover the Gold Lost in Coloring.—Dissolve a handful of sulphate of iron in boiling water, add this to your "color" water, it precipitates the small particles of gold. Now draw off the water, being very careful not to disturb the auriferous sediment at the bottom. You will now proceed to wash the sediment from all traces of acid with plenty of boiling water; it will require three or four separate washings, with sufficient time between each to allow the water to cool and the sediment to settle, before pouring the water off. Then dry in an iron vessel by the fire and finally fuse in a covered skittle pot with a flux as before directed.

Mat Brushing.—Very excellent results are obtained by running the fine wire matting brush at about 2,500 revolutions per minute, applying rain water or sour beer diluted with water at tho place where the brush strikes the work;

MARK.

OBSERVE

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

occasionally hold a piece of sandpaper to the brush. Should the points of the brush be too straight, let them strike over a piece of wire, but do not hook them too much, as this would prevent matting. Always preserve the brush in a good condition; should the wires become entangled or twist into knots, separate or cut them out. After the work is matted, take a soft hair brush and brush it in soap water, then rinse it in warm water charged with a small quantity of spirits of ammonia and caustic potash; immerse it in pure alcohol for a short time, and finally dry it in sawdust.

Cold Silvering of Metals.—Mix 1 part of chloride of silver with 3 parts of pear lash, 1½ parts of common salt, and 1 part of whiting, and well rub the mixture on the surface of brass or copper (previously well cleaned), by means of soft leather, or a cork dipped in the powder. When properly silvered, the metal should be well washed in hot water, slightly alkalized, and then wiped dry.

Artificial Pearls.—The following process for manufacturing artificial pearls is based on the property of logwood extract and bichromate of potash to form with gelatine a compound insoluble in water: 1. Dissolve in heat 1 part gelatine and 3 parts water; 2. Dissolve in heat 1 part logwood extract in 5 parts water. Mix the two solutions, pour off the excess of water, then mix one part of the logwood and gelatine mixtures with 2 parts water. Agitate until it dissolves, and add 8 parts of solution one, so as to have excess of gelatine. Evaporate till small pellicles are formed, then cast in the molds required. After one hour the casting is dipped in a bath containing 1 part of bichromate of potash to 30 parts water, where it is left for five minutes. Artificial pearl of a brilliant black is thus obtained which is hard and insoluble.

The Oil Stone.—Twenty years ago, the oil stone was found only on the joiner's bench, and possibly that of the machinist, and its sole use was the sharpening of the edges of tools. To-day its use has extended beyond this province of edging tools to that of grinding, reducing, finishing, in fact, invading the limits of the grindstone, emery, rotten stone, tripoli, and reaching almost to rouge. This stone, which is a slate brown in science as novaculite—from novacula, a razor,—is cut and dressed in hundreds of varying forms for different purposes. In any hardware or mechanic furnishing store it may be found in all manner of shapes under the name of "slips," adapted for tools of all forms. In dentists' supply stores it may be seen in twenty or more cylindrical and circular forms, and so minute as to be used at a rapid rate of revolution even between the teeth of dental suffering humanity. Some of these cylinders, ovoids, cones, and edged wheels are so minute that a pea looks large by their side yet they are all veritable grindstones. In the manufacture and finishing of the metals, the oil stone, or novaculite, plays an important part. Our recent exactions as to fits and measures can hardly be filled except by the use of this stone, and it is in demand for truing turned surfaces and planed areas of iron and brass, slowly grinding down the imperfections left by the finish file and the corundum wheel. Recently its powder has largely usurped the place in mechanics' valuation of flour of emery or emery of the higher grades. It is found that a finish "for fit" can be readily obtained by its use in much less time than by the scraper; and that it does not leave embedded particles of quartz or corundum to keep up a perpetual wear. This material is not strictly an oil stone; it is amenable to all of these. Perhaps its best use is with water, especially when the stone is of the harder sort, as the Ouachita.

OTHER NOTES.

International Exhibition.—An international exhibition of metal work is to be held at Nuremberg next year. It will be held in the new museum building, and will contain specimens of the art of the silversmith and the worker in brass and copper, together with the machinery and appliances used in the making of jewelry and art metal work. The exhibition will be open from the middle of June to the end of September.

Transitory State.— The German gold and silversmiths and jewelers are at present passing through the state of transition from "cheap and nasty," when everything sold at a penny a dozen and the adjective "bad" was the positive form, to the present substantial, artistic productions. In this state of affairs it is hardly to be expected that the manufacturers of the better class of goods will realize much on their productions.

Sharpening Files.—The process of sharpening files by means of the sand-blast is exciting universal interest in Europe. Of course, it is next to impossible to re-sharpen old and worn files by this process, but it is said to be excellent for imparting an extra finish to new files, and those that have been sharpened originally in this manner can easily be retouched and sharpened twice or three times after becoming partially dull. Report has it that Krupp, in Essen, is making universal use of such files.

Convenient Mixture for Producing Cold.—In the coming piping hot times, when ice is at a premium, the owner of a parched throat will be gladdened by learning that he can prepare "ice-cold lemonade" by means of the mixture of equal parts of nitrate of ammonia, soda and water, which, it is said, produces a temperature of—23°C., equal to—9.4° Fahr. It has the following good qualities: It does not attack metalic vessels; it is cheap, and can be recovered by evaporating; only a small quantity of water is necessary, and it can therefore be evaporated the more quickly.

JAMES BOSS GOLD CASES BETTER THAN EVER AT

REDUCED PRICES !

THE character and magnitude of the plant of the KEYSTONE FACTORIES are unrivaled. Improved and patented machinery of the most ingenious description occupies every floor of two of the most massive and stately buildings in Philadelphia, while hundreds of operatives, selected for their commanding skill, and drilled in special and original methods, assist in giving shape, construction, and finish to the most complete and serviceable Watch Cases ever produced.

Celebrated as JAMES BOSS GOLD CASES were heretofore, they have now an additional claim to fame and popular favor. Notwithstanding their reduced price,

Every Style of Jas. Boss Gold Case is Made Better Than Ever

It will particularly repay every jeweler on the alert for new, fresh, and reliable goods at prices that *MUST* sell them, to examine the

DOUBLE | PEERLESS | BOSS | GOLD | CASES.

It is, of course, impossible to illustrate, through a print, the graceful roll of the curves, delicately executed rope knurling, and exquisite vermicelli engraving of these cases. No description can do them justice. They are literally superb, and are sold as low as any first quality goods known to the trade.

Every Case has the Dust-Proof Band, is close-fitting to a nicety, interchangeable, and is guaranteed for Twenty Years.

The greatest recommendation of Jas. Boss' cases is that their guarantee is *bona fide*, and that they give universal satisfaction.

SPECIAL NOTICE.

To ensure insertion, changes or new advertisements must be sent to the office not later than the 20th of each month.

Editorial.

THE OUTLOOK.

The speech of the premier of England at the annual banquet of the Lord Mayor of London, has become such an established institution that it is now looked forward to as a pretty accurate gauge of the Government's policy, and the relation of the empire towards other countries. In a somewhat similar manner, since Mr. Smithers became President of the Bank of Montreal, his annual review of the general business of the country and his estimate of the prospects for its future, have come to be looked forward to with much interest by merchants and financial men generally in all parts of the Dominion. This is no mean compliment to Mr. Smithers and the great monetary institution of which he is the head, and it has so far been thoroughly deserved. Mr. Smithers' reading of "the signs of the times", and his commercial forecasts have so far been fulfilled in a very remarkable manner and will cause his utterances at the Annual Meeting of the Bank of Montreal recently held to receive more than ordinary attention.

Of the year just passed Mr. Smithers said :—

"Many of you are business men, and I think there are but few among you that would not be prepared to endorse the statement I now make, that it has been a year of unusual difficulty in all commercial affairs, and that there has been, unquestionably, a general depression in business. Business has not only been greatly restricted, but to a large extent unremunerative."

Of the future he said :—

"Nothing would please me more than to give you a *couleur'de rose* view of things —nothing would be easier or pleasanter than to tell you that everything is beautiful, and there is nothing to do but to put on steam and go ahead ; but that is a responsibility I am not prepared to take."

There has been improvement, he says, in some branches of business, and he names the lumber trade as one in which the position and prospects are on the whole favorable.

But dealing with business as a whole, he asks :—

"Are the country merchants buying goods ? Are they paying for them ? Do they hold large or light stocks ? What is the record of failures, etc., etc.? These are the burning questions and they are not difficult to answer. There is a general concurrence of opinion that the imports, especially of dry goods, will be light, and the distribution of goods does not, I fear, come up to the expectations of importers, and there is too much reason to fear that excessive competition, and the absence of profit, is the great feature of the times. As far as I can gather, the stocks held by both wholesale and retail merchants are less than at the same time last year, and though payments have been poor, there are some signs of improvement. The record of failures both in the United States and Canada was alarmingly large during 1884, both in number and amount, though I learn from the best authority that there has been some improvement in this respect since the opening of 1885."

"If I cannot foresee any more than the rest of you what is before, I can at least advise you so to manage your business as to be prepared for whatever comes, and if I am to sound the tocsin to-day the keynote must be 'Caution'—no other word would suit the occasion. We have passed through troublous times, and I hope the worst is over, and that we are down to hard pan, but I would not take down the danger signal. My advice to every one to day is to go slowly—do not expect any great and general revival of business—if it comes, so much the better you will be in a position to take advantage of it, but I am bound to say that at present I can see no great indications of it. There are many thoughtful men who think that this year will be no better than the last, and it is a safe view to take. You cannot go wrong if you hope for the best, but prepare for the worst.

"And now, in conclusion, putting everything together, I think I speak the views of my colleagues as well as myself, when I say there is nothing specially encouraging in the outlook."

From these short extracts of Mr. Smithers' long and very valuable report, it will be seen that that gentleman although advising caution, regards the outlook as fairly good, and promising enough to warrant our business men in going ahead with energy tempered by prudence. To us it seems that the prosperity of Canada depends mainly upon the result of the coming harvest ; if there is a bountiful one, as appearances at present indicate, the trade prospects will be brighter than they have been for several years. If it is a failure our merchants will have to take in sail and get their business into as compact a shape as possible. As far as the jewelry trade is concerned it has certainly been unusually dull for the past six months, but there are not wanting signs for a decided revival in the near future.

The formation of the Canadian Jobbers' Association in American Watches and the confidence it has inspired amongst the retail trade, is a good augury of an improved condition of things as far as the jewelry business is concerned, and it only requires a careful adherence to the ordinary principles of business to make this branch of trade more prosperous than it has been for years past.

AMERICAN v. SWISS WATCHES.

The competition between American and Swiss Watches in this country is one of extreme interest to every Jeweler, and reminds us very much of the battle that has been going on for years in Europe between Artillery and Armour Plate. Just as soon as the plate makers get an armour plate thick enough to resist any known projectile, their opponents put their wits to work and make a gun heavy enough to pierce it ; and so the battle goes on, each side being victorious in its turn.

A good deal similar is the battle between the Swiss and American Watch Manufacturers. For years the American Market was supplied wholly with watches of English and Swiss manufacture, and in those days no person ever seriously dreamed that an industry could be fostered at home which would revolutionize the entire watch trade of the world. When the American watch industry was first started it was looked upon as a utopian idea, and its promoters little short of lunatics. The idea that raw uncultivated America could ever compete with cultivated Switzerland, a nation of born watchmakers, was deemed too ab-

surd even for discussion. However, the promoters of the new industry persevered, and finally, after much misfortune and discouragement, the American watch industry became an established fact. It soon became apparent that American watches had come to stay, and that they were going to be formidable competitors. Accordingly the cry was raised by interested parties that the material of which they were constructed was poor, and they would not last like watches of European manufacture. In spite of all this opposition, however, they continued by sheer force of merit to become more popular, and after first displacing the English watch entirely from the home market they began to reduce the lead of the Swiss Watch, then to compete with it on even terms, and finally to practically drive it out of the market. At the present time in the United States, as in Canada, the demand for Swiss Watches is limited to two qualities : the very cheap or the very dear ; the intermediate goods used being almost exclusively of American manufacture.

It seems to us that the only thing that now stands in the way of the American Watch having complete possession of the markets of this continent is the fact that they have not hitherto supplied the trade with the quantity of low-priced movements demanded by it. The American Watch is the popular Watch, and it is as a rule only because the dealers cannot get them cheap enough that they buy Swiss goods to take their place. If American Watch manufacturers could or would supply all the cheap movements that the trade demands, we would find a very heavy falling off in the import of Swiss goods. As is the rule in everything else, the price of American Watches depends on the supply and demand. When trade is booming and they can sell more than they can make, the prices go up and they do not care about selling low-priced goods when they can easily dispose of all the better class Watches they can turn out. These are the times when the Swiss Watch again gets a foothold, and when their cheaper goods get a chance to take the place of their American competitors, whose prices have been advanced. Below we give a table showing the imports of Swiss Watches into the United States from the year 1864 until 1882, by which it will be seen that the increase or decrease of these goods have followed the fluctuations of their American competitors as closely and surely as the ebb and flow of the ocean tide. When American Watches are high, Swiss goods sell readily and the importation is increased. When American Watches are plentiful and low in price Swiss goods become a drug in the market and the importation falls off.

The following table shows the value of Watches imported into the United States from 1864 up to and including 1882. The smallest amounts were in those years in which it was supposed that the Americans had ruined the Swiss manufacture of Watches :

1864	$1,695,438
1865	2,220,390
1866	2,618,681
1867	2,072,483
1868	2,093,945
1869	2,664,515
1870	3,302,434
1871	3,421,150
1872	3,662,502

Of course the views above are our own, and being situated in a neutral country, as Canada undoubtedly is, we think we are in a position pretty accurately to gauge the comparative merits of these rival goods. It is but natural that the rivals themselves should look at it with different eyes, and it is, therefore, with interest that we read the views of M. Claude Saunier in an address to the Watchmakers of France on this very subject. He said, "The Watchmakers of Switzerland have succeeded in retrieving the losses in their trade with the United States. This they have accomplished by mutually upholding and helping each other, by disseminating professional instruction throughout the country by special technical publications, by uniting into 'collectivities' at home and abroad, by establishing societies in the interests of manufactures, trade and science, and by discriminating with rare intelligence between what is best made by hand and what is best made by machinery. Their success in recovering lost ground shows what a tenacious, intelligent and patriotic will can accomplish in nations as well as in individuals." Mr. Saunier continues : "The efforts of the Swiss manufacturers which have been so justly crowned by success lead us to enquire what the Americans are doing in the watchmaking line. The reply to this question would be too long for our present space, so we will only mention a few items here and take up the subject again in a forthcoming number. It is a fact that their capability of production is constantly increasing and might even close all the foreign markets to foreign goods in this line. The principal establishments manufacturing watches in America are the "Waltham" and "Elgin," the former with 2,500 workmen producing 1,000 complete pieces a day, and the latter turning out 850 pieces a day. The total annual production is thus in the neighborhood of eight hundred thousand watches. Several factories are preparing to supply the market with what they call a metal stem-winder, anchor escapement, for the price of $2 or $3, with the end in view of driving out foreign competition entirely. A Swiss paper commenting upon this fact remarks : 'We have called the attention of our readers to this fact so that they might be warned against an excessive production of that class of goods which is in direct competition with American watches, which may at any time take the place of our exportations of similar grades if the present somewhat moderate production should assume much larger proportions.' "

PRACTICAL REPUDIATION.

Canada has hitherto prided herself upon being not only able but willing to pay any debts that she may have incurred; but if the bill recently passed by the Manitoba Legislature is to become the law of that Province, then our people may cease to boast of their honesty. This bill proposes to exempt from seizure under execution for debt, the land, buildings, implements, horses, cattle, furniture &c. &c. of farmers, and the dwellings and furniture of those residing in towns and villages to the extent of $3,000, and should properly be called "An Act to cheat the Creditors of Manitoba". The most serious thing about this act, is the uncommon provision therein contained which makes it retroactive as well as prospective. Were this act simply a prospective one that would apply only to debts incurred after it became law, it would be bad enough in all conscience, because it would entirely ruin the credit of the inhabitants of the prairie province. The evil they seek to lay upon other people would fall upon themselves,

THE ACME SILVER CO'Y,

MANUFACTURERS OF THE

FINEST QUALITY OF

Electro-Plated Ware.

FACTORY & SALESROOM:

NOS. 9 and 11 CHURCH STREET, TORONTO, ONT.

We are now manufacturing a line of Goods that are entirely new to the CANADIAN TRADE.

Our Designs, Finish and Quality are already acknowledged by Connoisseurs to be superior to anything ever before produced in Canada.

We carry a complete Stock (in large variety) of Dinner and Breakfast Castors, Cake Baskets, Fruit and Berry Dishes, Tea Sets, Pickle Casters, Cups, Goblets, Butter Dishes, Card Receivers, Communion Ware, Waiters, Pitchers, Tilters, Pitcher and Card Plates, Bake Dishes, Vases, Toilet Sets, Jewel Cases, Hotel Ware, &c., &c. Also Knives, Forks and Spoons, Pearl and Nickel Goods, &c. &c.

We do Repairing and Re-plating, making old Goods equal to new.

N.B.---We do our business upon the merits of our Goods entirely. We have no assumed name or reputation (earned years ago), to enable us to place inferior Goods upon the Market.

for surely no sane person would allow another to get into his debt who could pay or not just as he chose. This we say would be bad enough, but it would affect the people who passed the law more injuriously than it would outsiders, because they would be compelled on account of the want of credit to pay cash for everything they bought.

In the retroactive clause of this bill however is the chief menace to the rights of outsiders, and it is against this part of it that the kick will chiefly be directed. At the present time there are millions of dollars of outstanding accounts due all over Manitoba, which if this Act becomes law will be practically worthless. The petition of the Ontario Association of Agricultural Implement Manufacturers alone shows that the farmers of Manitoba owe for reapers, mowers and such like machinery the enormous sum of one million dollars, a very large percentage of which may as well be at once written off as worthless if this retroactive clause is allowed to go into force. The Manitoba merchants themselves are just in about as bad a fix as outsiders, and like the proposed law just about as much as the others do. Meetings have already been held by the Winnipeg, Montreal and Toronto Boards of Trade and they have all unanimously passed resolutions strongly condemning the Act. The prevailing opinion amongst business men is that it is simply an Act to confiscate other peoples' money and to make a bid for emigrants. That such a state of affairs can be any benefit to the emigrants we very much doubt, and we are strongly of the opinion that most of those who come from Britain to settle in that Province would very much prefer to pay any debts they may incur instead of being forced to be honest because they can get no one to trust them. We think if the legislature of Manitoba refuse to withdraw this obnoxious and unjust measure that this is a case where the Federal Government may with a great deal of acceptance to the people at large exercise their veto power and kill the bill by disallowing it. Such an action on their part would, we think, be the most popular act of disallowance they ever did.

If they do not interfere however, and the legislature of Manitoba have not common sense enough of themselves to amend it, we predict a very "cold" time for the prairie province as long as such an iniquitous measure remains upon their Statute Books.

Correspondence.

Editor Trader :

Dear Sir,—In the article on "The First Locomotives," in The Trader for June there is an error in that it speaks of Robt. whereas it should be George Stephenson. If I have read Smiles aright the article in question should read George and not Robert Stephenson. Robert was George's son and inherited very largely his father's inventive genius.

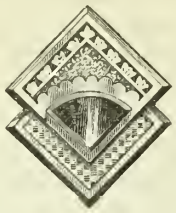
Yours respectfully,

Thos. Evans.

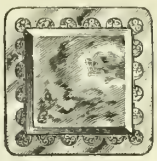
Alliston, June 3, 1885

[Right you are, friend Evans.—Ed. Trader.]

Selected Matter.



STORIES OF FINGER RINGS.



A story is told of the ring in connection with the great Magna Charta, or rather with the king and one of the twenty-four barons selected to enforce the provisions of that great foundation stone of English liberty. Eustace de Vesci had a very beautiful wife, and king John, as immoral as he was treacherous and cruel, coveted her possession. The lady, however, lived some distance from the court, and in order to accomplish his designs the king had recourse to strategem. Observing one day while at table that the baron had a ring upon his finger, he laid hold upon it, and remarking that he had a like stone which he wished set in the same style, kept the article as a copy. Having thus secured this token he immediately sent it to the lady in her husband's name, with a message that if she wished to see him alive she should come at once. Fortunately, de Vesci happened to be out riding when she came, and met her on the road, when explanations followed, and the intentions of the king were disclosed. In order, therefore, to punish John, as well as secure the safety of his wife, the baron found a common wanton, and clothing her in the garments of the lady, compelled her to assume the character and meet the king. The story pleasantly concludes with an account of the monarch's chagrin when, after brutally taunting the husband regarding the exploit, he learned that the supposed lady was nothing but a common strumpet.

But perhaps the most conspicuous example of the ring in English history was connected with an affection of the great queen Elizabeth, and though the story is strongly romantic in its nature, it is also tinged with tragedy and pathos. The records clearly inform us that Elizabeth had many male favorites during her long reign, upon whom she bestowed as much affection as might be given by a queen to her subject, and equally as a chaste maiden to her lover. Among them all, Robert Devereux, Earl of Essex, appears to have gained most completely the heart of the queen. Upon him she showered privileges and perquisites with an unsparing hand, bestowing upon him all the interest and wealth of affection which the promptings of her love for him could suggest, and among other tangible evidences she gave him a ring as a pledge, intimating "that if ever he forfeited her favor, if he sent it back to her, the sight of it would insure her forgiveness." Subsequently Essex was arrested for treason, and not without cause. During the trial, and before the execution, the queen waited anxiously for the token which never came, and though the whole world doubted that she would allow Essex to be brought to the scaffold, such was her anger and chagrin at his obstinacy that she refrained from interference, and the head of her last and best loved favorite fell beneath the axe. But the pride of the earl was not as stubborn as the queen imagined, as appears from the narrative of a descendant of that house, lady Elizabeth Spelman, for she stated that "when Essex lay under sentence of death he determined to try the virtue of the ring by sending it to the queen and claiming the benefit of her promise; but knowing he was surrounded by the creatures of those who were bent on taking his life, he was fearful of trusting it to any of his attendants. At length, looking out of his window, he saw, early one morning, a boy whose countenance pleased him, and him he induced by a bribe to carry the ring which he threw down to him from above, to the lady Scrope, his cousin, who had taken friendly interest in his fate. The boy, by mistake, carried it to the Countess of Nottingham, the cruel sister of the fair and gentle Scrope, and as both these ladies were of the royal bedchamber, the mistake might easily occur. The Countess carried the ring to her husband, the lord admiral who was the deadly foe of Essex, and told him the message, but he bade her suppress both." It is a sardonyx, and said to be the identical ring given by the queen to Essex. It has descended from

Salesroom, 176 Broadway, New York.

WE SELL TO JOBBERS ONLY.

Lady Francis Devereux, Essex's daughter, in unbroken succession from mother and daughter to its present possessor. The ring is gold, the sides engraved and the inside of blue enamel. The execution of the head of Elizabeth is said to be of a high order as a work of art.

After the death of Essex, the queen, shielded by her imperious pride, appeared utterly indifferent to either his memory or his fate, but in the solitude of her own apartments she often gave way to passionate tears at his untimely end. Not long after, however, the Countess of Nottingham, lying upon her death bed, could not die without first revealing the truth about the ring and craving the pardon of Elizabeth. Her majesty, therefore, visited the couch of her dying kinswoman, and there learned for the first time that the ring had been sent but foully intercepted. The revelation aroused within her a terrible burst of passion and despair. The expiring penitent was beyond the reach of her vengeance, but as she left the room she vehemently exclaimed: "God may forgive you but I never can." The health of the queen had been failing previous to this interview, and the confession of the Countess proved a death blow. Thereafter the great Elizabeth kept her apartments, sometimes assuming the regal tones and pose of majesty, sometimes giving way to the most violent grief, and sometimes crouched upon the floor amid her blankets like a baffled tigress. The indomitable spirit of the queen fought desperately with the natural anguish of the woman, but the end was nigh, and even at the end a ring plays its part in death as it had in life. The interests of James VI. of Scotland who was heir to the throne, required that he should be early informed of the demise of the queen. For this reason he had confided to lady Scrope a sapphire ring, as a signal that upon its receipt he might know the mighty Elizabeth was no more. Exhausted by her devotions, the queen slept, and sleeping, died; nor was her death known until the lady Scrope silently dropped the ring to her brother who was lurking beneath the death chamber at Richmond palace. He caught the token and departed at fiery speed for Scotland. This last object is known in English history as the blue ring, and the stone is now in the possession of the Countess of Cork.

Queen Elizabeth was extremely fond of display, nor did she hesitate to receive jewelry, and even went so far as to suggest on every special occasion that such gifts would be acceptable. Many of her dresses, of which there were an immense number fairly blazed with gems of great beauty. Paul Hentzner relates that a Bohemian baron presented his letters to her at the palace of Greenwich, when as a mark of special favor the queen drew off her glove and "gave him her right hand to kiss, sparkling with rings and jewels."

The ring of Shakespeare, or a ring supposed to have been his, has been found. It is a gold signet, and bears the initials W. S. entwined in a true lover's knot. The finder, a laborer's wife, had it immersed in aquafortis to prove the metal, thus destroying the *ærugo*; but the style is said to be of the age of Elizabeth, and though no evidence exists of the use of a seal by Shakespeare, still the place where it was found (Stratford-on-Avon) and other reasons would seem to prove its authenticity.

Among the gems the diamond appears to have been the most popular at this period owing to its ability to write upon glass, and writings thus executed are still extant. The famous Raleigh wrote upon a window pane with his ring, "Fain would I rise, but that I fear to fall," and Elizabeth added, "If thy heart fail thee, do not rise at all," a reply that coming from the queen was a sufficient encouragement.—*Jewelers' Journal.*

HOW ANTIQUARIANS DECIPHER ILLEGIBLE WRITINGS AND FIX DATES.

The *Kunst und Gewerbe* reports a very interesting find, made a few years ago, in a stone quarry near the village Wittislingen, which lies close to an old Roman highway leading to a crossing of the River Danube. The treasure was found in a deep rock sepulchre, and was purchased by the National Museum at Munich. The *Allg. Zeitung*, which first reported the find, said that it is not alone the precious substance from which these pieces are manufactured, but also their ornamentation and inscription, together with the manner of interment of their possessors—their skeletons were found in the graves—that throw a highly interesting light on the state of the old German culture. The grave contained ornamental plates, rings, capsulas, large head of hair-pin, and ornamental pieces for books; girdle, dresses, and straps, all composed of fine gold and silver, and partly set with a scroll work of Zirconite (or hyacinth), together with a bronze vessel with handle, a shell, and many broken pieces of trinkets, household utensils, bronze and iron weapons, which have decayed with the lapse of years; besides this, was also found a fibula, or dress buckle, which, on account of its size and ornamentations, is perhaps the sole of its kind, and by its inscription solves a very interesting problem. It is perhaps the most interesting piece of personal trinkets that ever was unearthed from a grave of the ancient Germans. The main body is of silver, and upon its right side profusely adorned with gold, gold-plated scroll work and red jewels; upon its underside it bears the inscription, which is filled out with black enamel. How can the writing be interpreted, and what is the epoch of the fibula? These questions have excited the philologists at Munich, and it might be answered as follows: "Uffila vivat in Domino filix inocens funere capta quia vire dum potui fui fui fidelissima tua in Deo pio." Below it stands upon one side, "via fati," and upon the other "Digerig fet"(fecit). The engraver of this name added the undeciphered letters, "s.....o.....m...a(or d)....t(or f)...e...," and filled the other empty spaces at random with a few signs similar to letters, as was frequently done at that time. Now, the word "fidelis" upon ancient Christian tombstones signifies the faith and piety in belief; "inocens," which occurs as frequently, and which is sometimes corrupted into "inox," a sinless life; "felix" corresponds to our blessed in the Lord; "funere raptus" or "captus" means "suddenly snatched away by death." Wherefore, the inscription upon the fibula, or dress-pin, in which the "vire" is palpably only a barbarian corruption of "vivere," can be interpreted as follows: "Uffila live blessed in the Lord! Sinless have I been snatched away by death; as long as I could live I was the most faithful; thy Tisa, in the Lord." The fibula was undoubtedly the costliest treasure of her house, and the widow, foreseeing her rapid death and reunion with her husband in the grave, ordered that her dearest treasure be inscribed accordingly, afterward to accompany her into the common grave. The engraver, Digerig, added his name and the superfluous admonition "the way of fate," together with the other letters. Perhaps he even formed a Græco-Latin word, "somate," in order

In compliance with an increasing demand, we have placed on the market a

NEW PATENT DUST-PROOF

SCREW BEZEL

Silver Open Face Stem Winding Case

embodying many of the excellent qualities of our original Patent Dust Proof Case, though offered at a lower figure.

The back and center of the new case are made of one continuous piece of solid silver, into which an Albata Cup is screwed identical in shape with the back, thus greatly strengthening it and efficiently protecting the Movement against dust.

THE NEW CASE WILL BE CALLED

ALBATA CUP SCREW BEZEL

We shall continue the manufacture of our popular Patent Dust-Proof Case with Screw Crown and Screw Bezel in all the styles as heretofore, plain and inlaid, with Lever and Pendant Setting.

FOR SALE BY ALL JOBBERS.

ROBBINS & APPLETON,

GENERAL AGENTS OF THE

American Waltham Watch Co. of Waltham, Mass.

NEW YORK, BOSTON, CHICAGO,

LONDON, SYDNEY.

to say, "Thus it goes in this life." The date of origin of this trinket, however, is first of all proved by the place of burial; this was a lonely grave, cut deep into the rock. If the neighborhood had been entirely Christian at that time, then the common churchyard would most assuredly have been used as a place of burial. For this reason, the eighth or ninth century is decidedly too late. The style of ornamentation, as well as the fibula itself as of the other pieces, clearly pertains to the old Germanic time. In common with these, we find ox-head, projections and scroll work, with serpents' heads on the oldest utensils of this kind of Germanic times, specimens of which have been dug from the graves of the Visigothic King Theodoric, who fell in the great battle of the Huns, in the year 451, and of the Frankish King Chilperich, who was buried in 481 at Doornik (Tournay), and are given in Peigne de la Court's work on the place of the Attila battle. The ring with the head is similar to that of Chilperich; the ornamentation of the plate and capsula resemble Etruscan and Græco-Roman types. Most decisive of all for fixing the time is the lettering. This is entirely the same as has been found upon many Christian tombstones bearing Germanic masculine and feminine names. Their erection is generally placed into the time of the Merovingians. But when we compare the style of writing, as found in old documents of this age, the difference becomes visible at once. While the Merovingian round hand is ugly and interlaced, and the book writing rounds into "italics," the writing upon those tombstones retains the full vigor of the Roman squares, and the difference is still more pronounced in the vowels. Wherefore, the tombstones, the writing upon this fibula and its manufacture undoubtedly pertain to the third or fourth century.

COLORING AND POLISHING BRASS ARTICLES.

In order to prevent the constant oxidizing of brass articles, agents have for a long time been experimented with to protect the surface of these articles against the influence of the atmosphere, and the following method has been proposed as the most suitable and practicable one:

If brass is left for some time in moist sand it assumes a very handsome brown color, which, if polished with a dry brush, remains constant, and requires no cleaning or polishing. A darker or lighter green color may also be imparted if a thin layer of verdigris is created upon the surface by means of dilute acids, which are to be left on until dry. The antique appearance imparted to the brass in this manner is very handsome, and more or less durable. But it is not always possible, for want of time, to do this with each article, and a more rapid method for effecting the ends is therefore necessary, and the simplest way to do it is to cover the brass with a coating of varnish.

All the necessary work is to be done before the bronzing, and the brass annealed, dipped in old or dilute nitric acid until the scales can be loosened from the surface, which is then treated with sand and water and dried. The next step is to produce the desired bronze. Although this word actually signifies a brown color, being derived from the Italian word "bronzine," or, in English, "burned brown," it is rather loosely applied in the trades at present, and applied to all colors.

Brown, of all shades, is produced by immersion in a solution of nitrate or chloride of iron, whereby the strength of the bath determines the depth of the color.

Violet shades are obtained by immersing in a solution of chloride of antimony.

Olive green, if the surface is blackened by means of a solution of iron and arsenic in muriatic acid; it is then polished with a plumbago brush, and, when warm, coated with a lacquer composed of 1 part varnish lacquer, 4 parts turmeric, and 1 part gamboge.

A *steel grey* color is precipitated upon brass by means of a weak boiling solution of arsenic chloride. And a

Blue by an attentive treatment with a strong sulphide of soda.

Black is much used for optical instruments, and is produced by painting with a platinum solution or with chloride of gold mixed with nitrate of tin. The Japanese bronze their brass by boiling it in a solution of sulphate of copper, alum and verdigris.

The success in the art of bronzing chiefly depends upon circumstances, for instance, the temperature of the alloy or solution, the proportions and qualities of the material used for alloying, the proper moment at which the article is to be withdrawn, its drying and a hundred other minutiæ of attention and manipulation require a skill only taught by experience.

If the brass is to receive no artificial color, but simply to be protected against tarnishing and oxidizing, it is to be lacquered after having been thoroughly cleansed. In order to prepare the brass for this coating it must be dipped, after having deen annealed, and as aforesaid, rinsed and washed, dipped either for a moment in pure commercial nitric acid and then washed in clean water and dried in sawdust, or immersed in a pickle of equal parts of nitric acid and water, until covered with a white coating of the appearance of curdled milk, when the article is taken out, rinsed in clean water and dried in sawdust. In the first case the brass becomes lustrous, in the latter it becomes mat, which is generally improved by smoothing and polishing the prominent places. The article is then dipped for a moment in nitric acid as found in commerce, and containing a little crude cream of tartar in order to preserve the color up to the moment of lacquering, and finally dried in warm sawdust. When prepared in such a manner the article is taken in hand to be lacquered, for which purpose it is first to be heated upon a hot plate to be lacquered afterward. For this purpose is used a simple alcohol varnish, consisting of 1 ounce shellac dissolved in 1 pint alcohol. To this simple varnish are afterward to be added the coloring substances, such as sanders wood, dragon's blood and annatto, which increase the lustre of the color. In order to moderate the shading of the color, turmeric, gamboge, saffron, cape aloes and gum sandarac are added. The first colors make the lacquer reddish, the second yellowish, while the two, when mixed, give a nice orange.

A good pale lacquer consists of 3 parts aloes and 1 part turmeric, to 1 part of the simple varnish. A gold lacquer is obtained by adding 4 parts dragon's blood and 1 part turmeric, to 1 part of the simple varnish, while a red lacquer is produced from 32 parts annatto and 8 parts dragon's blood, to one part of the varnish.

Lacquers are subject to chemical change by heat and light and therefore must be kept in a dark place. The vessels in which they are stored are generally of glass or clay, and the brushes with which they are applied must be camel hair and have no metallic parts about them.—*Ex.*

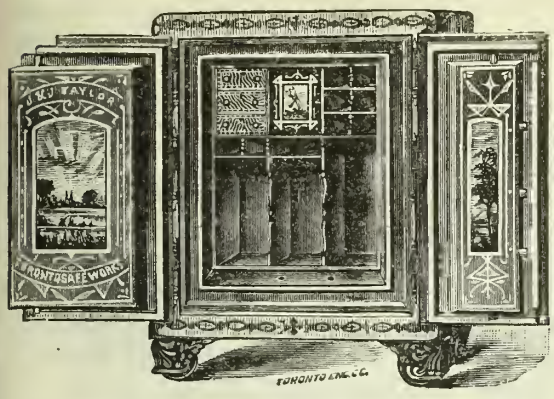
A WORD TO EMPLOYEES.

In times of business depression, such as we have been going through for the past two or three years, the greatest forbearance between employers and their employees becomes a necessity of the situation. When there is but a small demand for goods, those engaged in making or selling them have a serious struggle to maintain themselves. Their production must be cut down, and their expenses be reduced to correspond. Take, for instance a firm in the jewelry trade that manufactures a portion, at least, of the goods they handle; this necessarily involves a large investment for a factory and adequate machinery, and the expense of a force of workmen sufficient to produce the goods required; there are, also, the salesrooms in the city requiring a force of bookkeepers, salesmen, etc. In a busy season this force is all actively employed, and the employees as a rule have no complaints to make regarding their compensation. But a dull season comes, there are few sales and no profits, but the expenses run on all the same. There must be a curtailment however, for necessity knows no law, and the first suggestion is to close the factory. But that involves the dispersement of a force of trained workmen, whose experience has been valuable to their employer, and the throwing out of employment of many who are dependent upon their daily earnings for the maintenance of their families; idleness means to them deprivation if not positive want and suffering. Few employers care to enflict such hardships upon men who have served them faithfully, but the necessity for a reduction of expenses is imperative. So the factory is closed for two or three days a week, or wages are reduced. This latter course is more objectionable to the workmen than a reduction of the working hours, for they are always apprehensive that if wages are once cut down they will never be restored, and they would rather lose fifty per cent. of their time than twenty per cent. of their wages. Here is where there should be the utmost frankness and consideration shown on both sides, and generally a plain statement of the case will result in an amicable adjustment of the difficulty. Workingmen are noted for their lack of comprehension of business propositions; it is natural that they should be wanting in business knowledge, for their training lies in another direction. But their common sense will tell you that the same expense cannot be maintained for the production of $50,000 worth of goods that is required to produce $100,000 worth. The manufacturer and the merchant are subject to certain expenses that they cannot escape from, such as rent, maintenance of the property in which their capital is invested, etc. Having dealt fairly and honorably with their employees in prosperous times, they cannot be expected to carry all the burdens imposed by general business stagnation; employer and employees have cast their lines in the same pool, and must abide by the result.

A manufacturer told us recently that for two years he had not been able to draw enough money from the firm to pay his living expenses; that their factory was kept running solely for the purpose of keeping the men employed, and giving them an opportunity to support their families. It would have been better for the firm, he said, if they had closed their factory two years ago, for they had positively been running it at a loss. This is not an isolated case, but serves as an illustration of what has been quite general in the business. Manufacturers very much prefer to run their works to their full capacity, and to employ as many workmen as possible, for they count that the greater amount of goods produced and sold the greater the amount of their profit. They are always reluctant to make reductions of any kind, but when the inevitable demands that they shall be made their employees should meet them in a spirit of fairness and forbearance. The past two years have been full of hardships for all business men, and the fortunate persons have been those who were working for fixed salaries for a responsible employer who came forward with the requisite means to meet his pay-roll at the stipulated times.

There are indications that there will soon come some improvement in the business situation, but how soon or to what extent are problems the future alone can solve. The jewelry business is peculiarly sensitive to fluctuations in business, being almost the first industry to feel any depressing influence and about the last to recover from it. This makes it all the more necessary for those employed in it to exercise the greatest forbearance and consideration for those whose capital and credit are exposed to such unusual vicissitudes and perils. In this industry the interests of the employed and the employer are peculiarly blended, and the inducements for standing firmly together are stronger than in almost any other calling. Mutual confidence, forbearance and good faith should characterize the relations that must necessarily exist between them. If the past few months have imposed hardships upon the employees in the trade, we trust they will not forget that their employers have had still greater ones to contend with, for they have had more at risk and their responsibilities have corresponded.



PERILS OF PRECIOUS STONES.

A jeweler and diamond dealer in New York recently furnished a reporter of the New York *Herald* with the following interesting description of an ingeniously planned diamond robbery. The narrative reads like a romance, and for the sake of a guild that has suffered heavily from being plundered, it is to be hoped that it is.

"One of the most cunning robberies that I can recall was carried out as follows: One fine morning a lady of charming manners and address called upon a physician who had a high reputation for skill in the treatment of mental disorders and who took under his personal care a few patients whose friends could afford to pay well for the attention. The lady, with many sighs, poured her tale in the sympathetic professional ear. She had a brother who, poor fellow, was slightly deranged. He was apparently perfectly natural on all ordinary topics, but entertained extraordinary delusions in connection with precious stones. His mania seemed to consist in the belief that he owned a quantity of jewelry and that he had disposed of it at a high figure. He was in the habit of clamoring for payment, and when this was refused would bewail that he had been robbed. Terms, she intimated, would be no object.

"The physician listened patiently. A number of delusions of this character, he remarked, had come under his personal experience. Precious stones were favorite subjects of hallucination. His closest attention should be given to the case.

"It was arranged that to avoid exciting the patient's suspicion, he should be directed to call next day for his sister at the doctor's residence, and that she should then take occasion to bring him into

MONTREAL OPTICAL & JEWELRY CO., Limited.

contact with the doctor. The lady then sorrowfully withdrew.

"The heaviest purchaser at the diamond counter that afternoon was a lady whose manners were marked by a fascinating blending of dignity and grace. She selected a diamond *parure* of exceptional beauty and high price. Having made this purchase, she directed that it be sent punctually at eleven o'clock next morning to her residence. Her husband, Dr. Blank, would be prepared to make payment upon delivery. This request was perfectly regular. It would be unusual for a lady to carry a check book or so large a sum of money with her. Dr. Blank's name was in the medical, city and elite directories. The lady's request was readily acceded to.

"At the time appointed the salesman presented himself at the house. He was shown to the parlor, where he found the fair purchaser of the day before awaiting him. 'Were the stones there just as she had selected them? Oh, yes; how very nice! Was the bill ready also? Yes. Well, would the gentleman step into her husband's study and obtain the amount of his account? Before he went away, however, she would like to see him again with regard to some rubies as to which she would like to have the benefit of his opinion.'

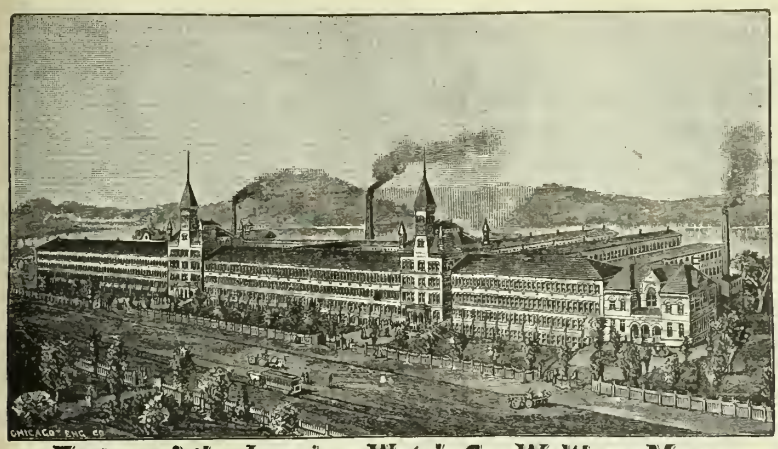
"The doctor received the salesman with much suavity. 'How was he feeling? Had he slept well lately? Was his tongue coated and his rest disturbed by unpleasant nocturnal visions?'

"'He was puzzled by the doctor's question, was he? Mind unable to grasp the meaning of these questions? He was not a patient. Of course, not! Oh! he had come to collect a bill for some jewelry! Oh! just so. They would attend to that little matter presently—pres-ently. In the meantime, how was the appetite?'

"The salesman grew impatient. 'Ah! easily excited; temperament abnormally irritable! The usual symptoms—the usual symptoms! He had a bill for the jewelry delivered, had he? Just so, just so; an interesting bearing out of the old adage that there is a method in mad—well, well; this bill should be attended to—all in good time—all in good time." The doctor seemed to be under some misunderstanding! 'Not at all! The doctor understood the case thoroughly—very thoroughly. And now how about the diet? Were the meals taken regularly? Very important matter this taking the meals with regularity!'

"The salesman became annoyed. Was the doctor mad? 'To be sure he was! What a queer coincidence! A gentleman who was the Hereditary Grand Vizier of the planet Saturn, and who was at the present time one of the doctor's most interesting guests, had asked that self-same question that very morning. Everybody in the house was sane except the poor doctor, and he was mad—mad as a march hare! He ought to be borne with patiently in his affliction! Never mind about that, eh! There must be an immediate settlement or the jewels must be returned? Quite so—quite so. That should be arranged to everybody's satisfaction by and by—by and by. Patience, quietude, were all that would be necessary. Let the patient be seated. Was he troubled with heart palpitaton or excessive thirst?'

"The salesman became angry. The doctor fixed upon him a magnetic eye and was more professionally suave and soothing than ever. The more the payment of the bill was pressed for the more the doctor begged that the patient would not excite himself, and assured him that everything would be done to make him comfortable and happy in his new home.



"The salesman, agitated and alarmed made for the door, in quest of the lady and the jewelry. The doctor was at the door before him, still fixing him with the same magnetic glance and more suave and soothing than before. The salesman sought to effect an exit by force. The doctor touched an electric knob beside the door post. In an instant two stalwart attendants made their appearance, and two minutes later the salesman was raving away like mad in a straight-jacket.

"'The doctor stepped into the parlor to consult with the sister of this unfortunate lunatic. She had disappeared. So had the diamond *parure*. Neither has ever been found."

"MEASURING TIME."

The time of the invention of wheel clocks moved by weights is uncertain. Some enthusiasts are found to assert that 220 before Christ such a clock was made—in the time of Archimedes—but there is no evidence to support such a belief. The first unquestionable fact that can be stated upon the subject, is that Pope Sylvester II. did construct a wheel clock with weights, at Magdeburg, in 996, and it is just possible that this was only a revival of an early invention, and that Boethius was the originator of the mechanical wheel clock in A. D. 510. One thing, however, is certain, namely, that clocks were in ordinary use in the monasteries of Europe in the eleventh century and no doubt the monks, who had plenty of leisure and ample means for the cultivation of experimental science, perfected them, and in a large measure contributed to the perfection of their machinery as we know it. In 1370 a clock was made in France which was considered a marvel of accurate time-keeping, and which may have had a pendulum, but we cannot find positive evidence of the discovery of the use of the pendulum until the days of Galileo, although ancient astronomers are said to have used them in computing the duration of the eclipses. From the date of Galileo's discovery to recent times constant improvements have been made in the science of horology until it has reached what we may call perfection.

The great contest of watches, or more properly, of clocks, between Huygens and Dr. Hooke, in the seventeenth century, is a matter of history, as are also the discoveries to which they gave rise in regard to the elliptical shape of the earth; but, dismissing such deeply scientific problems, we will content ourselves with a glance at the introduction of the first watch, or portable clock. Edward VI. appears to have been the first Englishman to wear a watch, and this consisted of "onne larum gilt, with two plummets of lead;" that is to say, it was driven by weights. This is supposed to have been received by the king as a present from Nuremberg, and was playfully called a Nuremberg animated egg. The word "watch" was derived from an Anglo-Saxon word meaning to wake. The first portable time-piece of which we have any record was that of the Chinese pocket dial mounted upon the head of a cane or carried by a chain round the neck. An Italian sonnet written by Gaspar Viconti, in 1490, makes mention of watches, and Shakespeare refers to them in "Twelfth Night," when he makes Malvolio say: "I frown awhile, and perchance wind up my watch." Queen Elizabeth had a watch in shape exactly like a duck, with chased feathers, the lower part of which opened, and the face or dial was of silver, ornamented with a

gilt design. The outer case was of brass and that in its turn was covered with black leather ornamented with silver studs. Mary Queen of Scots gave a curious token of her affection to her faithful maid of honor, Mary Seaton, in the shape of a watch in the form of a skull, the dial occupying the place of the palate and the works that of the brains. The hours were marked in Roman letters. A bell in the hollow of the skull received the works and a hammer struck the hours. Striking watches were uncommon, and in the time of Louis XI. a stolen watch was discovered in possession of the thief by its striking. Guy Fawkes and his associates had a watch when they intended to blow up the Houses of Parliament, "to try conclusions for the long and short burning of the fusee." All these early watches had but one hand, and required winding up twice a day, until, in 1550, springs were substituted for weights.—*Jewelers' Circular.*

THE BITER BIT.

We had a friend who kept a country store in Newcastle, Ind., in the third decade of the century. R. was a Quaker, a straight man himself and sorely troubled at times with the crookedness he came in contact with among his customers. He used to tell stories in illustration of their wicked ways, and we remember this as one of them.

Mrs. Sapphira rode up one day and dismounted with a roll of country jeans under her arm which she wished to exchange for an equal quantity af Steubenville jeans, to make a Sunday suit for her husband, agreeing to pay twenty-five cents per yard for difference in quality. R. measures her cloth and says, "Thee has seven yards and a half here."

"No," says Mrs. S., "there's just eight yards."

Again the cloth was slowly measured and showed but seven yards and a half.

"I tell you there's eight yards," says she "an' I know it."

So the worthy Quaker unrolls a piece of Steubenville jeans, and with her cloth for a measure he cuts off an equal length, ties it up for her, takes her two dollars, and she departs with her bargain. In a half hour she is back in hot haste and comes in stormily, with "Look here! there's a levy (12½ cents) comin' to me."

"No says R., "thee paid me for eight yards at a quarter a yard."

"Why, you lyin' little Quaker, you said yourself there wasn't but seven yards and a half."

"True," says R., "but we made the trade on what thee said, for I took thy word when thee would not take mine."—*Exchange.*

SUPERSTITIONS CONCERNING PRECIOUS STONES.

ANCIENT AND MODERN.

The falling of an emerald from its setting has been held as an ill-omen to the wearer even in modern times. When George III. was crowned a large emerald fell from his diadem. America was lost during his reign. It is probable, however, that the fallen stone was picked up and reset in the crown,—an event not likely to happen in the case of the other gem. The emerald is said to have taught the secrets and knowledge of future events, it bestowed eloquence and increased wealth. This superstition suggested to Miss Landon, one of the most charming English poets, the following beautiful lines:—

It is the gem which hath the power to show
If plighted lovers keep their faith or no;
If faithful, it is like the leaves of spring;
If faithless, like those leaves when withering.

Take back again your Emerald gem,
There is no color in the stone;
It might have graced a diadem,
But now its hue and light are gone—

Take back your gift, and give me mine,
The kiss that sealed our last loved vow;
Ah, other lips have been on thine—
My kiss is lost and sullied now.

The gem is pale, the kiss forgot,
And more than either you have changed;
But my true love has altered not,
My heart is broken not estranged.

In the Talmud it is said that Noah had no other light in the Ark than that furnished by precious stones.

COUNTER APHORISMS.

Buying for cash gives you store rent free.

The bookkeeper cannot make a firm rich.

Quarrelling partners rob the money drawer.

A dirty store draws more flies than customers.

It is the crooked dealer who thinks all clerks dishonest.

You cannot judge of a dealer's stock by the sign on the front of his store.

The nicest apples are exposed to the public, the same as one's nicest manners.

A twenty-five per cent. settlement yields seventy-five per cent. profit to somebody.

The dollar from the poor man will buy as many goods as the dollar from the rich man.

A well-dressed show window will cause heads to turn as quickly as a well-dressed girl.

You cannot judge of the honesty of a tub of butter from its appearance any more than you can of an individual.

SPECIAL NOTICE.

Jewelers throughout Canada will oblige the Editor by sending in to this office for insertion in these notes any items of news pertaining to the Jewelry business that they think would be of interest to the Trade generally.

BUSINESS NOTES.

THE STOCK and fixtures of S. P. Kleiser of Toronto, was sold by the Trustee to Mr. Herwich at 28 cents on the dollar. Mr. Herwich proposes to continue the business at the old stand.

MR. HERWITZ. of the firm of Rothschild & Co. of this city, sailed for Europe last week for the purpose of making purchases of diamonds and jewelry for his firm.

WE don't see any watch man oftener than Mr. A. G. Funck, general agent of the Illinois Watch Co. He called on us the other day to say "how do you do," and report things booming in the movement business.

REMOVAL.—Messrs. Rothschild & Co., wholesale jewelers, Toronto, have removed to their new premises at No. 8 King St. West. Their new offices are elegantly fitted up and are amongst the most attractive in the trade.

ALMOST AN ACCIDENT.—While the men were removing the two large safes from the warehouse of the late J. Zimmerman to Rothschild & Co.'s new rooms, No. 8 King St. West, one of the safes fell over off the waggon. A workman standing by narrowly escaped being crushed to death.

A CREDITABLE PRICE LIST.—The new price list of watch movements, watch cases, &c., just issued and distributed by Messrs. Lee & Chillas to the trade is one of the finest things of the kind we have ever seen. It is beautifully printed in two colors, neatly bound, and indexed all through, and is alike creditable to the printer and the firm who pays for it.

MR. H. H. FUDGER, of the firm of Smith & Fudger, arrived safely home from Europe a couple of weeks ago. Mr. Fudger looks to be greatly benefited by the trip, and from appearances around the warehouse we should say that the firm and their customers will reap consider-

MARK.

OBSERVE

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

able benefit from it in the shape of new and fashionable goods and hard-pan prices.

That Wellington Street is bound to become the Maiden Lane of Toronto is now evident, as it has now six wholesale jewelers and expects shortly to have more. Messrs. John Segsworth & Co. are having a new building erected on the north side, almost at the corner of Yonge Street, which promises to be one of the finest in the city. They expect to occupy it this fall.

Burglars entered the premises of the American Watch Case Company at Toronto, on the night of the 20th June, but owing to the vigilance of the Company's watchman, had to leave without making a haul. The A.W.C.Co. have now employed a special watchman to guard their own premises all night, and if there is any virtue in buckshot and a mastiff's teeth, midnight mechanics had better give their place a wider berth in future.

Mr. H. L. Roberts, our old friend of Boss Case fame, called in to see us a few days ago. Mr. Roberts looks the picture of health, and accounts for it by saying that their business had now arrived at that stage that their cases would almost sell themselves, and he had nothing to do now but to take care of himself. There is probably more truth than poetry in his remark that Boss cases sell themselves.

Z. Aurbach, wholesale jeweler and fancy goods dealer of Montreal, has assigned during the past month. His liabilities are estimated at about $40,000, mostly owing to European creditors. From the amount of failures amongst jobbers in these lines, it is evident that there are too many people in business, and the sooner the trade is confined to fewer houses with adequate capital for their business the better for everybody.

Removal.—Our young and energetic friends, Messrs. Thayer & Ellis, finding their old premises too small for their rapidly growing business, have leased the commodious warehouse, No. 3 Wellington Street East, formerly occupied by the late John Zimmerman, and will remove there in a few days. This young firm are made of the right kind of stuff, and are bound to succeed if hard work and a desire to suit the wants of the trade can command success. We wish them continued success.

We have just been shown a price list of material and trade work published by Mr. W. C. Coleman, of Toronto, which is about as complete a thing of the kind as we know of. In addition to these features, this little book contains a lot of useful receipts and horological tables, that are of great value to any practical watchmaker. Mr. Coleman distributes them to the trade free of charge, and every jeweler should secure one.

Almost every retail jeweler in Canada knows George Cooper, the former engraver of Toronto. George went along with his Company in the "Queen's Own," and was unfortunately wounded in the battle with the Indians under Poundmaker at Cut Knife Creek. His many friends in the trade will be glad to know that George fought like a hero, and that although his wound (through the thigh) was a severe one, he is now almost convalescent.

We had a Visit a few days ago from Mr. Perkins, the genial agent of the Elgin Watch Co. Mr. Perkins is doing missionary work in Canada amongst the benighted jewelers who have never heard of the Elgin watch, and reports plenty of converts on his present field of labor. He says the Company are getting up a new cheap 6 size ladies' movement which is going to sweep the country, and expect to put it on the market in about a month.

Seal rings are naturally revived at this time, both for ladies and gentlemen's wear. It is quite the correct thing for a lady to dash off her initials in her own peculiar chirography, and leave with a jeweler to insure a *fac-simile* of her autograph on her ring. This is a newer style than the monogram, and at the present time, is taking very well. As seal rings are becoming to the hand,—especially a large well-formed one,—it is believed that they will have quite a run.

The Question of Buttons has bothered many a bachelor, but the question of sleeve-buttons is one affecting every one wearing cuffs. The patent lever button made by Messrs. Howard & Son, and commonly known as the "Horse Shoe and Clover Leaf" button, has reduced this question down to a very simple issue, old style buttons and misery or Howard's patent lever button and comfort. The "Clover Leaf" button is a first-class article, reliable in quality, elegant in design and finish, and it has practically killed the sale of other buttons whether of gold or rolled plate on the Canadian market.

A New Plate Company.—We direct the attention of our readers to the advertisement of the Acme Silver Company, of Toronto, a new competitor for public favor in this line. This company have leased the premises and bought the plant and machinery formerly operated by the Meriden Silver Plate Company in Toronto, and have made arrangements with one of the largest companies in the United States to supply them in the metal with goods of the newest design. This company has only recently become incorporated, and will be managed by Mr. Blackburn, late of the Meriden Silver Plate Co., whose experience in this line of business should be a guarantee of success.

A New Firm.—It will be news to most of our readers to learn that the well-known jewelers Mr. W. G. H. Lowe, of Toronto, and Mr. A. C. Anderson, of Hamilton, have amalgamated under the style of Lowe & Anderson. The amalgamated business, which will now rank amongst the largest in Canada, will be carried on at the old stand of W. G. H. Lowe & Co., 16 Wellington Street East, Toronto. Both Messrs. Lowe and Anderson are old jewelry men, honorable in their dealings, and well up in the business, and the new firm should not only be financially strong, but enterprising enough to secure for itself a large share of the Canadian trade. We wish the new firm a long and successful career.

Attempted Safe Robbery.—The gold leaf factory of C. H. Hubbard, 44 Adelaide St. West, was broken into on the night of the 19th June by burglars, and a daring but unsuccessful attempt made to force open the safes. It appears that the burglars got into the yard, broke a pane of glass in one of the back windows, and unfastening the latch effected an entrance. They drilled holes near the combination locks of three safes on the premises, but owing to the doors being lined with steel they were unable to penetrate far enough into the doors to get at the locks. They had to content themselves with stealing about $200 worth of gold and silver leaf which had been left in the shop. Had they succeeded in getting the safes open they would have secured some thousands of dollars' worth of booty. The affair is being investigated by the detectives.

Our old friend, James Walton Jackson, the well-known jeweler, of St. Catharines, is out in a late issue of the Toronto *News* with the following verse:—

BATOCHE.

"Charge yonder rifle-pits!" Middleton said,
Huzzas drown the echo; on, on they have sped,
Nerved to high daring, with prowess they do—
Metis' and redskin are bayoneted through!
Rifle-pits filled with the rebels—now dead;
Brave volunteers! Never braver were led,
Charged them resistless as waves of the sea—
Batoche is conquered! The captives are free
Loud ring the joy-bells—the victory tell,
Toll solemn dirges, for there heroes fell,
Ring out that Canada's sympathy's large,
Toll soft for loved ones who fell in the charge.
Honor them, honor them, all through the years—
"Died for their country!" our brave volunteers.

James Walton Jackson.

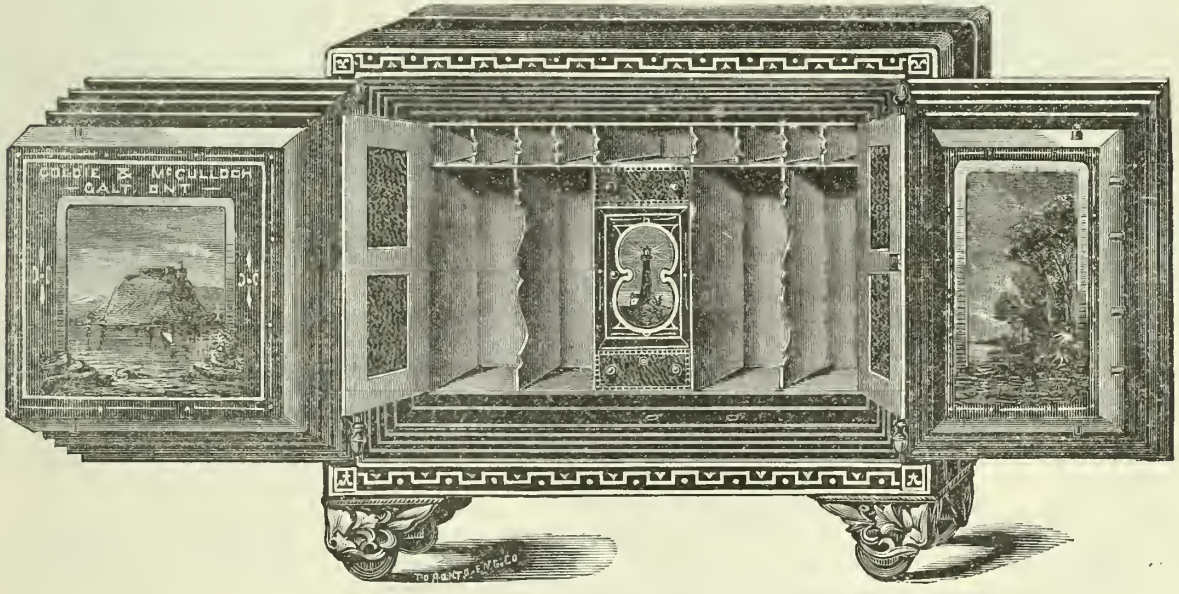
The Failure of Simon P. Kleiser, the well-known retail jeweler of Toronto, although it has been looked for by the knowing ones for a considerable period, has nevertheless been a surprise to the trade generally. Fifteen years ago Mr. Kleiser, who had made a good deal of money in the material and trade watch repairing business, took it into his head to launch out into the watch business, and has ever since that time been one of the most prominent figures in the retail watch business in Canada. His idea seemed to be that low prices must draw the trade, but events have again proved the fallacy of any merchant making money by selling goods at or about cost. His surplus of $10,000 which he had when he commenced business has dwindled away altogether, and he is now so far behind that it is problematical whether he will get a settlement with his creditors or not. No jeweler in Canada has done more to demoralize the watch business by cutting prices, but as is usually the case he has been forced to the wall, while many of his competitors who asked and got a reasonable profit have weathered the storms of commerce and are to-day in prosperous circumstances.

WORKSHOP NOTES.

Cement.—A cement for meerschaum can be made of quicklime mixed to a thick cream with the white of an egg. This cement will also unite glass or china.

Bending Glass Tubes.—Fill the tube with finely-sifted sand, close both ends and heat it over the flame of a Bunsen burner. It may thus easily be bent without losing its roundness at the elbow.

Frosting Polished Silver.—Cyanide of potassium, one ounce, dissolved in one-half pint of



GOLDIE & McCULLOCH,

All information can be obtained either by calling on or communicating with our representative at Toronto, MR. GEO. F. BOSTWICK, who has a LARGE VARIETY TO SELECT FROM; also, MANY SAFES OF OTHER MAKERS, TAKEN IN EXCHANGE FOR OURS, FOR SALE AT LOW PRICES.

TORONTO OFFICE AND WAREROOMS:

Adjoining the "Mail" Building, No. 56 King Street West.

water. Do not hold the silver in your hands, but use boxwood plyers, and apply the mixture with a brush to the surface.

Silver from Waste Products.—The refuse is to be mixed with an equal quantity of wood charcoal, placed in a crucible, and submitted to a bright red heat, and in a short time a silver button will be found at the bottom. Carbonate of soda is another good flux.

Grinding Tools.—Mr. F. K. Kaltenthaler says, in answer to a correspondent: "I use a grindstone with a crank for the first grinding of my graving tools, and when nearly ground finish them on an American oilstone. It expedites the work and answers well.

To Silver the Inside of Hollow Glass.—Convex mirrors, reflectors, globes, hollow glass vessels, etc., can quickly be silvered with the following amalgam, which becomes fluid at a low heat and adheres to glass: Lead and tin, each two ounces; bismuth, two ounces; mercury, four ounces. Add the mercury to the rest in a melted state, and then move from the fire; mix with an iron rod.

Ornamental Designs on Silver.—Select a smooth part of the silver, and sketch on it a monogram or any other design you choose with a sharp lead pencil, then place the article in a gold solution, with the battery in good working order, and in a short time all the parts not sketched with the lead pencil will be covered with a coat of gold. After cleaning the article the black lead is easily removed by the fingers, and a silver ornament disclosed. A gold ornament may be produced by reversing the process.

Washable Coating for Gypsum Figures.—According to C. Pusher, 3 parts caustic potash are dissolved in 36 parts hot water, 9 parts stearic acid are added, and the obtained soap paste is diluted with the same quantity of water and 95 per cent. alcohol. The warm solution is applied upon the warm gypsum cast, and this after a few hours, is repeated with a wet sponge. The casting becomes still handsomer if, in place of potash a corresponding quantity of ammonia is used. Old casts are first cleaned with a 3 per cent. caustic potash solution.

Hardening Gold Springs.—To gold detent, thermometer, suspension and balance springs can be imparted a high degree of elasticity. Rolling hardens them, but they are rendered very brittle thereby. They can be made pliable and elastic, not by hardening, as in the case of steel, but by annealing, care being taken not to exceed a certain degree of heat. The spring may be coiled on a block and placed in a tube, with a smooth steel lid; then heat the tube in the flame of a spirit lamp, and as soon as the steel is of a blue temper, remove the flame and allow the whole to cool.

Flattening an Ordinary Balance Spring.—Remove the collet and stud, and clamp the spring by a central screw between two plates, which are then placed on a blueing tray and gently heated. A small piece of whitened steel is laid on the plate in order to see that the heat does not exceed what is needed to give a blue temper. Allow the plates to cool and separate them. Ordinary springs being made of rolled steel and subsequently coiled, always open out on heating; it is therefore necessary, before resorting to the above method, to coil up the spring, as otherwise the outer turn will be found to have opened beyond the stud.

To Fuse Gold Dust.—Use such a crucible as is generally used for melting brass; heat very hot, then pour in your gold dust, mixed with powdered borax. After a while, a scum or slag will rise to the surface, which may be thickened by the addition of a little lime or bone ash. If the dust contains any of the more oxidizable metals, add a little saltpetre; skim off the slag or scum very carefully. When melted, grasp the crucible with a strong iron tongs and pour immediately into cast-iron molds slightly oiled. The slag and crucible may be afterward pulverized, and the auriferous matter recovered from the mass by cupelling with lead.

Cleansing Polishing Leathers.—A correspondent complains that his polishing leathers have shrunk together after washing them as directed by us. This can only have been by the use of very hot water; this should be hardly lukewarm. Wash your leathers with ordinary soap which contains much potash, and renew the water as often as necessary until perfectly clean. Then beat soap to froth, and meanwhile mix in a little olive oil, using barely a tablespoonful per leather. Next rinse the leather well and ring it dry, stretch it to all sides, and for the purpose of thoroughly drying hang it in a dust-free place but not near a stove. The oil is for the purpose of making the leather soft and supple, and it need not be feared that the oil will make it smeary. The leather can also be washed in benzine; they must then be wrung out in a soft linen rag or handkerchief, and rubbed with it until thoroughly dry, otherwise they would shrink together and become hard.

OTHER NOTES.

Steady Increase in Australian Gold Digging.—Mr. W. G. Langtree, Acting Secretary for Mines in Victoria, reports the estimated quantity of gold raised in the quarter ending June 30 as 190,218 ounces, 3 pennyweights; and he gives the number of miners employed on the gold fields during that quarter as 29,075.

Burmese Ruby Mines for Rent.—According to the Rangoon papers, a French mining company lately offered the large sum of 300,000 rupees per annum for permission to work the ruby mines of Burmah. The Burmese government, however, declined the offer, and demanded an annual rent of 500,000 rupees for the monopoly.

Aluminum is at present employed as a decorative and protective coating for iron and steel against rust, and is highly recommended in place of the nickelizing, tinning or coppering. It is said that the aluminum coating leaves the sharpness of the form of the articles protected with it, adhere, with great tenacity, and that it can equally well be employed upon cast and wrought iron; it can both be ground and polished, and permit an elaboration with the graver. There are many other considerations why it should be preferred to the other metals customarily used, and the fact that aluminum is rather costly will be only a secondary consideration; the first question is its adaptability.

C. W. COLEMAN,

WATCHMAKER TO THE TRADE

AND DEALER IN

Watch Material, Tools, Spectacles, Watch Cases, &c.

Complicated Watches repaired, adjusted and cleaned. Broken or imperfect parts in every grade of Watch replaced by new.

Also Jewelry Jobbing, and manufacturing of Special Designs, Engraving, &c.

Spectacles at 75 cts., $1.25, and $3.25 per Dozen.

Samples of above three lines sent prepaid for 50 cts.

Orders to receive prompt attention must be accompanied with city reference or the cash.

No Step Backward ! Every Advance a Triumph !

JAMES BOSS GOLD CASES BETTER THAN EVER AT

REDUCED PRICES !

THE character and magnitude of the plant of the KEYSTONE FACTORIES are unrivaled. Improved and patented machinery of the most ingenious description occupies every floor of two of the most massive and stately buildings in Philadelphia, while hundreds of operatives, selected for their commanding skill, and drilled in special and original methods, assist in giving shape, construction, and finish to the most complete and serviceable Watch Cases ever produced.

Celebrated as JAMES BOSS GOLD CASES were heretofore, they have now an additional claim to fame and popular favor. Notwithstanding their reduced price,

Every Style of Jas. Boss Gold Case is Made Better Than Ever

It will particularly repay every jeweler on the alert for new, fresh, and reliable goods at prices that *MUST* sell them, to examine the

DOUBLE | PEERLESS | BOSS | GOLD | CASES.

It is, of course, impossible to illustrate, through a print, the graceful roll of the curves, delicately executed rope knurling, and exquisite vermicelli engraving of these cases. No description can do them justice. They are literally superb, and are sold as low as any first quality goods known to the trade.

Every Case has the Dust-Proof Band, is close-fitting to a nicety, interchangeable, and is guaranteed for Twenty Years.

The greatest recommendation of Jas. Boss' cases is that their guarantee is *bona fide,* and that they give universal satisfaction.

SPECIAL NOTICE.

In reference to the above, we desire to say that the facilities now possessed by the new firm in the shape of ample capital and first-class connections in both American and European markets, enables us to offer to the trade exceptional advantages in the price and quality of goods. We propose to keep our stock of Watches, Watch Cases, English and American Jewelry, Clocks, Watch-material and Electro-plated ware, fully assorted and to sell at bottom figures to good men. The business will in future be conducted at the old stand, 16 Wellington Street East, where we trust to be able to serve all the old customers of both firms, and as many new ones as may do us the favor to call and examine our stock and prices.

Thanking the trade for their liberal patronage in the past and assuring them of our continued desire to serve them we are Yours truly,

THE TRADER.

TORONTO, ONT., AUGUST, 1885.

The recognized organ of the Jewelry and kindred Industrial-Trades of Canada.

Published on the first of every month, and sent free to every Jeweler and Hardware Merchant in the Dominion of Canada.

Our rates for advertising will be found very low, and will be made known upon application.

We shall be glad to receive correspondence from all parts, and will publish such letters as will be of interest to the Trade. The name and address must invariably accompany the communication, not necessarily for publication, but as a guarantee.

All business and other communications should be addressed to

THE TRADER PUBLISHING CO.,

57 *ADELAIDE STREET WEST,*

Toronto, Ont

SPECIAL NOTICE.

To ensure insertion, changes or new advertisements must be sent to the office not later than the 20th of each month.

Editorial.

OURSELVES.

Our readers we think will bear out the assertion that we do not often have much to say about ourselves, but at the close of our sixth volume we may be pardoned, we think, if we venture to draw their attention to the progress the journal has made since its inception.

As we write, we have before us No. 1 of Volume 1 of THE TRADER dated September 1st, 1879. This number was in size the same as the present TRADER, but consisted simply of an 8 page paper without any cover. The present issue as our readers will notice is, including the colored cover, 28 pages, or three and a half times its original size. The advertisements in the initial number consist of four. P. W. Ellis & Co., Zimmerman, McNaught & Co., W. Millichamp & Co., and P. Patterson & Sons. In the present number will be found the advertisements of three of these four firms, two of whom P. W. Ellis & Co. and Lowe & Anderson successors to Zimmerman, McNaught & Co. have had advertisements in every number that has since been issued.

Looked at from this standpoint, there can be little doubt that THE TRADER has been a success and that it has in the matter of its growth far exceeded the expectations of its promoters. The publishers have endeavoured as far as in them lay to carry out the promise made by them in their introductory editorial. They then said, "We propose to discuss all questions involving trade issues, from a purely independent standpoint, and shall give forth no uncertain testimony for the side we consider to be in the right. We shall be glad to receive communications on live trade issues, or trade abuses from our readers, and our columns will always be open for the free discussion of subjects that will tend to advance sound business principles and elevate the standard of commercial morality." We have endeavoured to carry out these principles as fairly and as fully as we could, and the many strong and favorable endorsements we have received from the trade in all parts of the Dominion affords us ample proof that our efforts have been appreciated. For these expressions of approval and appreciation, we thank our many friends and we shall do our utmost in the future to continue to merit their good opinion.

Before leaving this subject, however, we would like to ask the trade, whether they as a body have taken the advantage of this journal that they ought. We have provided them for six years with a trade journal which contains information invaluable to any jeweler, free of charge, and all we have asked in return is that they would read our articles and use our columns for the purpose of discussing live trade issues or the interchange of ideas. With some few notable exceptions, our jewelers have not taken advantage of their opportunities in this respect, and in our opinion have lost very much information thereby. There are hundreds of things that our retail jewelers could discuss in such a manner, that it would pay them to discuss if they only would. Such discussions would no doubt pave the way for better acquaintance and trade organization, a thing that everybody must admit is badly needed amongst the retail trade. We have plenty of jewelers capable of writing first-class articles in connection with trade topics and we invite all such to ventilate their opinions in the only medium that circulates amongst the entire trade of Canada.

In our introductory article before quoted from, referring to our advertisements we said—"As this paper is distributed free of expense to every jeweler in Canada, we do not think that we shall be considered unreasonable if we venture to direct the special attention of our readers, not only to the original and selected matter, but also to the advertisements of the well-known and first-class houses it contains. Although our revenue is derived entirely from our advertisements, we shall in all cases endeavour to direct the attention of the trade to reliable houses who offer reliable goods." In this respect we think we have amply made good our promise. No advertisement has ever appeared in our columns except of first-class houses whose standing was beyond dispute and who were always ready to carry out their promises. We propose in the future as in the past to carry out this feature and to make THE TRADER not only a readable paper, but a trustworthy guide to the best markets in the jewelry trade.

OUR VOLUNTEERS.

The past week has been one of enthusiasm and rejoicing throughout Canada on account of the return of our victorious veterans from the North-West. Our citizen soldiers have done their duty nobly. They spring to arms with alacrity at the first call, they endured all the hardships, privations and dangers incident to a campaign with heroic fortitude, and last but not least, they were entirely successful in vanquishing the rebels and in restoring law and order in the North-West. They deserve well of their country.

The magnificent demonstration accorded to the contingent from the vicinity of Toronto on their return to the Queen City of the West, was the finest thing of the kind the Dominion of Canada has ever seen. Toronto looked its best; thousands of banners, streamers, arches, festoons and mottoes of all and sundry kinds, glittered in the sunshine or fluttered in the breeze, and the streets were jammed for miles with thousands upon thousands of gaily dressed citizens who literally cheered themselves hoarse. Everybody was glad, everybody cheered and did various other things that in a colder blooded mood they would never have thought of doing. It was a grand ovation as worthy of Toronto as the men who received it were worthy of such a reception.

Now that the men are home and things are getting settled down people are beginning to realize the scurvy manner in which the Government has treated their claims for compensation; men who fought their country's battles, and by their valor and sacrifices restored law and order to a section of country which the blunders or worse of Government

officials had provoked if not encouraged. The vote to such men of a grant of 320 acres looks like a big thing until you come to examine it, and then one sees that it is a fraud of the most palpable description. Any person who wants to settle can get 160 acres of Government land for nothing and get the other 160 acres for one dollar per acre, so that taken at its best it is but a present of 160 acres of land. But when we find out that in order to avail themselves of this gift, our volunteers have either to settle on the place themselves or put some one else on it within one year, we see how misleading the offer is and of how little value it can be to our brave volunteers, most of whom are city men and have no desire to leave home and their present occupations to get this very liberal reward of their valor. In lieu of this land they can elect to take $80.00 worth of scrip which will be accepted by our Government in payment for North-West lands only. From this it will be easily seen that the government consider this $80.00 of scrip is about equivalent to the original offer of lands. This scrip will only bring about 50 cents on the dollar, so when boiled down to hard pan this reward means about $40 in hard cash. It is liberality with a vengeance. Compare this grant of $40.00 as a reward to men who have endured incredible hardships and risked their lives for four months, with the extra allowance of $500 to the members of the Dominion Parliament for attending to their duties during the same period and taking things easy at Ottawa and we have the true inwardness of Canadian politics. It is a disgrace to Canada and certainly no encouragement to citizens to peril their lives for their country when their services are met by such a scurvy recognition.

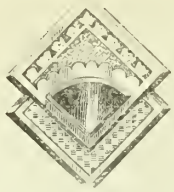
THE INSOLVENT ACT.

As a great many people prophesied, Sir John Macdonald has again squelched the "Insolvent Act" for another year, at least, by keeping it back until it was too late for the House to consider it this session. This action is a pretty fair specimen of the way politicians in Canada regard the interests of the country as compared with those of party. A new "Insolvent Act" is a measure unanimously demanded by the mercantile community from Halifax to Vancouver; it is one that is essentially just in every particular, and moreover, in consequence of the want of such an Act, business is unsettled at home, and Canadian credit suffers abroad. These things have been represented to the Premier both in Canada and England a score of times. He has been interviewed by commercial deputations, who pointed out to him the necessity of legislation in this direction, and on every occasion has replied that he was thoroughly in sympathy with the object they had in view and would do his utmost to carry it into effect. How he has carried out those oft-repeated promises, the records of the past three sessions will tell.

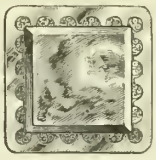
The session just closed was the longest one since Confederation; the Government has brought in measures entirely uncalled for, and which were so glaringly partizan in character that they provoked enough discussion to make the session fully double its usual length. A Franchise Bill that cannot possibly come into force until the next general election, a couple of years from now; a Bill to grant a few more millions to the C. P. R. millionaires—those and such like political measures, that are only intended to serve partizan purposes, were rushed through in spite of clamour and protest, whilst such legislation as "The Insolvent Act" was coolly shelved until a more convenient season.

There is altogether too much politics and too little patriotism about our legislators to suit commercial men. If they would consider the interests of Canada just about one-tenth what they do that of their party, the country would be more economically governed and be in a much more prosperous condition. Our rulers apparently do not ask themselves "What is best for the country?" but "What is best for our party?" In their scales and with their weights, party goes down and country up every time.

Although the "Insolvent Act" has been shelved for the time being, it is ultimately bound to carry. If Sir John Macdonald had thought that it would have strengthened his party any it would have been law long ago; as matters stand at present it will remain in *statute quo* until he sees that holding it back longer will hurt his chances of re-election. When that time comes his party will suddenly get new light upon the subject, and it will go through with a rush. In the meantime our merchants must agitate the question and let those in power see that they mean business and are bound to have such an Act.



AN ADVANCE IN AMERICAN MOVEMENTS.



Since our last issue the price of nearly all American watch movements has advanced somewhat, an indication, we think, of a revival in trade in the United States. As we pointed out in our last issue, any such advance is sure to be taken advantage of by their Swiss competitors, who will now be able to compete against them more favorably than before. Without any disparagement to the movements made by Swiss manufacturers, it is safe to say that people in Canada prefer American-made goods at anything like the same figures. When, however, the difference becomes too apparent, the sales of Swiss goods increase and they displace American goods to an equal amount. Heretofore American movement manufacturers have made a special export price to Canadian trade in the form of a five per cent. concession, which they now propose to take away and make them pay the same prices as American jobbers. In so doing, we think they are making a mistake. They have almost complete possession of their own and the Canadian market, and in order to keep the latter they are bound to make some concessions in order to bring the price down as near as possible to American prices. Every per cent. they increase in the export trade, they lessen their chance of doing business, and this, we fancy, their Swiss competitors will not be slow to take advantage of. Swiss manufacturers are now working hard to bring their movements up to a standard where they can successfully compete with American movements in quality and undersell them in price. When they get there, as they assuredly shall some day, fancy prices will become a thing of the past, and watch movements will get down to rock bottom prices. At present American manufacturers have a strong lead, and we think if they are wise they will do nothing to lessen it.

We do not anticipate that the slight advance on movements will affect the trade injuriously. The crop reports are excellent, and if the harvest is secured in good condition, the prospects for a large and good-paying fall trade are almost all that could be desired. If the United States is also blessed with an abundant harvest and a return of prosperous times, we are of the opinion, that although prices of low grade movements

may not advance further, they will not be so plentiful nor so easily obtained as they are to-day. Two years ago times were good and low grade movements were selling at a premium, and we do not think that we would lose anything by returning again to a similar condition of things.

Selected Matter.

ANNALS OF THE FINGER RING.

JOHN W. MILES, IN "JEWELERS' JOURNAL."

As a pledge of betrothal and marriage it is known that the ring has been employed from the most ancient times, but the significations of it are somewhat obscure. That the Egyptians used rings of gold as money is manifest from their monuments, and it is supposed that one of these rings was placed upon the bride's finger, as a token that her husband's possessions had become hers also by the ceremony of marriage. The selection of the left hand was in accordance with the theory that the left hand was inferior to the right, and hence symbolized the subjection of a wife to her husband. Still, again, the finger next the little finger, which has always been the recipient of this emblem, signified not only an affair of the heart, by reason of the anatomical fallacy previously mentioned, but also gave an additional security to the golden hoop, since this finger is the least used of any, and cannot be extended except in the company of another, which, in a measure protects it. All these explanations are very ingenious but extremely difficult of proof.

That the early Jews used the wedding ring is undoubted, although Selden claims that it was after they saw it in use by others. Hebrew marriage rings of the sixteenth century are still extant. These are of large size, and known as "tower" rings. It may readily be supposed that rings of this character were often very fine specimens of art, and even the architectural ornament served as a receptacle for perfumes or souvenirs, a portion of the roof opening upon a hinge and being locked with a key.

With the Romans the ceremony of betrothal before marriage prevailed as at the present day, and rings were passed as earnest in the same manner as at the conclusion of any other bargain. At the completion of the marriage settlement rings bearing the names of the contracting parties were presented to the guests. Sometimes the *annulus nuptials sponsalitius* bore inscriptions like "May you live long," or, if a stone was inserted, it bore an intaglio like a hand pulling the lobe of an ear with the motto, "Remember me,"—a promise of conjugal punishment in case of forgetfulness.

Among the Christians the use of marriage rings prevailed as early as 860. There is a queer legend of a wedding ring which was given by Joseph to the Virgin Mary. It occurs in "Patrick's Devotions of the Roman Church," and though somewhat lengthy, it appears sufficiently interesting to be quoted in full. "It was discovered in the year 996 in this way: Judith, the wife of Hugo, Marquis of Etruria, being a great lover of jewels, employed one Ranerius, a skillful jeweler and lapidary of Clusium, to go to Rome to make purchases for her. There he formed an intimacy with a jeweler from Jerusalem, who, when Ranerius was about to return home, professed great affection, and offered him a ring as a pledge of friendship. Ranerius, looking upon it as of little value, declined it with a slight compliment; but the jeweler from the Holy Land bade him not contemn it, for it was the wedding ring of Joseph and the blessed Virgin, and made him take it with a special charge that it should not fall into the hands of a wicked person. Ranerius, still careless of what he said, threw it into a chest with articles of inferior value, where it remained until his forgetfulness cost him dear, for when his son was only ten years old (the number of years that his father disregarded the Virgin's ring) the boy died and was carried to his burial. But, behold, as the hearse went forward, on a sudden the dead child rose from the coffin, ordered the bearers to stop, and calling to his father, told him that by the favor of the blessed Virgin he was come from Heaven to tell him that as he had contemned religion by concealing her most holy ring in a common heap, he must immediately send for it and publicly produce it that it might be openly venerated. The chest being brought and delivered into the son's hand, he presently found the ring although he had never seen it before; then, most reverently kissing it, and showing it to the spectators, they religiously adored it, during the joyful pealing of bells, which rang of their own accord, whereupon, ordering himself to be carried to the place where he desired to be buried, he delivered the ring to the curate of the parish, and then laying himself down in his coffin was interred. This ring wrought many miracles; ivory ones touched with it, worn by women in difficult labor, relieved them; an impression of it in wax, applied to the hip, removed the sciatica; it cured diseases of the eyes, reconciled married people that quarreled, and drove out devils.

"Five centuries afterward, in 1473, the church of Musthiola, where it effected these wonders, becoming ruinous, the ring was deposited with a religious community of Francescans at Clusium. One of the brethren of the order, named Wintherus, a crafty German, and very wicked, having obtained from the magistrates an appointment to show the ring on a certain occasion, after exhibiting it at the end of his sermon, stooped down as if he were putting it into the place provided for it, but instead of doing so he slipped it up his sleeve, and privily conveyed himself and the ring from the city across the water. All was well so far, but when he got into a neighboring field it suddenly became dark, so that, not knowing which way to go, but well knowing what was the matter, he hung the ring on a tree and falling to the ground penitently confessed his sin to it and promised to return to Clusium if it would dispel the darkness. On taking it down it emitted a great light, which he took advantage of to travel to Perusia, where he sojourned with the Augustin friars till he determined on making another effort to carry it into Germany. He was again hindered by the darkness returning. It infested him and the whole city for twenty days. Still he resolved not to return to Clusium but tell his story in great confidence to his landlord, one Lucas Jordanus, who with great cunning represented to him his danger from the Clusians and the benefits he would receive from the Perusians if he bestowed the ring on that city. Wintherus followed his advice. As soon as the ring was shown to the people the darkness disappeared, and Wintherus was well provided for in the house of the magistrate. Meanwhile, the Bishop of Clusium coming to Perusia, endeavored in vain to obtain the relic. The city of Sena sent an ambassador to resist the claims of the Clusians. He was enter-

In compliance with an increasing demand, we have placed on the market a

NEW PATENT DUST-PROOF

SCREW BEZEL

Silver Open Face Stem Winding Case

embodying many of the excellent qualities of our original Patent Dust Proof Case, though offered at a lower figure.

The back and center of the new case are made of one continuous piece of solid silver, into which an Albata Cup is screwed identical in shape with the back, thus greatly strengthening it and efficiently protecting the Movement against dust.

THE NEW CASE WILL BE CALLED

ALBATA CUP SCREW BEZEL

We shall continue the manufacture of our popular Patent Dust-Proof Case with Screw Crown and Screw Bezel in all the styles as heretofore, plain and inlaid, with Lever and Pendant Setting.

tained by the Perusians with great respect, but they informed him that having used no sacrilegious arts to obtain the blessed Virgin's ring, they respected her too much to restore it to the owners; that they received it within their walls with as much respect as they would do the Ark of the Covenant, and would defend their holy prize by force of arms. The bereaved Clusians laid their case before Pope Sixtus IV., and the Perusians did the same. Wintherus was ordered by the Pope, on the importunity of the Clusians, into closer confinement; but as the heat abated, he passed a merry life in Perusia, and at his death the Francescans and the Canons of St. Lawrence disputed for the possession of his body. This honor was, in the end, obtained by the latter, in whose chapel he was buried, before an altar dedicated to St. Joseph and the Virgin, and a monument was erected by the Perusians to the ring stealer's memory, with an inscription which acknowledged that the receivers were as much indebted to him for it as if it had been his own property and he had offered it of his own accord."

Modern learning has demolished the theory of this ring, for, says the Rev. C. W. King, in his Handbook of Engraved Gems: "The highest glory ever attained by the work of the engraver was that of the cameo of the Abbey of St. Germain des pres, which enjoyed for an entire millenium the transcendant (though baseless) fame of adorning the espousal ring of the Virgin Mary, and of preserving the portraits after life of herself and Joseph." But, alas! antiquaries have now remorselessly restored the ownership of gem and portraits to two nobodys (probably *Liberti*, judging from their names), whose votive legend, "Alpheus with Aretho," is but too plainly legible in our Greek reading times.

A curious ring used in betrothals during the fourteenth century was the "gemmal" or "jemmal" ring. This was either double or triple, and on the occasion of betrothal they were separated, each party retaining one, and reunited again after marriage. In case of the triple ring a friend or witness held the third hoop. These were called gemmel rings and showed two hands clasped when the circles were closed. Sometimes they were made still more complicated, but the triple ring appears to have been the usual refinement. Thus Herrick writes:

"Thou sent'st to me a true love-knot, but I
Return a ring of jemmals to imply
Thy love had one knot, mine a triple tye."

Sometimes they were called the "joint" ring, as in Dryden's "Don Sebastian":

"A curious artist wrought 'em
With joynts so close as not to be perceived;
Yet are they both each other's counterpart.
Her part had Juan inscribed, and his had Zayda,
(You know these names were theirs), and in the midst
A heart divided in two halves was placed.
Now if the rivets of those rings enclosed
Fit not each other, I have forged this lye,
But if they join, you must forever part."

That which has been written in these articles bears but a small portion to the vast amount of material at the command of the writer, but unfortunately a late discovery that the subject has already been treated by foreign pens, deprives the review of that zest which only comes from original research, and necessitates a speedy ending of a work which must, perforce, follow in paths already trod. Customs, however, may change; styles may vary, but the ring will still hold its place and rank until that eternity of which it is the emblem.—*Exchange.*

THE NIAGARA GORGE AS A CHRONOMETER.

G. FREDERICK WRIGHT.

In order to understand the recession of the falls of Niagara, it is well to remember that the rock strata which underlies it dips gently (twenty-five feet to the mile) toward the south. The upper or No. 1 stratum consists of compact Niagara limestone about 80 feet in thickness. Underneath it is the comparatively soft Niagara Shale, or No. 2 stratum, of about the same thickness. Nos. 3 and 5 are also strata of hard rock, with a softer rock intervening. The river formerly plunged over the escarpment at Queenston, about seven miles below the present cataract, and when the perpendicular fall must have been upwards of three hundred feet. From that point to the present cataract the river now occupies a narrow gorge from five hundred to twelve hundred feet in width, and from two hundred and fifty to three hundred and fifty feet in depth. The softer rocks rapidly wear away, thus undermining the harder rocks above, and leaving them to project over, and finally to break off in huge fragments, and fall to the bottom, where they would lie to obstruct the channel, were it not for the great momentum of water constantly pouring upon them, and causing them to grind together until they are pulverized and carried away piecemeal. The continuity of the underlying soft strata insures the continuance of a projecting stratum at the top, and a perpendicular plunge of water passing over it.

Double interest attaches itself to the Niagara gorge, when we consider the evidence of its post-glacial origin, and thus are permitted to regard it as a chronometer of the glacial age.

That the Niagara river can have occupied its present channel only since the glacial period, was shown by Professor Newberry when he proved that the Cuyahoga river, emptying into Lake Erie at Cleveland, occupied in pre-glacial times a channel about two hundred feet below its present bed, borings in the bed of the Cuyahoga extending that distance in glacial clays before reaching the rock. To receive a tributary at that depth, the level of Lake Erie must of course have been correspondingly depressed; and, as the lake is nowhere much more than two hundred feet in depth, we may confidently say that before the glacial period, such a body as Lake Erie did not exist, but instead a wide valley through which a great stream, corresponding to the present Niagara, found its way to the head of Lake Ontario, through a deep and continuous gorge. Professor Spencer, indeed thinks he can trace the course of this pre-glacial gorge from near the mouth of the Grand River in Canada, northward to Lake Ontario.

We might also infer the relatively late origin of the present channel of the Niagara from the small amount of work which the river has done in its present channel. The Alleghany and Ohio rivers, which lie outside the limit of glaciation, illustrate in a striking degree the extent of pre-glacial erosion. For a distance of more than a thousand miles these streams occupy a continuous eroded trough, averaging about a mile in width and from three hundred to five hundred feet in depth; whereas the gorge in the Niagara river below the falls is only about seven miles in length.

That the Niagara gorge is post-glacial, was also shown as early as 1841, by Prof. James Hall, of the New York survey, who pointed out to Sir Charles Lyell the probable course of a pre-glacial channel, now filled with glacial *debris* extending from the whirlpool to St.

David's, where the level of Lake Ontario is reached.

From the falls to Queenston, the perpendicular bank of the gorge, from two hundred and fifty to three hundred feet in height, is continuous upon the east side; but upon the west side, about half way down, occurs a remarkable indentation, known as the "whirlpool." Following this bank around, small streams expose the rock before descending to the whirlpool, and the rocky bank re-appears. The opening of the supposed pre-glacial channel to the north-west is much wider than its entrance at the whirlpool, and the descent of three hundred feet to St. David's is rapid. The broad opening towards St. David's is also filled with gravel rather than with till; and this gravel extends southward over the higher level toward the falls, somewhat like the familiar "lake ridges" of Ohio.

It will be seen that the existence of a pre-glacial channel from the whirlpool to St. David's—a distance of about three miles—is somewhat hypothetical, since for a space of nearly two miles the original features of the country are wholly disguised by the glacial deposit, and no wells have been sunk to a sufficient depth to test the question properly. The well to which Sir Charles Lyell referred was probably about the head of the stream which is really in the gravel outside the escarpment. Still there is little doubt that before the glacial period there was a narrow gorge, about two hundred and fifty feet deep, extending from the whirlpool, and perhaps a little above it, to the Ontario level at St. David's. But it is equally clear that the river which wore this gorge was not the Niagara, since a stream of that size must, during the long pre-glacial period (measured by the eroded channel of the Ohio and Alleghany(, have worn a gorge far longer than that between the whirlpool and the present falls. The pre-glacial channel from the whirlpool to St. David's was probably, therefore as Dr. Pohlman suggests, the work of a comparatively small stream, with a drainage basin occupying not more than two or three counties in Western New York.

Considering now the gorge from Queenston to the falls of Niagara as the work done by the stream since the close of the glacial period, and taking that as the dividend, if we can determine the annual rate at which the falls recede, and take that for the divisor our quotient will represent the time that has elapsed since the glacial period. By comparison a practical calculation may be made as to the amount of recession of the horse-shoe fall in the interval of thirty-four years. This cannot vary much from a hundred feet upon the whole line, being, as the commissioners calculate, two hundred and seventy feet at certain points.

Until this last survey, the attempts to estimate the time required for the cataract to recede from Queenston to its present position have been based upon very insufficient data. Mr. Blakewell, an eminent English geologist, gave personal attention to the problem as early as 1830, and, from everything he could learn at that time, estimated that the falls had receded about one hundred and twenty feet in the forty years preceding. He recurred to the problem again in 1846, 1851, 1856 (*American Journal of Science*, January 1857, pp. 87, 93), and was each time confirmed in the belief that the apex of the horse-shoe fall was receding, on an average, three feet a year. On the other hand, Sir Chas. Lyell, upon his first visit, in 1841, "conceived" (upon what basis he does not tell us) that, at the utmost, the rate could not be more than one foot a year, which would give us thirty-five thousand years as the minimum time. But, as it appears, the result of the recent survey is to confirm the estimate of Mr. Bakewell, thus bringing the period down to about seven thousand years.

Two elements of uncertainty, however, tending to lengthen the estimate, should be noticed. In the first place, the recession may have been somewhat slower while the hard stratum was exposed. In the second place, the deposits of gravel running southward from St. David's, and corresponding to the lake-ridges, indicate that subsequent to the glacial period this whole region was slightly submerged beneath a shallow body of water; in which case the recession of the gorge would have begun only upon the emergence of the land. And we have no means of telling how long an interval may have elapsed between the withdrawal of the ice and the withdrawal of the water.

On the other hand, it is probable that the channel of a pre-glacial stream extended somewhat above the whirlpool, thus reducing amount of work done since glacial time.

The above estimates are confirmed, also, by the small amount of change that has taken place in the species of animals during this period. The mollusks found in the river above the falls at the present time are identical species with the shells found in the deserted river channel at the top of the escarpment opposite the whirlpool, while nearer the falls the bones of the mastodon have been found in the same deposits; all of which corresponds with a vast amount of other evidence, going to show that the present species are, in the main, identical with those existing at the close of the glacial period. The theory of evolution is relieved from a heavy burden by supposing a recent date for the close of the glacial epoch; for the changes since that epoch have been so slight, that the time allowed by physicists is insufficient for the whole development of organic forms, unless the rate of change is more rapid than must be the case if the glacial period is thrown very far back.

JOHN ARNOLD.

It may be of interest to many readers of your excellent journal to hear something about that great horologist, the late John Arnold, whose fame has gone out from England to all nations and provinces where the English language is spoken. John Arnold was truly a genius of rare ability and attainments, who possessed great mechanical ingenuity combined with indefatigable industry and perseverance. It may not be generally known that when a young man he was engaged in locksmithing, an important industry in the last and beginning of the present century. His trade called him to travel over England and Scotland, from town to town, repairing locks and bottle jacks and also cleaning clocks and watches. While upon one of his tours he actually cleaned a watch on the summit of the spire of the Cathedral at Salisbury. This incident is related about as follows:

From time to time some daring person has climbed this spire to oil the weather cock, a most dangerous feat, as the spire is four hundred and four feet from the ground. It is ascended by ladders for about three-fourths of its height, which are fixed inside the spire. A small door then opens and the adventurer has to climb the rest of the way by a series of iron handles which are fixed in the stone work, and by which he is able to make

TRADE 

MARKS.

An Open Letter of Special Interest to the Retail Trade of Canada.

TORONTO, JULY 25th, 1885.

GENTLEMEN,

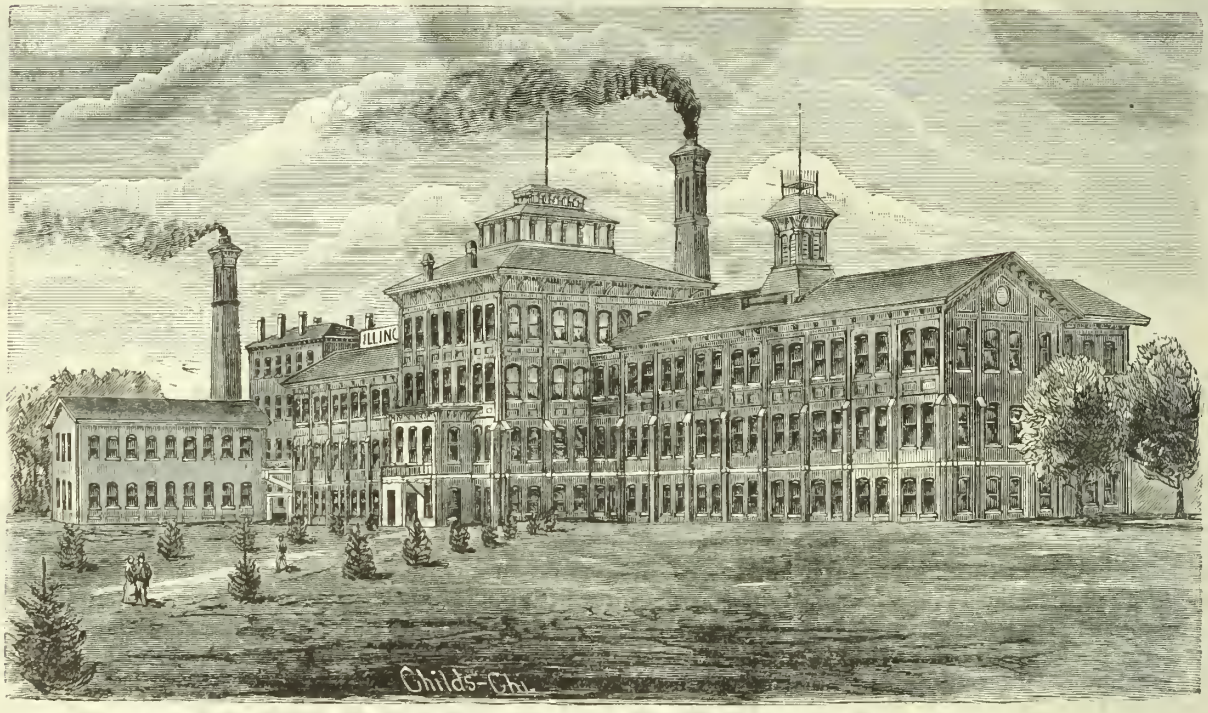
The manufacture of Fine Gold Watch Cases is one of the most intricate as well as the most exact of mechanical operations. If not properly constructed and fitted in every part, it is practically useless, and certainly far from being "a thing of beauty and a joy forever." In a perfect watch case, three things are absolutely necessary, viz., (1) first-class material, (2) tight jointing and fitting, and (3), a perfect finish. The American Watch Case Company, of Toronto, claim to combine in the Cases of their manufacture all these essentials, and to produce as perfect a Case as any in the world. We have fitted up our new factory with the latest and most improved American machinery, use only pure gold from the U. S. Mint, and employ the most skilled workmen that can be had in the best U. S. factories. This being the case, we have no hesitation in asking the Trade of Canada to purchase our Cases on their merits, feeling satisfied that as far as quality of material and perfection of finish is concerned, they are equal, if not superior to any similar goods imported into this country.

As regards price, we claim that our goods can be sold fully twenty per cent. lower than any imported goods of equal quality that are honestly entered through the customs and pay the usual duty demanded by Government. Three-fourths of the value of a gold case is in the material. Importing it as we do in the form of bullion direct from the mint, it comes in free of duty, but if manufactured before it is imported, a duty of twenty-five per cent. is levied upon it by the customs authorities. The Trade will thus see that we offer them Cases equal to any imported, on which this expenditure for duty is saved, and that by handling our goods they will be enabled to sell an equally good Case at a very much lower price than they have been formerly compelled to charge for the imported article. We have laid down the following platform in regard to the manufacture of our goods, and shall not depart from it on any consideration. 1st. We manufacture no goods without our own Trade Marks. 2nd. We stamp no goods of higher quality than they really are. 3rd. We guarantee the quality of every Case we make to be as stamped upon it.

GUARANTEE OF QUALITY.—The AMERICAN WATCH CASE COMPANY OF TORONTO guarantees every Case manufactured by them and bearing any of their Trade Marks as above to be of the quality stamped upon it according to the U. S. Standard.

Dealers and the public can therefore buy Goods bearing this Stamp with the full assurance that they are getting the quality exactly as represented and no other, a great point in these days of stamped up Goods, and one we feel sure that they will not be slow to appreciate. We have just sent out to every Retail Jeweler in Canada a complete list of the Gold and Silver Cases of our manufacture, and the prices and terms at which they can be had from the Jobbing Trade. We sell no Goods direct to the Retail Trade ; but they can be procured at our Catalogue Prices from any of the leading Jobbers in Canada. Assuring you of our best desire to give you honest goods at honest prices, we are,

Yours very truly,



The American Watch Case Co., of Toronto.

ILLINOIS WATCH FACTORY,

—AT—

SPRINGFIELD, ILLINOIS, U. S. A.

CAPACITY 500 WATCHES PER DAY.

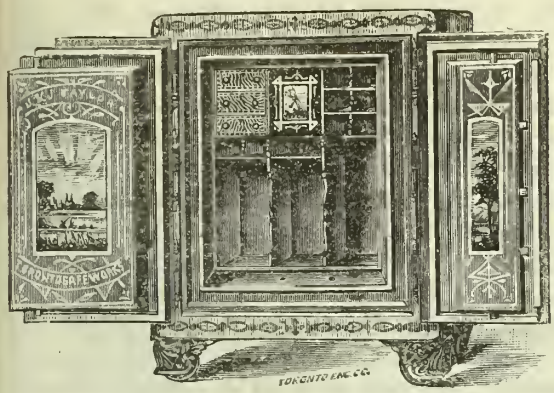
ESTABLISHED 1870.

All Movements have Patent Pinion, and all are Quick Train. All Stem Winders made to fit Hunting and Open Face Cases, the latter bringing the figure XII at the pendent.

Orders for Movements with special engraving in grades above I. W. Co., received in lots of five and upwards without extra charge.

Special attention is called to our I. W. Co., which is the **only** low-priced Movement in the market having all the following improvements :—

SUNK SECONDS DIAL, PATENT PINION, DUST BAND, QUICK TRAIN, EXPANSION BALANCE, TEMPERED HAIRSPRING.



OUR No. 5 IS THE CHEAPEST ADJUSTED, FULL JEWELLED, PATENT REGULATOR MOVEMENT MADE.

Our No. 150, Ladies' 8 size Watch is of superior finish, low-priced, and guaranteed

THE BEST CHEAP LADIES' WATCH EVER PRODUCED.

For full information please consult our advertisement in last month's issue of THE TRADER.

his way to the top to complete his dizzy work. On one occasion some persons were assembled at the Pheasant in Salisbury, a well-known inn (during the stage coach era of olden times), and they were talking about this feat, when John Arnold, who was present, offered for a small wager to ascend the spire, to take with him his tools and a watch, to take the watch to pieces on the very top of the spire, to clean it properly and to bring it down within one hour. He accordingly climbed the spire, fixed his back against the stem of the weather cock, completed his task and descended within the given time. This feat was performed by John Arnold, who afterward came to London, and on June 4, 1764, presented to George III. a curious lilliputian watch a repeater of his own make, set in a ring. The sides of the article did not exceed that of a silver two penny piece. It contained one hundred and twenty different parts, but altogether weighed not more than five pennyweights eight grains. Space will not allow me to give a minute description of all its parts, but for this delicate and exquisite specimen of art Arnold had to make nearly all the tools that he used in its manufacture. This tiny watch contained the first ruby cylinder ever made. The king was so pleased with this mechanical wonder that he presented the donor of it with five hundred guineas as a recognition of his artistic skill.

Some time afterward the Emperor of Russia, having heard of the king's watch, offered Arnold one thousand guineas if he would make another like it for him. This Arnold refused to do, so that he might not depreciate the value of his gift. The cylinder was made of an oriental ruby, its diameter was the fifty-fourth part of an inch, its length the forty-seventh, and its weight the two hundredth part of a grain. After this John Arnold rapidly rose in his profession, invented the chronometer escapement, the compensation balance and the cylindrical balance spring, and finally obtained the government reward for his improvements in the construction of marine chronometers. Some have said that he pirated the work of Earnshaw, but I much question this, as his great genius has never been surpassed. He established a factory at Chigwell, Essex, on the borders of Epping Forest, where every portion of the chronometer was made on the premises.

There are several specimens of John Arnold's work which were presented to the clockmakers' company by the late Charles Frodsham, in the year 1875. Among them is a fine old specimen of a pocket chronometer, No. 28, in silver gilt case, pivoted detent escapement, with figure S compensation balance, or pieces carrying weights in direct line to centre of balance, re-sprung by Chas. Frodsham, for the purpose of testing the compensation, also specimen of a one-day marine chronometer, No. 14, in an octagon case with enamel dial, epicycloidal escape wheel, adjusting balance spring stud; also a fine specimen of a two-day marine chronometer, No. $\frac{8}{10}\frac{4}{4}$, in octagon case, enamel dial, jeweled to the centre wheel, epicycloidal escape wheel, and a gold balance spring.

John Arnold, the subject of this sketch, died on the last day of the last century, at the early age of fifty-five.—*W. B. Crisp, in the Jewelers' Journal.*

DIET AND FOOD.

1. Foods are scientifically divided into —1. Water. 2. Meaty or albuminous substances. 2. Starches or carbonydrats. 4. Fats. 5. Mineral matters. 6. Accessory foods. All of which have their representatives in the body itself. A human being is so "watery" that the corpse of a man weighing 150 pounds, and carefully dried, would come out a shrivelled mass of 50 pounds in weight. The meaty substances are represented by muscle; the starchy by glycogen found in the liver, and by a sugar (inosite) found in the muscles; fat is present, padding angular parts and giving a roundness to the frame; mineral matters abound, especially in the bones and teeth.

II. The composition of the human body is somewhat as follows:

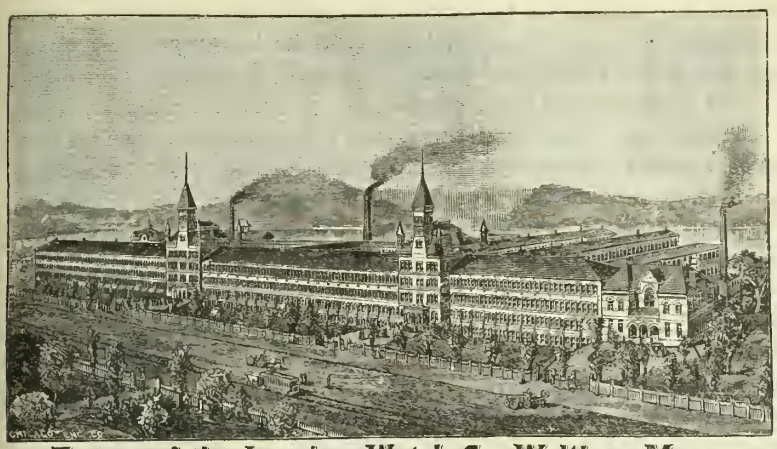
ADULT MAN.

Bones	16	per cent.
Muscles	42	"
Organs in the chest and abdomen	9	"
Fat and skin	25	"
Brain	2	"

Therefore, supposing a person weighed 150 pounds, 63 pounds would be muscle, 37½ pounds would be skin and fat, 24 pounds would be bone, and three pounds would be brain.

III. More than half the weight of the body is bone and muscle.

IV. The amount of water in food is very large. A beefsteak contains 75 per cent. of water. In buying a pound, only one fourth of that pound is dry solid meat. Cabbages contain 85 to 90 per cent. of their weight of water, and succulent fruits sometimes more than 90 per cent. Of substances most commonly eaten, rusks or biscuits are the driest, and water-melons the most watery of foods.



V. When water is taken into the system it assists without doubt in the building up of new tissues, in the repair of old. According to this view, it is not merely a dilutent of fluids, it does not simply play an inactive part like a lubricant of machinery, but it is in the truest sense a food.

VI. Life cannot be maintained on pure starch, sugar or fat for a long time; on the other hand a purely meat diet cannot maintain life indefinitely.

VII. Sugar cannot be made the basis of diet, but rice can; so that taking complex foods, rice heads the list. Of the three great foods on which, with very little addition, millions of human beings live—viz., rice, bread and potatoes—rice is nearly all assimilated, fine wheaten bread being almost equal to rice, while with potatoes there is nearly 40 per cent. of waste, or substances which pass away without being utilized. So that in point of economy, and considering the relative price of the three, rice stands first.—*American Grocer.*

THE INVENTOR OF "INTERCHANGEABILITY."

The death of Georges Leschot, the celebrated watchmaker of Geneva, partner in the firm of Vacheron and Constantin, recalls to my mind the account of the origin of "interchangeability" which he gave me a few days before his death, in the following words: "The idea of 'interchangeability' was suggested to me by a slight accident which occurred in 1834. At that time gold-plating by heat or by mercury, better known as fire gilding, was the only process known, and delicate pieces were liable to be more or less injured by the operation. This happened one day to the plate of a repeater that I was gold-plating; it came out of the operation melted nearly to the centre. All the preceding labor I had spent upon it seemed wholly lost, but the idea came to me to make use of the injured plate in such a way as to transfer to another the pieces that were to have

been fastened upon it. In order to do this I made a strong ring of steel, into which I forced the plate, so that the disjointed pieces were again united; then, by means of a pantograph, I marked all its holes, etc., on a plate of metal, on a scale four times as large as in the original plate, with the utmost care, verifying each step of the work over and over again so as to avoid any chance of error. This done, I made a new plate of the same size as the first one, to which I carefully transferred the marks obtained by the pantograph. I made each hole exactly similar to the corresponding hole in the original plate, with the grooves, etc., duplicates of those in the other. When I came to set the plate in position and mount the other pieces upon it, I found that although not perfect, yet it went very satisfactorily. The only alteration I found necessary was with the quarter hammer, which I had to change a trifle. It was a complete success, if you take into account the time I had saved. I became convinced then of the possibility and advantage of tracing a watch upon a certain scale, and of keeping the same scale for other watches, thus developing the idea of interchangeability which I brought to further perfection later." Such are the facts in the inventor's own words in regard to the origin of the process vaunted so highly across the Atlantic, and which has been in use in Geneva for fifty years and more.—*Translated for The Jewelers' Journal.*

THE TEMPLE OF BAALBEC.

The ruins of the ancient city of Baalbec, situated on the plain forty-three miles north-west of Damascus, are the wonder of modern architects.

Everything is colossal. The area is larger than that of the temple of Jerusalem. We may begin with the walls, which are half a mile around, and of such height and depth as are rarely attained in the most tremendous fortress. When from within I climbed to the top, it made me giddy to look over the perilous edge to the depth below; and when from without the walls I looked up at them, they rose high in the air. Some of the stones seem as if they had been reared in place, not by Titans, but by the gods. There are nine stones thirty feet long and ten feet thick, which is larger than the foundation stones of the temple of Jerusalem, dating from the time of Solomon, or any blocks in the great pyramid.

But even these are pigmies compared with the three giants on the western wall, 62 feet, 63½ feet, 64 feet long. These are said to be the largest stones ever used in any construction. They weigh hundreds of tons, and instead of being merely hewn out of a quarry, which might have been on the site, and left to lie where they were before, they have been lifted nineteen feet from the ground, and there embedded in the wall. Never was there such cyclopean architecture. How such masses could have been moved is a problem with modern engineers.

Sir Charles Wilson, whom I met in Jerusalem is at this moment in Baalbec. Standing in the grounds of the temple, he tells me that in the British Museum there is an ancient tablet which reveals the way such stones were moved. The mechanics were very simple; rollers were put under them, and they were drawn up inclined planes by sheer human muscle, the united strength of great numbers of men. In the rude design on the tablet the whole scene is pictured to the eye. There are battalions of men, hundreds to a single roller, with the taskmasters standing over them, lash in hand, which was freely applied to make them pull together, and the king sitting on high to give the signal for this putting forth of human strength *en masse* as if an army was moving to battle. A battle it was in the waste of human life it caused. These temples of Baalbec must have been a whole generation in building and have consumed the population of a province and the wealth of an empire.—*Henry M. Field, D. D.*

THE CLYNDOGRAPH.

The clyndograph of M. Moessard is a new panoramic photographic apparatus, which by a simple rotation of the objective gives the cylindrical perspective of the earth. A view furnished by the apparatus embraces an angle of 170°, so that a complete turn of the horizon is obtained in two views and a fraction of 20° range. The instrument is based on the principle that a lens or combination of lenses, constituting a photographic objective, may be subjected to any movement whatever without the image it produces on a screen changing its form or position, provided that the movement takes place around the nodal point, behind which is maintained immovable. This follows from the known property of the nodal point being the point of view of the perspective produced. Suppose, then, there be (1) an objective suspended horizontally and turning round a vertical axis passing by its after nodal point; (2) two vertical shutters fixed behind to right and left of the objective, to limit the field in the horizontal direction and arrest rays too oblique; (3) a screen of cylindrical form vertically centered upon the axis of rotation, and having for radius the distance of the nodal point from the principal focus of the objective, in any position whatever of the objective the lie of the country comprised in the field of the instrument will be projected on the screen. If the objective be put in motion one gets successively for each point of the panorama an immovable image which impresses the eye or sensitive paper while the point remains between the two shutters. In M. Moessard's actual apparatus Teiebaut sensitive plates are used to receive the impressions. The instrument is expected to prove useful in preliminary surveying and military operations.—*Exchange.*

FAMOUS BRONZE DOORS.

Among the monumental works in bronze which emanated from Constantinople some of the most remarkable are the bronze doors which decorated several of the Italian churches, more particularly those which are enriched with inlays of silver. The church of San Marco possesses one brought from Constantinople, and which originally adorned the church of Santa Sophia, and like the bronze horses, was brought to Venice as spoils of war in 1204. Other doors worthy of mention are those at Amalfi, in the Duomo, San Salvadore di Bireto, Atrani, the Benedictine Church at Monte Cassino, and the church at Monte Santangelo—the last four examples were all the gift of one family, the Pantaleoni Viaretta in 1807, "pro mercede animea suae et merita S. Sebastiani, martyris." At Amalfi, in the cathedral of San Andrew, it is Pantaleone di Mauro who gave them, in honor of the Apostle, and for the repose of his own soul. At Monte Cassino another member of the same family gives the bronze doors, and these are enriched with silver letters, containing an account of all the possessions of this magnificently endowed Benedictine abbey—the head house of the order. They date from

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

1066. At Monte Santogelo the Pantaleoni are again the generous donors of the bronze doors there. In the Duemo at Salerno are fine bronze doors, once containing silver inlays, given by Landolpho Butromile and his wife, 1099. The design consists of crosses and figures of six of the Apostles. The similarity of the five examples all point to a common origin; the same stiff Byzantine treatment of the figures and heads, which are shown by incising lines into the bronze and filling them with silver. These were evidently done to order at Constantinople, and are ascribed to a Greek workman, Staurachios—Romanized into Starontius—who flourished about 1050-1072.—*Exchange.*

THE BOY TRADER.

"Where are you going with the puppies, my little man?" asked a gentleman of a small boy whom he met with three pups in a basket.

"Goin' to drown them," was the reply.

"I want a pup for my little boy to play with. What do you say to letting me take one of them?"

"I'll sell you one," spoke up the kid, with American enterprise. "I'll sell you this yaller one for 50 cents, the black one for 75 cents, and the spotted one is worth $1 of any man's money."

"I think my little boy would like the spotted one best, but you ask too much for it. You had intended drowning all of them, but I'll give you 25 cents and save you the trouble of drowning the spotted one."

"Twenty-five cents for the spotted purp!" exclaimed the boy. "I can't stand it; taxes is high; rent is high. It costs good money to get into the roller rink. Oh, no; I can't take less than $1."

"But you intend to drown—"

"Take the black one at 75 cents."

"My little boy wouldn't like the black one."

"Take the yaller one at half a dollar. He's dirt cheap."

"My little boy wouldn't like his color."

"Well, then, you better tell your little boy to play with his toes," and he continued towards the river. "No party can deadbeat his way on me these hard times."
—*Baltimore Times.*

There are times in a man's life when the whole sky seems rose colored, and this old, dull world a paradise. One of these is when he has discovered a quarter in the lining of his last summer's vest.

THE ORIGIN OF EAR-RINGS.

According to the Moslem creed the reason why every Mohammedan lady considers it her duty to wear ear-rings is attributed to the following curious legend: Sarah, tradition tells us, was so jealous of the preference shown by Abraham for Hagar that she took a solemn vow that she would give herself no rest until she had mutilated the fair face of her hated rival and bondmaid.

Abraham, who had knowledge of his wife's intention, did his utmost to pacify his embittered spouse, but long in vain. At length, however, she relented and decided to forego her plan of revenge. But how was she to fulfil the terms of the vow she had entered into? After mature reflection she saw her way out of the difficulty.

Instead of disfiguring the lovely features of her bondmaid, she contented herself with boring a hole in each of the rosy lobes of her ears. The legend does not inform us whether Abraham afterward felt it incumbent upon him to mitigate the smart of these little wounds by the gift of a costly pair of ear-rings, or whether Hagar procured the trinkets for herself. The fact remains, however, that the Turkish women, all of whom wear ear-rings from their seventh year, derive the use of these jewels from Hagar, who is held in veneration as the mother of Ishmael, the founder of their race.—*Deutsche Roman Bibliothkek.*

THE BASE BALL MANUFACTURE.

It is estimated that 10,000,000 base balls are made and sold in this country every year. Perhaps very few persons know the process by which these balls are manufactured or the nature of the stuffs used in constructing a standard ball. The most expert workmen are employed. First there is a little hard rubber ball, and around that the wrapper winds a strong, blue, coarse yarn. When this reaches a prescribed size, it is firmly wrapped with white Venetian yarn.

The balls are then placed in an oven and baked until all the moisture is taken out of them and they are reduced in size. This makes them solid. After this they are coated with cement. This causes the balls to retain their shape, and they cannot be knocked crooked. Then comes some fine blue yarn, and around the whole is placed some fine white gilling twine. The balls are weighed, for each must be of certain weight, and are now ready for the covers. These latter are made of the best quality of horse hide. The cover consists of two pieces, each cut in the shape of the figure "8." By bending one section one way and the other in an opposite direction, a complete cover is obtained.

For years balls were covered with four pieces of leather, and at one time two covers were placed upon a ball; that is, the ball was half made before it was covered, and then another ball constructed over it. But even that did not prevent its being knocked out of shape. They cannot disturb the ball as now made, because the cement holds it.

A little machine owned by a Philadelphia firm is used for winding the balls. It wraps 2½ ounces of the American Association balls in a minute, and the rest is finished by hand. This apparatus is a little wonder. It does its work as neatly as if it had brains, but is capable, say its owners, of a good deal of improvement.
—*Ex.*

NEW USE FOR COPPER.

New uses for copper are coming to the front daily, says a Michigan paper. The last channel found is in the manufacture of white bronze, which is composed of equal parts of copper and ferro-manganese, which produce a metal of such tenacity that it surpasses the best steel armour plates. The melted mixture is cast in block, and is perfectly malleable. To obtain a white metal that can be rolled out in sheets the above alloy is melted again, and twenty or twenty-five per cent. of zinc and white metal added, which imparts to it the desired quality. A plate of the first named alloy two inches thick was found by experiment to offer more resistance to a cannon ball than a steel armour plate of the same thickness. This new kind of "white bronze" is not to be confounded with the alloy used in this country under the same name for monuments. The latter consists principally of zinc.—*Exchange.*

Three 110-ton guns have been ordered by the English Government. The first will be delivered in October next, the others in the following January and April. Each gun will cost £19, 500; the weight of projectile will be 1,800 lbs., and the weight of powder charge 900 lbs.

GOLDIE & McCULLOCH,

(ESTABLISHED 41 YEARS AGO.)

MANUFACTURERS OF

FIRE AND BURGLAR-PROOF SAFES; STEEL VAULTS, especially adapted for Bankers and Jewellers; FIRE-PROOF and BURGLAR-PROOF VAULT DOORS and all kinds of FIRE AND BURGLAR-PROOF SECURITIES.

3 Silver Medals,
4 Bronze Medals,
2 Diplomas,

Awarded to our Fire and Burglar-Proof Securities during the last 4 years.

A Splendid Tribute to Merit.

NEW STYLE OF JEWELLER'S FIRE AND BURGLAR-PROOF SAFE.

No First Prizes have been awarded to any other exhibitors during these last 4 years.

SPECIAL DESIGNS AND STYLES TO SUIT THE REQUIREMENTS OF JEWELLERS.

Intending purchasers should, before purchasing elsewhere, see the large variety to choose from at our Toront Warerooms, on King Street, next door to The Mail Building.

Terms are as easy and prices as low as those of inferior makers.

A large number of Second-hand Safes, by other makers, on hand, including several fitted for jewellers. These Safes have been taken in exchange and replaced by others of our own make.

WAREROOMS—NO. 56 KING STREET WEST, TORONTO.

GEO. F. BOSTWICK,

REPRESENTATIVE.

SPECIAL NOTICE.

Jewelers throughout Canada will oblige the Editor by sending in to this office for insertion in these notes any items of news pertaining to the Jewelry business that they think would be of interest to the Trade generally.

BUSINESS NOTES.

It is reported that telephonic communication between Toronto, Ottawa, and Montreal will shortly be established.

The Keystone & Boss Case traveller was in Canada last week making things lively as usual in the Watch Case trade. The Company report demand good for the season of year.

George Walker, jeweler, of Paris, has sold out his business to Pequegnet Bros. of Berlin. One of the brothers will run the Paris business, and if their previous record in other places is any criterion, this new addition is bound to be a success.

Mr. Schofield, General Agent in New York of the Elgin Nat. Watch Co., paid us a visit last month. Mr. Schofield is a genial gentleman with an eye to business, and his visit to Canada will, no doubt, tell in the interests of the Elgin Watch.

P. W. Ellis & Co., Wholesale Jewelers, expect in a few days to remove their factory, salesrooms and offices to Samuel Stern's old building on Wellington St. East. We hope to be able to pay a visit to their new and enlarged factory as soon as opened and give it an extended notice in our next issue.

We are asked by Messrs. Rothschild & Co., to state that the Mr. Herwich who bought the stock in trade of S. P. Kleiser, jeweler, of Toronto, was not a member of their firm or having any connection with them. The gentleman who purchased this estate was formerly a merchant on Queen Street West.

Mr. John Campbell, traveller for Rothschild & Co., wholesale jewelers of Toronto, has just returned from New York, where he has been purchasing jewelry for the firm's fall trade. He reports a large assortment of elegant goods and fair prospects of a large fall trade in the U. S. and Canada.

The Wholesale Jewelers of Toronto were well to the front in the matter of decoration during the volunteers reception. The principal were those of P. W. Ellis & Co. and Smith & Fudger, and in our opinion no two buildings in the city looked better or gave a more hearty welcome than these.

The Meriden Britannia Co. should be almost tired of taking diplomas and medals for their manufactures. Their latest achievement in this line was at the New Orleans World's Exposition, where they were awarded four medals of the first-class respectively for "Spoons and Forks," "Hollow-ware?" "Sectional Plating," and "Best General Collection of Silverware."

Mr. George Chillas, of the firm of Lee & Chillas, Secretary of the Canadian Jobbers' Association in American Watches visited New York last week in connection with the business of the Association. The prospects of the Association are good and the trade seems generally to regard its organization as one of the best things that the jobbers have done for many a long day.

Mr. M. Schwob of the firm of Schwob Bros., Montreal, and President of the Canadian Jobbers' Association in American Watches, sailed for Europe last month. Mr. Schwob's trip is one of business and pleasure combined, and we trust he will mix them so judiciously as to make it pay and at the same time improve his health. The Trader wishes him a pleasant journey and safe return.

Corporal Smith, Q. O. R., son of Mr. Henry Smith, of the firm of Smith & Fudger, was one of the many heroes who tramped down Yonge street last Thursday. Although brown as a gipsy and considerably heavier than when he went away, the campaign in the North-West seems to have agreed with him, and the probability is that when he gets back into the harness again, he will make things hump on the road. Welcome home.

"Another Hero."—Mr. John Marshall, one of the employees of the American Watch Case Co., of Toronto, went along with his company of the 10th Royal Grenadiers to aid in putting down the late rebellion in the North-West Territory. On his return to the factory his fellow-employees presented him with a purse of money and a complimentary address for his plucky behaviour at the front. Mr. Marshall is the kind of stuff they make heroes out of.

We are pleased to learn that Mr. R. Russell, formerly with A. C. Anderson & Co., of Hamilton, will remain with the new firm of Lowe & Anderson, and travel for them through Eastern Ontario, Quebec and the Maritime Provinces. Mr. Russell has by integrity and ability earned the reputation of being one of the best salesmen on the road, and we have no doubt that with his increased opportunities to make big sales, he will boom things on his route. We wish him success.

Our Max.—That the jewelry trade of Toronto was pretty well represented in the North-West during the recent rebellion is evident from the fact that five of the volunteers serving there were from this City. Amongst others we should mention Max Stern, second son of Mr. Samuel Stern, who served in the Governor General's Body Guard (Cavalry) under Lieut. Col. Denison, all through the campaign. Max looks stronger and healthier in every way than before the rebellion, and is every inch a soldier.

Mr. Matthews, jeweler, of Winnipeg one of the now celebrated 90th Battalion of that city, was in the city a few days ago. Our readers will remember that Mr. Matthews was wounded at the battle of Fish Creek and it was reported that his arm had to be amputated. We are glad to learn, however, that the doctors have been able to save his arm and that in a few months it will probably be as well as it ever was. Mr. Matthews should have some substantial recognition from the Government on account of the loss of business his wound will entail.

The Merchant.—We have just had laid on our table the copy of a new trade paper The Merchant, which has been started in Toronto. Although not attempting to open out any new field in journalistic literature, The Merchant bids fair to be a formidable rival to the financial and trade journals already in existence. It is neatly printed on toned paper, its editorial and specially contributed articles are ably written, and it is highly creditable to the publishers. It looks as if it had come to stay and we wish it success.

Almost a Fatal Accident.—Mr. John Donaldson, Accountant, formerly with John Zimmerman & Co., of Toronto, met with what might have been a fatal accident a few days ago. The gas jet inside of the vault in his office leaked, and on Mr. Donaldson trying to light it, the gas, which filled the whole vault, exploded, knocking him down and burning him very severely about the face and hands. We are glad to state that he is now almost recovered, and beyond the marks of a big singeing, looks kind of natural again.

Our "Carriage"—We are glad to know that our young, ambitious and enterprising friend Charlie Ellis has got so far advanced in family matters as to set up a carriage. Charlie's carriage (although only a baby one) is a stunner, and knocks the spots off all the other baby carriages in Toronto. It is satin lined, silver mounted, double geared, patent springs, quick train, safety pinion, in fact combines all the latest improvements in the line, but from what the proprietor says it is none too good for the little cherubs that occupy it. And talking of these same cherubs, reminds us that in our notice of their arrival we credited Charlie with "a pair of twins." This their respected parent informs us is not correct, that strictly speaking we should have said "twins." We may consider ourselves sat on.

A Big Thing in Safes.—Messrs P. W. Ellis & Co. the well-known manufacturing jewelers of this city are not only alive to the importance of having their valuables amply protected, but of having it so securely done that they will not lose any sleep over it. The attempts lately made to burglarize jewelry establishments throughout the Province has determined this firm to get the most thorough protection that they posssibly could for the very valuable stock they carry at all times. The precaution adopted is in the form of an immense steel vault built by Goldie & McCulloch. This vault is designed for perfect burglar-proof protection, and has been constructed of alternate layers of plate iron and welded chrome steel and iron 1¼ inches thick through the whole structure. This arrangement is designed to give the greatest possible resistance to any attack that may be made upon it. The structure weighs ten tons, and was a few days ago taken from the railway to its destination on Wellington Street East on a large thick truck brought here for this special purpose, drawn by four magnificent black horses. It is the first of its kind that has been placed in a Toronto jewelry establishment and its perfect ability to resist every effort to obtain its contents unlawfully will doubtless contribute largely to the ease of mind of the members of the firm.

THE
BATES & BACON WATCH CASES,

Stamped B. & B.,

WORKSHOP NOTES.

For a quick filter The Druggists' Circular recommends the employment of chamois skin, freed from thin pieces, cut to the desired size, washed in a weak solution of sal soda or any alkali to remove any grease, and thoroughly rinsed in cold water. By means of it tinctures, elixirs, syrups, and even mucilages are said to be filtered rapidly. If it is washed well after each time it is used this filter will last a long time.

Removal of Oil Spots from Marble.—Oil spots, if not too old, are easily removed from marble by repeatedly covering them with a cream of calcined magnesia and benzine, and brushing off the former after the dissipation of the latter. Another recipe reads as follows: Slaked lime is mixed with a strong soap solution, to the consistency of cream; this is placed upon the oil spot and repeated till the oil spot has disappeared. In place of this mixture another one may be used consisting of an ox gall, 125 grams of soap-makers' waste lye, and 62.5 grams oil of turpentine, with pipe clay to the consistency of dough.

Fusible Cement.—According to the *Journal Suisse d'horlogerie*, a good, easily fusible cement for fastening glass and porcelain upon metallic surfaces can be prepared as follows: Brass powder in form of a sediment, which has been prepared by laying zinc in a solution of sulphate of copper, is placed into an iron or enameled mortar, and mixed with concentrated sulphuric acid of 1.85. To this paste add 70 parts quicksilver to 20 to 30 or 36 parts brass, according to the hardness desired. When the mixture has been well united, it is carefully rinsed in warm water, in order to expel every trace of acid from it, after which it is left to cool. After a few hours the ready cement will be so hard that tin can be scratched with it. For use it must previously be warmed so that it can be worked in the mortar, whereby it becomes as soft as wax. In this state it is spread out upon the metallic surface, and the object to be fastened (glass or porcelain) is pressed upon it. When the cement has become sufficiently cold it retains with great intensity.

Gold Filings.—The following process is very useful for working up filings and scraps of gold, gold-plated jewelry, etc. It does not, of course, refine the gold as in the usual process of quartation, but merely destroys the filings of copper, silver, German silver, brass and other metals acted upon by the acid. It will "eat" the solder or brass out of hard-soldered or plated goods, leaving the thin shell of gold. The iron filings are thoroughly separated from the mass by the repeated use of the magnet. All pieces of soft solder and lead should be picked out, and if there is much soft solder in any of the plated articles it should be melted out, and the residue then placed in a shallow glass or china vessel and rather more than covered with good nitric acid. When the bubbles cease to agitate it, the acid should be poured into another cup, and if there is any base metal left, more acid should be added, and the mass stirred occasionally with a strip of glass. When no bubbles appear on adding new acid, that may also be poured off, and the filings washed two or three times, or until perfectly clean, letting them stand a minute or two to settle before pouring off the water. They are then dried and melted. The filings and scraps treated in this manner seldom require more than one melting to make them easily worked and fit for jobbing. There is no skill required, only considerable care in the handling. The silver remaining in the acid may be precipitated in the ordinary manner with common salt. The chloride obtained may be melted into a button, and being pure silver, used as an alloy for other gold.

Strengthening the Eyesight.—To a query in the columns of *Deutsche Uhrm Ztg.*, in which the interrogator complains of weak eyesight, and also for advice from his fellow craftsmen, a number of answers are given, from which we select the following: "A professor lately deceased, recommended me in 1867 to use bi-concave No. 30, feebly blue spectacles, and at the same time bathe forehead and temples with a mixture of Ol. balsam 8.0, spir. lavendel 120.0. I have used this remedy diligently, and my eyes have become so strong thereby that I have dispensed with the use of spectacles since 1873, therefore over ten years. Repeated tests of my eyesight with the optometer have resulted in 'No spectacles necessary.'" The next answer recommends spirits of fennel seed, mixed with distilled water, as an excellent lotion for the eyes. "I suffered with weakness of sight about thirty years ago, since which time I still employ it up to to-day with excellent results. There was a certain patent medicine which really possessed excellent curative powers; it was analyzed some time ago, and the result published in a certain paper as follows: Fill a good sized bottle three-fourths full with absolute alcohol, put into it enough of fennel seed to fairly fill the bottle, cork it, and let it stand for several days in moderate heat, until the alcohol has colored green; now decant the clear fluid and mix with a little ethereal oil of fennel from the drug store. For use, employ a second bottle, in which pour to one part of this essence five parts of distilled water or filtered river water, and shake the mixture well, by which it changes into a milky fluid. With it moisten a linen cloth and dab the parts around the eyes morning, noon and night. It does not hurt if a little enters the corners of the eye. For continued use it may be taken a little stronger; if it should bite in the commencement, dilute it a little more.

OTHER NOTES.

As a rule, the Old Testament revisers have performed their work well. But they were not particularly happy in rephrasing "vanity and vexation of spirit." They have made it "vanity and a striving after wind." This, it must be admitted, is somewhat colicky.

The Hydraulic Clock in the Garden of the Tuileries.—The visitors of the garden of the Tuileries lately pause before a timepiece of extraordinary dimensions, which has been erected upon a terrace at the water's edge. It consists of four columns, painted green, about 8½ yards high, while the dial, glittering in the tricolors of the "Grande Republic," surmounts the columns. The large hand, about 2 meters long, points out the date, while the small hand indicates the day of the week. Beside this the clock contains a smaller dial with hour and minute hands; the striking work tolls the hour on a bronze bell. The action of this "chronometric turbine" is as follows: At the foot is located a metallic drum through which runs a streamlet of water. The drum contains two small turbine wheels which are actuated by the running of the stream. The axes of the turbines, prolonged upward, end in endless screws by which the wheel work, provided with a fly, is propelled. It is obvious that the reservoir from which this stream of water is obtained must always stand at the same level, otherwise the hydraulic pressure would change.

C. W. COLEMAN,

WATCHMAKER TO THE TRADE

AND DEALER IN

Watch Material, Tools, Spectacles, Watch Cases, &c.

Complicated Watches repaired, adjusted and cleaned. Broken or imperfect parts in every grade of Watch replaced by new.

Editorial.

THE OUTLOOK.

So far as we can see, the business outlook is far more satisfactory than at this time last year. Last year's harvest was exceptionally good, and although prices were low, the effect of the extra crop was to aid farmers and merchants to make up for the partial reverse of the previous season. At this time last year our farmers and merchants were considerably further behind than they are at present, and although this year's crop will not be so heavy as that of last season, it is nevertheless a fairly good one, and present indications are that prices will rule considerably higher than last year.

The wheat crop of the United States is 204,000,000 less than that of last year and 137,000,000 below their average of ordinary years. The Russian wheat crop is reported to be very inferior, and the probability is that she will not be able to export more than half her usual quantity. In other countries the crops appear to be about a fair average. These facts should indicate a stiffening of prices at least, if not a decided advance in the value of the wheat crop we have to sell, which should go far towards making our income this year in excess of that of 1884.

Our general importations are somewhat behind those of last year in volume, but this is rather a matter for congratulation than otherwise. The stock held by our merchants, both wholesale and retail, are as a general rule very much lighter than formerly. People have been doing a kind of hand to mouth business for the past six months, and should therefore be in a position to buy liberally for the fall trade which gives every indication of being above the average. Although we do not anticipate a boom this fall, we do look forward to a good, steady, paying trade for our merchants generally, and we think that every wise business man will shape himself so as to participate in the gains that a paying fall trade is sure to bring. While it is well to buy cautiously, it is equally good to remember that as a rule it is those who have the goods to sell who do the trade. Over caution is almost as dangerous to a business as rashness in overbuying; the thing every merchant should aim at is to strike the happy medium and simply try and liberally anticipate their actual trade. We trust that the present hopeful prospects may be fully realized.

ONTARIO'S ASSIGNMENT ACT.

The "Act respecting Assignments for the benefit of Creditors" passed by the Local Legislature of Ontario on the 30th March last and which by proclamation of the Lieutenant Governor of this Province, comes in force on the first of this month, is of importance to every merchant in or doing business with merchants in Ontario. The right of absolving a bankrupt from his liabilities should rightfully rest with the Dominion Parliament, but as we pointed out in our last issue that body was more intent on passing measures suited to the exigencies of their particular political party, than in legislating for the common good of the people. The Dominion Government having quietly strangled the Insolvent Act recommended by the Boards of Trade, the Ontario Government acting with the advice and concurrence of the Hamilton and Toronto Boards of Trade, prepared and carried through the Act referred to above, which we think will be found of considerable benefit to traders in this Province generally. In the absence of an Insolvent Act it appears to be the best thing that could be done and is about as far as Provincial legislation can go in this direction. The only bad feature about the Act to our mind is that contained in clause 6, "a majority in number and value of the creditors who have proved claims to the amount of $100 and upwards, may at their discretion substitute for the Sheriff a person residing in the county in which the debtor resided or carried on business at the time of the assignment." This provision we consider interferes very considerably with the liberty of action which should be possessed by the creditors in the settlement of all bankrupt estates. We have always held that as the creditors of any insolvent are the real owners of his estate, that they alone should have the entire control of its management. If the clause is allowed to stand as it probably will for a year, it will hamper their action considerably and add materially to the expense of winding up insolvent estates. In small businesses one of the creditors could often be appointed and would only charge his actual disbursements, and thus make a better showing for the creditors than if it had to go through the hands of an outside assignee whose only interest is in what he can make out of it. On the whole, however, it is fairly satisfactory, and on the principle that half a loaf is better than no bread at all, we are not disposed to find any more fault with it than is absolutely necessary. What the country wants is not any make-shift measure from the Provincial Legislature, but a proper Insolvent Act framed upon the basis laid down by the Canadian Boards of Trade and passed by the only power in Canada competent to make law, the Dominion Parliament.

In reference to the new Ontario Act the more important points on which it declares are such transferences of property by debtors to creditors as are void against the assignment, and such as are not; the appointment, rights, duties and remuneration of assignees; the publication and registration of assignments; the voting of creditors, and the proof of their claims.

As to the first point the Act provides that everything in the nature of a gift, conveyance, assignment, or transfer of property, real or personal, by one in insolvent circumstances, unable to pay his debts in full, or knowing himself on the eve of insolvency with intent to prejudice any of his creditors, or give preferences to one or more over the others, shall as against them be utterly void. In case of a money payment to a creditor under such circumstances, and within a month before the execution of an assignment for the general benefit of creditors under this

Act, the same shall be void as against the assignment, but not as against persons claiming in any other way. Assignments to the Sheriff or other assignee, for the purpose of ratable and proportional payment of creditors, as well as all *bona fide* sales, payments, conveyances, etc., made in the ordinary course of trade are protected by the Act. So are payments of money to creditors, if an assignment does not take place within a month of the same. It is a valid assignment according to this Act if couched in such terms as "all my personal property "which may be seized and sold under "execution, and all my real estate, credits "and effects," and all such then, whether vested or contingent, becomes vested in the assignee, except such as is exempt by law from seizure or sale under execution, subject, however, as regards lands, to the provisions of the registry law as to the registration of the assignment.

An assignment under this Act is to take precedence of all judgments and of all executions not completely executed by payment.

The twelfth section provides for the publication of notice of the assignment in the *Ontario Gazette*, and in at least one newspaper having a general circulation in the county where the property is situated, also for the registration of such assignment, while the penalty provided for omission in each case is $25 for every day intervening between the date on which such publication or registration should have taken place, and the date on which it actually did take place.

The seventeenth section provides that at any meeting of creditors the creditors may vote in person, or by proxy authorized in writing; and section 18 gives the following scale for calculating the votes of creditors:—Every claim of or over $100 not exceeding $200, one vote; every claim of or over $200 not exceeding $500, two votes; every claim of $500 not exceeding $1,000, three votes; every additional $1,000 or fraction thereof, one vote. This section further provides that every creditor in his proof of claim shall state whether he holds any security for his claim or any part thereof; and if such security is on the estate of the debtor, or on the estate of a third party, for whom the debtor is only secondarily liable, he shall put a specified value thereupon. The assignee may then, with the authority of the creditors, either consent to the right of the debtor to rank for the claim after deducting such valuation, or he may require from the creditor an assignment of the security at an advance of ten per cent. upon the specified value, which is to be paid out of the estate so soon as the assignee shall have realized the security. In such a case as this the difference between the value at which the security is retained, and the amount of the gross claim of the creditor, shall be the amount for which he shall rank and vote in respect of the estate.

Section 20 provides that the law of set-off shall apply to all claims made against the insolvent estate, as also in all suits instituted by the assignee for debts due the assignor, in the same manner as if the assignee were plaintiff or defendant, except in so far as any claim for set-off is affected by the provisions of this or any other Act respecting frauds or fraudulent preferences.

Correspondence.

HE WAS REFUSED CREDIT.

To the Editor of The Trader.

Sir,—I was recently much impressed and amused, as I witnessed how, in a most novel and adroit manner, one of our jewelry merchants dealt with a customer who, when informed that the repairs to his watch was $2.50, boldly proposed paying one dollar on account, and the balance at some future time. The gentleman met the proposal, not with embarrassing words, but gravely removing his nose glasses from off their accustomed place, apparently having his vision so sharpened, that for one brief moment at least, he could dispense with their use, cast a look of intense sympathy at the applicant, which so plainly signified, "I would like to do it, but ——." Then directing with the same instruments the gaze of the "would-be creditor" to the following lines hanging in a conspicuous place in the store, he was allowed quietly to read:

"Mine friend did come,
And I did trust him.
I lost mine friend,
And lost his custom.

To lose mine friend
It grieves me sore,
So I resolved
To trust no more."

At a subsequent visit I made enquiries as to results.—He furnished satisfactory security for the amount.

Yours truly,

Jno. W. Campbell.

Editor of The Trader.

Sir,—

In the Chicago correspondence of the *Jewellers' Circular* for July 1 note the following remark:

"As a result of the action of the American Association of Jobbers in watches, the trade in watches and jewelry is beginning to leave the dry goods men and return to its legitimate channels and the trade generally feels the benefit."

Anent the recent formation of the Canadian Association of Jobbers in American watches for the better understanding and regulation of their trade, prices, etc., can they not go a step farther in the footsteps of their American cotems and as they do, sell to the legitimate trade only? They would confer an inestimable boon to the trade generally and eventually themselves also. Whatever may have been the necessities of twenty years ago, the time has certainly arrived when the present promiscuous manner of doing business should be abolished. There is probably no State in the U. S. suffering more from the "general storeishness" manner of doing business than Canada is to-day.

No trade suffers more from this "promiscuous manner," than the jewelry trade or have so many outside competitors as the ordinary legitimate retail jeweler. If the wholesale trade or this Association would tackle the matter they could largely control the evil, but as long as the wholesale dealer in pipes, in concer tinas and jews harps, in buttons and fancy wools, in combs and brushes, in knives and corkscrews, in paper and envelopes, in toys and dolls, (I think I have got all the trades represented there, have I not Mr. Editor?) continue to sell watches—and they can't sell a customer one thing and refuse him another—a complete remedy seems impossible although herein lies the root of the evil.

If the American watch and clock companies would join together and say we will allow only legitimate wholesale jobbers in watches and jewelry to handle our goods and refuse to supply dealers in toothpicks and base balls, who only deal in watches and clocks as a side show, with our goods, the trouble would be at an end. No one now-a-days will venture to state the jewelry trade of Canada is not self-sustaining. The best and most prosperous wholesalers to-day are those who have made specialties of one line o[f]

In compliance with an increasing demand, we have placed on the market a

NEW PATENT DUST-PROOF

SCREW BEZEL

Silver Open Face Stem Winding Case

embodying many of the excellent qualities of our original Patent Dust Proof Case, though offered at a lower figure.

The back and center of the new case are made of one continuous piece of solid silver, into which an Albata Cup is screwed identical in shape with the back, thus greatly strengthening it and efficiently protecting the Movement against dust.

THE NEW CASE WILL BE CALLED

ALBATA CUP SCREW BEZEL

We shall continue the manufacture of our popular Patent Dust-Proof Case with Screw Crown and Scre wBezel in all the styles as heretofore, plain and inlaid, with Lever and Pendant Setting.

FOR SALE BY ALL JOBBERS.

ROBBINS & APPLETON,

GENERAL AGENTS OF THE

American Waltham Watch Co. of Waltham, Mass.

NEW YORK, BOSTON, CHICAGO,

LONDON, SYDNEY.

trade and to which they have devoted their entire energies.

To point out an evil is easy; to show an effectual remedy is another matter. There is one thing the retail jewelers throughout the province should do and can do and arightly considered will find it to their interest to do. Support and buy only from the legitimate trader and to remember that in buying from a firm who will sell a twelfth dozen watches or chains to any peddler or merchant and his clerks, and his sisters, and cousins, and aunts and their friends, they are really supporting a formidable competitor to their own local trade.

In my own town (and I know that my experience is not exceptional) within a stone's throw I have dry goods men, grocers, hardware dealers, druggists who buy everything they want in watches or jewelry not for their own use only but frequently for sale in their stores, where they buy their own trade goods. Nor is this all, their clerks and their friends (and who has not a friend) make use of this same connection and they will supply a watch for a customer of theirs at any time if they get a chance.

Respectfully,

G. W. BEALL,
Watchmaker and jeweler.

Lindsay, 20th August, 1885.

Selected Matter.

THE USES AND METHODS OF WORKING GOLD AND SILVER AND THEIR ALLOYS.

[Abstract of a Paper read at the London (Eng.) Horological Institute on Wednesday, March 18, 1885.]

The well-known alloys of copper and silver for gold, and the copper alloy for silver, are so familiar to us, that I shall dwell more upon an alloy not generally used in the high standards of gold, but frequently employed in low standards, viz., zinc.

Gold of a very low standard alloyed with zinc, when polished, presents the appearance of gold of a much higher standard. A curious fact presented itself to me a short time ago, whilst operating upon a portion of a gold Geneva watch-case. To all appearance it was gold of about twelve carat, worth something like 40*s*. per ounce. Wetted with nitric acid, the usual green was not noticeable; after the acid was wiped away, I found spots of an unusually deep red color. was not my province to value gold, but to repair the case, I proceeded to anneal, preparatory to soldering. The flame of gas no sooner touched the metal than an explosion occurred, splitting and shattering my portion of watch-case to pieces. When it was cool, I dipped a piece in a weak solution of vitriol; it then presented its true character, viz., an alloy of silver, small portion of copper, zinc, and gold, and reported by an assay to be gold of six carat, worth 21*s*. per ounce. I may add, this gold or zinc alloy, after being annealed, has become as brittle as thin sheet glass. This caused me to inquire what effect is produced by the addition of zinc to an alloy of gold or silver. I therefore prepared and melted a similar alloy, which proved to be malleable, but not so malleable as gold alloyed with silver and copper, and decidedly harder than gold containing the two latter alloys. Annealing has the desired effect of softening the metal. In process of flatting, and when polished, it presented a good color, and I was curious to know how long, or under what circumstances, the elements in the zinc would produce these mischievous results. I was satisfied that a galvanic or electric action would have to be produced. I had flatted a piece of this gold and zinc alloy exceedingly thin, which, when annealed, showed no signs of cracking upon being bent. For the present I was not satisfied, and having cut the sheet of metal into small pieces, I laid them aside. Some few days after, taking a piece in my hand without any positive motive, I placed it in my mouth, and after a second or so, between my teeth I noticed a cracking sound. I was now persuaded that the gases or acids of the mouth were producing the galvanic action I was seeking, and taking another piece I breathed heavily and repeatedly upon it. In about half an hour the piece so breathed upon became as brittle as my portion of watch-case, and thoroughly useless for any mechanical purpose. This accidental and imperfect experiment demonstrated the fact that zinc is both a dangerous and mischievous alloy; as articles of gold jewelry so alloyed must, upon coming in contact with oxygen, lose most of their physical properties by galvanism and oxidation. The knowledge of this may deter operators upon low standard gold from using zinc as an alloy, of which the most that can be said is that it produces a good color and is apt to deceive the uninitiated of its true standard. Brass, an alloy which I know is used in the ridiculously low standard sold as gold, produces similar results to that of zinc.

Hellot, a writer upon metallurgy, states that gold highly alloyed with zinc becomes wholly volatile when heated. Pure gold has a very feeble affinity for oxygen, but is an excellent conductor of heat and electricity, and with some presumption I say gold is an element capable of being placed and replaced. I have not been fortunate enough to find any metallurgist whose writings would bear me out, but most have come so near as to hesitate in their decision. Napier, a metallurgist whose writings I often turn to with profit and interest, gives his experience, that melting 30 lbs. weight of pure gold, he found a loss of 4½ grains, which he eventually collected from the vapor escaped in the process of melting. The same writer, in a paper read before the Chemical Society, shows that gold alloyed with silver or any other metal, when melted or cupelled together, becomes exceedingly volatile,but more so if the metal employed be lead; and Makins still further corroborates this fact by experiments he made, and deposits obtained from a flue attached to a muffle furnace. Therefore, although we may say gold and silver are indestructible by heat, yet they do escape us in what I may call metallic vapors. The strong acids employed in the wet process of liquefying gold and silver volatilize these metals; therefore we may say the air we breathe in Clerkenwell is, to some extent, charged with precious metallic vapors.

Now a word upon assaying. Assays are generally made with reference to standard, as so much better or worse. In endeavoring to show how assays are made, the process may appear very simple, and may be so if you keep your calculations correct, and use a proper balance or scales. Should an assayer be present, I hope he will take it that I am giving but an outline of how assays may be made. The experiment I made in assaying was under the most unfavorable circumstances, but the results were sufficient to encourage me in the hope that with more adapted appliances I may succeed in making a faithful report. The metal I operated upon was obtained from the sediment of the water we call in the trade "wash-hands." Upon being reduced, it appeared to me exceedingly base. I therefore melted and remelted it

with salt alone as flux, until I had destroyed much of the base metal. I then cut off a small piece as carefully as I could, weighed it, adding fine silver of the same weight, and six times the weight in lead. I melted the whole together in a bone-ash pot. In this way all the impurities were got rid of by the lead carrying it into the porous parts of the pot, leaving a clear bright bead of metal. Taking the cupel or pot from the furnace, and allowing the bead to cool, I found I had an alloy of pure gold and silver, which I again weighed, and calculated the loss of base metals. The bead I now flattened and annealed, so that I could bend the strip into coronet shape. Then, with strong nitric acid, I separated the silver as chloride of silver. My coronet now presented a porous sieve-like appearance. I carefully poured off my chloride and preserved the same, so as to extract the silver at a more convenient time. My coronet or porous sieve-like fine gold I washed and shrunk by annealing. The fine gold weighed and calculated by the weight of the piece operated upon gave as the result so much fine gold in a given weight. An independent assay master reporting upon the same bar of metal gave as his report, 10 oz. 16 dwt. 5 grs. to the lb. troy, against mine of 10 oz. 17 dwt. 4 grs. to the lb. troy. The very slight difference I attributed to my imperfect weighing. There are other means of making assays, but not having practical experience in the process, I will not attempt to describe them.

The silver assay I made much more easily; but the same applies to silver as to gold, viz., careful weighing. Accurately weigh the piece of silver to be reported upon, add as much lead as the appearance of the quality of the metal justifies. If tolerably good, eight or ten times the weight will be sufficient; if very base, considerably increase the weight of lead, melt the silver and lead together in a porous cupel, as we did the gold, in a furnace at high temperature. In a short time the lead would have carried with it all the impurities into the porous parts of the pot, leaving a bright bead of fine silver, which, being weighed and calculated by the loss in the first weighing, gives as the result so much fine silver in the pound troy. A parting assay requires greater care, although made in much the same way as gold. I will give it in the words of Makins, late Assayer to the Bank of England:—

"In addition to the operations of assaying for the amount of silver or gold as already detailed, there are cases where it is required to estimate silver contained in gold, and also gold in silver, such are called 'parting assays.' The latter, viz., that of silver contained in gold, is effected by simply dissolving the metal in dilute nitric acid, and collecting the gold powder left; this is then to be washed with boiling distilled water, and annealed to brightness, when it will be in a state for weighing.

"The valuing of silver in gold is somewhat more complex. A double gold assay is made in the usual way, and at the same time an assay pound of the metal is cupelled with no silver added. Thus the copper and oxidizable metals are removed, and the button left will be composed of the gold and silver of the specimen only. The difference of weight of this above the parted assay will of course be due to silver."

The annual waste of the precious metals is enormous. In the first place, we have something like 80,000,000 silver coins in circulation. If we take the loss on each at 1-100th part of a grain, we get a loss of 1641 oz. of silver every year from our English coinage alone. Still keeping my estimate at the 1-100th part of a grain for the whole of Europe, we get a loss of 9,846 oz. Taking four times that amount for the whole of the known world, we get a positive loss of 30, 384 oz. from the circulation of silver coinage alone.

Photography, an art which is, perhaps, the greatest destroyer of silver, we will consider next. Taking all the cities and towns in England together, we have an average of about 150 photographers in each. Supposing each to consume (a very low estimate indeed) 10 oz., we get an annual loss of 450, 000 oz. in England alone. Considering the magnificent works of art we receive from the continent and America, we multiply the amount five times for America and other countries of the world, and get a loss in photography of 2,250,000 oz. yearly. From the most reliable shipping returns, we learn that there is an average loss of about 2,000 vessels every year. These vessels carry gold and silver in some form or other, either in coin, watch-cases, jewelry, or plate, so we may reckon the average loss with each vessel at 30 oz., making a total of 60,000 oz. lost in the waters of the deep. The losses by fire are considerable; the wear from watch-cases and articles of daily use, the enormous loss in the manufacturer's workshop, and other minor losses, we should not over-estimate at 200,000 oz. throughout the world.

From the underestimated sources I have named we have an annual loss of silver amounting to 2,540,384 oz. Considering the value of gold, the loss of this metal is proportionately greater.

Gold is used in a greater number of trades than silver, and in most of them little or none is ever recovered. Taking our gold coinage in circulation to be about 70,000,000 pieces of coin, estimating the yearly loss by abrasion to be 1-10th part of a grain for sovereigns, and 1-20th part of a grain for half-sovereigns, we get an annual loss from coinage in England of 12,868 oz.; and to be on the safe side, I will only take five times as much for the rest of the known world, and that will show the loss from gold coinage to be 64,340 oz.

The consumption of gold in the potteries and glass factories is enormous. We will take 300,000 oz. as the loss from potteries and glass, 3,500 oz. as the amount used in photography, and 400,000 lost in gilding. The loss from watch-cases, chains, and jewelry, and loss in the workshop and other minor causes, we must give at another 400,000 oz. From these figures we get an annual loss of gold amounting to no less than 1,167,840 oz.

RINGS AND THEIR HISTORY.

Capricious as are the freaks of fashion in dress and personal ornaments, it has been able to work little change in the habit of wearing rings since the world first took a fancy to them. The material and workmanship alter with the advance of art, but the ring itself, from its regular beauty apart from all superstitious, sentimental, or mystical associations, must ever be a cherished ornament. Rings have always been the favourites of princes and ladies. The history and poetry of finger rings are laid up in numerous learned treatises, which few people would dream of perusing. Enduring as the rings are, their antiquity reaches far beyond the oldest we can see in the museums. The earliest mention of their use occurs in the Book of Genesis some 1727 years B. C., but it is quite possible that even the mythical prehistoric man wore a ring. We afterward hear in the sacred records of Pharaoh's ring, and

that used by Darius at Babylon; and Herodotus tells us that the Babylonians used to wear rings. They were originally intended strictly for use as signet rings, and not as ornaments, and their use as such soon spread from the East into Europe. In the Homeric poems there are no traces of the custom of wearing rings, and the earlist rings used in Greece, about Solon's time, were signet rings, for use only. They soon became fashionable as ornaments, however, with precious stones set and engraved in them, dandies crowding their fingers with them up to the nails. The Lacedamonians always wore iron rings. Some among the German tribes, in the time of Tacitus, wore rings of that metal until they had slain an enemy in war. As for the Romans, the best authorities assert that they received the fashion of ring-wearing from the Greeks, but it probably filtered simultaneously through to both nations from the Pelasgians, who in very olden times settled on the coast of the Mediterranean and kept up friendly intercourse with the Orientals. The Roman rings were always of iron and always strictly for use, but increasing luxury corrupted this primitive fashion. Still, such men as Marius and such families as held "high-toned" principles, never gave up the iron ring. The Roman fast young men made an improvement in the Greek profusion by introducing light rings for summer wear and heavier ones for winter. From the rings of the Roman knights and the officer who had the care of the emperor's state signet in later days, the history of rings comes down to our time without any other very noteworthy remark. Rings play an important part in many Oriental legends, especially Solomon's ring, which, among other marvels, sealed up the refractory Jins in jars and cast them into the Red Sea. A Lydian hero, Gyges, possessed a famous ring which rendered him invisible whenever its stone was turned inward. As Plato tells of the marvelous manner in which he acquired it we could almost fancy he had heard the story told by some Eastern story-teller, so exactly is it like an Arabian night's entertainment. It is remarkable showing the universality of legends which often are the fairy tales of rising generations, that this very same story comes up again in the Welsh romance of "Morte d'Arthur." One who is said to have a ring which possessed this virtue when so handled, and which with Guendolen's chess-board, was reckoned among the thirteen wonders in Britain. Another famous Greek story tells of the ring of Polycrates. He was warned in the time of his greatest prosperity by a pious king of Egypt to sacrifice whatever article he most valued in order to propitiate Nemesis. Manning a boat, therefore, he rowed out to the open sea and flung into the depths his ring, which was of gold with an emerald gem, the setting of the renowned Theodorus. This being very dear to him, he grieved much over his loss. Five or six days after, however, a fine fish was brought to him, and inside this the royal cooks found the ring much to their master's delight. The chronicler naively adds that "his Egyptian friend, seeing it was impossible to rescue another from destiny," broke off their alliance on hearing of this piece of good fortune. It is curious that the story also had an earlier parentage. Legend there accounts for Solomon losing his wisdom by connecting it with the possession of a marvelous ring. This he one day, in a fit of fondness, intrusted to one of his wives, who flung it into the Kedar, and thereby for a long time rendered the king reckless and foolish. Luckily it was found inside a fish, and on being restored to the king his wisdom also returned to him.

I need not speak of the numberless rings of antiquity which possessed magical, musical, or medicinal virtues in the estimation of the credulous; can we not even now purchase galvanic rings? Nor need I tell how universally the ring has been adopted for the symbols of espousals, betokening eternity in its figure and the surpassing excellence of true love in its material, and how, being worn on the fourth finger, it thereby (so the ancients believed) pressed a vein that ran straight to the heart. It may be noted in passing from this that much curious learning attaches itself to the different fingers on which rings are worn. Originally, says that arrant gossip, Pliny, rings were worn on the fourth finger, then on the second, afterward on the last. Our ancestors who "ran wild in the woods" seem to have preferred the fourth finger. The Monkisk verse Miles, "Mercator, Stultus, Marites, Amator," assigns them, counting from the thumb, to the soldier, the merchant, the fool, the husband, the lover. When it is remembered how Hannibal carried enough poison in a ring to kill himself when tired of life, no one need suppose that rings which contain hair perfume or a watch are modern discoveries. Ere now there has been a ring which held a familiar token inside of it. Numerous curious rings, or rings which once belonged to celebrated people, are to be found in most museums. I shall only mention one or two interesting specimens. St. Louis is said to have had a ring of fleur de lis and daisies, with the motto, "Can we find love beyond this ring?" At an exhibition in London a very fine ring was shown, which was found by a laborer when digging among the ruins of a church, supposed to be of the middle of the sixteenth century. It was a massive plain band of pure gold, with a motto engraved within its hoop "*Devx Corps, Vng Cver*," and the initials C. M. entwined by a true lover's knot of peculiar form. What a life romance lay within that ring. Ancient rings were generally massive. Henrietta Maria's, the Queen of Charles I., is thick and large enough to be worn on any modern lady's thumb.

The mottoes on rings form a curious department of archæology. At the present day, perhaps because we are less sentimental than our great-grand parents, no one ever thinks of having more than a few initials engraved within a ring; but during the sixteenth, seventeenth, and eighteenth centuries it was a very common practice to have mottoes inscribed within the hoop of spousal, nuptial, or merely presentation rings. These were sometimes called "gypsy rings," the East having always been famous for such amulets. The motto itself was called the "posy" or "chanson." Numerous collections of such mottoes have been formed at various epochs.

Ring posies are neither double nor single. The double ones are generally serious, such as

"God our love continue ever
That we in Heaven may live together."

Or

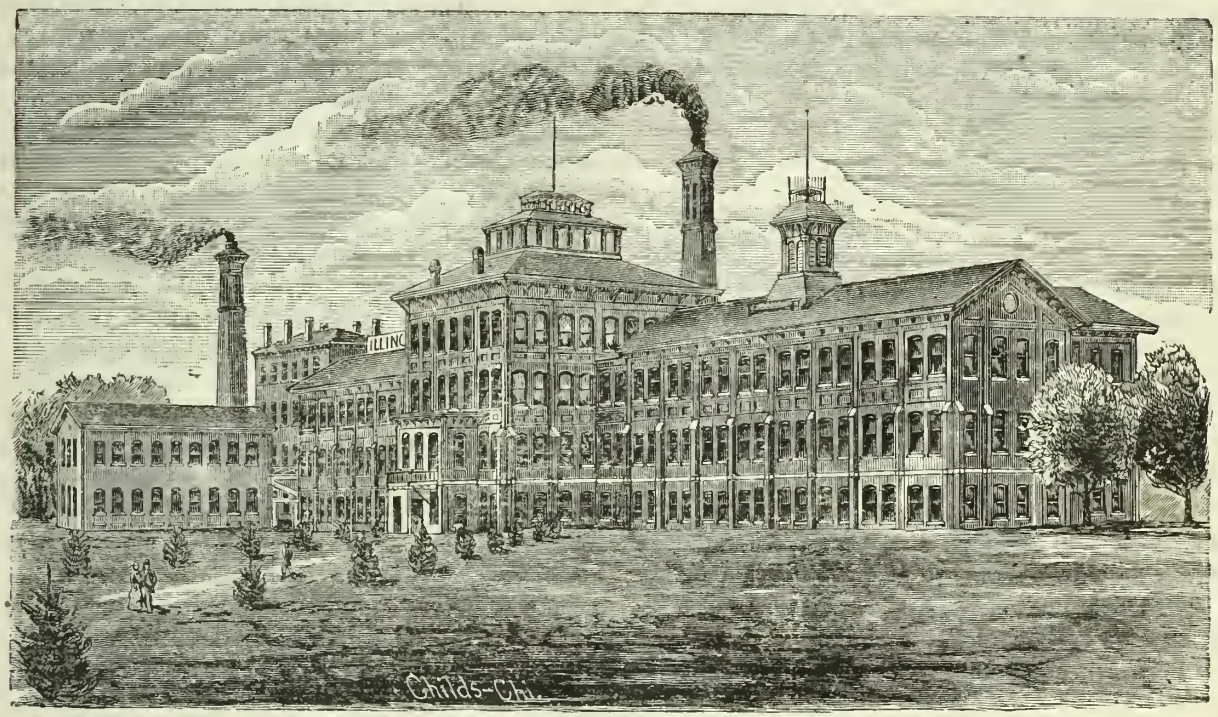
"Let him never take a wife
That will not love her as his life"

Single posies are very varied. Here are two beautiful ones to head our list.:—

"God above, and peace and love."
"God and thee, my comfort be."

Several more worth quoting cannot be classified; I will give them all round, as Perdita distributed flowers to her guests:

"Sweet heart I pray, do not say nay."
"Love me little, but love me long."
"I bid adieu to all but you."
"For a kiss take this."
"Like and take, mislike or sake."
"This and my heart."
"True blue will never stain."



One more must be mentioned---Nerissa's ring—

ILLINOIS WATCH FACTORY,

—AT—

SPRINGFIELD, ILLINOIS, U. S. A.

CAPACITY 500 WATCHES PER DAY.

ESTABLISHED 1870.

All Movements have Patent Pinion, and all are Quick Train. All Stem Winders made to fit Hunting and Open Face Cases, the latter bringing the figure XII at the pendent.

Orders for Movements with special engraving in grades above I. W. Co., received in lots of five and upwards without extra charge.

Special attention is called to our I. W. Co., which is the **only** low-priced Movement in the market having all the following improvements :—

SUNK SECONDS DIAL, PATENT PINION, DUST BAND, QUICK TRAIN, EXPANSION BALANCE, TEMPERED HAIRSPRING.

OUR No. 5 IS THE CHEAPEST ADJUSTED, FULL JEWELLED, PATENT REGULATOR MOVEMENT MADE.

Our No. 150, Ladies' 8 size Watch is of superior finish, low-priced, and guaranteed

THE BEST CHEAP LADIES' WATCH EVER PRODUCED.

Whose posey was
For all the world, like cutler's poetry
Upon a knife—Love and leave me not.

Of all the familiar objects of domestic life, it may be remarked, in conclusion, none are so intimately connected with our deepest feelings and most cherished memories as rings. The spousal ring touches the chord of all that is noble and elevated in either sex; it is "the enchantment of human life," calling up devotion and chivalric tenderness in man, and mellowing the kindly impulses which draw the maiden to all that is good into the most intense and self-denying love for man. Friendship and departed relatives leave their mementoes with us in rings. Who cares for a ring that has no fond memory clinging to it? The whole life history is compressed in the wedding ring. Love, loss, chastisement, endurance, the false life of the past dropping away, glimpses of the perfect future revealing themselves, the unfolding of aims and hopes that are the buds of our race's development—such winged thoughts hover around wedding rings. There is no romance, for those who can read it, like that of an old wedding ring. The thoughts it awakes in a contemplative mind are precious as its own gold, bright as its lustre, and boundless as the circle of eternity.—*Brooklyn Eagle.*

WHO SHALL MAINTAIN TECHNICAL SCHOOLS?

Technical instruction, with a view to facilitating and improving industrial methods, thereby maintaining that superiority in manufactures which alone commands the world's markets, continues to grow in favour in Britain as well as on the Continent. But with this characteristic difference, that while the latter are largely and in some instances exclusively under the patronage of the State, the former are left to private or associated enterprise. Thus far the experiment under both systems has worked out satisfactory results; but as the voluntary system has to contend with serious odds, to competition with the paternal governments of the Continent, the question of how to maintain and increase the efficiency of this system of instruction is engaging the attention of thoughtful minds to an extent rarely known before. While it is true that the Government is not a contributor to their support, it is to be observed that Parliament is by no means indifferent to their success; in evidence of which we may refer to a Royal Commission on Technical Instruction, which was recently authorised to make an inquiry into the subject in all its bearings, and to whose recently submitted report we have heretofore alluded. The report presents evidence of a conclusive character as to the efforts which are being made by other nations to fit themselves to compete with Britain in every branch of industrial activity. Governments are vieing with municipal authorities and private individuals in establishing and endowing institutions of the most varied character; all of which, however, has the same end in view, viz., that of fitting their populations to meet the constantly increasing demands made upon them by the growing necessities of the time. Technical instruction, it is admitted, could not teach a trade; it could not supersede workshop experience; but while valuing that experience, the Commission do not shut their eyes to the fact that it often resulted in mere mechanical routine knowledge. What was wanted was not mere experience, but intelligent experience, and that could only, or at any rate could best, be gained by systematic training in the scientific and artistic principles which underlie every industry. To insure that training the discipline and opportunity afforded by a school were essential. Continental nations were certainly doing more of this kind of systematic training of their industrial workers of all classes than England had hitherto been in the habit of doing. The success which had attended these efforts was shown not only in the existence of gigantic manufacturing establishments, but also, and perhaps especially in the great perfection of manufacture to which many of these had attained, and in the keen competition they were able to maintain with English products. It was the universal opinion in these countries that without these technical schools for high and low, results of this character could not have been arrived at, and the greatest apprehension for the future welfare of their industries, expressed by intelligent foreigners, was that England should some day or other awaken to the necessity of placing her industrial instruction on a similar footing. Thus, admitting that France, Germany, &c., had done more for systematic technical instruction than had been done in Britain, the question was, what are the best means of remedying the evil? The Technical Commissioners by no means approved of the wholesale introduction of Continental methods. They felt that each country must work on its own lines, and the only way to secure permanent progress was to expand and extend the system under which they had been accustomed to work. Abroad, as already stated, almost all the technical schools were State supported, and, hence, to recommend the adoption of principle that in England would be only to court defeat. Nor did the Commissioners find wanting among English institutions examples of technical schools which might be placed on a footing of equality with any of a similar character elsewhere, both as regarded efficiency and the influence they were exerting in the improvement of the industries they were designed to advance. What was chiefly needed was the multiplication of such schools, and the attainment of that object could only be effected by a general consensus of opinion as to the importance, or rather the necessity, of the kind of instruction which such institutions afforded. And as this can only be obtained by exciting a widespread public interest in the subject among the people themselves, if labour and capital will join hands in the work the result would not be doubtful.

About all that is said in favour of the experiment in England is not less applicable to the present state of the question in the United States. There is a general recognition of the importance of multiplying and maintaining these technical schools; but, unfortunately, the disposition is to fall in line with the Continental plan of throwing the burthen of their support upon the state rather than to make them self-sustaining by private enterprise. Hence we have schemes for incorporating technical instruction with the curriculum of the public schools, in addition to music and painting, and the languages, for which in the aggregate, the taxpayers of this city alone have to pay about 4,000,000 dols. per annum. The Free Academy, or University of the City of New York, we believe, is at this moment making some experiment of the kind, but with what results we have yet to learn. It is scarcely in accordance with the fitness of things that the hand-saw and jack-plane should be mixed up under the same roof with Greek and Latin, though it would doubtless make no inconsiderable addition to the army of ten thousand placemen who are now drawing salaries from the municipal

exchequer. By all means let us encourage technical instruction in every possible way—none need it more urgently than the present generation of American youth; but let us avoid the temptation of adding to the functions of the State in a matter of this kind, lest while seeking to enlarge the area of American skilled industry and the market for its products we add to the burthens already imposed upon it for the support of an already overgrown Government machine, which needs to have those functions restrained rather than enlarged. There is nothing in this way that private enterprise cannot accomplish infinitely better and infinitely more economically than the State.—*Jewellers' Circular.*

LUCK V. SKILL IN MINING.

During a recent visit to the mountains, a reporter quietly listened to a discussion going on between several miners regarding luck as specially applicable to and associated with mining ventures. The participants were about equally divided in opinion as to whether luck or shrewd judgment was paramount as an actuating motive in the generality of mining operations. Appeal was finally made to an old California miner, who had hitherto taken no part in the conversation, and he responded as follows:

"It may not be business to say so, but during many years of experience I have noticed that the prospectors who believed firmly in luck, and who had the most 'notions' and superstitions, always got on to the best ground. They did less work and less tramping, but their luck always brought them more cash to spend in the rainy season."

"Can you tell us some instances where nothing but luck brought a fortune to a fellow?" asked one of the party.

"Golly, I could talk of occurrences of this kind all night, but there is one case that was running in my mind all the time this confab has been going on, only the chap was not particularly a miner, but a carpenter who did jobs in the mines when work was slack in the towns.'

"Oh, never mind that, but tell us about him," said several voices at once.

"All right; and if you discover anything but 'nigger-luck' in the story, stop me without ceremony. 'Spose you've heard of Lucky Baldwin over on the coast?"

"Of course we have," said everybody.

"Well, he's the chap. Did you ever know why we dubbed him Lucky Baldwin?"

"No," was the general response.

"Well, shove the cigars this way and I'll tell you about him."

Lighting a cigar deliberately with the puffing method peculiar to one most familiar with a wheezy pipe, the old man finally said:

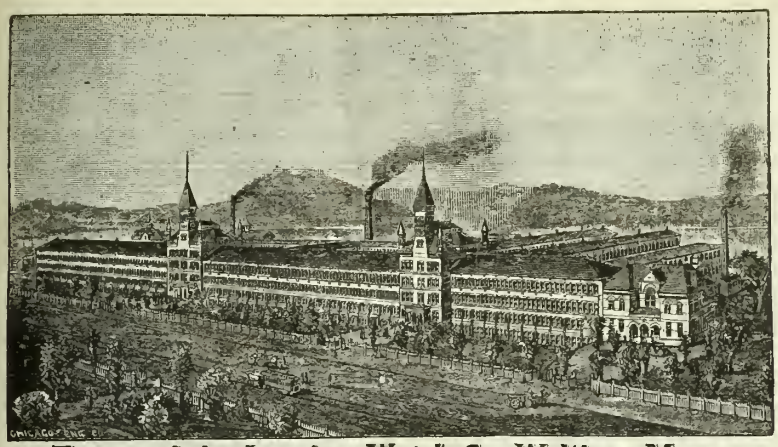
"Times had got a little dull and stocks were low, and so Baldwin, who was always studying up some wild scheme or other to make money, concluded to go to China on some racket, and, as he happened to have 1,000 shares of Crown Point, which had cost him $3 a share, he was mighty anxious to realize on them. The price being off several points, he raised the wind some other way, and, feeling that the time would come when he could get even on his stock, he left it with a friend to sell when the price rose to $3 a share, and off he went to China. Soon after his departure the Comstock got into a bonanza and prices began to fly up. Baldwin's friend, who, by the way, was a carpenter also, watched the market closely, and when his $3 limit was reached he rushed down to a broker and told him to sell 1,000 shares of Crown Point at $3. 'Where's your stock?" asked the broker. 'Here it is,' said the carpenter. The broker examined it and then said: 'Have you power of attorney to sign Baldwin's name?' 'Not a power,' replied the carpenter. 'Well, then,' said the broker, 'I can't sell this stock, nor will anyone else.' You see, Baldwin, in accordance with his customary carelessness, or rather ignorance of business methods, had gone off without transferring or indorsing the stock made out in his name. Of course, his business trip to China was a failure, as were all his deliberately-planned enterprises, and he arrived in San Francisco strapped, but soon found that instead of having $3,000 waiting for him it had swelled to an even $1,000,000."

"No wonder they call him Lucky Baldwin," said a Chicago tenderfoot.

"Hold a moment, pardner," remarked the old Californian, "nobody thought of giving him that name then for a little lucky turn like that. Wait till I get a little further along with my story, and you'll see a better reason for the name."

"Is there more coming? Great Scott! Wasn't one million enough on a scratch?"

"We didn't give names those days in California unless a man earned them—yo can bet your bottom dollar on that. Baldwin cashed in his stock, and as he was considered rather fresh, the boys put up a job to divide the million among the gang. Jim Keene was baldwin's broker, and he and the rest concluded that they would saddle a big block of Ophir on Baldwin at from $10 to $15 per share, which they proceeded to do, thus tapping him of half his pile. No sooner had Baldwin got this bundle of Ophir into his possession than the big bonanza was struck in Consolidated Virginia and California, adjoining the Ophir, and that stock doubled up in sympathy."



"'Rah for Baldwin," cried the Chicago tenderfoot.

"Keep cool, pard, that was only ordinary luck," growled the old Californian.

"Thunder and Mars, another million and you say only ordinary luck?"

"That's what I said. Ophir kept right on doubling up so fast that the gang wanted to get Baldwin's stock, and so they put up another job on him. You see the Bank of California held most of the balance of Ophir stock, and so Ralston sent for Keene and 'sized him up' to vote Baldwin's stock at the annual election, so that the Bank would have control of the mine. Keene being still agent for Baldwin, pocketed his plum and went square back on Baldwin. Lord, wasn't Baldwin mad. The stock kept going up, and Baldwin, knowing that the old assessment dodge would be played on him, shoved his stock on the market just exactly as the conspirators expected and wished he would, until he hadn't a share left, obtaining the highest prices, which were from $250 to $300 per share. No sooner had he unloaded on the gang than the stock began to tumble as rapidly as it had risen, and it busted the Bank of California, but Baldwin had over $10,000,000 to his credit, and the name 'Lucky Baldwin' was duly earned and accredited to him. You see there was not a bit of sense or smartness from the beginning to end, so far as 'Lucky' was concerned. He blundered into the first million, was trapped into a bad investment, and was angered into selling out in the nick of time, and so luck—stupid nigger luck—made him the straw which broke the back of the great institution known as the Bank of California, and transferred its gold into his own private pocket."

"What became of Lucky Baldwin?"

"Oh, he built a big hotel, got a big farm, and plastered his money around without any business judgment; but he had such a stack of gold that he couldn't fool it away, and probably has an odd million or two left yet. No, boys, I don't pretend to say that luck is a chief factor in mining, but I'd rather have a heap of luck than a heap of sense without luck."—*Ex.*

A RETAILER ON HOUSE SALESMEN.

Said a retailer to us a short time ago. in speaking of a wholesale grocery house, "There is but one salesman in that store that can sell me a bill of goods; if he cannot wait upon me I prefer to buy elsewhere." This was getting the thing down to so fine a point that we questioned the speaker as to his reasons for this severe discrimination, and what he said may be of value to those who need the criticism. "In the first place," he continued, "I like to trade with a person who does not show by every action that he feels himself better than I am; and I like to trade with a man who has been a 'drummer' on the road. They are the boys who know how to treat a customer and make one feel at home in the store. I hold that those young chaps who are found in so many jobbing houses, and whose experience is limited thereto, do not know how to sell a bill of goods. In the first place they are so swelled with self-conceit and the importance of their position that they are positively disagreeable. To use plain language, they are badly affected with the big head. Their pointed shoes and choker collars cannot make up for their sad deficiency of tact. Now, I will tell you what I'd like to see done. I would like to have the proprietor of every wholesale house send these knowing young clerks upon a three months' trip on the road. Give them a grip-sack and send them out to the tender mercies of the world. Even if they do not pay expenses, it would be a good paying investment to the bosses, for these young clerks would come back with such a heap of knowledge and experience as would be very apt to make them quite decent fellows in the future. But just so long as they have a desk in the store, and wait upon a customer just as though they were granting a great favor, I have no use for them. Before the days of 'drummers," jobbing-houses kept good salesmen in their stores, but latterly they have neglected this factor, and seem to feel that anyone is good enough to wait upon a customer who comes to the city to buy. I would rather buy from a 'drummer' any time, if I could only have a chance to examine goods, than go to the city and have set upon me these embryotic Stewarts and Claflins, who never saw a cross-roads country store. Retailers are often invited by jobbers to visit them at their stores, and this is all well enough; but have experienced men to wait on them, or the effect may not be what was expected. I know the 'drummer' has much to answer for, but he knows how to sell goods without giving offence."—*St. Louis Grocer.*

A PAWNBROKER'S TRICK.

I have also heard of a trick in vogue among a certain class, which it is well to know. It is peculiarly a pawnbrokers' trick. A pawnbroker accumulates, through his own forfeited stuff and sales of unredeemed pledges, a bushel—more or less—of watches, each of which is worth from 75 cents to $3. Then he goes to work and puts them all on his shelf as pledges, making out pawn tickets for them bearing fictitious names and purporting to represent loans of from $5 to $15. He also registers the pretended loans on his books just as if they were legitimate transactions. One by one those tickets are lost. He slyly drops one in a bar room. His wife, when unobserved in a horse car, lets one flutter down to the matting. His clerk goes through a hotel entrance and one is left on the floor behind him. Of course, each ticket is picked up by somebody, and human nature is, on the general average, so weak that the finder is most apt to say to himself: "Hello! here's luck! Some poor devil has lost this, but I don't know who, and couldn't return it if I would. Up the spout for $10, eh? Well then, it must be worth $20 or $25 anyway, for pawnbrokers never give more than one-half and generally only one quarter of the real value on anything. The watch isn't mine but I might just as well have it as that blood-sucker of a pawnbroker. I'll go and get it out." So he does. The pawnbroker, as is the uniform custom, takes the money along with the ticket offered for redemption. Then he goes to the shelf, takes down a package done up in paper and strings bearing the number of the ticket, and hands it over. The man does not stand around there to examine his prize. How does he know but the loser of the ticket may come in at any moment to give notification of his loss and stop delivery of the watch? He hurries away to the nearest beer shop, nervously tears off the papers and then proceeds to paint the atmosphere blue with his observations. Of course he cannot have any redress. He can't kick on a transaction the basis of which is his endeavor to obtain a wrongful possession of another man's watch. Besides what could he prove anyway, but that the pawnbroker's judgment in the valuation of pledges was sometimes bad or his liberality in loans spasmodically surprising? — *N. Y. cor. Manufacturing Jeweler.*

THE NUMBERS ON A WATCH FACE.

A group of travelling men were gathered about a stove in a hotel office the other evening, when one of them startled his fellows by saying: "I do not believe that one of you can tell what kind of numerals are on the face of your watch, and if you can I will bet the cigars for the party that not a man here can write them down as they are on his watch."

"I'll take the bet," said one who prided himself on his qualities of observation. "I look at my watch at least ten times a day, and I know I can do it."

"All right —begin," remarked he who had made the proposition.

"Do you want them in a circle?"

"No. Along a line will do."

"Well here goes," and he began putting down I, II, III, until he got to four, where he hesitated. First he put down IV, and then, glancing at the clock in the room, changed it to IIII, and proceeding wrote V, VI, VII, VIII, IX, X, XI, XII.

"There!" he said exultingly, "I think I have won the cigars for the crowd."

"I will just bet you the drinks you haven't," replied the other.

"Well, I will go you," at the same time pulling out his watch.

"Well, show me VI on your watch and I will settle for everything," remarked he who made the proposition.

All crowded around and gave the smart man the laugh, and he then and there resolved never again to bet on a man's own game.—*Ex.*

MARK.

OBSERVE

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

"CURIOSITIES OF COMMERCE."

Among the "curiosities of commerce" none, perhaps, is more curious than that the major portion of the produce exported from South Africa is simply used for the adornment of ladies. Out of a total value exported of £7,500,000, ostrich feathers and diamonds account for £5,000,000. Twenty years ago all known diamonds had come to Europe or the United States from immemorial Eastern stocks or from the scanty produce of mines in Brazil and elsewhere, which were calculated to yield not more than £50,000 worth in a year. To-day situated in the midst of a wide-stretching plain affording at all points a sea-line horizon of flat "veldt," we find this town of Kimberley with a large European population of wealthy and well-to do people, and a large native population earning every year more than £1,000,000 in wages. And from this mining oasis in the agricultural desert has been sent in the last fifteen years something like £40,000,000 of diamonds in the rough, which, with the cost of cutting, setting, and selling must have taken from the pockets of consumers something approaching £100,000,000.—*London Times.*

SPECIAL NOTICE.

Jewelers throughout Canada will oblige the Editor by sending in to this office for insertion in these notes any items of news pertaining to the Jewelry business that they think would be of interest to the Trade generally.

BUSINESS NOTES.

Mr. John Welsh, jeweler of Stratford, was at the last general meeting elected Grand Patriarch of the Order of Odd-Fellows in Canada. We congratulate him on his deserved promotion.

Mr. Lowe, of the firm of Lowe & Anderson, has been putting his "business holidays" in the City of Winnipeg. He reports business fairly good in the prairie city, with fair prospects ahead.

Mr. W. F. Snell, the well known jeweler of Strathroy, Ont, is at present rusticating in Southern California. His assistant Mr. Ferguson is running the business machine until his return.

We direct the attention of our readers to the letter of Mr. G. W. Beall in another column, and will have something to say about it in next month's issue. In the meantime the genial Secretary of the Canadian Jobbers' Association in American Watches might rise and explain.

Mr. John Segsworth, wholesale jeweler of this city, is at present absent in Europe on his annual expedition for novelties in jewelry for the fall trade. He is expected back early this month. His arm chair is ably filled by Charlie during his absence.

Mr. Beverly Heath, the popular traveller for Simpson, Hall, Miller & Co. of Montreal, called upon us the other day. He reports the demand for S. H. M. & Co's goods as great as ever and seems thoroughly satisfied with the prospects of fall trade. More power to you Beverly.

Mr. Taisey, the popular manager of the Waltham Watch Co. agency in Boston, was in the city a few days ago visiting his usual customers in the wholesale trade. He seems to be satisfied with the trade his company is doing and says their trade in Canada is increasing very fast.

An Attractive Price List.—Our attention has been drawn to the new and very complete Price List of American Movements, Silver, Gold and Filled Cases issued by the enterprising firm of Lowe & Anderson. It is one of the most complete lists of the kind ever issued in Canada, and the artistic cover would reflect credit on the taste of an Oscar Wilde.

Almost every Jeweler in Canada knows Mr. Perry the popular representative of the Hampden Watch Co., and one of the oldest watch men in America. He paid a flying visit to our sanctum during his last trip to Toronto, and in addition to his looking the picture of health, expressed himself as being thoroughly satisfied with the prospects for this fall's trade.

The Boss Case People are always to the front with something new. The latest thing they have is their 6 size Ladies' Boss Case, a perfect little gem in its way, and something that is bound to sell on sight. This case seems to have struck the popular fancy, and coming as it does just in the nick of time will undoubtedly have a large sale.

The American Watch Case Co.'s New 6 and 18 size gold cases are pronounced by competent judges to be as nearly perfect as possible and fully equal to any ever imported into Canada. The new company are making rapid strides in all branches of their manufacture and aim to make a perfect case. They are bound to win success.

Surpassing Themselves.—The Hemming Bros. are surpassing themselves this fall in the line of fancy jewelers' trays, fittings and cases. Every jeweler who wants to have the very latest thing in fittings should give them a call before deciding what he will have. Their factory is a credit to Canada, and we are glad to know that their efforts are being appreciated by the trade giving them all they can possibly do.

We paid a Visit a few days ago to Messrs. Smith & Fudger's establishment, and from garret to cellar found the whole warehouse crowded with new goods of this season's importation. If the newest styles, close prices, and punctuality and correctness in delivery, are in any way conducive to building up a business, then this firm should be away up near the tip top of the mercantile ladder. They thoroughly deserve the success they have attained.

We regret exceedingly to learn of the death of Mr. George Lee, senior partner of the firm of Lee and Edsall, hardware merchants of Bowmanville, Ont. About two years ago Mr. Lee contracted a severe cold which finally turned into consumption and thus caused his early demise. Mr. Lee was a genial wholesouled upright fellow, whom everybody liked, and his many friends in the hardware business throughout Canada will hear of his early death with great regret.

Death of Mr. Elijah J. Davis.—We regret to chronicle the death of Mr. Elijah J. Davis, senior member of the firm of Davis Bros., jewelers, Yonge St., Toronto. The cause of Mr. Davis' death was dropsy of the heart, from which he had been ailing for about two months before his death. The deceased besides being one of the most energetic and prominent retail jewelers in the city, was also a prominent Odd-Fellow, and a large representation from that body was present at the funeral as a mark of respect and esteem.

A Smuggler Arrested.—A despatch received from Buffalo, N. Y., on Aug. 21st, says: On Wednesday evening at Suspension bridge custom officer Asher Cudaback arrested Benj. Moechelle of Toronto for smuggling. On his person were found 20 gold watches, valued at $400. He also carried a jewelry case with a false bottom, in which the goods were concealed. He was brought to Lockport and arraigned before the United States commissioner, when his examination was adjourned till Monday afternoon next.

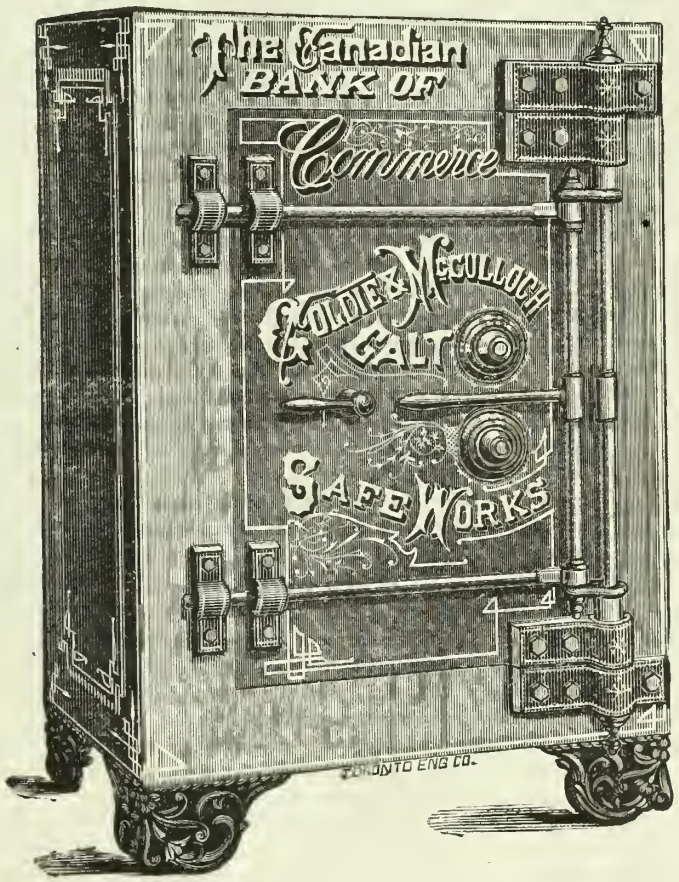
S.E. F. & Co.—When these letters are stamped upon bracelets of any kind, it is a sure guarantee that the goods so stamped are thoroughly reliable and will give satisfaction alike to the seller and wearer. To jewelers who want to build up a business we say that we know of no goods better suited for such a purpose than those stamped S. E. F. & Co. Besides being reliable they are elegantly finished and of the newest styles. Ask your jobbers for them and order from any of the illustrations of them given in The Trader.

Mr. S. H. Hale, the genial New York manager of the American Waltham Watch Co., paid Toronto a flying visit a few days ago, for the purpose of looking up the prospects of the fall trade in this market. Mr Hale speaks in glowing terms of the prospects of the Company's new "Seaside" ladies' movement and is sanguine that it is exactly what has so long been wanted in order to make the Swiss watches take a back seat in Canada. This being Mr. Hale's first visit to the capital of Ontario, he was shown the lions by Mr. T. H. Lee and expressed himself as being very favorably impressed by the city's general appearance. Come again Mr. Hale.

Reliable Chains.—There is probably as much humbug about the quality of rolled plate chains as anything we know of. Competition in price has not only forced the prices down but the quality as well until one is half afraid to guarantee the quality of such goods. There are exceptions to this state of things, however, and amongst the persons who have "not bowed the knee to Baal" are the manufacturers of the R. F. S. & Co. rolled plate goods. They pride themselves upon making a thoroughly reliable article at an honest price and jewelers can, therefore, buy their goods with the full assurance

GOLDIE & McCULLOCH,

(ESTABLISHED 41 YEARS AGO.)



MANUFACTURERS OF

FIRE AND BURGLAR-PROOF SAFES; FIRE-PROOF AND BURGLAR-PROOF VAULT DOORS; STEEL VAULTS; NEW STYLE JEWELLERS' SAFES, etc.

THE LARGEST MONIED INSTITUTION IN THE DOMINION, the Bank of Montreal has awarded us the contract for building the Steel Vaults required in their new Banking House in Toronto. This will be the most extensive work of the kind ever built in Canada.

2 Gold Medals,
3 Silver Medals,
4 Bronze Medals,
2 Diplomas,
Awarded to our Fire and Burglar-Proof Securities during the last 4 years.
A Splendid Tribute to Merit.

No First Prizes have been awarded to any other exhibitors during these last 4 years.

We will be glad to have Visitors to Toronto call at our Warerooms, No. 56 King Street West, next door to the Mail building, where we have always a large stock on hand.

Our Fire-Proof Safes are always filled with wet filling, universally acknowledged to be the best, but owing to the mode of construction which is different from other makes they do not become damp or musty inside, a common fault with inferior safes.

Terms are as easy and prices as low as those of inferior makers.

A large number of Second-hand Safes, by other makers, on hand, including several fitted for jewellers. These Safes have been taken in exchange and replaced by others of our own make.

WAREROOMS—NO. 56 KING STREET WEST, TORONTO.
NEXT DOOR TO THE MAIL BUILDING.

GEO. F. BOSTWICK,
REPRESENTATIVE.

hat they will be fully up to any guarantee the manufacturers may give regarding them. In such goods, the best are always the cheapest.

SOMETHING NEW IN SEALS.—The handsomest seal for warehouse use that we have ever seen is the new one now used by Smith & Fudger, wholesale jewelers of this city. The design consists of an oval belt containing their name and address, and inside the belt on a raised circle the firm's trade mark consisting of a combination balance and escape wheel, regulator and index plate with the usual letters S at one end and F at the other. Whether these letters stand for "Slow" and "Fast" and are thus used to denote the characteristics of the partners, or for the real names of the gentlemen comprising the firm we know not,—their customers and our readers must decide for themselves. All we have to say is that the work is most artistically done and is a splendid specimen of fine English workmanship.

CUSTOMS SEIZURE.—We understand that the Winnipeg Customs authorities have seized the stock of W. Perret, jeweler of that city, for contravention of the Customs regulations. Mr. Perret asserts that the seizure is entirely without cause and that as their goods were almost entirely bought in Canada from respectable houses they will have little or no difficulty in clearing themselves from the consequences of such a charge. As the law now stands it is in the power of the Customs authorities to practically ruin any firm in this way by stopping their business for an indefinite period. The Winnipeg Customs people seem to be the worst offenders in this respect and they should therefore be all the more certain of their ground before they incur the responsibility of injuring a firm's reputation by making a seizure.

ONE OF THE EMPLOYEES of Messrs. John H. Jones & Co., of Montreal, has been arrested, charged with systematically stealing goods from his employers. His *modus operandi* seems to have been to send the stolen goods to confederates in Troy N. Y. where they were disposed of. The money thus realized was divided amongst the conspirators, the Montreal clerk getting one third of the amount. It is said that one of his pals has split on the transaction and will give evidence in Montreal at the trial. If the case can be clearly proven, a severe example should be made of the offender. A thief is bad enough, but theft by a trusted employee who takes advantage of his position is very much worse. Since the above was in type we learn that Mr. Chas. Lambethe, clerk, arrested for the above crime and who was allowed out on bail has decamped to the U.S. More anon.

NEW WALTHAM MOVEMENT.—The new 6 size movement named the "Seaside," just placed upon the market by the Waltham Watch Company is a daisy and bids fair to sweep the market for this year's trade at least. Heretofore exclusive dealers in American Watches have been at a considerable disadvantage in competing against ladies' size Swiss movements on account of the lower price of the latter, but this new departure of the Waltham Company will not only bring American Ladies' Watches within the reach of the consumer, but make them lower in price than their Swiss competitors. The only thing that has stood in the way of American Ladies' Size Watches capturing the Canadian market has been the price, and now that this difficulty has been overcome, they should keep abreast with their sales of 18 size goods. It is safe to say that the introduction of the "Seaside" movement means a revolution in the Ladies' Watch trade so far as Canada is concerned.

WHO IS MR. PERKINS? is a question which might have been asked by the jewelry trade of Canada, some time ago, but which is hardly necessary at the present time, in view of the fact that he has just about completed a tour of Canada and visited with much acceptance almost every retail jeweler in it in the interest of the Elgin Watch. Since leaving Canada we have been favored with a few lines from him from Leavinworth, Kansas, and we here reproduce an extract of his letter, in order to settle the controversy between our political leaders as to the advantages of that State over Canada as a field for emigration. He says "I believe for the first time in my life I appreciate the full meaning of the Spanish salutation "How do you sweat."? I never experienced so trying a heated term as we are now passing through in Kansas, all one can do is to sit still and perspire and wonder if "Shoel" can hold more hot discomfort to the square inch than does Kansas."

A BIG ADVERTISEMENT.—The American Waltham Watch Co., besides having the biggest thing in the watch, have also secured the biggest thing in the advertising line from royalty itself. Their English manager, Mr. Bedford, has a big head and we congratulate him upon the successful issue of a usually doubtful experiment. The following extract from one of the leading London papers is self-explanatory and shows how even British Royalty itself, has become the means of furthering the interests of one of the most prominent of American industries:—

"It was a happy thought that prompted our Waltham friends engaged in the American Watch Co.'s exhibit to present to the Princess Beatrice, youngest daughter of her Most Gracious Majesty, Victoria, Queen of Great Britain and Ireland and Empress of all the Indies, a splendid watch of Waltham manufacture on the event of her marriage with the German prince consummated a few days ago. The acceptance of the gift by the princess through Sir Henry Ponsonby may also be deemed an equally gracious recognition of the kindly sentiments actuating the donors.

INVENTORS' EXHIBITION, London, July 4, 1885.
SIR HENRY PONSONBY, WINDSOR CASTLE:

Sir: On behalf of the male and female operatives employed by the American Waltham Watch Co., now at work in the Inventors' Exhibition, I beg most respectfully to ask, through you, Her Royal Highness the Princess Beatrice to accept from them and their fellow work people in Waltham, Mass., U. S. A., to place among her wedding gifts, the accompanying gold watch, as a specimen of their work and as a small token of the great respect and admiration they feel for Her Majesty the Queen and the Royal Family, as well as of the unbounded generosity and kindness they have experienced at the hands of the English people. I am, Sir,

Your very obedient servant,

ALFRED BEDFORD,
Manager.

WINDSOR CASTLE, July 8, 1885.

Sir Henry Ponsonby is desired by Princess Beatrice to return Her Royal Highness' best thanks to Mr. Bedford and the male and female operatives employed by the American Waltham Watch Company, for the beautiful watch which they have had the kindness to present to the princess.

With expressions of esteem,

HENRY PONSONBY,
Bart.

A BIG CONCERN.—The biggest thing in Canada in the way of jewelry manufacture is the new factory of P. W. Ellis & Co., 31 Wellington Street East. This firm which started some eight years ago at the corner of King and Toronto Streets, with about half a dozen hands, has developed into the magnificent establishment which we had the pleasure of looking through the other day, and employs a staff of nearly ninety workmen. This growth, as our readers may imagine has not been one of the mushroom kind; unlike Jonah's gourd, it has not sprung up in a night with the probability of being withered by the heat of a single day of sunshine. Their progress has been the result of a patient persevering honest effort, combined with a large amount of energy and well directed brain work. Year by year their staff has been increased, their machinery improved and a larger range of work manufactured, until at the present time they have a factory and salesroom which would be considered creditable in any country.

Entering on the ground floor the visitor finds himself in the jewelry salesroom and general offices. In the centre of the room is the immense burglar-proof vault specially built by Goldie & McCulloch for the firm, in front of which runs a very handsome salescounter upon either end of which are placed nickel show cases. At the north end is the private office of Mr. M. C. Ellis the buyer for the firm, where customers are made to feel at home by having writing materials, lavatories &c. provided for their accommodation. At the south end of the flat the general business offices are situated and also the private office of Mr. R. Y. Ellis the financial manager of the business. At either end of the flat, immense plate glass windows have been placed which render it both light and cheerful. The stairway and office fixtures are in the "Queen Ann" style, and are of mahogany and walnut. In the basement which has a solid concrete floor, the powerful engine which supplies the factory on the top flat with power, and all the heavy machinery is situated. The first floor is fitted up as a watch repairing and material department, and also contains the general shipping rooms. The top flat of all is the factory proper, and here under the presidence of Mr. P. W. Ellis the senior member of the firm and his assistant Mr. Thos. Ellis, are some ninety workmen all busily engaged in making jewelry of all kinds. In every direction are moving wheels, and belts driving lathes and laps, and machinery to which no one but an expert could possibly give a name. To the uninitiated it looks like chaos, but when you go

THE AWARD OF THE JUDGES

AT THE NEW ORLEANS EXPOSITION OF MEDALS OF THE FIRST CLASS TO THE MANUFACTURERS BOSS, KEYSTONE & LEADER WATCH CASES

is one more solid block of testimony added to the already overwhelming evidence of the superiority of the Watch Cases manufactured at the Keystone Factories. But notwithstanding this fact, the makers of these Cases do not propose to rest upon their laurels.

PROGRESS

is the motto of the Keystone Factories ; and it is but natural that the announcement is now made that a full and exceptionally elegant line of Boss, Keystone and Leader Cases, engraved from entirely new and special designs, is in course of construction for the fall trade.

FINEST AND BEST WORKMANSHIP.

As heretofore, every case will be made exactly in accordance with a strictly defined design insuring honest material, perfect fit, unsurpassed finish, the most thorough engraving, and unequalled durability.

Keystone Watch Case Factories,

19th and Brown Streets,

PHILADELPHIA, PA., - - - - U. S. A.

through it with the proprietor and learn the use of each machine, you find out that everything is run exactly by a given method and is bound to produce a given result. The almost perfect system of the factory is the result of years of practical application to details and is bound to command success. The biggest surprise to any one who sees all the stuff in the new place, and ever saw the old one, is where they ever kept such a stock. Charlie Ellis says they didn't know what they had themselves until they got it out into the daylight, and now he thinks they are going to have their space pretty well taxed.

It is by the enterprise of such business men as P. W. Ellis & Co. that a country is made prosperous and we not only offer them our congratulations on their success so far, but trust it may go on increasing. In this wish we think we shall be heartily supported by the jewelers of Canada generally, for such a factory as theirs is an immense benefit to the trade. The fact is that the country could not do without such an institution now, and go back to the old methods.

Absolutely Sure Protection Against Burglars.—The Bank of Montreal is now erecting in Toronto a new and elegant banking house, different in style and architecture from any heretofore built in this city. In erecting such a building, to last as it certainly will for several generations, the Board of Directors determined to procure the very best possible protection against burglars, for the vast sums of money and securities constantly in their hands. They are securing this protection through the well-known firm of Goldie & McCulloch, to whom has been awarded the contract for building an immense steel vault larger and heavier than anything of the kind heretofore built in this country. This vault, or steel room as we may properly call it, will weigh when completed some 30 tons, and will, we doubt not, be a standing monument to the credit of the builders. Goldie & McCulloch are making great strides in public favor in this branch of their very extensive business, and are already at the top of the ladder of success. Their position is well merited, and has been attained by an untarnished record of nearly half a century. Still they may feel proud of being able to say that the largest monied institution in the Dominion has entrusted to them the construction of this, the most important part of their new premises. We congratulate the firm, and also their representative at Toronto, Mr. Geo. F. Bostwick, through whom this heavy contract has been awarded.

WORKSHOP NOTES.

Attaching the Dial.—The pinholes in the dial feet should be drilled with a very small drill, in such a direction that the pins will not come in the way of anything, and will be easily got at; they should not be drilled below the surface of the plate, but broached until the pin touches it. If the hole should be a little below the surface, it is better to lengthen the copper foot by squeezing it with a pair of blunt nippers until it is above the plate, than to leave it in such a position that no pin can stop it.

To Harden Case Springs.—In order to harden case and other pressure springs, they should first be heated, then rubbed over with soap, next heated to a cherry red (not a white, because the steel would burn), dipped quickly in petroleum, and annealed light blue; in place of oil, rub them over with tallow, let it smoke off, and cool on the annealing sheet. The tempering and smoking off are best done outside the workshop, as a bad smell is created thereby.

Silver Alloys.—Pure silver is a metal of only an inferior degree of hardness, in consequence of which, silverware manufactured from the pure metal would be subject to rapid wear, and for this reason it is generally alloyed, except for articles for the chemical laboratory. Silver is most frequently alloyed with copper; besides this, it is also alloyed with gold and aluminium. Alloys containing silver and nickel, or silver, nickel and zinc, are much employed in the manufacture of tableware and articles *de luxe*, which, while being of a handsome white colour, are much cheaper than those from silver and copper, which was formerly much used in the manufacture of silverware.

Simple Test by the Specific Gravity.—The goldsmith, after having smelted his bench scrapings, sweepings, &c., and reduced it into a button, desires to roughly estimate the percentage of the precious metals contained in it. This can be done approximately as follows: A certain quantity of it is taken and drawn out into a wire, which is to be of exactly the same length as one from fine silver; of course, both must have been drawn through the same hole. Silver being nearly one-half lighter than gold, it is natural that the one of fine silver must be lighter, and the increased weight of the wire under test corresponds to the gold contained in it.

OTHER NOTES.

"The American Clean Towel Co.," recently organized at Montreal, deliver for 20 cents a week a clean towel every morning to any address in the city. "Dirt cheap" say we.

A nice distinction in terms is given by a financial paper which says that the word "point" in regard to English consols means a sixteenth of 1 per cent., while in American stocks it signifies 1 per cent., in grain it means 1 cent, and in provisions 2½ cents.

The following is from a late French paper: "It is well known that the Americans are a very practical people, even in their religion. One of them has just invented a burglar-proof safe, which, when tampered with, suddenly extends a powerful pair of tongs, or grippers, which seize the malefactor and hold him in a firm embrace. There is nothing extraordinarily new in all this, but there is something further. Nearly always, safes that are likely to be visited by burglars are in buildings unoccupied during the night, and it is only the next morning that the captured robber is carefully released from the trap to be duly imprisoned. This is, of course, time lost, which the religious inventor desires to utilize. He has, therefore, had prepared by an eloquent preacher a very long and remarkably forcible sermon, in which the rights of property, the disgrace of stealing, and the dangers attendant on it, both in this world and the next, are set forth in the most touching language. This sermon, stored in a phonograph, is set off at the same moment that the pinchers operate, and the homily is rolled out in the ears of the patient. The monotonous nasal tone peculiar to the phonograph renders the illusion perfect; the unfortunate robber believes he hears the voice of the preacher himself, and in the morning when the police arrive they find him thoroughly subdued and repentant."

PROTECTION TO RETAILERS.

The letter of Mr. G. W. Beall, of Lindsay, on the above subject, which we published in our September issue, has, as our readers will see by the correspondence in the present number, given rise to considerable discussion amongst the retail jewelers of Canada. The subject is one of considerable importance to the entire jewelry trade of the country, and we are perfectly satisfied that if properly represented to the Canadian Jobbers' Association in American watches, that Association will take steps to fall into line with the wishes of the retail trade. As a matter of fact, the Jobbers' Association of Canada have, of their own accord, afforded Canadian retailers a considerably larger measure of protection than does the United States Association of the same kind. In the latter country a merchant may be a wholesaler and retailer at the same time and in the same place of business, an arrangement, on the face of it evidently unfair to ordinary retailers, who have not got the advantage of buying goods at wholesale prices. In Canada, however, one of the fundamental principles laid down for the government of the Jobbers' Association, is that a man cannot be a wholesaler and retailer at one and the same time. He has to elect which kind of business he intends to pursue and govern himself accordingly. In an article on this subject, taken from last month's *Jewelers' Circular*, which we publish elsewhere, our readers will see that in this respect our Canadian Jobbers' Association is held up as a model worthy of imitation by the United States Association.

So far as we know, little or no complaint is made against our legitimate jobbers, for selling direct to the consumer at retail. The friction voiced in Mr. Beall's and Mr. Richardson's letters being, that the jewelry trade suffers from the unfair competition of fancy goods men, druggists and hardware men, who are able, by virtue of their buying some special lines of goods from the jewelry jobbers who also handle fancy goods and sundries, to buy watches and jewelry and undersell them. While it may be, and no doubt is quite true, that some few sales are lost to the jewelers from this cause, it does not seem to us that a very great deal of damage can be done to the retail trade by the few goods that are sold in this way. There are always two sides to any question, and the other side is that those outsiders who purchase watches and jewelry are not only regular merchants, but regular customers of the jobbing firms from whom they buy the goods. These jobbers say that until some agreement is entered into by the trade regarding it, that they cannot very well sell a customer one kind of goods and refuse him another, and there is a good deal of force in their reasoning. They do not buy such goods any cheaper, if as cheap as a regular jeweler can, and they certainly cannot afford to sell them at any less margin of profit. Outside of the fact therefore, that the jeweler has more opposition to contend against, the competition of such merchants should not be hard to overcome. All things being equal, the consumer wanting watches or jewelry will invariably give the preference to a legitimate dealer in such articles, if, as he should have, he has the right kind of stock, and is willing to sell it at a reasonable profit. The trouble of a great many of our retail jewelers is that they want and expect to get the same profit on fine watches and jewelry as they do on cheap plated goods. In this way it often happens that their desire for a large profit kills their chances of a sale at a fair margin. The day for mystification in the watch trade has gone forever, and now-a-days the public know just as well as the jeweler knows, that a watch is simply a fine machine, constructed upon correct mechanical principles, and that they are now bought and sold exactly the same as any other merchandise. The publicity given by the various manufacturers and jewelers themselves has posted the public pretty thoroughly as to quality and price, and the Dutchman's one per cent. of profit is now an unknown quantity in the watch business. We venture now to predict that it is only a question of a few years in Canada when watches will be sold at the same percentage of profit as hardware or any ordinary merchandise. As our readers well know, we are no advocate of slaughtering goods; we believe in a fair profit, but not an exhorbitant one. We think that the merchant who sells goods at cost is far more unwise than the one who doubles his money every time, but either extreme is, we think, detrimental to the best interests of a good and permanent business.

So far as we can see, the solution of the difficulty lies with the retail dealers themselves, and they can bring it about in either of two ways: (1) Mr. Beall's plan of refusing to buy from any dealer who sells to a merchant other than a bona-fide jeweler, or (2) Mr. Richardson's plan of forming a Retail Jewelers' Association and asking the Jobbers' Association to aid them in putting a stop to it. We must say, of the two plans, we infinitely prefer the latter, because it would be better for the interests of the jewelry trade generally if the wholesale and retail trades can be got to work harmoniously in order to obtain the desired result.

We think that the retail trade should be protected as far as possible from unfair competition from outsiders, and, as Mr. Richardson says, in asking the wholesalers to grant to them (the retailers) the same privileges as they themselves enjoy from the manufacturers, they are surely asking no more than what is fair and just. We think that the wholesale trade, if the matter be properly represented to them, will be only too glad to co-operate with the retail trade in order to put an end to this abuse, and it therefore rests with the retailers themselves to organize and bring the matter properly before the Jobbers' Association. We do not think that any good can result from stirring up strife between two branches of the same trade, each of which is necessary for

the other's welfare. We are glad, however, to have the question discussed, as we think that its thorough ventilation, while it can do no harm, may produce beneficial results.

COMMERCIAL UNION.

It is a singular thing that at the present time both political parties in Canada are looking anxiously around for some new cry with which to catch the popular fancy and lead their party to victory at the next general election. What the rallying cry of the party in power will be, no one at present knows, and the present premier is too astute a politician to give himself away before he has everything ready to suit his purpose. The Liberal party has apparently been looking around for a policy for some time, and, while they have half a dozen in view, they do not seem to have settled definitely upon any of them. If the utterances of *The Globe*, the heretofore leader of political thought in the Liberal party, is any criterion, the probability is that one of the planks in their platform at the next general election will be that of free trade with the United States. "Commercial Union" its friends dignify it with, but "National Suicide" would, we think, be a more appropriate name for it. If so, they may as well take a permanent lease of the Opposition benches at Ottawa, for we feel certain that the good common sense of the people of Canada will not jump from the frying pan of commercial depression into the fire of commercial extinction, which such a measure would undoubtedly effect. In discussing the question of Commercial Union with the United States, we propose doing so purely from a mercantile point of view. We don't give a solitary cent whether it is the policy of the Liberal or Conservative party, we consider that it is detrimental to the best interests of the country, and shall, therefore, oppose it with all our might, and advise everyone of our readers to do likewise. If our destiny is to become a part of the United States, then it does not matter how soon Commercial Union comes, for it will prove a most effective means of forcing us into the Union, but if on the other hand, we aim some day in the perhaps distant future, at setting up a separate nationality of our own in Canada, then such a measure should be nipped in the bud, and any political party who, for the sake of place, may venture to propose such a thing, should be kept in the cold shades of opposition, where they can do no harm. If Commercial Union simply meant a reciprocal trade in natural products between Canada and the United States, we would wish it God-speed, but such an arrangement would be vastly different from the one now discussed so favorably by *The Globe*, which is to do away with Custom Houses altogether and make Canada simply the same as any state in the Union so far as trade is concerned.

We hear a good deal of talk now-a-days about Free Trade and the National Policy, much of which is downright nonsense. Free Trade is utterly impracticable in Canada for the simple reason that the government cannot be carried on without money, and this money can only be raised as at present, by levying duties on our imports, thus affording incidental protection to our manufacturers, or, failing this, by direct taxation. As both political parties are agreed that direct taxation is impracticable, it follows, as a matter of course, that nine-tenths of the talk of *The Globe* and papers of that ilk are so much bosh, which they do not believe in themselves, and which is only indulged in with the hope that they can convert enough unthinking voters to carry their party back into power again. As we cannot (being simply a colony) negotiate our own treaties, and any such arrangement must be made through the Imperial Government, we hardly think that, even if such an arrangement as Commercial Union with the United States was seriously proposed to the home Government, they would be disposed to acquiesce in it unless they were convinced that the change would be beneficial to themselves, a thing utterly impossible unless they were put on an equal footing with their American competitors. We have not the least doubt but that England would be only too glad to negotiate such a treaty for us if equal concessions were given to her, but she would never of her own free will sanction a discrimination against her own trade in favor of a foreign country, and we would be fools to expect such a thing.

As a matter of fact, nearly one half of our revenue from Customs' duties is derived from goods of American manufacture. If, therefore, this source of income were entirely swept away, as it would assuredly be were this *Globe* bantling to be nursed into life, from what source would the deficiency in revenue be made up? Then, again, if we should succeed in making such a treaty with the United States, we could not either in loyalty or fairness, refuse to make a similar arrangement with Great Britain, even if her legislators were foolish enough not to insist on it as the price of their complaisance. It would not only be unpatriotic, but ungrateful in us to allow the products of American factories to come into Canada free of duty and levy a tax upon the manufactures of the mother country. It would be impossible for us to refuse such a concession, and then we would find our Customs' revenue practically gone, and the Government obliged to resort to direct taxation in order to carry on the work of the country. This is a state of things that we think not even *The Globe* would like to face, especially if its own party were in power.

Leaving the question of loyalty aside altogether and looking at this question from a dollar-and-cent point of view, we are further of the opinion that such a union would ruin not only the manufacturers, but also the wholesale trade of Canada, and, if this were the case, we can scarcely see how the country, as a whole, could be made more prosperous, while two such large classes as those above mentioned were suffering severely from the effect of it. While it may be true that some of our factories, whose output is of goods that are used in their own immediate vicinity, or of goods which we now export to the United States, might not suffer, it is no less true that those factories, whose output comes into direct competition with those of United States manufacturers would either have to go to the wall or continue operations under very disadvantageous circumstances. Our factories are principally reproductions of United States industries, and in many cases, on account of the goods they manufacture being patented in that country, even free trade in the abstract would not enable our manufacturers to sell in a country where their productions are in very many cases protected by patents. The effect of the United States patent laws alone would be to drain our country of capital, for who would care to invest capital in manufactories in a country which could as easily be supplied from

the established American factories as from their own, and which market, on the abrogation of such a treaty, would be restricted to its original dimensions and population. Even with the protection that is afforded by our present tariff, some of our manufacturers find it hard enough to resist the determined hostility of those aggressive factories in the same line of business in the eastern and middle states, who are bound to have the Canadian market at any cost. Remove this protective tariff and they would have free scope and could crush them out of existence as surely as a boa-constrictor crushes its victim before devouring it. "But," says the free trader, "if they can come into your markets, you have equal right to go into theirs." This may be quite true but still very unfair to the weaker party, as Canada undoubtedly is. It would be a great deal like the lion and jackall combination in their hunting expeditions, the former gets all the meat and the latter all the bones. Do away with our present duties, and in a mercantile sense Canada would play the jackall to the United States lion and simply act the part of a provider.

The effect on the wholesale trade of Canada would, we think, be equally disastrous, for it stands to reason that the immense establishments of New York and Boston, with their superior facilities for buying and distributing goods, and their overwhelming capital, would very quickly gobble up the bulk of our wholesale trade and force all but some of the largest houses to the wall.

The effect of such a policy on the cities of Montreal, Toronto, Hamilton and London, which thrive principally on the product of their factories and their wholesale trade, would be very damaging, to say the least, and they would very soon be in a position to receive Macaulay's New Zealander in the becoming manner laid down by that author. If such a law were to come into force there would at once be a loss to every holder of American-made goods, both wholesale and retail of the amount of duty levied by the Canadian Government at the time they were imported. On the stock of such goods usually held in Canada, this would mean an immediate loss or depreciation of from twenty-five to thirty millions of dollars, an amount of money that would not only seriously affect our merchants, but seriously handicap them in their efforts to hold their own against American jobbers, whose cost on the same goods would be lower by the amount of duty paid by the Canadian importer.

Looked at from any point of view, politically or commercially, we think that the drawbacks against such a union by far outweigh any benefits that might incidentally accrue from it. We are getting on well enough at present if the professional politicians would only let us alone. The trouble is, however, that we have too many irresponsible political hacks, who care nothing whatever for the country so long as their own party holds the reigns of power, and nothing for their own party itself, save as it affords them a sure means of extorting from a long suffering people a living for which they never worked. If out of office, these people are always going about with some new cry in order to get a share of the loaves and fishes, or if their party is in office, are ready to take up any specious cry in order to keep themselves there.

The greatest danger, we think, that Canada has to fear, is from these irresponsible tinkerers, who care nothing whatever for the country so long as their own personal ends can be served. At the present time the leaders of both parties are in a state of unrest and fearful that their opponents may get hold of any cry that may carry them to victory at the next general elections. Both are trying to feel the public pulse without committing themselves to anything, and in consequence of this, the public mind has become somewhat unsettled. As far as Commercial Union is concerned, we would advise both parties to leave it severely alone, because it will surely be a millstone around the neck of any party making it a plank in their platform. What the country wants is not Commercial Union or any other patent political cure at all, but less politics and more honest expenditure of the public monies. Canada is altogether too much governed at present, and if about two-thirds of our professional politicians were to become producers instead of caterpillars on the leaf, the people who do work would not have so much cause for complaint. We may have more to say about this on some future occasion.

PLENTY OF AMETHYSTS.—A large vein of amethysts has been discovered in Silesia, while blasting a railroad through the porphynetic rock of the mountains. It is a very important find for the stone cutting establishments of Warmbrunn,

Correspondence.

Editor Trader:

SIR,—I read with a great deal of interest the letter of Mr. Beall in your last paper, and I think he is quite right in some respects, although I think he overestimates the damage done to the jewelers by wholesale houses selling goods to outside parties. For my own part while I know of several sales that I have lost through this cause, I have found as a general rule that when I had the goods in stock I always stood the best chance of making a sale. The sales I have lost were mostly for articles I did not keep in stock. I quite agree with Mr. Beall, however, that if jobbers would sell watches and jewellery exclusively to the jewellers it would pay them fully as well in the long run and it would make it easier for us retailers to pay our bills when they come due. The wholesalers are protected by the manufacturers and I hardly think they could in fairness refuse to protect us in the same manner. If they do, then I think the plan suggested by Mr. Beall should be tried, and only such wholesalers dealt with as would agree to protect the retailer. Hoping to find that some abler pen than mine has taken this matter up, I am

Yours etc.,

LONDON RETAIL JEWELER.

Sept. 7th, 1885.

To the Editor of THE TRADER:

DEAR SIR,—I see in your last issue a communication from Mr. Beall, regarding the evils that the retail trade have to contend with. If, as Mr. B. says, the watch and clock companies would join together to supply none but jobbers, and they in turn combine to sell to none but those carrying a stock of watches and jewelry, trade would assume a healthier tone. But in my opinion the matter rests chiefly in the hands of the retail dealers, for so long as they continue to assume an aspect of indifference, so long will the jobbers do so. But let the retail men combine and call upon the wholesale men to support them, and I believe every one of them will respond to all reasonable demands. All the leading factories of both movements and cases have agreed to have a uniform price for all jobbers, and should any one of the jobbers cut the prices they are struck off the jobbers' list and the manufacturers will not supply them with any more goods. The wholesale men will

(1) We manufacture no goods without our own Trade Marks.
(2) We stamp no goods of higher quality than they really are.
(3) We guarantee the quality of every case we make to be as stamped upon it.

acknowledge that they would not like the movement or case makers to supply retail dealers with say a half dozen or dozen movements or cases; then why should the retail dealers be willing that dry goods and druggists' clerks be allowed to buy a single watch or chain, or any other piece of jewelry, from them and forestall the regular retail dealer who is carrying a stock of goods.

As a case in point, I will give you an instance: A gentleman to whom I had sold a gold watch, some three or four years since, came to me about three months since to get a lady's gold watch. I had not one in to suit him, upon which he asked me if I would not go down with his wife to Toronto and pick one out for her, in the same manner I had done for him, which I agreed to do, and was expecting to be called upon to go to Toronto, but in the meantime the lady's brother, who is a druggist's clerk, got wind of it, and so I lost the sale.

Mr. Beall seems to think that it is impossible to remedy the evil. In my opinion, if the retail trade will combine together and show the wholesale men the wrong they are doing they will agree to remedy it, as it is no more than they obtain from the factories. In my opinion, the retail trade should have a uniform scale of prices, as the wholesale trade have, and if any one is known to sell below those prices, shut them off as dealers in American Watches, &c. The wholesale men will readily agree that this is the only way to bring the trade to a healthy basis, as the retailer and the wholesale dealer's interests are identical. The druggist is well protected, no one being allowed to sell drugs without he has a license. Some rabid free-trader may object to these measures. For my part I believe in free trade upon equitable terms; but when it is a discriminating measure, then I believe it to be wrong.

In conclusion, I would say let the retail dealers appoint a meeting in Toronto, and let them adopt some definite measures, and then call upon the wholesale dealers to assist them to carry out those measures, and I believe every man in the business will agree to carry them out, if they ask no more than what is fair and just. In fact, it is no more than what they have obtained from the manufacturers. Hoping to see other communications from abler pens than mine, I subscribe myself, Yours truly,

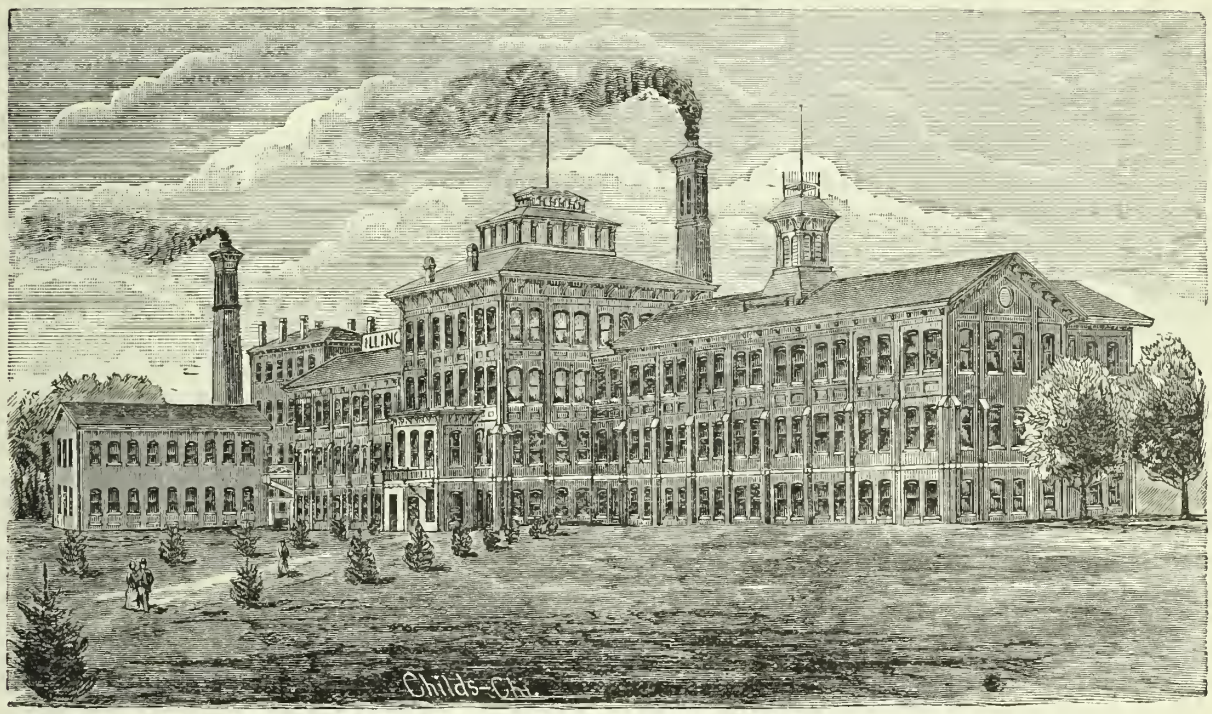
B. Richardson,

Aurora, Sept. 7, '85. Jeweler.

Selected Matter.

PROTECTION TO RETAIL DEALERS.

If the jewelry trade is ever to be restored to its legitimate channels, and be once more conducted according to ancient and venerated usages, the greatest amount of protection must be thrown around the retail dealer, in order that he may derive the greatest amount of benefit from the patronage that is to be found in his field, and that by right belongs to him. He it is who comes in direct contact with the consumer, and it is the proper medium through whom the manufacturer should dispose of his goods. But because retail dealers are too numerous and scattered over an extended area of country, the jobber comes in as an intermediary, taking the products of the manufacturers and distributing them to the retail dealers, each in his particular locality. For doing this the jobber is allowed certain privileges, chief among these being the privilege to buy goods at a price that will permit of his selling them again to the retail dealers at a profit. One of the crying evils in the trade for the past few years has been the fact that some jobbers have not been content with the patronage of the retail dealer, but have entered into competition with him in his own markets, selling his goods at retail to individuals at the same prices he would to the retail dealer. Of course, in such a competition, the legitimate dealer must go to the wall, for the jobber has a decided advantage over him in buying goods, and can afford to sell at prices that would be ruinous to the dealer, who has to pay a jobber's profit on all the goods he buys. The complaints against this pernicious practice have been numerous and loud of late years, till at last some attention has been paid to them.



The formation of the National Association of Jobbers in American watches is intended to afford protection to retail dealers to a certain extent, so far as movements and silver cases are concerned, but it does not go far enough. We have given an earnest and cordial endorsement to this association, and can therefore venture to offer a few suggestions to it without being regarded as presumptuous. The association has undertaken to indicate to the makers of movements and cases whom they may regard as jobbers, and accord to them jobbers' discounts. In making up their list, these jobbers have left out many persons whose chief business was that of a retail dealer, but who, through favoritism or some other cause, had been accorded jobbers' privileges. This made quite a reduction in the list of jobbers, but the association itself would have been considerably reduced if it had gone still further and compelled its own members to elect which they would be regarded in future, jobbers or retail dealers. There are those who claim to do a jobbing business exclusively, who represent to the retail dealers that they never sell goods to anyone at retail, yet who are found seeking the orders of individuals on the sly. Strangers can buy single articles from them at the same price the retailer has to pay for them by the quantity. They also sell to outsiders, whence comes the worst competition the retailer has to meet, thus fostering a rivalry that is unprofitable and disastrous to the legitimate retail trade. The jewelers of Canada have an organization somewhat similar to the one referred to, but one of the first requirements of membership is that the applicant shall elect which branch of his business he will pursue, that of a jobber or retail dealer. Both cannot be recognized in the same person. If such a rule were enforced here, there would either be a material reduction in the number of members of the association or of the number of retail dealers in the principal cities. The retail dealers of the country are entitled to protection at the hands of the Jobbers' Association, to prevent jobbers selling to their customers by retail at wholesale prices; but we do not understand that the association exacts from its members or the jobbers whom it recognizes, any pledge or agreement not to retail goods. It virtually says that retail dealers shall not be recognized as jobbers, but does not pledge the jobbers not to sell any goods at retail. If to the offence of retailing goods the jobber adds that of selling to outsiders, he contributes about all in his power to make the business of the retail dealers unprofitable, if not disastrous. When such practices have been permitted to prevail, it is not to be wondered at that every dealer in the country became ambitious to be recognized as a jobber. The Jobbers' Association claims be the friend of the retail dealers, and ambitious to protect them from illegitimate competition from every source. We would respectfully suggest that it would be well for the

ILLINOIS WATCH FACTORY,

—AT—

SPRINGFIELD, ILLINOIS, U. S. A.

CAPACITY 500 WATCHES PER DAY.

ESTABLISHED 1870.

All Movements have Patent Pinion, and all are Quick Train. All Stem Winders made to fit Hunting and Open Face Cases, the latter bringing the figure XII at the pendent.

Orders for Movements with special engraving in grades above I. W. Co., received in lots of five and upwards without extra charge.

Special attention is called to our I. W. Co., which is the **only** low-priced Movement in the market having all the following improvements :—

SUNK SECONDS DIAL, PATENT PINION, DUST BAND, QUICK TRAIN, EXPANSION BALANCE, TEMPERED HAIRSPRING.

OUR No. 5 IS THE CHEAPEST ADJUSTED, FULL JEWELLED, PATENT REGULATOR MOVEMENT MADE.

Our No. 150, Ladies' 8 size Watch is of superior finish, low-priced, and guaranteed

THE BEST CHEAP LADIES' WATCH EVER PRODUCED.

DONT FAIL TO SEE THIS PAGE NEXT MONTH.

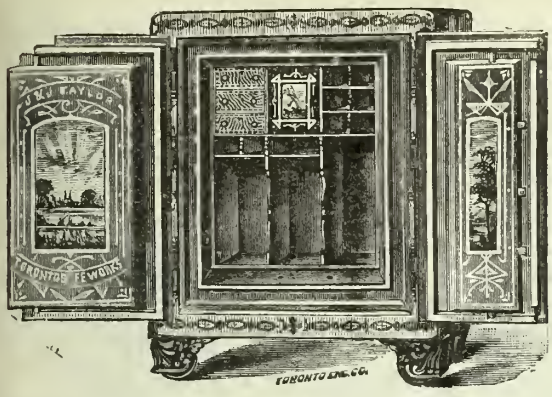
association to require all dealers, including its own members, to confine their transactions to one branch of the business. If they elect to be jobbers, require them to abandon the practice of selling goods at retail. If they prefer to conduct a retail business, then deny them jobbers' privileges and place them on an equal footing with other retail dealers. The association at present assumes to deal only with American watch movements and silver cases, but what we have here is applicable to the sale of jewelry of all kinds as well as to watches. Jobbers and retail dealers have distinct fields of operation, and it should not be possible for either to encroach on the other. Until the line of demarkation between them is recognized and observed by all interested, the complaints of unbusiness-like practices will continue to be made and the trade to suffer from a competition that is unfair, demoralizing and unprofitable. It is already alleged against the Jobbers' Association that it has made some unfair discriminations in preparing its list of jobbers for the guidance of movement and case makers, and it might well give the subject further consideration. The retail dealers are entitled to all the protection that can be provided for them, for theirs is an unenviable lot at best, and if they are forced to enter into competition with jobbers as well as outsiders, there is little hope of their being successful. They are expected to pay dollar for dollar of their indebtedness, yet the very class of men who are their creditors often force them into positions where they must make a sacrifice on every dollar's worth of goods they sell.—*Jewelers' Circular.*

HISTORY OF THE GREAT SOUTH AFRICAN DIAMOND MINES.

Among the "curiosities of commerce" none, perhaps, is more curious than that the major portion of the produce exported from South Africa is simply used for the adornment of ladies. Out of a total value exported of £7,500,000, ostrich feathers and diamonds account for £5,000,000. Twenty years ago all known diamonds had to come to Europe or the United States from immemorial Eastern stocks, or from the scanty produce of mines in Brazil and elsewhere, which were calculated to yield not more than £50,000 worth in the year. To-day, situated in the midst of a wide-stretching plain affording at all points a sea-line horizon of flat "veldt," we find this town of Kimberley, with a large European population of wealthy and well-to-do people and a large native population, earning every year more than £1,000,000 sterling in wages. And from this mining oasis in the agricultural desert has been sent in the last fifteen years something like £40,000,000 worth of diamonds in the rough, which, with the cost of cutting, setting, and selling, must have taken from the pockets of consumers something approaching £100,000,000.

As all the world knows, the South African diamond mines have their own story of unexpected discovery at the least as startling as that of any gold field or other rich mineral deposit in the world. In 1867 the first diamond was found, the favorite toy of a little Boer girl, which she had picked out from among the roots of an old tree. Its genuineness was not long in doubt, and in a few months the bed of the Vaal river was known as

A PROFITABLE DIAMOND REGION.



Prospecting became the rage, and here and there on the open, flat, grassy veldt diamonds were found in spots with common peculiarities of soil and so forth. In three years' time the secret of the diamond deposits had been so far fathomed as to prove that they were strange circular deposits, or patches, of peculiar earth isolated from one another and few in number. These were at once "rushed," and a regulation digging community took possession of the new district. Private individuals, previous proprietors, and Governments fought for the claim to these new mineral riches, but despite these squabbles the practical work was carried on of marking out these circular patches in diggers' claims over the flat surface. At first the rule was each digger for himself; and with pick and shovel diamonds were brought to grass in such profusion that the whole mining world was startled by a discovery exceeding in magnitude, real and prospective, any previous find. But, as men dug deeper in their claims, so they found it necessary to arrange and amalgamate with their neighbors; moreover, the deeper they went the more necessary for machinery to hoist the soil to the surface. And then, as they passed through the top "yellow," they came upon a blue soil which was yet more rich in diamonds. Suffice it to say, that in ten years' time each one of these greater circular areas had been so far emptied of soil as to represent great quarries 100 to 200 yards across and 300 or 400 feet deep. Early in the digging the geologist stepped in to point out that these circular basins were evidently a species of volcanic crater, hollowed out in the surface rock by subterranean action and filled up to the surface with

A BLUE DIAMONDIFEROUS MUD.

The walls of these basins are locally known as "the reefs," and in their greed to secure all they could, the older miners cut out all the "blue" right up to the reef. When, however, the cuttings got down deep the walls or reefs began to fall in, owing to the disintegrating action of boiling sun and heavy rain, covering up in their fall large areas of valuable blue. At first the digging was simple and cheap—the mere turning up and searching of loose soil; a second stage was reached when the soil had to be cut out and hauled up to the surface with the aid of machinery; a third stage brought the miners to a stiffened blue, which had not only to be brought to the surface, but then spread about and broken up by hand labor and exposure to the weather, and at the present moment all around the mines are to be seen literally miles of the "blue," laid out in shallow layers over the open veldt. With these more extended operations came more elaborate machinery for hoisting, for spreading on the "floors," and for sorting. Now, round each great basin or quarry is a circle of steam engines working wire rope lifts up and down to the bottom of the quarry; and round the brink run locomotives and trains of trucks whisking the "blue" so brought up away to be spread out like so much manure over the veldt, and to be taken thence, when duly disintegrated by the weather, broken up by hand, and harrowed and rolled, to the washing places, where it is all sent by hydraulic action through a series of rotatory sieves and pulsators on the principle of, in successive mechanical operations, washing away all dirt that is lighter than diamonds. The washers are so arranged that the outfall of each portion is

GRADUATED IN SIZE,

and falls on a series of sorting tables. At these stand five or six of the principal men—owners and directors of companies among them—spreading out the clean washed stuff graduated from the size of pebbles to that of sand; and the visitor may stand by in wonder to see the searcher at the one end pick out his eight

or ten "big" stones per hour, or assist the searcher at the other busily sorting out of the sand innumerable white specks of diamonds. The day's work, tumbled into small snuff-boxes, will frequently reach a local value of £1,000. None can fail to be struck on looking into one of these great mines or quarries that the whole of that great mass of earth and rock has been dug out, pulverized and searched for the diamonds it contains. One can look into a quarry of slates or stone and see the rocks themselves cut down and carted away for use; but in these quarries the soil and the rock are cut out and dug out, and what for? Simply that out of every 100 tons raised out of the quarry an ounce weight of diamonds may be secured. It is a startling and impressive thought in gazing into these great quarries that all that soil should have been dug out at a cost for labor alone of something like £15,000,000 and with the aid of invested capital of £1,000,000 in machinery, in order to distribute so many hundred weight of precious stones to decorate the ladies of civilized centres.

And now a fourth stage has been arrived at. As I have said these diggings have reached a depth of 300 feet to 400 feet, and the sides of the quarries have fallen in. The new problem is how to continue to dig out the blue which now lies practically beneath the reef. The consequence is that round these quarries regular mining shafts are being sunk, and the "blue" is to be be attacked by

UNDERGROUND WORK.

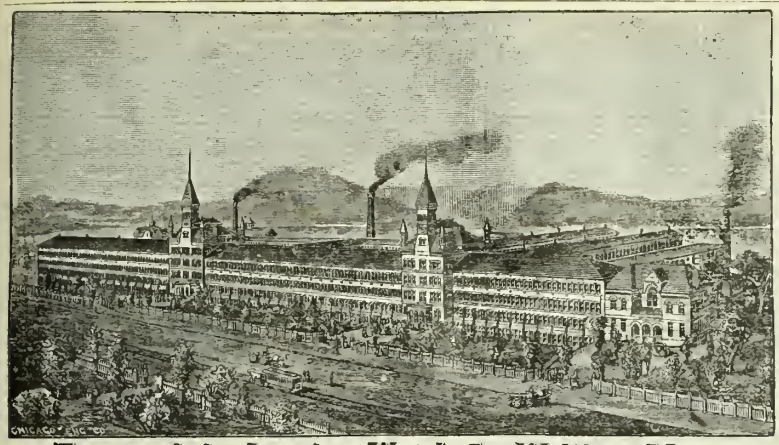
Good mining judges maintain that this is the wrong system, in as much as when the shaft is sunk no method of underground mining can secure and bring to grass any large proportion of the blue, which is not in veins but bulk. A truer system would be to terrace the reef sides and always work them as open mines or quarries. Thus, as years go by, the cost of getting out these diamonds increases steadily; but it also so happens that the price of diamonds has steadily and greatly fallen. The all-round price per carat has fallen from £3 to 15s. per carat. At this one cannot be surprised. Of old the world was content to receive each year an accession of new dug diamonds of about £50,000 in value on the average. But suddenly from South Africa comes a new supply, exceeding £4,000,000 worth each year for ten years. It is true that recently in Australia, North America, and other extra-European centres of European civilization, a new population has come into being, numbering over 70,000,000, the upper ten thousand of which are specially prone to diamond ornaments, and no doubt at the first there was a great void to be supplied. But now it would seem that the limit has been reached, and the market is overstocked, and the world as it stands thus supplied seems hardly likely to take more than £2,000,000 per annum. The fall in price has, however, already checked the output, as several of the smaller mining bodies and also those working the less profitable mines have ceased work. It seems probable also that even the larger mines will reduce operations in the face of the low prices, and then as the supply falls off so may prices again be expected to rise. A diamond is a pure and unmitigated luxury, and therefore there could be no complaint if those who hold the monopoly of the supply chose to restrict output in order to keep up prices. It seems not improbable that a policy of this type will shortly animate all the diamond diggers of this district.

BUT THIS FALL IN PRICE

is not only due to over production. It is estimated that 10 per cent. to 15 per cent. of the fall is due to the sale of stolen diamonds. These, of course, can be, and are sold at a very low price, as their cost of production usually means some trifling sum paid to a native laborer for what he can secrete on his person or by other means smuggle out of the mine. In the early days when each man worked for himself, there was no diamond stealing, but as it grew to be necessary to work on a larger scale and by the aid of hired labor, and as at the same time the process of operating afforded new opportunities for stealing, this crime grew to be one of the great curses of the industry. At present at every stage of the process laborers or employees come across diamonds. The men down in the mine, blasting and picking out the blue, frequently come upon the valued stones; and, as the "stuff" is handled at every stage, diamonds show themselves. The natives posted to empty the buckets coming up from the mine watch keenly for what may gleam in the process, and so does the engine driver or mule man who runs the laden trucks out to the floors. And on these floors the regular gangs, who unload and break it up, find many and large "stones;" and so right through the process, there is ample opportunity at every turn to pick up a stone which is sure to be worth pounds and may be worth thousands.

How to prevent or even to check this thieving has taxed the best energies of proprietors and police for many years past. Success has not yet appeared, for with every new appliance some new form of theft seems to come into being. There are endless means actually adopted. Swallowing the stones is quite common, and at one time the thief threw them

WRAPPED IN DOUGH TO DOGS,



which were killed and cut open by his confederates outside. Hiding them about the dress and pitching them away to be picked up at night are among the other means. From the commencement the method of collecting the stones has been rough and ready rather than careful and complete, and to the stranger there appears to be not only every chance but every temptation for employees to steal perpetually.

The evils of this diamond stealing are far-reaching. Foremost among them stand an unnatural lowering of prices. The possessor of the stolen stone has paid but little for it, and although he will naturally endeavor to realize as high a price as he can, he nevertheless greatly undersells the possessors of stones that have honestly paid all the expenses of production. It is estimated that every year from one-fifth to one-sixth of the stones exported are stolen, or, in other words, something like £500,000 worth of stolen diamonds leave the colony annually. At the diggings at first there was a not unnatural laxity in dealing with this new and prolific wealth, and the social soil was at the least congenial to the development of this laxity into customs little less than criminal. Now-a-days there is danger that this stealing, with its necessary complement the "illicit diamond buying," or "I. D. B. trade," as it is euphemistically known, may sap the morality of the community, and against this vigorous protest is now being made. Mr. Merriman, the most energetic of the ex-Ministers, spoke strongly on this matter not long ago to

A GREAT KIMBERLEY AUDIENCE,

which evidently endorsed all he said. He introduced the new view that this stealing is criminal—an offence against society:—

"What is euphemistically called the

NEW STYLES AND REDUCED PRICES FOR XMAS TRADE.

'I.D.B. trade' I prefer to call flagrant, open, undisguised theft: it is robbing the honest man of the fruits of his industry and demoralizing every one who comes in contact with it. * * * People may look at it as a light thing, but those who steal diamonds and shoot people carrying diamonds will by-and-bye come to shoot people carrying sovereigns. You feel the pinch of the I.D.B. trade from the standpoint of your material interests, but I look upon it in quite another way; I look upon it and upon the importance of stamping it out from a social point of view, because I am convinced that if it is allowed to go on unchecked—if the idea is allowed to get abroad that the Government of the country is indifferent to the matter—then I say the whole country gets demoralized, which is of a great deal more importance than your diamonds, important as they may be to you."

Those curious in such matters as the repression of crime will find a fruitful field of inquiry in the numerous measures that have been adopted or advocated for the repression of this diamond stealing. There have been complaints, inquiries, Parliamentary Commissions, and stringent Acts; and the endeavor has been made to check the evil in all its stages from the first picking up of the diamond to its final disposal or sale. There are those who advocate placing wire and goggle masks on those working in the mine so arranged that they cannot see the diamonds but only sufficiently to do their work. Others advocate walling in the mine, with its "floors" and washing houses, and camping within the enclosure all employees—only allowing them exit now and then and after close search. So far as legislation has interfered it ordains that no one may buy or sell a diamond

UNLESS DULY LICENSED,

allows no one to possess an uncut diamond without accounting for it, orders the registration of each diamond sold, and establishes special courts for the trial of all such cases. There has also been established an elaborate detective system and daily search of all employed in the mine. Others, again, prefer to trust to the introduction, so far as possible, of machinery in substitution for human labor; and in this direction there is, without doubt, great room for improvement in nearly every mine and every part of the process. The true remedy seems to be pushing on with each and every class of preventative measures. The Diamond Trade Act, however, only extends over the Province of Griqualand West. The consequence is that the thieves have only to convey the stolen stones across the Free State border or "run" them into the Cape Colony to escape all penalties of illicit diamond buying. It should surely be possible at once to stop this, and a new effort is to be made in the coming session of the Cape Parliament to get this Act extended to the whole of the Cape Colony, and to negotiate with the governments of the Free State and the Transvaal to pass similar ordinances.

The mine owners are willing to pay large sums to stop this illicit trade. One mine calculates it loses each year at present £100,000 in unnecessarily depreciated price, and £100,000 in value of

DIAMONDS STOLEN,

or a total loss of £200,000 in an output of £1,000,000, and there seems ground for hope that by vigorously adopting the measure above detailed this great evil may be successfully put an end to.

These diamonds are found in paying quantities in four or five out of fifty or more "dead mud volcanoes" scattered over this district. The nightmare of the industry is the dread that similar mines may exist elsewhere and possibly under better conditions of access and working. This would mean at once such a fall in price that Kimberley would be dethroned so far as diamond digging was concerned. A glance at the map will, however, show that Kimberley is in a most commanding position to become a central emporium of South African inland trade. This should give this energetic town a new lease of life even should diamonds fail. And this prospect of becoming a trade centre is on the point of realization, because the railway connecting it directly with the great ports of Algoa Bay and Cape Town will be completed within the year. Kimberley thus becomes a centre of distribution to the Free State, the Transvaal, and the African interior to the north. Situated on the central tableland, 4,000 feet above the sea, in a bright, clear, and fresh climate, Kimberley without doubt commands

THE BEST HIGH ROAD

for European commerce and civilization into the African interior. The recent proclamation of the Queen's authority up to the 22nd parallel of South latitude has given zest and confidence to those who are working here to open up for English trade this route, and this movement has been assisted by the rapid and pacific settlement of the Bechuanaland difficulty by Sir Charles Warren. Kimberley differs from most South African settlements in being an essentially English community. It is, therefore, most "Imperial" in tone, and warmly patriotic. It hopes the British Government will never swerve from the principle of retaining for English trade access to the interior along this central plateau, of which Kimberley, with its railway connection, is the key. The vigorous prosperity of this great English centre is having a most salutary influence on the political situation. It is a standing and undeniable protest against the hasty assumption of some in England that South Africa, after all, belongs mostly to the Boers, for we have proof here that energy and application can insure as brilliant success and progress in South Africa as in Australia or the States; and we have clear evidence that while the Boer element is receding in prosperity and power the English element increases rapidly in both. This comparative fact is the real basis on which the future settlement of South African difficulties depends, and one of the main incentives and causes of this growth of the English element has been the discovery in Griqualand West of diamonds in wholesale quantities.—*London Times.*

CLOCK MAKING IN THE BLACK FOREST.

[*From Report of the Royal Commission on Technical Education*]

By means of lotteries and further grants, the Gewerbe-Halle was erected and opened in 1874, and the school was transferred to the new building, and was re-constituted and formally opened in June, 1877. The Government grant for this purpose was £650. The school is managed by a local council chosen from the surrounding districts and consisting of eight persons. The annual budget is £360, of which sum the Province of Freiburg contributes £25 and Gillingen £50. The school is held in two small rooms, very ill-suited for the purpose, and a new building is in course of erection by the local Gewerbe-Verein (trade society) at a cost of from £1,250 to £1,500. There are at present eighteen pupils. Most of them are admitted free, and many are supported by exhibitions which are given by the neighboring towns and may

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

amount to £20 per annum. The school fee is £1 per annum. The students must have been previously engaged, for at least two years, in practical clock making before they can be admitted. The course lasts one year. In the morning they have theoretical studies consisting of geometry, arithmetic, algebra, physics, mechanics, technology of watch and clock making, geometrical drawing, projection, technical drawing, bookkeeping and commercial arithmetic, together with thirty hours practical work per week in the shops in the afternoon. The lathes and tools seem excellent of their kind, butthe accommodation was very cramped.

By far the most important manufacture of the Black Forest is that of small carved clocks, many of them with musical accompaniments, known as cuckoo clocks. In Triberg, and a group of small towns and villages surrounding it, known as the clock country, 13,500 people, the population of upwards of ninety parishes, are engaged in clock making. We went to Schoenach, a village in the hills above Triberg, where almost every cottage is the home of a clock maker. The houses are large and substantially built. They are generally a considerable distance apart and are surrounded with meadow land and pastures. In addition to the home workers there are three or four small factories in which the wheels and other parts of clocks (Uhrenbestendtheile) are made. In one of these, visited by us, there were about five or six workmen employed and an apprentice. The power was derived from a small overshot wheel. There was a wire cutting and straightening machine for preparing the pinions, some fine drills, a tooth cutting machine, a shaping machine for the wheel teeth and a small press for driving on the bosses, etc. The machinery was ingenious and well adapted for its purpose. The rough castings made in the village were excellent. We were told that the men working piece work in the factories could earn from two to three marks per diem, though a very small proportion of the working men can earn the latter sum. In a second factory we visited subsequently, the movements made here were being fitted together and made into clocks. Carpenters were making the rough framework to contain the wheels, and others were preparing the varnished outer cases. The clock passed from hand to hand, one man adding the winding barrel, another the train of wheels, a third the escapement, and another placing the works into the case. The clocks were being packed up for sale in another part of the works. They seemed all pretty much of one pattern, and of a very common description. The proprietor informed us that he had produced clocks of exactly the same kind as those that were made in the cottages. They went mainly to various parts of Europe. None now go to England or to America. The Americans not only supply themselves with cheap clocks, but they have driven out the Black Forest maker from the English market. The people employed at clock making live, we are told very poorly—mainly on potatoes—though we saw soup and meat in some of the cottages. The cottages are very large; some of them contain as many as twelve families. Many of the people have only one or two rooms and a bit of land, probably about twenty perches, for which they pay from ten to fourteen marks rent per month. An old gentleman mowing in a very wet meadow was pointed out to us as the Burgermeister of Schoenach. We went into several of the cottages and saw the people at the work. The women were polishing the clock cases and the men were making the wheel work. We were told here that an industrious worker at home could earn as much as a good workman in a factory. The water power is everywhere most ingeniously utilized, and the water itself is, as in many parts of England, employed for irrigation on the steep hillsides.

WHO IS THIS?

There have been a great many stories told of the reckless daring and abandon of the cowboy. He is an American production, and at the sound of the word cowboy the mind reverts to some Western locality where law and order are unknown and are supplied by a rude set of conventionalities, the non-observance of which means violence without process of trial. The typical cowboy must be fearless, ready to shoot at a moment's warning, wild in his make-up and language, and ready to perpetrate a joke on a "tenderfoot" at any time.

But there is often considerable braggadocio in the cowboy, and a good illustration of this fact was told a *Sentinel* reporter by a station agent who had lived in the West for many years, and who had been in the employ of various railroads in localities where cowboys were numerous.

"I have seen a good many daring deeds performed and coarse jokes perpetrated by cowboys," said the agent, "but I will tell you of a little incident where the wind was taken out of three cowboys by a determined, fearless 'tenderfoot.' It happened only last spring. I was then station agent and telegraph operator for the Northern Pacific Railroad Company at a place near the Montana line. It was not much of a place, as it consisted only of a depot, a house or two and a saloon.

"One morning a traveling man arrived at the depot by stage from up North somewhere. He had a small sample case and satchel. He was below the medium height and rather slight, but was very neatly dressed and wore a silk hat. He was traveling for a New York jewelry house. He was about an hour early for the train East, and he opened his grip on the platform, took out a brush and dusted his clothing and shoes. He then drew out an old newspaper, leaned up against the side of the depot with one foot projected in front of the other and began reading

"Meanwhile, however, three cowboys had sauntered up to the depot. They all eyed him closely and watched his operations. When he began reading they huddled together and talked awhile in an undertone. Presently one of them—a big six-footer—left the group and began to saunter carelessly about the platform with his head in the air, inspecting the posters on the building and the cornice When he got around where the traveling man stood, he lifted his big brogan and planted it firmly on the jewelry man's foot. No apology was made. The traveling man merely looked up, drew his foot back a moment, then placed it back where it was. The cowboy passed back to the other two. They all chuckled and joined in the low-toned conversation.

"Soon the cowboy started out again on a similar round, gaping at the roof. When he reached the traveling man he tried to bring down his coarse boot on the extended foot. The traveling man jerked his foot back suddenly, and the brogan came down with a thump on the platform. Another conference and chuckling followed. Finally the cowboy set out on the third round. Just as he was about to raise his foot to plant it on that

SOLE AGENTS for the celebrated Sargent Time and Combination Locks. These world-renowned Burglar-Proof *Back Shaft Combination Locks* are made with *Spindles*, having ENLARGED CENTRES, and cannot be either *driven in or drawn out.*

WE KEEP POSTED ON ALL IMPROVEMENTS AND TRY TO KEEP AHEAD OF THE TIMES.

Our Safes are made to PRESERVE THEIR CONTENTS not only from Fire and Burglars, but also from being destroyed by DAMPNESS, MUST and MOLD, and we have NEVER KNOWN OF ONE BECOMING DAMP INSIDE.

They are every one constructed on scientific principles, and are true to the purpose for which they are built.

We have on hand a large number of Safes, by other makers, that have been REPLACED by our own make, and are selling them at very low prices.

Orders can be filled immediately from our—

WAREROOMS—NO. 56 KING STREET WEST, TORONTO.

NEXT DOOR TO THE MAIL BUILDING.

GEO. F. BOSTWICK,

REPRESENTATIVE.

of the traveling man, the latter looked up quickly and said:

"'See here, there is my foot, and its going to stay there. You step on it if you want to, but I want to tell you that before you can get off of it I will kill you.'

"Such a volley staggered the cowboy. He looked at the foot and then at the small possessor, finally moving off without stepping on it.

"Another consultation followed. The traveling man calmly read his paper for a few minutes, and then took from his satchel three apples. He looked at them a moment, and suddenly threw them a few feet into the air, and then quickly drew a revolver, fired three shots, splitting each apple into a dozen pieces before they reached the ground. He replaced the cartridges in the empty chambers of the revolver and returned it to his pocket.

"The cowboys witnessed the act without saying a word, and soon, completely cowed, turned and left the depot. The traveling man told me, after they left, that he would have killed the three of them had the fellow stepped on his foot again, and I think he would, as he was quick as lightning. He then showed me a medal he carried which he won as being the most rapid and one of the best shots in New York. The story simply illustrates that there is sometimes a great deal of fictitious valor and daring about the cowboy."—*Milwaukee Sentinel.*

SPECIAL NOTICE.

Jewelers throughout Canada will oblige the Editor by sending in to this office for insertion in these notes any items of news pertaining to the Jewelry business that they think would be of interest to the Trade generally.

BUSINESS NOTES.

T. H. Harmer, jeweler, of Kingston, Ont., is reported to have disappeared from that city. The key of the store was found beneath the door.

It is Currently Reported that Mr. Eaves, wholesale jeweler of Montreal, was recently cheated out of some six thousand dollars by a couple of travellers he had in his employment.

We were pleased to receive a visit from Mr. Chas. Addison, jeweler, of Ottawa, Ont., last month. Mr. Addison was appointed one of the judges of the jewelry exhibits at the Toronto Industrial Exhibition—a good appointment we should say, as he is a practical jeweler who thoroughly understands the business from A to Z.

Boycotting a Manufacturer.—It is currently reported from the other side, that the Deuber Watch Case Company of Newport, Ky., having discharged 103 employees, for no other reason than that they are Knights of Labor, a general system of boycott has been begun by the K. of L. against the goods manufactured by that firm.

Where is Brother Knox?—Where is brother Knox now with his scheme to make every jeweler pass an examination before the Canadian Horological School, and allow only such as passed successfully to sell watches or jewelry. If brother Knox would produce a scheme from his pocket and get the Government to carry it through, the holders of diplomas from the C. H. S. would have a pudding. Now is your chance Mr. Knox.

Mr. E. Bulwer.—The general manager of the Simpson, Hall, Miller & Co., plate company in Canada, was in Toronto last month, having accompanied the Mayor and Aldermen of Montreal on their official visit to the Toronto Industrial Exhibition. Mr. Bulwer says business is first-class with them and that they have all the orders they can attend to. He paid "The Trader" a visit and proved to the satisfaction of the editor that the best business men in Montreal were not all dead yet. Come again, Mr. Bulwer.

Dissolution.—The firm of Hall & Fullerton, Barristers, &c., of this city, having lately been dissolved by mutual consent, Mr. W. M. Hall the senior member of the firm, has opened an office on his own account on King Street East, between the *World* and *Globe* printing offices. Mr. Hall is one of the most promising commercial lawyers in Canada, and having done a good deal of business for the jewelry trade during the last few years in a very satisfactory manner, we can safely recommend him to any of our friends wanting such service.

We are pleased to notice that our old friends, Messrs. C. N. Thorpe & Co., the well-known manufacturers of the "Boss Patent Gold Cases," were successful in carrying off the gold medal at the New Orleans Exposition for the best display of filled gold cases. The "Boss" case is one that any dealer can always swear by, and on account of its sterling qualities it is bound to remain a favorite with retail dealers who want to sell first-class goods. The "Boss" people keep this quality fully up to the standard and it pays them.

P. W. Ellis & Co. have, since moving into their new premises, issued a new watch price list in keeping with the building they are in. It is handsomely printed and indexed all through, and is one of the best price lists yet issued from Toronto. This firm have now got thoroughly settled down in their new warerooms and factory and are making things hum. They expect to be able to fill their customers' orders very promptly, owing to the increased facilities they now possess in the manufacturing line. We wish them continued success.

A Strong Testimonial.—One of the hottest fires ever experienced in Toronto was that of the glucose factory on the Esplanade a few weeks ago. The books, papers and valuables of the Company were deposited in one of J. & J. Taylor's fire-proof safes, and the manager of the Company, Mr. Robert Sutherland, is out with a card stating that although the fire through which it passed was probably as hot as Nebuchadnezzar's seven times heated furnace, yet the contents of the safe were taken out unharmed. This is a strong testimonial to the good workmanship and reliability of the J. & J. Taylor safes.

Death of an old Kingston Merchant.—We regret to learn of the death of Henry Skinner, Esq., of Kingston, at his residence in that city about a fortnight ago. Mr. Skinner was for many years one of the leading wholesale merchants of Kingston and his demise will be regretted by a large circle of acquaintances amongst the retail trade of Ontario. Mr. Skinner was a gentleman of sterling integrity and worth, and a good example of the success that sound business principles combined with honesty is sure to win.

A Mistake.—In our report of Messrs. P. W. Ellis & Co.'s factory in last month's issue, we made the mistake of saying that Mr. Thomas Ellis was the assistant manager of the factory This we find is an error, Mr. William Ellis being assistant manager, and Mr. Thomas Ellis one of the firm's most efficient travellers. We might remark, however, in self-defence that there are so many Ellises in the firm and they are all so good looking and so much alike that it is no wonder we get slightly mixed in speaking of them.

Taylor's Safes.—The safest exhibit at the Toronto Exhibition was that of J. & J. Taylor, the well-known safe manufacturers of this city, and fully justified the high reputation this firm have enjoyed for such a long term of years in this country. It is needless to say that they were a centre of attraction in the part of the building where they were situated, and that the beauty of their workmanship drew forth the highest encomiums from those who took the trouble to inspect it.

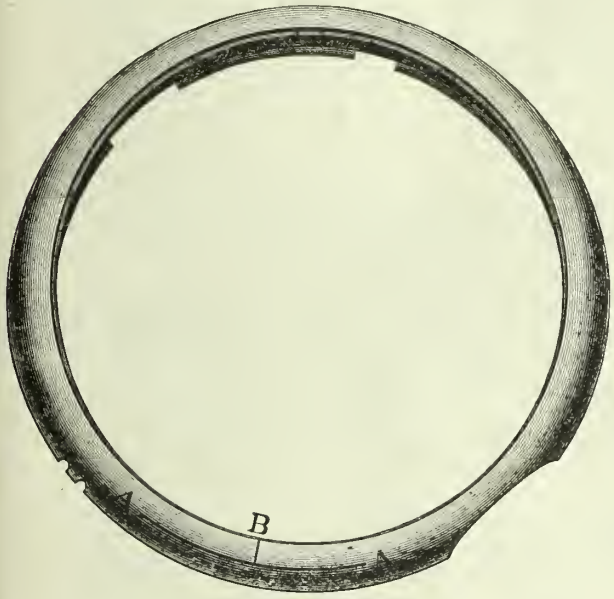
How are you Beverley?—In our last issue our printer, by some oversight, spelled the name of Mr. Beverley Heath with two instead of three e's. We are sure the typo had no intention of hurting Mr. Heath's feelings, and as he has apologized for the error in the handsomest manner, we have spared his life this time. Although Mr. Heath spells his name with three e's he don't charge anything extra for plated-ware on that account, and merchants wanting S. H. M. & Co. silverware can always be sure of courteous treatment by entrusting their orders to his care.

Who is Mr. Feeley?—We were asked the other day by a jeweler we happened to meet, and we gazed on the enquirer with blank amazement and wanted to know where he came from. When he afterward explained that he had just arrived from British Columbia and didn't know much about Canada, we began to believe he was in earnest in asking the question. The fact is that Mr. Feeley, the representative of the Meriden Britannia Company, has become so identified with the manufacture and sale of silverware that it's hard to think of electroplate without calling up a mental picture of the aforesaid Feeley and his genial grip-sack.

Talking about Price Lists just reminds us that Messrs. Goldie & McCulloch, the safe makers, have just issued what is probably the finest catalogue of safes ever published in America. This catalogue is profusely embel-

ONE OF THE GREATEST IMPROVEMENTS EVER MADE IN WATCH CASES.

An Adjustable Bezel for Hunting Cases !



THE FITTING OF GLASSES MADE EASY.

THE KEYSTONE FACTORIES STILL AT THE FORE.

The fitting of crystals in Hunting Cases has always been an annoyance. The great variation in sizes of glasses (for frequently at least three different sizes are found in one package, all numbered alike), defective edges, and difference in shape between the edge of glasses and groove in the bezel, all tend to make easy and proper adjustment a difficult task, and often the attempt costs more, in the breaking of glasses, than is received for the job.

Again, the groove in bezels is often of a size between glass sizes; consequently one size glass will be too small, the next too large, and the effort to fit them must end in an irritating failure.

To obviate these drawbacks is the province of the

KEYSTONE ADJUSTABLE BEZEL.

As will be seen in the above cut, the bezel is slitted vertically (B) and laterally (A) for a short distance in such a manner as to give it elasticity or spring without impairing its strength, but permitting the ready and effective insertion of crystals of different sizes, defective edges, or not perfectly round. To illustrate: An adjustable bezel for which a medium 19 11-16 glass is the correct one will not only take any glass in a package of 19 11-16, but it is also adapted to a 19 12-16 if required.

The arrangement which secures this very desirable result is so minute as to be comparatively invisible to the naked eye, and in no respect mars the uniformity of surface of the bezel. The liability of dust to work in upon the dial is no greater than with the ordinary bezel, as the lateral cut (A) is made below the top of the dial-plate.

The advantages of this great improvement are so plain, reducing to the smallest extent possible the danger incident to fitting glasses, that it is but reasonable to assume that

THE KEYSTONE ADJUSTABLE BEZEL

(the name of the great improvement) marks the introduction of an invention at once ingenious, practical, and exceptionally valuable.

This improved bezel is patented, and can only be obtained on Boss, Keystone and Leader cases, but without any advance in price.

THE KEYSTONE WATCH CASE FACTORIES:

19th and BROWN STREETS, PHILADELPHIA.

NEW YORK, 14 JOHN STREET. CHICAGO, 100 STATE STREET.

lished by extra fine wood engravings of the different styles of safes manufactured by them, and from it any merchant can form a very correct idea of the size style, fittings and finish of the goods they are intended to illustrate. This catalogue is a fine specimen of printing, and is creditable alike to the printer and the firm whose enterprise and integrity has brought their goods into the prominent position they now occupy in Canada.

A Ready Reckoner Free of Charge.—The new price list of Smith & Fudger is one of the handiest and most complete lists of American watches we have yet seen. The special feature of the compilation, however, is the "Ready Reference Table" on the back page, which, as the author modestly observes, is useful "For casing Waltham and Elgin 18-size movements in silver cases—Canadian and Imported." This list gives the retailer at once, and without error, the combined cost of any grade of Waltham or Elgin movement, and any weight and quality of silver case he may desire to combine with it. We are sure that the trade has only to see this table to appreciate its excellence and convenience.

Why they didn't Exhibit.—A great many jewelers have asked the manager of the American Watch Case Company why they did not have an exhibit at the Industrial Exhibition this year and expressed disappointment thereat. The fact is, the demand for their new gold cases is so great that they have been obliged to do their level best to fill orders, and had really no chance to get an exhibit ready. Their new cases are exquisitely finished, and the fact that the quality of every case bearing their stamp is guaranteed to be according to the U. S. mint assay, has made for the manufacturers of this Company a ready sale amongst those dealers who desire honest goods at the lowest price. The Company don't propose to take a back seat on fine gold cases.

Sensible to the Last.—A recent telegram from Washington says: "There is now a movement looking to the disposal of surplus 1 and 2 dollar bills of Canada in the United States, which had, previous to the silver agitation, depreciated to 85 cents. Now, however, they are received at par with the standard silver dollar of this country, and a great deal of this paper is in circulation." As the United States treasury is now completely choked up with American silver dollars, which they can't force into circulation unless at a very heavy discount, we may understand how kind our American cousins are to take our Dominion notes, which are payable on demand in gold, at a similar depreciation. A Canadian Government note is worth its face value in gold at any time, and the only fault we have ever heard of them at home is that they are not more plentiful.

"The Very Finest" exhibit of leather and plush jewelry cases of all kinds ever shown in Canada was that of Messrs. Hemming Bros. at the Toronto Industrial Exhibition. This assortment was, we consider, one of the attractions of the main building and reflected the highest credit upon the exhibitors. Canada should be proud of having such a factory as that of the Hemming Bros., and we think that by patronizing this firm our jewelers will not only be doing the "patriotic thing" but will get as fine and elegant goods as can be imported from abroad. When to this is added the incentive of much lower prices than are charged for similar goods of foreign manufacture, we do uot wonder that this enterprising firm has built up such a large industry. Merit, like blood, will tell.

Our Fighting Editor.—"Where is the fighting editor of The Trader?" asked an irate importer of Swiss watches of us the other day. We assured him that the gentleman he wanted was out of the city and his club might be put by for at least a month and then we gradually drew from him his grievance. It appears that he was mad because we said that the new Yankee 6 size movement was bound to make the Ladies' Swiss watch take a back seat. We thought so then and we think so still, although this good-looking representative of the leading Swiss industry assures us that the recent improvements in Swiss watches are so great that they will very soon have reserved seats with satin and velvet linings in every jewelry store in Canada. All we have to say is that the battle is not over yet, and in this as in any other struggle it is the survival of the fittest. "Give them the justice" and may the best watch win say we.

The Jewelers' Security Alliance.—Owing to the absence of American cracksmen since last spring but little has been heard of jewelers' safes being blown open and robbed. According to an old saying, "it is always the unexpected that happens," and now that our jewelers have lulled themselves into fancied security, we may expect to hear of burglaries somewhat more frequently than we have been doing of late. The Jewelers' Security Alliance is not a preventative from burglary, but it is the next best thing, for if a jeweler gets his safe burglarized it at once places the best detective talent that can be secured for money on the track of the burglar free of charge to the person robbed. The Alliance has now a good reserve fund on hand, all of which is available to hunt down the first burglar who has the presumption to rob the safe of one of its members. Their motto is "Protection or Punishment," and they propose to carry it out to the letter, and protect by making the burglar afraid of punishment.

Inspector Lash.—Almost every jeweler in Canada will remember "Beau" Lash, the once genial traveller for the old firm of J. G. Joseph & Co. After Mr. Lash left the jewelry business he went to the North-West and entered the mounted police, where his merits soon raised him to the position of Inspector and Indian Agent. Our readers will remember that when Riel made his stand at Batoche he held as hostages some score of prisoners whom he threatened to massacre if General Middleton did not withdraw his troops. The heroic charge of the volunteers spoiled his little game and the prisoners were rescued from the cellar where they had been confined for about two weeks; chief amongst them was Inspector Lash. Mr. Lash has been granted leave of absence and has visited his old home in Ontario in order to recuperate. When we saw him he was looking splendidly and receiving the heartiest kind of a welcome from his many friends in Toronto, who were delighted to see him alive and well. Mr. Lash says he don't want any more of that kind of experience.

The American Waltham Watch Co. were exhibitors at the New Orleans Exposition, and deservedly carried off the gold medal for the best exhibit of movements and gold cases. As showing how extensive is this Company's business, we may remark that at the same time they were competing for this medal at New Orleans, they were exhibiting at the International Inventions' Exhibition at London, England, a great many of their most intricate machines for making the material used in the construction of their watches. In addition to this eye-opener to English horologists, they also had on view a complete set of samples of the watches made by them, numbering in all some 2,500 different kinds. It is needless to say that the Waltham Co.'s exhibit was one of the principal features of the Exhibition, and that the comparison between theirs and the English method of watchmaking has started numerous criticisms on that branch of trade, which must eventually be compelled to go back on their old fogy ways and adopt methods more in keeping with the spirit of the age.

How we Progress—The following advertisement which speaks for itself appeared in one of the London (England) magazines in the year 1845, or forty years ago. If the gentleman who put this in could take a walk through some of the great American factories he would surely be compelled to admit that when he had attained as he thought to the perfection of watchmaking, he had still much to learn. The world still moves; this is an age of progress and if you don't move along with it you will get your heels trodden on :—

FLAT, PATENT LEVER WATCHES, London made, with the late improvement of placing the balance level with the other wheels of the watch, so as to render it flat for the waistcoat pocket, with the detached escapement, capped and jewelled in four holes, hand to mark the seconds, hard enamel dial, maintaining power to continue the action of the watch while winding, are offered in silver engine-turned cases, price six guineas each, or hunting cases six and a half guineas. An undertaking is given, with fixed terms, by which the watches will always receive attention. T. COX SAVORY & Co., Watchmakers, Jewellers, &c., 47 Cornhill (seven doors from Gracechurch Street, London).—N. B. Second-hand watches purchased in exchange.

WORKSHOP NOTES.

Balances.—A gold balance is preferable to a steel balance. The latter metal has the advantage of being less affected by alteration of temperature, but, on the other hand, gold is denser than steel and is not liable to rust or be magnetized.

Spring Temper to Brass.—A spring temper may be imparted to brass by drawing it through a wire plate. A small piece can be hardened by burnishing it hard. Soft pin tongues are sometimes stiffened by twisting the wire, but if carried too far it will crack or injure it.

Butting.—The tendency of pinion leaves to butt the wheel tooth when coming into contact is caused either by the bad shape of the teeth or the leaves, or by using a pinion of an improper size, or by the wheel and pinion being placed at an incorrect distance from each other.

The Functions of Oil Sinks.—Oil sinks are formed in watch and clock plates so that by

capillary attractions the oil is kept close to the pivot instead of spreading over the plate, and back slopes are formed on the arbors so that the oil may not be drawn all up the body of the arbor. The "attraction" is sometimes negative and becomes a repulsion, as is the case with mercury in a glass tube. It is still called capillarity, whether the fluid is raised above its natural level or depressed below it.

Flat Polish on Steel Works.—To polish such parts as rollers and collets, first get a flat surface by rubbing with fine emery on a glass plate or a bell metal block, and afterwards finish off on a zinc block with diamantine; but for levers you must use a long, flat bell. metal or zinc polisher, and press the lever into a piece of soft wood (willow is the best) in the vise, moving the polisher instead of the work. For large articles, such as indexes or repeater racks, which are not solid, and springs, it will be found best to wax them on to a small brass block and polish them underhand in the same manner as rollers.

Soldering—The functions of a flux is to cleanse the surfaces to be united, and various substances can be employed for this purpose, for instance, sal ammonia reduced to powder, and either stirred into a paste with sweet oil or simply dissolved in water. Again, sal ammonia and pulverized resin are made into a paste with water or oil. Resin alone will answer for soft soldering copper or brass. Another agent is Venice turpentine, which has the advantage of not causing steel to rust, although it is disagreeable, because it makes the objects sticky, and they must, after soldering, be rinsed in alcohol or turpentine.

Artificial Safety Lamp.—The use of the ordinary lamp or of matches should never be used in dangerous places for obvious reasons, and the watchmen of the city of Paris have resorted to the following contrivance, which is at once very convenient and quite safe: A small piece of phosphorus of about the size of a pea is put into a very clear glass bottle, which is then filled about one-third with boiling olive oil, after which it is corked tightly. When the light is to be used uncork the bottle for an instant, then re-cork tightly, and a light equal to that furnished by a lamp will issue from the bottle. When it becomes dim, uncork the bottle for a short time so as to admit fresh air.

Silver-Aluminium Alloys.— Aluminium and silver make handsome white alloys, which compared with those from pure aluminium, are much harder, in consequence of which they take a much higher polish, and at the same time they are preferable to the silver-copper alloys for the reason that they are unchangeable in air and retain their white colour. It has been proposed, therefore, no longer to alloy the world's coin with copper, but with aluminium, which makes them far more durable, and even after a long-continued use they retain their white colour. Experiments on a vast scale were for this purpose instituted in European countries, but for some reason or other it appears that the silver-copper alloys were retained. According to the quantities of aluminium added, the alloy possesses very varying physical characteristics. An alloy consisting of 100 parts aluminium and 5 parts silver, differs but little from the pure aluminium, yet it is far harder and assumes a higher polish. An alloy consisting of 169 parts aluminium and 5 parts silver possesses a very remarkable degree of elasticity, and has therefore been recommended for the manufacture of balance springs for watches and dessert knives. An alloy composed of equal parts of aluminium and silver, rivals bronze in hardness.

OTHER NOTES.

New Metal.—Professor Websky has proposed the name of Idunium for the metal discovered by him. He found it to be one of the constituents of lead vanadiate; the mineral is rather scarce, of a yellow color, and contains several other metals, especially zinc, iron and arsenic.

Universal Time.—It appears that the Greenwich Observatory intends to make the first move toward introducing universal time, having set the astronomical clock, which sends out the time signals, to mark the beginning of the day at midnight, and not, as customary hitherto, at noon. The dial is divided into 24 hours.

A Rare Occurrence.—Some time ago a violent storm tore off the large hand of the steeple clock at Altona, Germany, and hurled it more than 100 yards, when finally it lodged, point down, in the roof of a house. The clock is about being superannuated, and proceedings were on foot for placing in a new one. The old hand, doubtless, became impatient at the tardy action of humanity, to several generations of which it had pointed out their time between the cradle and the grave, and hence its unseemly haste in desiring to be relieved.

A Giant Diamond.—A very large diamond was about a year ago found by a boer in the territory of the Orange Republic. He kept it hidden for about a year, under the well grounded fear that miners might kill him and steal it. A diamond trader was finally lucky enough to see it, and he persuaded the owner to put it on the market. The stone appears to be a second edition of the Star of South Africa, at present owned by Lord Dudlay. It was finally purchased by a syndicate, formed of the most important diamond traders of London and Paris. It weighs 487 karats, and when ground will be reduced to about 225 karats, being heavier by 89 karats than the Regent.

A Princess as Goldsmith.—A goldsmith shop was lately established and opened with great pomp and circumstance at the Austrian bathing place, Meran, and the neighborhood is at present daily thronged with carriages, bearing thither the nobility of the place. The Archduchess, Maria Theresa, belonging to the Austrian imperial family, has taken the fancy to learn the art of goldsmithing; she sits at the bench with her apron on like any other apprentice, learns the manipulation of the file, blowpipe, etc., much to the astonishment of said nobility, who watch her eagerly. But whether, as youngest apprentice, she has to sweep the shop, fetch water and run errands, we are not informed.

Editorial.

THE OUTLOOK.

The present indications are that better times have come again, and unless no unforeseen reverse occurs, they have come to stay. The lessons of the past two years will, we think, hardly be thrown away upon our merchants, and if they profit by them as they ought, they may look to the future as likely to bring them considerably more profit and solid comfort than the past two years have done. Most of them have learned to keep their business well in hand and live within their means—two very important lessons in any kind of business or times. While we do not expect any great boom in business, we certainly look forward to a good deal of solid prosperity. The money which capitalists have for some time past kept locked up will once more be put into circulation, and soon every artery of commerce will feel the vigor of its pulsations, and be benefited therefrom. Idle capital is about as useless to commerce as so much pig iron; but, put into circulation, it infuses life into every branch of industry it touches. In order to get capitalists to invest, they must have confidence in the prospects of trade, and from the present outlook we should say that it will soon be pretty fully employed.

The mercantile failures in the Dominion of Canada for the quarter ending September 30, as reported by R. G. Dun & Co., were 254, compared with 227 for the corresponding quarter of 1884. The liabilities were $1,911,000, while the liabilities for the corresponding quarter of 1884 were $4,112,000. For the first nine months of 1885 the total failures number 944, as compared with 979 for the first nine months of 1884. The liabilities amount, for first nine months of 1885, to a trifle over seven millions, compared with $14,855,000 in the same period last year.

From the above it will be seen that for the nine months of the present year already passed, the failures in this country are 35 less in number and about $7,000,000 less in amount than for the same period of 1884. These facts speak for themselves, and are strong arguments in support of the "better times" theory.

The reports from all quarters of the country indicate larger sales and better collections than at this time last year. In the light of these things we would advise our readers to prepare to take advantage of the improvement, and where possible to keep a stock commensurate with the wants of the part of the country they live in. While caution, like speculation, may be carried to extremes, we trust that our readers may strike the happy medium.

TRIBUNALS OF COMMERCE.

We reprint in another column an article by Mr. W. H. Howland, and published in the columns of our esteemed contemporary, *The Merchant*, of this city. Anything from Mr. Howland's pen is usually well worth perusing, but in this article on "The Tribunals of Commerce," he has opened up a vein which, if properly worked, would produce almost wonderful results to the entire mercantile community of this country. It is hard to estimate the vast amount of good, solid cash that is annually wasted by merchants in Canada on the worthless opinions of pettyfogging lawyers. In nine-tenths of the cases where law is resorted to, to settle disputes, one side or the other has been so badly advised as to be morally certain of defeat from the outset. No matter how poor his opinion may be about his client's case, or whether his client wins or loses, the lawyer is level-headed enough to collect his bill of costs, which most people who have been through his hands are ready to aver, is always out of proportion to the quality of the advice received or the services rendered by him. The lawyer risks nothing except his time and the wear and tear of his valuable brains, and mainly on the strength of his advice people go to law. In every case that comes before the courts one side is bound to lose, therefore certainly one-half of the advice tendered by lawyers to their clients and on the strength of which they went to law was worthless. If the law allowed the merchant to pay for this worthless advice in worthless coin, they would be square, but the lawyer, no matter how poor his advice may have been, wants his pay in standard coin of the realm at the rate of one hundred cents to the dollar.

Could a law be placed upon the statute books, prohibiting the lawyer from charging for his services where it could be proved that the action was entered because of his advice and was unsuccessful, it seems to us that a great deal of the present pressure upon the time of our courts would be removed, and that not one-half of the suits we now read about would ever get into court. The difference would then be, that the lawyer would have the practical standard of success to be measured by, and if he failed to come up to its requirements, he would be minus his fees. We imagine the effect would be that he would deter his clients from going to law unless he himself was sure of their success; as it is, he usually advises them to go in anyway, knowing that he is all right whether they are or not. The lawyer's opinion and advice are what he has to sell, and are as much merchandise as the merchant's goods. If the merchant sells the lawyer an article and it does not turn out as represented, the latter naturally wants it made good. If, however, as is often the case, the lawyer sells the merchant his opinion and his services, and they turn out worthless, he declines to be judged by the same standard. We do not think this is fair, and, as we said before, its tendency is to induce a large amount of unnecessary litigation, which would never occur except to further the ends of an overplus of second-rate lawyers. Of course there are some honorable exceptions to these strictures, but we are sorry to say they are the exception rather than the rule.

For these reasons, we hail with delight any measure such as the one advocated by Mr. Howland, which will bring business common sense into the settlement

of disputes instead of so much expensive legal wrangling. Shorn of its exuberant verbiage, law is common sense, and in ninety-nine cases out of one hundred it will be found that, in any ordinary mercantile case, a plain statement of facts to an arbitration of three business men will almost invariably bring forth a common sense or legal verdict.

This subject is well worth thinking about, and the more our merchants think about it, we are convinced, the more readily will they acknowledge that it possesses very decided advantages over the present tedious, cumbersome and expensive method of settling disputes.

PROTECTION TO RETAILERS.

In connection with this subject the following, from the Secretary of the Watch Manufacturers' Association of the United States, has been handed us for publication, the contents of which speak for themselves :

NEW YORK, Sept. 2nd, 1885.

Geo. Chillas, Sec'y,
Toronto, Canada.

DEAR SIR,—At a meeting of the Joint Executive Committee held this morning, the following resolution was adopted :

"Resolved, that this Committee rule that no member of the Canadian Association of Jobbers shall retail American Watches, and it is further understood that this resolution shall apply to all members previously accepted, and that a copy of this resolution be forwarded to the Secretary of your Association.

"It is further understood that the above resolution be accepted as a basis for the acceptance of future applicants."

Yours respectfully,
(Signed) E. J. SCOFIELD,
Secretary.

This action of the United States Watch Manufacturers, it appears to us, is simply a confirmation of the action of the Canadian Jobbers themselves, who, some months ago, decided that members of their Association should be either wholly wholesale or retail. The action of the United States Watch Manufacturers' Association will strengthen the hands of the Canadian Association considerably.

As it may be of interest to the retail trade to know what firms compose the Canadian Jobbers' Association in American Watches, we publish below the full list of officers and members :

MONTHLY STATEMENTS.

We have had our attention called to the matter of Monthly Statements by one of the largest houses in the jewelry trade, with a request that we would give our views upon it if we considered the matter of sufficient importance. As a great deal of misapprehension exists regarding these statements of account, it may not be out of place for us to suggest to some of the readers of THE TRADER, that they should be looked upon in the light of business friends instead of business irritants. As far as our experience goes we look upon Monthly Statements as a business necessity, which, when properly understood and acted upon, in a very great measure prevent or at least help to unravel those snarls in accounts that are liable to occur even in the best regulated business. Writing upon this very subject one of ourAmerican exchanges editorially gets off the following very pertinent observations, which are so much in tune with our own ideas upon this subject that we insert them in full and give them our heartiest endorsement :

"Many regard them in the light of dunning letters, and take offence at the regularity with which they put in their appearance, while others look upon them as invoices, and pay no attention to them. From time immemorial it has been a custom in commercial circles for creditors to send monthly statements of their accounts to their debtors. These are not, necessarily, in the nature of a reminder of existing indebtedness, but are more frequently mere memorandums, to enable the debtor to make comparisons between his own books of account and those of his creditors. Suppose a buyer comes to the city in the latter part of August and buys a bill of goods; they are sent to him with an invoice ; errors may be made in charging up the goods ; they may not reach their destination ; or any one of a hundred things may occur to make a difference in the account between the debtor and creditor ; on the first of September the creditor sends to his debtor a statement of his account to date ; it cannot be considered a demand for payment, for the goods were purchased on four months' time ; it cannot be a duplicate invoice, for it may include items that had been purchased and delivered months before, or that the purchaser took with him. It is simply and solely what it professes to be—a statement of account as shown by the books of the creditor. The debtor is expected to compare it promptly with his own books, and if any discrepancies are discovered, to send notice thereof forthwith ; if goods are charged that were not ordered, or if others were bought that were not sent, the statement should reveal the errors and lead to their immediate correction. Suppose the man who purchased goods in August on four months' time makes other purchases in September ; on the first of October he will receive another monthly statement, which will include both his August and September purchases, and every time he buys goods he will find his invoices supplemented by the monthly statement, showing the condition of his account. The primary object of the monthly statement is to facilitate the correction of mistakes, and, in case of the miscarriage of goods, to enable them to be traced. In the multitude of packages sent out by manufacturers and jobbers, there are unavoidablo mistakes made in packing, addressing, or entering on the books, and if monthly statements received from those to whom they are sent that degree of attention they should, these mistakes would be detected before the lapse of time

About Trade Marks.

Perhaps nothing in the whole category of mercantile pursuits has been more abused than the use of trade marks. A trade mark, to be of any value, must be a guarantee of quality, and is worth more to the manufacturer owning it than to any one else. If a manufacturer has a right to use a certain trade mark and the public learn that this mark is never put upon inferior goods and that they are quite safe in buying anything bearing it, such a trade mark very soon becomes a valuable property to the owner. On the other hand if a manufacturer does not care about his reputation and is willing to put his trade mark upon goods of debased quality he very soon finds out that people are not so gullable as he imagined, and that his goods are appraised at their real value. On account of the low price of "stamped up" goods they may sell for a while, but as soon as their inferiority is detected they have no market value, simply because no one has any confidence in them. The best and only guarantee that the consumer can have is the integrity of the manufacturer. If he is honest and conscientious in the use of his trade marks they very soon become a standing guarantee of quality, that give his goods a fixed standard of value. On the other hand nothing is more demoralizing to the trade than the "stamping up" policy so often resorted to by unscrupulous manufacturers and dealers. Such goods have no bottom price and every cut has simply to be met by a corresponding depreciation of quality. In no branch of manufacture is this practice more resorted to than in that of gold jewelry and watch cases.

A good story is told of an American (of course no Canadian would think of doing such a thing) retail dealer, more sharp than honest, who got an order from a customer for a watch, the case of which was to be 60 dwt. 18 kt. gold. This enterprising dealer conceived the idea that he could get it made 16 k and stamped 18 k, and thus make an extra profit on the transaction, and he therefore ordered a 16 stamped 18 k case from the wholesale men with whom he usually dealt. The wholesaler, however, was of the same mind as his customer as to the advantage in the way of extra profit that was to be obtained from the "stamping up" business, so he quietly ordered it from the manufacturer to be made of 14 k gold and stamped 18 k. Now the manufacturer from whom this case was ordered was more knave than fool, and although he was in the habit of making "stamped up" cases for the trade, such cases never bore his own trade mark. He therefore, seeing a chance for extra profit went them both one better, and the result was that the consumer, although he paid for good honest 18 k gold, got only a 12 k case stamped 18 k for his money. When he afterwards came to find out, as he very speedily did, that he had been victimized, he had the case tested, and the retail jeweler was forced to refund him his money. There was a kick all around. The customer suspected that the retailer was a rogue and refused to have anything more to do with him, although the latter swore by all the powers that he had ordered the case of full quality and trusted implicitly to the wholesaler of whom he usually dealt. The retailer then accused the wholesale merchant of deceit, who, like himself, denied the charge and saddled the entire blame on the poor manufacturer. The upshot of the whole concern was, that each party in the transaction thought the one of whom he had bought had cheated him and was therefore unworthy of future confidence or trade.

This incident illustrates very forcibly the danger of selling "stamped up" goods, even at a good profit. As a rule however, such goods are sold lower than standard goods and the seller is not able to make any larger percentage of profit than he could by handling honest goods at honest prices. Whether the profit be high or low, such a practice is bound eventually to ruin any respectable business.

For these and similar reasons, the American Watch Case Company, of Toronto, determined when they commenced business that they would make their trade mark, (as illustrated above) an absolute guarantee of quality, so that any customer could put as much reliance in gold cases bearing it as though stamped with the Hall mark of England. They therefore laid down the following rules for their guidance in this matter : (1). To manufacture no goods without their own trade marks. (2). To stamp no goods of higher quality than they really are. (3). To guarantee the quality of every case they made to be as stamped upon it.

These rules they have faithfully carried out, and dealers and the public can, therefore, buy goods of their manufacture with the full assurance that they are getting the quality represented and no other. This Company aims at making their trade mark the synonym of undeviating quality and stand always ready to fully carry out the terms of their guarantee. Although they sell no goods direct to the retail trade, they can be procured at catalogue prices from any of the leading jobbers in Canada.

made them undiscoverable. A case in point: A dealer in the far west bought a bill of goods some time ago of a jobber in this city, on four months' time; they were duly forwarded with the invoice; on the first of the following month the monthly statement was sent, which, on being received, was mistaken for an invoice and filed away; at the end of the four months another statement was sent, with a reminder that payment was due. Then the purchaser replied that he had never received the goods. Although so much time had elapsed, the railroad company sent out a "tracer," but no clue to the missing packages could be found. Finally, after the lapse of fifteen months, the railroad company very reluctantly concluded to pay for the goods, not because they were convinced that they were responsible for the loss, but simply because they could find no record of delivery. Had the purchaser, on receipt of the first monthly statement, notified the seller that the goods had not arrived, they could probably have been traced, and much trouble and annoyance saved. In another case, a dealer took offence at being served with a monthly statement, regarding it as a dun, and withdrew his patronage from the house sending it. He could not be convinced that it was a harmless document, but insisted that it was evidence of a lack of confidence in his ability or willingness to pay.

In these days of many transactions, and divided responsibility regarding them, it is essential that every possible safeguard should be thrown around both buyer and seller. The buyer comes to the city, is waited on by a salesman, and makes his selections; his order is turned over to another person, who makes up the packages; all the items must be entered in the books, and finally the package sealed, directed, and delivered to the express company. Suppose John Smith, of Pontiac, to be the buyer; there are three or four other John Smiths on the books of the seller, located in different places. In the rush of business the goods may be charged to John Smith, of Pontiac, but sent to John Smith, Dowagiac, or the wrong Smith may be charged with the goods. If these gentlemen, when they receive their monthly statements, would promptly call attention to the errors, they would be as promptly rectified; but if they are permitted to pass unchallenged, there is likely to be trouble growing out of future settlements. Business men cannot be too methodical in their methods, and there is nothing like promptness and care in all matters to beget long friendships. Dealers living in the country, where everything moves slower than in the city, are not apt to attach that degree of importance to little things that men do who are obliged to move with rapidity. In the cities all things are done with a business-like snap, and he who fails to keep pace with the great car of our commercial Juggernaut is liable to be crushed under its wheels. If our country brethren would but pay a little more attention to these small matters—such as providing for their notes at maturity, acknowledging the receipt of goods, invoices, and other business transactions—they would save themselves and others much unnecessary annoyance."

Correspondence.

Editor TRADER.

SIR,—The letter from Mr. Beale in your issue of September, has well served his purpose in promoting an active discussion of the great question of "Protection" as applied to the watchmakers (?) and jewelers in the retail trade in Canada.

Now, as neither a wholesale nor a retail dealer, but as an humble member of that fraternity known as "Commercial Travellers," I ask the question, What, in this country, constitutes a watchmaker and jeweller, and how am I to be guided in placing goods for my firm so that none may handle the wares but those who are legitimately entitled to do so? Cannot any man buy a watch sign, hang it in front of a store, put up the sign, "Watchmaker and Jeweller," install himself therein, and so qualify himself for admission into the ancient and honorable order of W. & J.? Now, Mr. Editor, it might be well before details are gone into, that general principles should first be laid down, and I submit that before any remedial legislation be passed, it is necessary to determine who desires it and for whose benefit it is required. Mr. Beale is quite as much a stationer as a jeweler or watchmaker, and his brother stationers in Lindsay consider that he is a great deal more so. It occurs to me that until some standard of qualification be adopted, the present state of affairs will continue. It is eminently in the interest of those who are really tradesmen, that they should be protected, and the wholesale trade would be as ready to assist in the work as the retailers are anxious to have it promoted. But what *the watchmakers, and jewellers* and the public generally require most urgently, is "protection" against the watch butchers who infest the land.

More anon,

PROTECTION.

Selected Matter.

CHARGE OF THE JEWELERS' BRIGADE.

[The author of the following spirited poem is unknown, but any luckless Canadian Jobber that ever had the misfortune to get into their clutches, will recognize the truthfulness of the poet's description.]

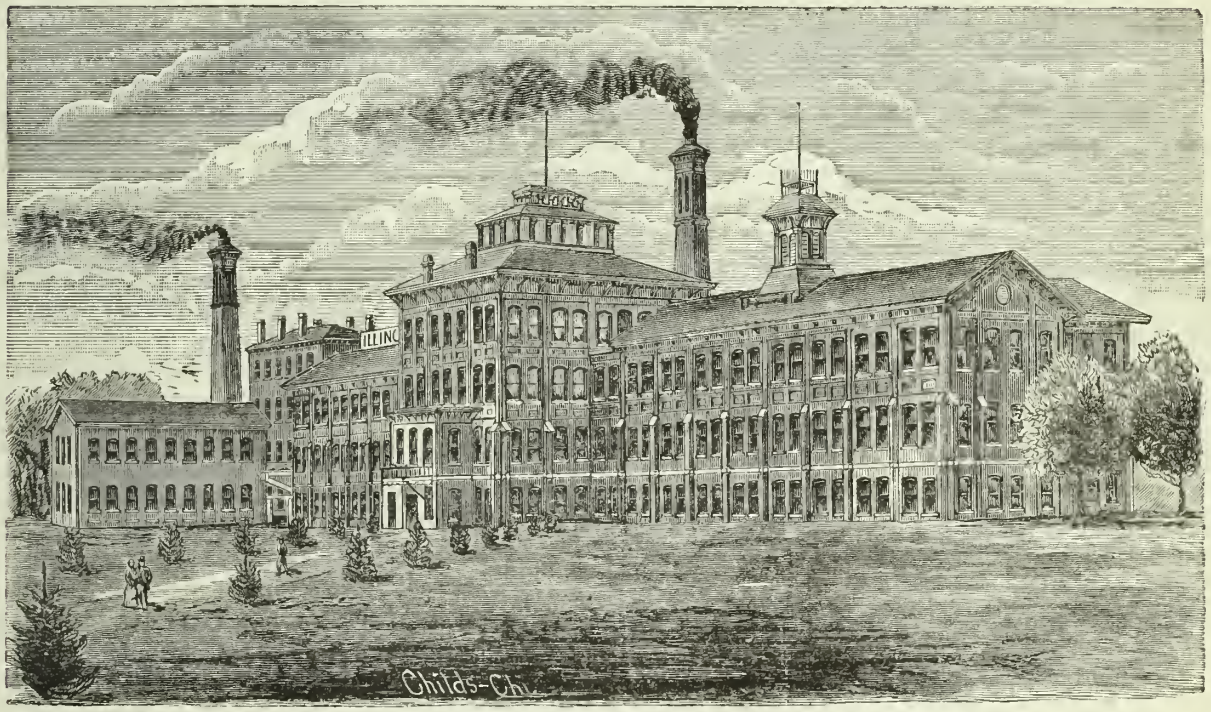
Boxes to right of them,
Boxes to left of them,
Boxes in front of them,
All checked and numbered!
Forward they came pell-mell,
Boldly they strode and well;
Into the Astor House,
Into the great hotel,
Strode the one hundred.

Flashed all their eyes with pride,
Rushed through the entrance wide,
Bearing their box at side,
Pushed through the porters, while
All the world wondered.
Plunged through tobacco-smoke,
Into the lobby broke
Looking for jobbers!
Stopped not to laugh or joke,
Not a man blundered—
Grasped for the register,
All the one hundred.

O, the wild charge they made!
All the world wondered.
O, the large lines displayed!
O, the new styles arrayed!
Onward and undismayed
Struck the one hundred.

Boxes to right of them,
Boxes to left of them,
Boxes behind them,
All checked and numbered.
Back home with beaming looks,
Clasping their order books.
Back home to do and dine,
Back by the Providence line,
Came the one hundred.

EMINENT GOLDSMITHS.



At the time of Aristophanes (about B. C. 410), there lived a Corinthian who appears to have worked in clay as well as gold and silver. His name was Thericles, and a certain very popular form of cup called Thericlean was named after him as the designer. The cup was made of black earthen ware, wood, and wood overlaid with gold. It was a kind of deep chalice, bulging slightly at the sides

ILLINOIS WATCH FACTORY,

—AT—

SPRINGFIELD, ILLINOIS, U. S. A.

CAPACITY 500 WATCHES PER DAY.

ESTABLISHED 1870.

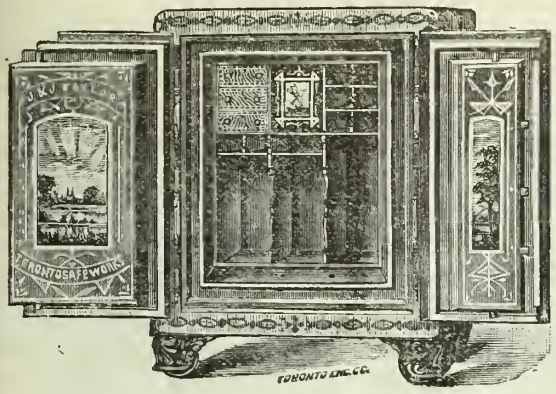
THE BEST CHEAP LADIES' WATCH EVER PRODUCED.

For full information please consult our advertisement in last July's issue of THE TRADER.

DONT FAIL TO SEE THIS PAGE NEXT MONTH.

and with two handles. When made of gold or silver it was usually decorated with various paintings, with sometimes a simple wreath of ivy just below the golden rim, and occasionally covered with representations of animals.



Naucydes was a very eminent Greek sculptor, and one of the most important artists between Alcamenes and Praxiteles. He was a native of Argos, son of Mothon, and master of the younger Polycletus of Argos. His period was about B. C. 396. Pausanius speaks of six works from his hand, *i. e.*: A statue of Hebe, in gold and ivory, a bronze statue of Hecate at Argos, and four representations in bronze of victors at the Olympian games (one each of Eucles and Bacis, and two of Chimon, the latter judged by Pausanius as excelling all his other works). Pliny enumerates a Mercury, a man sacrificing a ram and a Discobolus. As with most of the Grecian artists, Naucydes practiced goldsmithing as an accessory to his statuary, the former being overshadowed and the latter winning for him a place on the scroll of fame.

At about B. C. 360 there burst upon the world of Greek art, an artist whose birthplace is now unknown, but whose genius created a new and very important school. In the long list of Grecian artists the name of Praxiteles stands second to none except perhaps Phidias. The themes of the latter were grand and sublime, but those of Praxiteles were delicate and beautiful. Whatever that in nature was gentle, tender and lovely, served as an inspiration for Praxiteles and revealed themselves in his works with a soft delicacy inexpressibly charming. Consequently his subjects were mostly in the forms of women and children. Among his works in bronze was a Bacchus, a Satyr, a Matron weeping, a courtesan laughing (and supposed to be a portrait of the celebrated Thespian courtesan Phryne), and the finest of all his bronze works, Apollo Sauroctonos. (" Lizard Killer,") There is an authentic marble copy of this last in the Vatican at Rome. In marble his most famous work was the Cnidian Venus. The artist made two statues in marble of this goddess, offering both for sale. One of these was draped, and for this reason was chosen by the people of Cos, who had the choice. This decision was not actuated by any sentiments of modesty, for it is most probable that the drapery, while seemingly designed to hide the person, really exposed it to view. The inhabitants of Cos were skilled in the manufacture of the *Coæ vestes*, or garments of transparent silk, that, while covering the body, hid nothing from sight, and possibly the drapery of the Venus which they chose might have commended itself to them on this account. The other statue of Venus, entirely nude, was purchased by the Cnidians, and its possession made them famous. It was highly valued by them, and not only by them, but by the whole of Greece. At one time King Nicomedes desired to purchase it, and offered to pay off an enormous national debt for it; but his offer was declined, the Cnidians preferring to suffer the utmost extremity of taxation rather than part with it. It was intended to represent the goddess as standing before Paris when he awarded to her the prize of beauty. The artist modeled it from Phryne, the beautiful courtesan who has been mentioned, and of whom Praxiteles was deeply enamored. Among the numerous epigrams upon it in Greek anthology is one which, translated, reads: " Alas! where has Praxiteles me naked seen?" This famous statue was destroyed by fire at Constantinople in the fifth century. Pliny mentions two figures of Cupids as among his finest works, one of which was of Parian marble, and of this Pausanius tells the following story: The influence of Phryne over the sculptor was very great, and when she desired to possess one of his works he readily consented to present her with one and requested her to choose for herself. Among so many masterpieces, selection was by no means easy; but, rightly assuming that the judgment of the artist himself would choose the finest, she hit upon a device for obtaining his opinion. Accordingly she commanded a servant to find Praxiteles with all speed and inform him that his workshop was in flames and that with few exceptions his works had been already destroyed. The artist, not doubting the truth of this announcement, rushed out in the greatest alarm and anxiety, exclaiming: "All is lost if my Satyr and Cupid are not saved." Thus the strategem succeeded, and Phryne, confessing the plot, chose the Cupid.

Acragas was an engraver in silver, whose country is uncertain, but whose age was probably near that of Praxiteles. He ranked next to Mentor among the admired artists, and even in Pliny's time some of his works were still extant and kept in the temple of Father Lieber in the Isle of Rhodes. They consisted of cups engraved with figures in relief of Bacchæ and Centaurs. He also engraved upon cups representations of the chase, and these were held in high estimation.

Mentor was a very eminent Greek sculptor who wrought principally in gold and silver, which he chased with unrivaled skill. His country is unknown, but he must have flourished before the burning of the temple of Diana at Ephesus, as some of the finest productions of his hand adorned this famous temple and were destroyed at that time. His age may be placed, therefore, at B. C. 356 or before. His chief productions were in the form of vases and cups, the latter chiefly of the kind called Thericlea, of which mention has been made. These are praised with high honors by Propertius, Juvenal and Martial. Cicero also alludes to his works, and Pliny bestows more than usual space to this artist. He says: "It is a remarkable fact that the art of chasing gold should have conferred no celebrity upon any person, while that of embossing silver has rendered many illustrious. The greatest renown, however, has been acquired by Mentor, of whom mention has been made already. Four pairs of vases were all that were ever made by him (*i. e.*: all that were made in pairs), and at the present day not one of these it is said is any longer in existence, owing to the conflagrations of the temple of Diana at Ephesus and of that in the Capitol." Again, he says, " The Olympian Jupiter day by day bears testimony to the talents of Phidias and the Capitoline Jupiter and the Diana of Ephesus to those of Mentor, to which deities also were consecrated vases made by this artist." Speaking of the enormous prices paid for silver plate, he says, " Lucius Crassus (B. C. 119), the orator, paid for two goblets chased by the hand of Mentor one hundred thousand sesterces ($3,200), but he confessed that for very shame he never dared to use them."

Stratonicus was also a statuary and silver chaser, whose period was about B. C. 278. He was one of the artists who made bronze statues representing the battles of Attalus and Eumenes with the Gauls. He also made some figures of philosophers, all in brass, but he was distinctively known as a chaser on silver. Following Stratonicus comes Tauriscus of Cyzicus, who attained distinction as a silver chaser, and also Cantharus, a

statuary and engraver on silver, who was born at Sicyon, and is merely mentioned by Pliny as among those who acquired fame in the art of silver working. He also excelled in athletics. Cantharus was the name of a drinking cup, but this name was derived from a potter, Cantharus, who invented it.

The statuary Bœthus was born at Carthage, from which we must infer that he flourished before the destruction of that city (B. C. 146). No more definite conclusion can be given regarding his age. Pliny ranks him next to Mentor, and states that his works were still extant in the temple of Minerva at Lindus (Isle of Rhodes). Pliny also speaks of a beautiful figure in brass of a child strangling a goose, but admits that he was most celebrated for his works in silver. A water pot formed by him, of exquisite workmanship and immense weight, is mentioned in Cicero, and Pausanius states that his statues were principally of children, and praises a naked boy of gold at the feet of Venus, in the temple of Juno (at Elis).

Zopyrus is mentioned by Pliny as one of the eminent silver chasers who flourished about the age of Pompey the Great (about B. C. 60). He is said to have represented upon two cups, the court of the Areopagus and the trial of Orestes (for the murder of his mother, Clymnestra) and these articles were valued in Pliny's time at twelve thousand sesterces.

At about the same time flourished Pytheas. His work commanded a very high price, and Pliny says the value of his plate was rated at ten thousand denarii for every two ounces (some MSS. also placed the price at twenty thousand). One very celebrated work of his was a cup on which Ulysses and Diomedes were represented as carrying off the Palladium from Troy, in that sort of chasing which was called *emblema*. He also engraved upon small drinking vessels kitchen scenes, known as *magiriscea* (cooks in miniature), so remarkably fine and so liable to injury that it was impossible to take copies of them. The greatest gem engravers of that and the following age modeled their work from his designs, and his figure of Diomedes can still be seen in gems by Dioscurides Gnaeus, Calpurnius Severus and Solon.

Poseidonius, a celebrated silver chaser of Ephesus, belonged to the time of Pompey the Great. He is merely mentioned by Pliny, but his compositions are known to have been those of athletics, hunting scenes and sacrifices.

Contemporary with Poseidonius comes Pasiteles, who combined statuary and sculpture with chasing silver. He flourished in Rome about B. C. 60, and although a native of Magna Græcia, obtained the Roman franchise, with others of his country, about B. C. 90, when he must have been very young. He was an artist of the highest distinction, and his five books on the most celebrated works of sculpture and chasing were looked upon as a high authority in art. It is said that he never executed any work of which he had not previously made a complete model, and this extreme care once placed him in serious danger. It so happened that being one day at the docks where there were some wild beasts unloading from Africa, he engaged in drawing upon a silver plate a lion which he viewed through the bars of the cage. While absorbed in his work a panther made its escape from another cage, and but for those surrounding would have made short work of the artist. His escape was said to have been miraculous. He made the ivory statue of Jupiter which was placed in the temple of Metellus on the road to the Campus Martius. In one of his silver chasings he represented the prodigy which indicated the future renown of the infant Roscius as an actor. —*John W. Mills, in the Jewelers' Journal.*

THE BIGGEST THINGS ON EARTH OUTSIDE OF BARNUM'S.

The highest range of mountains is the Himalaya, the mean elevation being estimated at from 16,000 to 18,000 feet.

The loftiest mountain is Mountain Everest or Guarisanker, of the Himalayas range, having an elevation of 29,002 feet above the sea level.

The largest city in the world is London. Its population numbers about 4,250,000 souls. New York, with a population of 1,250,000, comes fifth on the list of great cities.

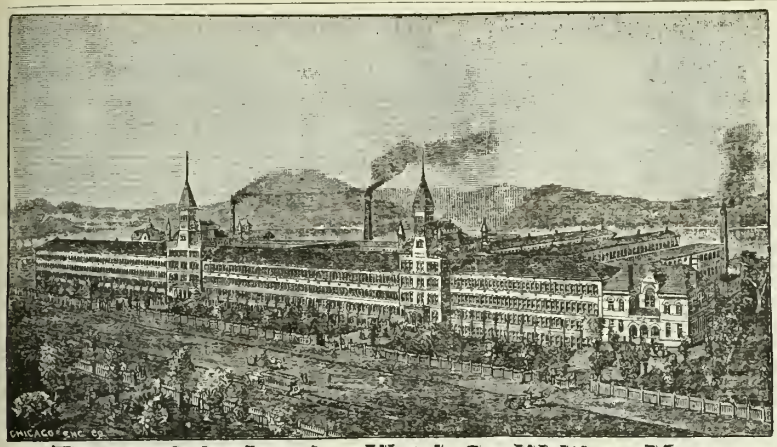
The largest theatre is the new opera house in Paris. It covers nearly three acres of ground. Its cubic mass is 4,287,000 feet. It cost about 100,000,000 francs.

The largest suspension bridge is the one between NewYork City and Brooklyn. The length of the main span is 1,595 feet, 6 inches; the entire length of the bridge is 5,980 feet.

The loftiest active volcano is Popocatapetl — "smoking mountain" — thirty-five miles west of Puebla, Mexico. It is 17,784 feet above the sea-level, and has a crater three miles in circumference and a thousand feet deep.

The largest island in the world, which is also regarded as a continent, is Australia. It is 2,500 miles in length from east to west, and 1,850 miles from north to south. Its area is 2,984,287 square miles.

The longest span of wire in the world is used for a telegraph in India, over the river Kistnah, between Bezorah Sectynagrum. It is more than 6,000 feet in length, and is 1,200 feet high.



The largest ship in the world is the Great Eastern. She is 680 feet long, 83 feet broad, and 60 feet deep, being 28,627 tons burden, 18,915 gross, and 13,344 net register. She was built at Millwall, on the Thames, and was launched January 31, 1857.

The largest university is Oxford, in England, in the city of the same name, fifty-five miles from London. It consists of twenty-one colleges and five halls, Oxford was a seat of learning as early as the time of Edward the Confessor. University College claims to have been ounded by Alfred.

The largest body of fresh water on the globe is Lake Superior, 400 miles long. 160 wide at its greatest breadth, and having an area of 32,000 square miles. Its mean depth is 900 feet, and its greatest depth is said to be about 200 fathoms. Its surface is about 635 feet above the level of the sea.

The biggest cavern is the Mammoth Cave, in Edmonson County, Ky. It is near Green River, about six miles from Cave City, and twenty-eight from Bowling Green. The cave consists of a succession of irregular chambers, some of which are large, situated on different levels. Some of these are traversed by navigable branches of the subterranean Echo river. Blind fish are found in its waters.

The longest tunnel in the world is that of the St. Gothard, on the line of railroad between Lucerne and Milan. The summit of the tunnel is 900 feet below the surface at Andermatt, and 6,600 feet beneath the peak of Kastelhorn of the St. Gothard group. The tunnel is 26½ feet wide, and is 18 feet and 10 inches from the floor to the crown of the arched

roof. It is 9½ miles long, 1⅝ miles longer than Mt. Cenis tunnel.

The biggest trees in the world are the mammoth trees of California. One of a grove in Tulare county, according to measurements made by members of the State geological survey, was shown to be 276 feet in height, 108 feet in circumference at base, and 76 feet at a point 12 feet above ground. Some of the trees are 376 feet high and 34 feet in diameter. Some of the largest that have been felled indicate an age of from 2000 to 2500 years.

The largest library is the Bibliotheque National in Paris, founded by Louis XIV. It contains 1,400,000 volumes, 300,000 pamphlets, 175,000 manuscripts, 300,000 maps and charts, 150,000 coins and medals. The collection of engravings exceeds 1,300,000, contained in some 10,000 volumes. The portraits number about 100,000. The building which contains these treasures is situated on the Rue Richelieu. Its length is 540 feet, its breadth 130 feet. The largest library in New York is, in respect of separate works, the Astor. About 190,000 volumes are on its shelves.

The largest desert is that of Sahara, a vast region of Northern Africa, extending from the Atlantic Ocean on the west to the valley of the Nile on the east. The length from east to west is about 3,000 miles, its average breadth about 900 miles,its area 2,000,000 square miles. Rain falls in torrents in the Sahara at intervals of five, ten and twenty years. In summer the heat during the day is excessive, but the nights are often cold. In winter the temperature is sometimes below freezing point.

The greatest pyramid is that of Cheops, one of the three pyramids forming the Memphis group, situated on a plateau about 137 feet above the level of the highest rise in the Nile. Its dimensions have been reduced by the removal of the outer portions to furnish stone for the city of Kairo. Its masonry consisted originally of 89,028,000 cubic feet, and still amounts to 82,111,000 feet. The present vertical height is 450 feet against 479 feet originally. The total weight of the stone is estimated at 6,316,000 tons.

The greatest fortress, from a strategical point of view, is the famous stronghold of Gibraltar, belonging to Great Britain situated upon the most southern point of and upon the coast of southwestern Spain. It occupies a rocky peninsula, jutting out into the sea, about three miles long and three-quarters of a mile wide. One central rock rises to a height of 1,435 feet above the sea level. Its northern face is almost perpendicular, while its east side is full of tremendous precipices. On the south it terminates in what is called Europa point. The west side is less steep than the east, and between its base and the sea is the narrow, almost level span on which the town of Gibraltar is built. The fortress is considered impregnable to military assault. The regular garrison in time of peace numbers about 7,000.

The largest inland sea is the Caspian, lying between Europe and Asia. Its greatest length is 760 miles, and its area 180,000 square miles. Great Salt Lake, in Utah, which may properly be termed an inland sea,is about ninety miles long, and has a varying breadth of from twenty to twenty-five miles. Its surface is 4200 feet above the level of the sea, whereas the surface of the Caspian is eighty-four feet below the ocean level.

The largest empire in the world is that of Great Britain, comprising 8,557,558 square miles, more than a sixth part of the land of the globe, embracing under its rule nearly a sixth part of the population of the world. In territorial extent the United States ranks third, containing 3,580,242 square miles, including Alaska; in population it ranks fourth, with its 50,000,000 of people. Russia ranks second, having 8,351,940 square miles.

The highest monolith is the obelisk at Karnak, in Egypt. Karnak is on the east bank of the Nile, near Luxor, and occupies a part of the site of ancient Thebes. The obelisk is ascribed to Hastau, sister of Pharaoh Thothmes III, who reigned about 1600 B.C. The whole length is 122 feet, its weight 400 tons. Its height without pedestal, is 108 feet 10 inches. The height of the obelisk in Central Park, without pedestal, is 68 feet 11 inches, its weight about 168 tons.

The largest bell in the world is the great bell of Moscow, at the foot of the Kremlin. Its circumference at the bottom is nearly 68 feet, and its height more that 21 feet. In its stoutest part it is 23 inches thick, and its weight has been computed to be 443,722 pounds. It has never been hung, and was probably cast on the spot where it now stands. A piece of the bell is broken off. The fracture is supposed to have been occasioned by water having been thrown upon it when heated by the building erected over it being on fire.

CONCERNING THE FORK.

Civilization, it has often been remarked increases our wants. To us of the nineteenth century it seems incredible that people could have managed to exist without the vast array of objects of necessity or luxury which surround us on every side. The generation which is now growing up will wonder how we ever could have lived without a telephone, while we in turn look back and ask ourselves what kind of an existence it was, when the locomotive and the steamboat were unknown, when the telegraph and the cable were yet undreamt of, when medicine and surgery were still in their infancy, when gas, steam and electricity had not been thought of or utilized.

We are apt to conclude that articles in common use to-day have always been employed. Looking over the catalogues of some of the great silver companies of the present, or gazing upon a table all set for the enjoyment of some grand dinner, and noticing the various forms of the forks displayed, from the simple and common *fourchette*, to the delicate and artistically-wrought implement fashioned to suit the daintiest taste, we may well wonder at the array. Especially, are we apt to be surprised, when we reflect that great personages of history, whose deeds thrilled the nation of their time and have lived after them, were without such common-place conveniences as a fork, without which the poorest of to-day need not be. The fork, relatively speaking, is not a very old acquisition.

Some interesting items in the history of the fork were recently brought out in a dispute between the eminent French dramatist Sardou and M. Darcel, the director of the Cluny Museum.

In one of the scenes of the piece *Theodora*, lately produced in Paris, the wife of Justinien, finding a friend whom she had known in former days, sits down with her to lunch, and unconcernedly picks up a fork, as if she had been used to it all her days, and commences to manœuvre upon the delicacies before her.

M. Darcel vigorously objected to the introduction of forks so many years before

MARK.

OBSERVE

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

their time, and insisted that no matter what the genius, the refined tastes, or the inclinations of the great Sarah Bernhardt might be, in order to portray truthfully and historically the role of Theodora, she must positively eat with her fingers!

This argument is perfectly valid; at Rome, Byzantia, as well as in Greece, there were no forks in vogue, except, as the French express it, those used by father Adam. The most famous hero of antiquity was reduced to the state of commonplace men before a piece of meat or of fish, to transfer which to his mouth, he knew of only one way, namely, between his thumb and index finger.

Forks made their appearance about the tenth century. We find mention that a certain father Galveston, a favorite of Edward II, had sixty-nine silver spoons and three forks. But, it is added, that these three forks were intended solely for the eating of pears.

Queen Clemence, of Hungary, in 1328, was the possessor of thirty spoons and one fork, and Queen Anne of Bourbon, had one of gold which was inherited by Charles V, King of France. This king himself, owned seven or eight, according to an inventory made in 1380. The one left him by will he subsequently had ornamented with precious stones.

The silverware of Chancellor Duprat, which an expert declared to be worth 33,848 pounds, a considerable amount in those days (1536,) included only one fork, while it contained two dozen spoons.

The inventory of the possessions of the Prince of Condé, (1588) records but one fork. It is described as silver coated with gold, but was reserved exclusively for the use of the prince.

The first inventory in which a number of forks are mentioned is that of Gabrielle d'Estrées, (1599). It includes twenty, of which eight were made of silver, the others being of iron with coral handles. But these forks were used only for toasting bread, and Gabrielle, like the Prince of Condé, sovereigns and common people, all ate with their fingers.

It is a strange fact that the introduction of forks for table service, at first provoked scandal. A curious pamphlet attacking the minions of Henry III, speaks indignantly in the following strain: "In the first place," says the anonymous writer, "they never touch meat with their fingers, but use forks, which they raise up to the mouth while stretching out the neck. They eat their salad with forks, for it is forbidden to touch meat with the fingers, no matter how difficult it may be, and they prefer touching their lips with this little instrument than with their fingers."

Before the introduction of the fork, there existed a sort of code of fine manners for the use of persons of culture. Among other things it is ordained that when something is offered at table, it is proper to take it with three fingers, and also, it is considered a breach of fine manners to touch one's nose with tho hand in which the meat is held.

At the present time in certain countries the fingers constitute the only forks in use. The Turks and Arabs still adhere to this primitive custom; in China two little sticks are employed wherewith the favorite rice is eaten. But, in general, the fork in one shape or another is now used, and it is not the lack of this instrument, but the tempting viand to plunge it into, which is a desideratum.—*Exchange.*

TRIBUNALS OF COMMERCE.

Some thirteen years ago, the writer brought before the Dominion Board of Trade the question of the desirability of establishing Tribunals of Commerce on the French system in this country, and considerable discussion of a very favorable character, both in the press and in the Board of Trade followed. No steps were taken of a practical character, much to our disappointment. The reason did not lie very deep. Once discussing the matter at the time with a very prominent counsel learned in the law, since deceased, he, after fully admitting all the advantages of the system, and the great saving both of money and time to commercial men likely to result from its establishment, quietly set me back by asking: "And who, then, will pay me my $25,000 a year? You can't have this Court in Canada, my young friend."

I am encouraged, however, by noticing the successful introduction of a reform almost as important in its character, both in Ottawa and Toronto, of the partial adoption of the Torrens' system of registering land titles, and in the hope that the same liberality which has induced the legal profession to permit the introduction of that system, may be extended so as to permit the greatest boon which the Legislature could extend to the merchants of Canada by the establishment of Tribunals of Commerce.

In favor of their establishment I would briefly urge three principal grounds:—

1. Because of the *absolute success* of the system in France, where there now exists over 100 such Tribunals.

2. The *great need*, owing first to the fact that customs of trade are not expressed in law; second, to the necessity of rapid adjustment. As affairs are at present, in the great majority of cases which would be submitted to a commercial court, any kind of a settlement is accepted in preference to coping with the difficulties and delays of the present system.

3. The *principle of special courts* has been found necessary and advantageous in other directions, such as probate, admiralty, divorce, bankruptcy and railways.

It will be argued that there are existing now facilities for arbitration which should cover the ground, but every one probably knows who has had to deal with ordinary arbitrations that they are not possessed of sufficient powers, have not the advantage of sufficient practice, nor are they in any sense equivalent to a court presided over by a legal assessor and assisted by experienced merchants who would value, as they are found to do in France, the honorable judicial position conferred on them by their associates in trade.

Now what does this court accomplish for the trader? Just this: It enables him to deal with a difference immediately—the case coming on as rapidly as the parties can be notified. It is then immediately dealt with and decided when the evidence is on the spot, and if not on the spot, the rules enable any distant evidence to be taken with great simplicity and inexpensiveness.

The custom of trade is determined by the commercial judges, and has the effect of law.

No lawyers are permitted to practice in the courts, and every party to a suit is supposed to deal with his own case. In France, however, the practice is, to some extent, to employ an agent who devotes himself to commercial cases, and whose charges are a matter of agreement with tho client, and not recognized by the court.

The forms are as simple as those of an ordinary commercial arbitration, and in purely commercial cases the decision is final.

The advantages over the present system are very positive:—

1st. They make it possible to adjus

GOLDIE & McCULLOCH,

REPRESENTATIVE.

all differences by the existence of such a court, and injustice need not be submitted to on account of the dread of the expense, loss of time, and delay of an ordinary suit.

2nd. The expense is shillings, where it is pounds in the ordinary courts.

3rd. And the time occupied is hours where it is now days.

When we look at our courts all loaded up with cases, at our overworked judges, utterly unable to keep up with the mass of work required at their hands, and finally, at the fact that often after a suit has been running its expensive course in the courts for weeks, it is suddenly discovered that it can better be settled by reference to experts, it must be the anxious thought of every merchant: How can we prevail upon our Legislature to grant us the great boon of Tribunals of Commerce in this Canada of ours ?

W. H. Howland, in *The Merchant.*

SUMMARY OF WATCH-CLEANING.

The greatest care is necessary in taking the watch down and separating its parts. First, remove the hands carefully, so as not to bend the slight pivots on which they work; next, remove the movement from the case, and take off the dial and minute wheels ; then let down the mainspring by placing your bench key upon the arbor, or winding-post, and turning as though you were going to wind the watch, until the click rests lightly upon the ratchet ; then with your screwdriver press the point of the click away from the teeth and ease down the spring ; next, draw the screws, or pins, and remove the bridges of the train, if a bar movement, or the upper plate, as the case may be ; then remove the balance with the greatest care, to avoid injuring the balance spring. The stud, or small post, into which this spring is fastened, may be removed from the bridge or plate of most modern watches without unkeying the spring, by slipping a thin instrument, like the edge of a blade-knife, under the cover of it and prying upward ; this will save much trouble, as you will not have the balance spring to adjust when re-setting the balance. If the watch upon which you propose to work has an upper plate, for instance, an American or an English lever, loosen the lever before you have entirely separated the plates, otherwise it will hang and probably be broken. The watch being now taken apart, brush the dust away from its different parts and subject them to a careful examination with your glass. Assure yourself that the teeth of the wheels and leaves of the pinions are all perfect and smooth ; that the pivots are all straight, round, and highly polished ; that the holes through which they work are not too large and have not become oval in shape ; that every jewel is smooth and perfectly sound, and that none of them is loose in its setting. See also that the escapement is not too deep or too shallow ; that the lever or cylinder is perfect ; that all the wheels have sufficient shake to avoid friction, but not enough to derange their coming together properly; that none of them works against the pillar plate ; that the balance turns horizontally and does not rub ; that the balance spring is not bent or wrongly set, so that the coils rub on each other on the plate, or on the balance, in short, that everything about the whole movement is just as reason would teach you it should be. If you find it otherwise, proceed to repair in accordance with a carefully weighed judgment and the processes known to you, after which, clean ; if not, the watch requires only to be cleaned, and, therefore, you may then proceed with this manipulation at once.

If you do it with benzine, we would highly recommend to you a home-made improved benzine jar, which is made as follows :

Take a circular piece of finely perforated metal, a coffee strainer answers very well. Then fit it inside your benzine glass, rivet in five or six wire feet, not more than a quarter of an inch long, so that you will have a small space between the perforated metal and the bottom of benzine jar ; fill the jar with the best benzine to be had—the spirit must at least be a quarter of an inch above the perforated metal ; lay the watch plates, etc., in this perforated metal, and the benzine, which holds the thick oil and other impurities in solution, will speedily precipitate them to the bottom, and their further contact with the work is prevented by the perforated plate, and when dried they are perfectly clean. Or, take a small, wide-necked bottle, fit a cork, and insert a brass wire ; turn up the end like a fish-hook, so that it will dip half an inch into the benzine, hook on the wheels, balance, and small pieces, and immerse them into the spirit, which will operate as before described. A little attention to small auxiliaries is often the difference between a quick workman and a slow one. Workmen of equal industry and ability often produce widely different results from the neglect of a small outlay in useful tools.—*Exchange.*

THE ANTIQUE CRAZE.

The collecting of " antique " and works of art has become a fully developed mania on the continent, and we fancy that our shoddyites are not exempt from it. A well defined and full equipped branch of art has, for the last few years, sprung into existence ; old objects of art have been multiplied by electro-plastic, copying, etc., until they are almost worn out in the process, and the imitations flood the market. The most eminent European artists have left off producing modern objects of art, for which they receive nothing, and engaged in the manufacture of the antique, for which they are paid double and triple.

Under the heading of " Old Enamel," one of our Amsterdam exchanges brings the following anecdote, which may be of interest to collectors of objects of art and antiquities, to enjoin on them an extra amount of caution.

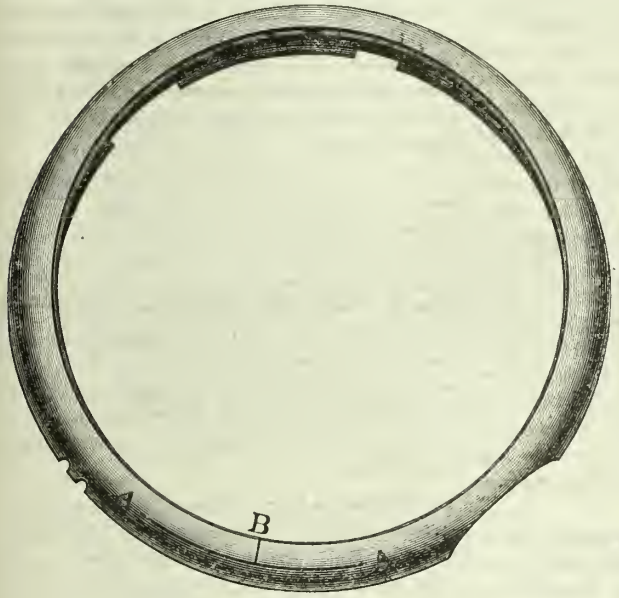
The enamel manufacturer, Soyez, of Paris, made the following remarkable statement about " old enamel " a few days ago, to the committee of inquiry: " It is daily ordered of me, and I make it under one condition, that I be permitted to state upon it from what original it was copied. This is generally refused, however. The originals are then sent to Amsterdam where they are copied, and come back to Paris to be sold at art auctions, and sometimes they fetch wonderful prices. Such a copy was not long ago brought to me for repairs ; it represented the murder of the Duke de Guise. "Can you repair the piece ?" I was asked. " Certainly," I responded ; " I will repair it in the same manner in which I made it originally." " You ? I bought it for 10,000 francs ; it was begrimed and dirty all over, and you do not believe the trouble I had to clean it." " I know that ; but in order to fully convince you I will show you the design from which I made it." I know a collector of antiquities in Amsterdam, who owns perhaps two million francs' worth of snuff doses and enamels of Limoges, Leonard Limousin and Pierre Reymond. In order to complete a dozen, he paid for one plate of the latter 3,000 francs, and the same plate, which bears the name of my firm, was made by me, and I sold it for 150 francs.

Verily, the fools are not all dead yet!

Exchange.

ONE OF THE GREATEST IMPROVEMENTS EVER MADE IN WATCH CASES.

An Adjustable Bezel for Hunting Cases !



THE FITTING OF GLASSES MADE EASY.

THE KEYSTONE FACTORIES STILL AT THE FORE.

The fitting of crystals in Hunting Cases has always been an annoyance. The great variation in sizes of glasses (for frequently at least three different sizes are found in one package, all numbered alike), defective edges, and difference in shape between the edge of glasses and groove in the bezel, all tend to make easy and proper adjustment a difficult task, and often the attempt costs more, in the breaking of glasses, than is received for the job.

Again, the groove in bezels is often of a size between glass sizes; consequently one size glass will be too small, the next too large, and the effort to fit them must end in an irritating failure.

To obviate these drawbacks is the province of the

KEYSTONE ADJUSTABLE BEZEL.

As will be seen in the above cut, the bezel is slitted vertically (B) and laterally (A) for a short distance in such a manner as to give it elasticity or spring without impairing its strength, but permitting the ready and effective insertion of crystals of different sizes, defective edges, or not perfectly round. To illustrate: An adjustable bezel for which a medium 19 11-16 glass is the correct one will not only take any glass in a package of 19 11-16, but it is also adapted to a 19 12-16 if required.

The arrangement which secures this very desirable result is so minute as to be comparatively invisible to the naked eye, and in no respect mars the uniformity of surface of the bezel. The liability of dust to work in upon the dial is no greater than with the ordinary bezel, as the lateral cut (A) is made below the top of the dial-plate.

The advantages of this great improvement are so plain, reducing to the smallest extent possible the danger incident to fitting glasses, that it is but reasonable to assume that

THE KEYSTONE ADJUSTABLE BEZEL

(the name of the great improvement) marks the introduction of an invention at once ingenious, practical, and exceptionally valuable.

This improved bezel is patented, and can only be obtained on Boss, Keystone and Leader cases, but without any advance in price.

THE KEYSTONE WATCH CASE FACTORIES:

19th and BROWN STREETS, PHILADELPHIA.

NEW YORK, 14 JOHN STREET. CHICAGO, 100 STATE STREET.

COULDN'T UNDERSTAND THE GAME.

An amusing story is told of an American millionaire who recently honored London with a visit. As he was walking down one of the busiest streets one morning, his eye was attracted by an organ-grinder who was solemnly and lugubriously playing at the corner of the street. The top of the organ was covered with a smooth green cloth, and it was this green cloth that at once appealed to the intellect of the transatlantic Crœsus. For him the green cloth suggested only one thought, and that thought was gambling. He fancied himself in the presence of some peripatetic roulet player, and he could not resist the temptation of taking a turn. So he stopped opposite the musical Italian and tossed a gold coin cheerily on the green surface of the hurdy-gurdy. The astonished foreigner stopped playing, grasped the coin, pocketed it, removed his hat, grunted out some voluble Tuscan thanks, and resumed his music. "Lost that time," the millionaire murmured to himself, and produced another coin. He tossed it again upon the board, from which it was again no less promptly and no less gratefully removed by the delighted musician. The millionaire shook his head. "Ah, luck's against me," he remarked, as he sent a third gold coin to gleam for a moment upon the green surface before it rapidly disappeared in the Italian's pocket. Another and another coin went the same way, without wearing out the patience of the American. But at last, when some six sovereigns had transferred themselves from his keeping to that of the organ-grinder, the American bent forward, and in a tone of the intensest curiosity, whispered in the ear of the amazed Italian, "Say, stranger, what do you call this game, any how?"—*Whitehall Review.*

EFFECTS OF GASES OF THE BODY ON WATCH OIL.

The oil used by watch and clock makers is always an element of some uncertainty to them, and one, also, of considerable anxiety. One specimen of oil evaporates too rapidly, while another becomes gummy and thick, and instead of acting the part as a lubricant, it actually becomes a clog and an impediment, and finally stops the watch altogether.

SPECIAL NOTICE.

Jewelers throughout Canada will oblige the Editor by sending in to this office for insertion in these notes any items of news pertaining to the Jewelry business that they think would be of interest to the Trade generally.

BUSINESS NOTES.

A THREE WHEELED WATCH is the latest thing in horology in the U.S. A factory costing $35,000 has been built in Jersey City for their manufacture. Next!

ASSIGNED.—Mr. H. Hale, jeweler, of Brantford, has assigned in trust for the benefit of his creditors. He has had an uphill fight of it for some years past and has done his best to pay his creditors in full—it now seems unsuccessfully.

SATISFACTORY.—A visit to the principal wholesale jewelry houses in Toronto, will satisfy anyone that the fall's trade has been decidedly ahead of that of last year. Every one of the merchants look pleased over what they have done, and are sanguine of prospects ahead.

"DRIVES."—Smith and Fudger have some splendid "drives" in electro-plated ware that every one should see. Any one who understands the value of goods naturally asks, "how can they be made for the money"? and the answer to this query is, "they are not made for the price they are sold at but are offered under cost." Of course such goods are quickly snapped up.

"HEPINSTALL, THE JEWELER," of St. Thomas, if the local papers are to be relied upon, is pushing business for all it is worth, and making a success of it. In addition to all kinds of jewelry, Mr. Hepinstall has made a specialty of spectacles, his "Boss" brand being the "Ne Plus Ultra" of that line. "Hep." evidently is a firm believer in printers' ink, the free and judicious use of which has no doubt been a considerable factor in his success.

OUR sanctum was honored during last month by a visit from our esteemed friend, Mr. Maurice Schwob, of Montreal, President of the Canadian Jobbers' Association in American Watches. Mr. Schwob, who has just returned from a three months' trip to Europe, looks the picture of health, and we should say has added ten years to his life by the holiday.

SPECIAL NOTICE.—We desire to inform the trade that we will in future insert *free* in a special column, all advertisements of jewelers wanting assistants, or of watchmakers wanting situations. We want to make THE TRADER as useful to the trade as possible and if they make use of the publicity its columns afford for the purposes above stated, we are satisfied that it will be to their advantage.

ENTERPRISE.—The new catalogue just issued by the Acme Silver Co., of Toronto, is the best thing of the kind that we have yet seen printed in Canada, and compares very favorably with the best class of American work. This Company have a lot of new and very artistic goods, and the demand for them is so great that they are compelled to run overtime in order to keep abreast of their orders. They seem bound to go ahead.

MR. A. S. WORMWOOD, representing the Illinois Watch Company, has been in the city for the past few days showing our jewelers the good points of the watches made by his company. Mr. Wormwood is a good talker and favorably impressed the trade with whom he came in contact, and the Illinois Company should certainly look for an increased trade as a result of his Canadian tour.

SENSIBLE.—R. Harkness, jeweler of Meaford, has done a very sensible thing in purchasing from Mr. Bostwick, representing Messrs. Goldie & McCulloch, a first-class burglar-proof safe, with composition iron and steel lining one inch thick, and a three inch door of the same material. Mr. Harkness can now afford to sleep easy at nights, as any burglar who gets into his safe will have to be as well acquainted with the combination as he himself is.

MR. ANDREWS, the well-known jeweler of St. Marys, Ont., has just about completed what is probably the finest jewelry store in Canada—outside of Toronto. Everything about his new place is of the finest quality and latest design, and it will be a credit to St. Marys. We congratulate Mr. Andrews on his enterprise, and wish him a prosperous career in his new place of business. As is usual in all first-class concerns, the show cases were made by Millichamp, and the trays, boxes and trimmings by the Hemming Bros.

"HE IS NOT THE AUTHOR."—In our last issue our printer made us say that Mr. E. Bulwer, Manager of the Simpson, Hall, Miller & Co. plate works at Montreal, had paid us a visit. The name should have read, Mr. E. Bulmer. Mr. Bulmer does not romance, he confines himself to facts and figures, and any one who has ever had much to do with his invoices can testify that he is usually correct in his statements. In this he differs from the great romancer, and is, we consider, a gainer by the comparison.

A HANDSOME CATALOGUE.—One of the handsomest catalogues we have ever seen is that of Simpson, Hall, Miller & Co., for the season of 1885. The covers are lithographed in colors and are emphatically a work of art. The illustrations of the plated ware are high-class work, and are printed in imitation of steel engraving. Altogether the book is first-class, and will no doubt prove itself a great help to jewelers and others who are compelled to order their goods by catalogue.

"A BRACELET KING."—Every person has an ambition of some kind or other; that of Mr. A. C. Anderson, of Lowe & Anderson, is apparently to be "the bracelet king of Canada." Mr. Anderson has just returned from Providence and Attleboro where he claims to have scooped the market in rolled plate bracelets and to be able to give the trade the largest assortment and the best value in such goods that has ever been shown in Canada. On this account his friends now dub him the Bracelet King. Next.

"THE GENIAL GRIPSACK," is the name of a new article that the Hemming Bros. of this city have just introduced for the use of jewelry travellers. In finish they are equal to anything of the kind we have ever seen, and are ingeniously arranged (as the Irishman would say)

LOWE & ANDERSON,

WHOLESALE JEWELERS

AND IMPORTERS OF

- AMERICAN WATCHES -

Our Stock is now complete in all Departments.

It is new and fresh, having been bought late in the season.

Our prices are right and the Trade are assured it is to their advantage to look at our Travellers' samples if unable to pay the house a visit.

Letter or wire orders punctually attended to.

LOWE & ANDERSON,

16 WELLINGTON STREET,

TORONTO.

P. S.---We beg to notify the Trade that the prices of Illinois Movements in our new Price List are incorrect. We hope soon to issue a corrected list of those movements.

so as "to give a great deal of room in a very small space." Every traveller should have one. This enterprising firm is also showing a new line of "Hair tanned buckskin" watch and set cases in natural colors, which are a curiosity even in this year of our Lord.

SOMETHING NEW.—Some very wise person has said that there is nothing new under the sun, but the philosopher who said it never saw the new adjustable watch case bezel that the Boss case people have just put upon the market. The makers claim that this patent bezel not only saves watch glasses but prevents the profanity that is engendered by a watchmaker breaking half a dozen glasses before he can get one to fit. If only to help morality, this new bezel should have the hearty support of every law abiding citizen and be extensively patronized by clergymen and others interested in the elevation of the race.

CUSTOMS SEIZURE.—The Hamilton customs authorities last week seized the stock of T. J. Carrol & Co., jewelers of that city, on suspicion of smuggling. It is to be hoped that the Hamilton officials will be more active in getting the justice of this seizure made apparent than the Winnipeg authorities are. If this or any other firm are proven to have smuggled goods, they should be rigorously dealt with; but if it cannot be at once clearly proven, they should not be needlessly hampered and their business as good as ruined by the greed of officials who only suspect that the law has been evaded.

GET VACCINATED.—We are not alarmists, but in these days when small-pox is so rife throughout the country and may break out at any moment in the most unexpected places, it is the duty of every person to get vaccinated and thus keep themselves free from the disease and check its spread. The editor has had his left arm in a sling for about a week (metaphorically speaking) on account of his being vaccinated, but if he had to keep it that way for a month he would prefer it to a week of genuine small-pox. He considers an ounce of prevention better than a pound of cure especially in regard to the small-pox, and therefore advises all the readers of THE TRADER to follow his example and get vaccinated.

WORTHY REPRESENTATIVES.—We were favored last week by a visit from Messrs. J. L. Sweet, representing the firm of R. F. Simmons & Co., the well-known manufacturers of rolled-plate chains, and C. E. Settle, representing S. E. Fisher & Co., the best known firm of bracelet makers in the United States. These gentlemen were visiting Toronto for the first time in the interest of their respective firms, and expressed themselves as being highly pleased with this city and the trade they were doing. Both of the above firms enjoy an enviable reputation for the excellence of their manufactures, and they are also to be congratulated upon the live and gentlemanly representatives that they send to this part of Her Majesty's dominions. Glad to see you gentlemen. Come again.

SIGHT FOR THE BLIND.—Although the days of miraculous healing have passed away, science has done much to alleviate the sufferings of humanity. There is probably no greater affliction than loss of sight, and spectacle manufacturers should, therefore, not only be classed as merchants but also as philanthropists. At least this is our opinion every time we come across Mr. H. J. Levetus, of the Montreal Optical Company. Mr. Levetus not only acts the good Samaritan to those afflicted with loss of sight, but looks every inch a philanthropist of the first water. We don't know whether Mr. L. sells spectacles for the purpose of making money out of them or not, but we can testify from a personal inspection of his stock that he carries the largest and best line of such goods in Canada.

BY ALL MEANS.—The Report has been for some time in circulation to the effect that Mr. Johnstone, Commissioner of Customs at Ottawa, was to be superannuated, and that Mr. Mingay, Collector at Winnipeg, was to be appointed in his place, with a revertion of the latter's position to Mr. Bowell, a son of the Hon. Minister of Customs. If general crankiness and red tapeism are recommendations for the commissionship, and report speaks true, Mr. Mingay possesses special qualifications for the position, and we trust he may get it. We do not know, however, that the change from Mr. Mingay to Mr. Bowell would be any relief to the merchants of Winnipeg, as the general opinion there seems to be that they hunt in couples. We have often said before that too much politics is the curse of Canada, and that in filling such offices it is not fitness that is considered so much as political exigency.

AN INJUSTICE.—We have before called attention to the arbitrary manner in which the Customs authorities at Winnipeg use jewelers suspected of smuggling goods. We understand that the stock of Mr. Perret, which was only seized on suspicion of being smuggled is still in the hands of the authorities, although nearly three months have elapsed since the seizure was made and Mr. Perret says that almost his whole stock was purchased of Canadian jobbers. Toronto jobbers who visited Winnipeg and interested themselves in the case were treated with scant courtesy and as good as told to mind their own business, although they had no end to serve except to see fair play to both parties. Such proceedings as these smack of tyranny and hardly harmonize with the liberty of the century. The Winnipeg Customs authorities should be made to understand that merchants have rights as well as themselves and that they might as well steal a merchant's stock outright, as seize it and keep it for an indefinite length of time. Fair play is bonnie play and they will try their little game once too often for their owu good.

WHO LIT THE FIRE?—Charlie Ellis, while on his last eastern trip, came near being the cause of one of the biggest fires on record. Feeling cold, and seeing a large stove in his sample room filled with paper, he touched a match to it and speedily succeeded in getting up a roaring fire, very much to his own and his customers' comfort. His exuberance did not last over a couple of minutes however, for by that time the servants up-stairs came tumbling down stairs in all sorts of *dishabille*, each one dragging their valuables after them, while an excited crowd speedily filled the yard and tried to assist the firemen by giving them the benefit of their advice. The flames were, after considerable exertion subdued, and an investigation brought to light the fact that the pipe which led from the stove in Mr. Ellis' sample room did not go any nearer heaven than just through the floor above. It was a most absurd thing for any hotel keeper to leave a stove in such a condition, but Charlie says that his experience with fires has been so varied and disastrous that next time he lights one he will find out how it is going to affect his future existence before he touches the match. If Charlie gets into many more such scrapes we will have to dub him the Handy Andy of the jewelry business.

A DARLING RUMPUS.—The action of Mr. H. W. Darling, president of the Toronto Board of Trade, in endeavoring to get railway companies to confer the same privileges upon members of the Board of Trade as upon commercial travelers has evoked no little opposition from that energetic and very necessary corporation. We do not see that anything is to be gained by the adoption of Mr. Darling's scheme except perhaps the saving of a few dollars to some wholesalers who do not seem to have the faculty of keeping their travellers more than a few months at a time. On the contrary we see a great deal to condemn in this attempt to undermine an Association which has proved itself of incalculable benefit not only to the travellers, but to wholesale houses and the railways as well. We have no idea that Mr. Darling's scheme will carry through, and it certainly does not deserve success. We think the Board of Trade would be well advised if they keep themselves free from railway favors and attend strictly to their legitimate business. If Mr. Darling must have scope for his bottled up energy, let him direct it to something practical such as, a new bankrupt act, tribunals of commerce, or even the shortening of our present credits. Any of these things are practical and necessary and in our humble opinion the president of the Toronto Board of Trade would be better employed in securing their adoption than in trying to injure an organization like the Commercial Travellers Association of Canada.

IN A TIGHT PLACE.—Now that the Privy Council of Great Britain have decided that Louis David Riel has had a fair and impartial trial by a legally constituted court, the question arises will the Government allow the law to take its course, or will they interfere and save his neck for the purpose of keeping themselves in power. It is a tight place for them, on one side the "Grit devil," and on the other the deep sea of solid French race opposition. If Sir John can steer the government bark safely through between these rocks, he will accomplish something well nigh impossible. If THE TRADER might venture to give him a piece of disinterested advice, we would counsel him to simply let the law take its course. We have nothing but good feeling for our French Canadian fellow countrymen, and the question as to whether Riel is French, Irish, English or Scotch should never be thought of at all. It should be, does he deserve hanging, and if so, let him hang. We think there can only be one answer to such a query and we also think that this is a crisis in our national career. If Sir John Macdonald has the firmness to do what is right in the present case, we are satis-

THE

R. F. S. & Co.

ROLLED PLATE CHAINS

—ARE THE—

BEST.

fied that although extremists may howl, every fair minded man will support him regardless of party. We want to know nothing about any race in Canada except Canadians. Whatever we may have been before we came to this country, we are Canadians now and it is the duty of every honest man in such a crisis to put country before party and support what is right even though the heavens should fall. If ever a man deserved hanging Riel does, and we think it would not only be mistaken clemency on the part of the government to pardon him, but it will introduce the principle of bringing into our courts of justice a pandering to national prejudice that will certainly work mischief in the long run. Our French Canadian fellow citizens must be taught that it is not revenge but justice that Canada wants, and that she is bound to have justice in each and every case no matter to what nationality the culprit belongs or what influence is brought to bear in his favor.

WORKSHOP NOTES.

CEMENT.—A cement for meerschaum can be made of quicklime mixed to a thick cream with the white of an egg. This cement will also unite glass or china.

PEGWOOD.—Watchmakers generally buy this article of watch-material dealers. A small shrub known as Indian arrowwood, to be met with in the northern and western states, makes an excellent pegwood. It is to be cut when the sap is down and split into quarters, so as to throw the pith outside of the rod.

STAINS FROM MARBLE CASES.—To remove stains from marble cases, clock dials, etc., take equal parts of fresh oil of vitriol and lemon juice; shake up these substances very thoroughly in a bottle, wet the spots with the mixture, and in a few minutes afterward rub with a soft linen cloth and the spots will be found to have entirely disappeared.

TOOLS RUSTING.—The rusting of bright steel tools is due to the precipitation of moisture from the air. It may be prevented by keeping the air surrounding the goods dry, and chloride of lime, having a peculiar affinity for attracting moisture, is, with great benefit, used for the purpose by placing a saucer full of it in the case containing such tools or bright steel.

TRANSPARENT SIGNS.—A signmaker of Hamburg has adopted the following novel method for heightening the effects of a glass sign: He places colored and white glass splinters between two sheets of glass, on one of which the name is written, and protects everything else with a coat of varnish impenetrable to light. The rays of light passing through the name and figures will be decomposed in the prismatic hues, and produce a striking effect.

TO POLISH STEEL.—A subscriber desires to know, "What is the best mixture for white metal polisher for steel, for putting on a good black color?" If the steel is of moderately good temper, use a zinc polisher with diamantine; for soft steel a tin polisher is better. The diamantine should be mixed on glass, with very little watch oil. Diamantine mixed with ordinary oil soon becomes gummy, and is unfit for use in a day or two, and if brought into contact with metal while mixing, turns black.

THE MIXING OF POLISHING MATERIAL.—Crocus should be thoroughly beaten upon glass or a polished steel stake, forming it into a stiff paste with very little oil. Far too much oil is generally used, and the mixture is made thinner than it should be. Olive or sweet oil is not suitable, and if used, the polishing stuff becomes gummy in a few days. Refined sperm oil answers well. Diamantine should be mixed in the same way, as dry as possible, so that when it is used the polisher is only just dampened with it.

TO HARDEN GOLD SPRINGS.—Gold detent, thermometer, suspension and balance springs can be imparted a higher degree of elasticity. Rolling hardens them, but they are rendered very brittle thereby. They can be made supple and elastic, not by hardening, as in the case of steel, but by annealing, care being taken not to exceed a certain degree of heat. The spring may be coiled on a block, and placed in a tube with a smooth steel lid, then heat the tube in the flame of a spirit lamp, and as soon as the steel is of a blue temper, remove the flame and allow the whole to cool.

OTHER NOTES.

A TROY lawyer gives as a reason for not going to Europe this summer, that a rich client of his has just died, and he was afraid the heirs would get the property.

THE latest novelty in purses in Paris is a baby's foot crocheted in silk, and furnished with a ring and clasp, like the old-fashioned long purses that a few persons still use.

A Buffalo physician, when asked the best preventative of smallpox to carry in the pocket, is said to have answered, "Camphor gum." It is the best thing to have on the person for that purpose and most all doctors use it.

THE microscopic edition of Dante, printed at Padua in 1873, was thought to be the smallest book in existence, but has had to give the place of honor to a newly-discovered "Officium" (Venice: Giunti, 1630), which in the original cover measures only 33 by 48mm, about an inch and three-tenths by one inch and eight-tenths. This last book may be described as the smallest volume in the world.

ON some of the German postal cards is a printed formula designed to save time in imparting news transmissible by this medium. It runs as follows: "Only a few lines to-day," then follows five lines, on which to write, then, "God be thanked, I am in good health and hope to hear that you are also. The weather is——: write soon, and give my love to all. In haste," and here follows the signature. There is even place reserved for a postscript.

THE latest municipal returns of Toronto are very gratifying and show that the city is rapidly increasing both in population and commercial importance. The population is now 111,800, an increase during the year of 7,524, and the assessment, upon which next year's taxation will be based, reaches $72,721,559, an increase of about three and a half millions over and above the figures of 1884. Since 1879 the assessed value of property in Toronto has increased by no less a sum than $23,000,000.

Editorial.

CO-OPERATION AMONGST RETAIL JEWELERS.

This is a measure which we have advocated in THE TRADER for years, and we quite agree with "Equity" in the present issue that very many abuses could be remedied by vigorous and concerted action on the part of the retailers themselves. This correspondent advances the idea that the formation of district associations would be far more advantageous to the retail trade than a general association, and we do not know but what his contention is correct. Such organizations would be more readily formed and probably more easily worked than a general association, and we are inclined to think that if these district associations were once got into good working order it would not be a very difficult task to effect some arrangement whereby delegates from each could be formed into one central orgauization, which could deal with all questions of general importance, leaving to the local bodies the task of seeing that the details were properly carried out. Such associations would, we think, be found very useful to the trade in many ways, and we propose iu our next issue to go into this subject at length, and show in what way they could be made of almost incalculable benefit to the trade generally. Space prevents us from replying fully to "Equity's" query about "personal smuggling" in this issue, but we shall ventilate it thoroughly in next month.

PROTECTION TO RETAILERS.

As will be seen by the correspondence in another part of this issue, the interest in the subject of protection to retailers has augmented rather than abated during the month which has just passed. The outcome of this discussion in the columns of THE TRADER has already been to get some of the most prominent of our wholesale jewelers to agree to the principle of protecting their customers in exactly the same manner as they themselves are protected by the manufacturer, and to pledge their influence in getting it adopted by the Canadian Association of Jobbers in American Watches. As we pointed out in a former issue, this was to be expected from our Canadian Jobbers, who have always shown a disposition to protect their customers in the retail trade by every means in their power.

There is hardly auy doubt that when this question of protecting retail jewelers by refusing to sell to outside trades comes before the Jobbers' Association it will carry almost unanimously. The principal point of difference however, will, we think, be probably found in the answer to the question,

WHAT IS A RETAIL JEWELER?

On this point there is, and no doubt will be, considerable difference of opinion, but we quite agree with both of our correspondents that the keeping of a stock of watches and jewelry commensurate with his business should be made the principal test of whether a man should be allowed to buy such goods from the wholesale merchant. This general principle is, we think, broad enough to unite all differences on this subject, whether amongst wholesalers or retailers, or both combined. If asked iu fairness to define who should come under the head of legitimate retailers, we should say:

(1) Practical Watchmakers actively engaged in business.

(2) Firms that make watches and jewelry their exclusive business.

(3) Firms that, although selling other goods, carry a commensurate stock of watches and jewelry, aud make it a regular branch of their business.

Class 1 would embrace a large number of practical watchmakers who, on the start, do what may be termed a "watch repairing" business, but who often develop into first-class men aud carry large stocks of goods. This class we regard as the germ of the jewelry business, and well worthy of encouragement as well as fair play.

In Class 2 may be found some of the largest and best appointed establishments in Canada, whose principals are neither practical Watchmakers nor Jewelers, but simply merchants who sell watches and jewelry just the same as they would dry goods or groceries. This class, as a whole, is the backbone of the trade, and as the summit of class one's ambition is to get into class two, it is evident that they are legitimate dealers in every sense of the word.

Class 3 is the one over which there will be kicking, if there is any difference of opinion at all. A little reflection will, however, show that this class have fully as good a right to recognition as either of the others, and cannot be excluded without a great deal of injustice to many practical men now actively engaged in business. As everyone knows, the bulk of jewelers sell plated ware, cutlery and optical goods, which it must be conceded, are not exclusively jewelers goods, for the two first mentioned lines may be found in any hardware or crockery store the country over, while optical goods in all large cities is an entirely separate business. In addition to these, however, a great many first-class jewelers regularly sell fancy goods, and in quite a few cases stationery is made an adjunct as well. Now we ask is the jeweler who sells stationery and faucy goods anymore legitimately a jeweler, or worthy of recognition by the Jobbers' Association, than the stationer or fancy goods dealer who regularly carries a stock of watches and jewelry commensurate to the size of his business. We think not, and on reflection we think that most of our readers will agree with us. If *practical workmanship* were made the test, as we have shown, it would bowl out quite a number of class three, and not a few in class two who make the sale of watches and jewelry their exclusive business. If being "exclusively engaged in the sale of watches and jewelry" were made the test, it would prevent the recognition of class three, many of whom are practical jewelers, and a large number of class one, who, although practical watchmakers, simply

do a repairing business and carry no stock whatever.

THE STOCK TEST.

From this it will be seen that, with the exception of class one, which everyone will readily admit is entitled to recognition, the "stock" test is the true one with which to answer the query, "What is a Retail Jeweler?" The fact that such a merchant is not a practical watchmaker has nothing to do with the question at issue, but is entirely a personal matter with the merchant himself. Everyone knows that a practical workman carrying stock has always a big pull over a competitor, with an equally large stock, who has no practical knowledge of the business, and if persons of the latter class desire to invest their good money as an experiment in the watch and jewelry business, and learn from experience that all is not gold that glitters, why should they be deprived of an opportunity to purchase a little experience. Such ventures usually work their own cure, and unless the person making it is naturally adapted for the business he will very soon get tired enough of it to quit just as quickly as possible. As one of our correspondents points out if such merchants were not recognized unless they employed a watchmaker, and the business was worth anything to them, they would very soon employ one, and thus not only compete for sales but for a share of the repair work as well. We could enlarge much more on this subject but think that enough has been said by us for the present

RIEL.

Whatever may be the faults of the present government, they certainly deserve credit for their firmness in carrying out the death sentence in the case of Louis "David" Riel, the leader of two rebellions, each of which has cost Canada millions of money to put down. Riel was a dangerous man; but when to this is added the further fact that he had not only induced untutored and almost savage Indians to rise and massacre the harmless whites that dwelt amongst them, but had actually participated with his own hand in the murder of Thomas Scott, surely justice and expedience alike demanded that his career should be stopped by the hangman. Now that the last act of the drama is played out, and the curtain has fallen so far as Louis Riel is concerned, it should be the endeavor of every good and loyal citizen, (professional agitators who make a living by agitating, excepted), to try and allay the feelings of hostility between the French and English races, which this episode in our history has unfortunately engendered. While this is the duty of every loyal citizen, those who are endeavoring from mercenary or party motives, to make capital out of Riel's execution, by fanning the flame of national jealousy and animosity, incur a fearful responsibility the extent of which as yet they do not fully comprehend.

It has seemed to us a sad commentary on the patriotism of our press to see the cold-blooded manner in which some of our leading journals have handled the question of Riel's execution. The *Globe* has notably been one of the most glaring offenders and by its action has proved itself unworthy of the respect much less the support of any Canadian who has one single spark of patriotism in his composition. On this as on many questions lately it has been non-committal. While it has had many long dissertations on the iniquity of Sir John Macdonald and appeared to be quite satisfied that he at least should hang for his share in the late rebellion, it has had no decided opinion as to Riel's guilt and what his punishment should be. Its managers knew that Sir John was between the devil and the deep sea and they took care that no word or act of theirs should give him the slightest indication of what honor and the interests of the country demanded at his hands. They knew that justice and the true welfare of Canada demanded that Riel should be punished for his crimes, but they were more concerned that the premier might be able in some way to get himself out of the scrape without losing prestige, than that justice should be done in the premises. They apparently did not care for right in the matter so long as it embarrassed the government; as they themselves used to say about the *Mails* attacks on a former minister of agriculture for Ontario. "It was anything to beat McKellar."

Although they had no advice as to the disposal of Riel, and were only concerned lest the government might not hang him, now that the execution has been carried out, they are profuse in their sympathy for the late rebel and his friends. They have suddenly discovered that he was a patriot, an insane one 'tis true, but no less a patriot, and that it was a disgrace for any civilized country to hang a crazy man, even though he were twice rebel and murderer to boot. If the government were wrong in punishing the leader of the rebellion, what arrant simpletons were our brave volunteers in risking their lives in putting down at the point of the bayonet and at a large sacrifice of valuable lives, a rebellion, that one would now infer from the *Globe's* editorials was not only just but perfectly proper. From their editorials lately we should judge that it was not Riel, Dumont, Poundmaker, Big Bear and their followers that should have been put down, but John A. and his cabinet. Instead of our brave volunteers facing the hardships of the north shore of Lake Superior, they should have taken C. P. R. palace cars to Ottawa and cleaned out the present government and put Riel and Company in their place. Such attacks as these from their standpoint may be wise ones, but we very much doubt it; they can do no possible good and can only bring the Liberal party into disrepute.

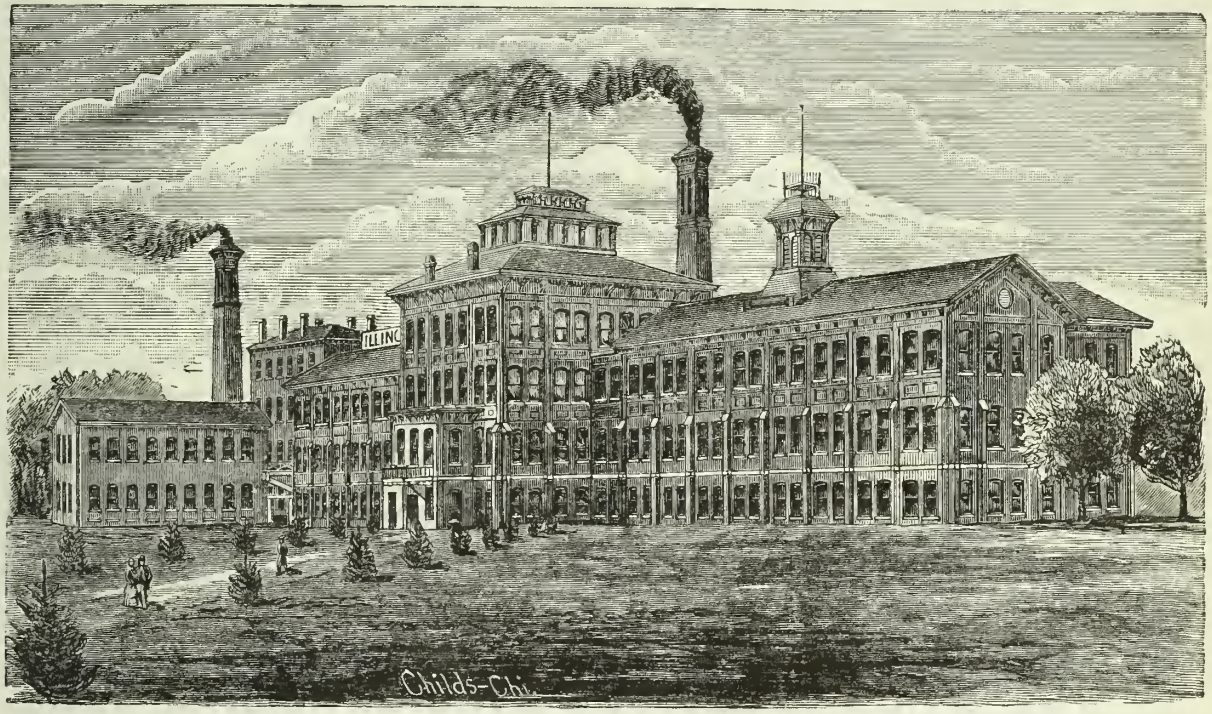
In such an emergency we think it is the bounden duty of every loyal citizen to strengthen the hands of the government in their endeavor to vindicate law and order, no matter whether they are politically in accord with them or not. Such questions should never be made political questions and the newspaper that in such a crisis seeks only the advancement of its own party to the detriment of the country should be branded as disloyal and unworthy of confidence.

For ourselves, we may say that we don't run THE TRADER on party lines. We look at all questions from a patriotic and commercial point of view and propose to let politics severely alone. We have always been and are to-day opposed to the present government in politics, but when we see them trying their best to do right, although it may be but rarely that in our opinion that they do so, we feel bound to give them any moral support that we can furnish. We believe in country before party every time, and if the party with which we have been identified for over thirty years is disposed for the sake of gaining power to seek the aid of rebels and their friends we cannot allow ourselves to go along with them. We would prefer eternal opposition for the Liberal party of Canada in preference to seeing them secure power by the aid of such disloyal allies as the friends and fellow-countrymen of Louis Riel are now

ILLINOIS WATCH COMPANY,

MANUFACTURERS OF

Gilt and Nickel



WATCH MOVEMENTS.

NEW YORK OFFICE
3 Maiden Lane.

CHICAGO OFFICE,
104 State St.

All Stem Winders made to fit Hunting and Open Face Cases, the latter bringing the figure XII at the pendent.

Orders for Movements with special engraving in grades above I. W. Co., received in lots of five and upwards without extra charge.

FACTORY AND HOME OFFICE, SPRINGFIELD, ILLINOIS, U. S. A.

We solicit the careful and critical inspection of the Jobbing and Retail Trade of all Canada upon our new, improved and popular movements, which we now have ready for the Holiday Market.

Our "No. 5" is the best adjusted movement ever offered for the money. It has fifteen jewels in settings, Oreide Screws in the balance, and Patent Regulator. It is an accurate timer, and wherever it is in use, it gives perfect satisfaction.

Our "Special No. 101," is manufactured only on special orders, and very recently put upon the market; but its flattering reception by the Trade, gives assurance that it is already the favorite low priced Nickel movement before the public. It has eleven jewels, the top plate being jeweled in Oreide Settings, Patent Regulator, new and beautiful pattern of Damaskeen Finish, Circled or Double Sunk Dial, as desired. Try one and you will order again.

Our No. 150, Ladies' 8 size watch, is still in the lead of all low priced 8 size movements, and is the best cheap Ladies' Watch ever produced. It has eleven Jewels, is carefully finished, closely timed, and we guarantee it to give satisfaction.

These movements are all new. They have all the latest improvements. We warrant them. Every Jeweler in Canada, wishing for something fresh, novel, attractive and certain to please and satisfy his Trade, should ask his Jobber for one of the new and improved Illinois Watch Company's Movements. All Movements have Patent Pinion, and all are Quick Train.

The Illinois Watch Company

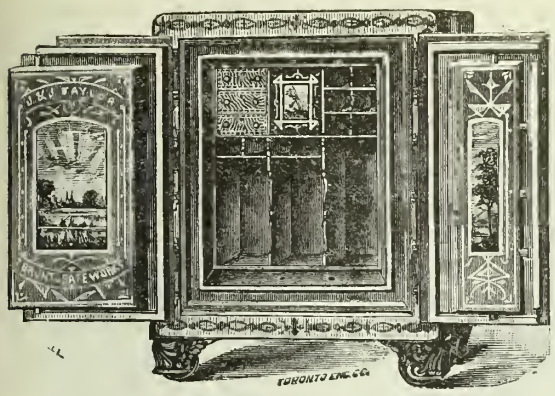
showing themselves to be. The Liberal opposition can find plenty of indictments against the present government without making political capital out of the race hatred that will be sure to follow if the present agitation in Quebec is fostered and encouraged. We warn them that if the Riel question is the only common bond of cohesion between the Liberal party and the French people of Quebec that it will prove a very rotten foundation upon which to build. Canada is strong enough to stand a certain amount of nonsensical bluster from the people of Quebec, but if it goes too far, she will have to put the foot down firmly, and tread out with an iron heel all such disloyal sentiments as have lately been expressed in that Province. Confederated Canada is here to stay, and if the French people imagine that because they can't have everything their own way and run the machine to suit themselves, that they can break it up, they will find out their error very speedily to their cost. If it is to be a war of races, which God forbid, they must certainly go under and they will then find that the English speaking people have gained sense since Wolfe's time, and that in the new *regime* which will surely follow, they will find themselves shorn of many of of their national laws and privileges, which makes their province so far behind the spirit of the age. The cure may be rough but it will certainly be effectual.

We see no reason why there should be any excitement about Riel's execution and had he been of any other nationality than he was, there would have never been a word said about it. Our French Canadian fellow-subjects seem, however to have taken his execution as an insult to their nationality, and at the present time it seems useless to argue with them. Perhaps when their excitement has had time to effervesce they will see that they have been wrong in so warmly espousing the cause of a traitor and murderer. For their own sake, and for the sake of Canada we trust that such may be the case. We want to live at peace with every one of our fellow-countrymen, no matter what their race or religion, and we believe that at such a juncture as this, it is the duty of every loyal citizen to do what in him lies to heal the breaches that this unfortunate rebellion has created, and to foster instead of trying to disturb the growth of a national life which only can make us great and prosperous.

THE C. P. R.



Our great trans-continental railroad is now an accomplished fact, and at the present moment one can go by an all-rail route on Canadian soil from Port Moody in British Columbia to Halifax in Nova Scotia. From "ocean to ocean" is no longer a flight of rhetoric, but the simple statement of a fact that should make every true Canadian feel a glow of honest pride as he realizes that these bands of steel which serve to connect the uttermost ends of our vast dominion, have also practically turned another page of our national history and must, in the immediate future, exercise no small influence in moulding our political destiny.

We have in time past had something to say about the folly of the Government in spending so many millions of the public in building this road and then making it a present to a private corporation. From our standpoint we have always held that the Canadian Pacific Company had, in common parlance, "a soft snap," in this contract, and they would have been very foolish to have paid for its construction out of their own pockets when they could get the country to foot the bill. However, the blunder has been perpetrated and we must now make the best of a bad bargain, and with this we dismiss our strictures on the contract and turn our attention to the road itself and its value to the people whose money has paid for it.

In spite of the dire prognostications of one section of the press, that the construction of the road would be bungled, and that it would be almost useless for practical purposes, we think that the road, when fully completed, will be the equal of any on this continent. And why should it not be so? Money was no object to the company, who had only to ask for a few more millions in order to have them. Our opinion is that the entire road has been well and solidly built, and as regards the part constructed by the company themselves, it has been cheaply built. The fact that the first through train from Montreal to Port Moody averaged twenty-four miles an hour over the entire journey without accident, is a very strong proof of its substantial construction. Anyone that ever travelled over any part of the C.P.R. can testify, that as far as depots, rolling stock and other equipments are concerned, it already stands second to none in the world. In our opinion, its sleeping, palace and dining cars are the most elegant we have ever seen.

But after all this comes the important question, "Will it pay?" If we are to believe the Opposition press, especially the *Globe*, it wont pay for grease for the wheels. They therefore argue that all that the company ever intended was simply to make all they possibly could do out of its construction, and then, when it came to the losing game of running it, throw it back on the hands of the Government. Looked at through party spectacles, this may appear to be the situation, but we fail to see, if such had been the company's intention, why they spent such large sums of money in thoroughly building and equipping the road, when they could have made so many millions more by doing the work in the cheap and useless style. We think that this at least proves that the company, whatever may have been its faults, did not intend to cribbage all they could during its construction and then, when they had squeezed it dry, throw the concern back on the country's hands. But, say some of their enemies before enumerated, even if they have acted on the square so far and continue to run it in the same manner, the thing must ultimately collapse, because it is simply a physical impossibility that it can pay. It may not pay to run it, although our opinion is that it will pay the company, and very handsomely too. We must remember that the people of Canada have, in money and lands, practically paid for the construction of this colossal railway, and that all that the company had really to pay for was the rolling stock and other equipments. When this is taken into consideration it will be seen that the real amount of capital upon which it has to pay a dividend is very small in comparison with any other railroad in America of anything like the same proportions. Further than this, the Government, in addition to its many other favors, has given it a practical monopoly of the carrying trade of the great North-West for twenty years, by prohibiting the construction of competing lines which could in any way seek to interfere with its traffic.

The route of the C. P. R. west of Ontario is through one of the finest farming and grazing countries in existence, and which, in a very few years, must of necessity become one of the

principal granaries of the world. All that this vast country wants is settlers, and the principal object of the company for years to come will be to get as many emigrants to take up land there as they possibly can. Every settler in that country will be compelled to use their road, for all their products must find their way to the seaboard over it, and all their imports must reach them in the same manner. As regards the through trade there exists a great variety of opinion. Our own idea is that the through traffic will be much more extensive than its opponents are disposed to concede. At its terminus is to be found the largest and best supply of coal on the whole Pacific coast. The trade winds and ocean currents also conspire to make it the most favorable port on the Pacific slope for traffic between the American and Asiatic continents. Before long, passenger trains will run from Vancouver to Montreal in four days, and it will be quite possible to travel from Liverpool to the Pacific ocean by the aid of our Canadian Transcontinental line in ten days. With such possibilities before us for the curtailment of time and distance, we think that the prospects for a fair share of through traffic are not of the worst description.

In conclusion we can only say, that as Canadians we are proud of the work just accomplished. Although a bad bargain for Canada, we trust that now it is built, we shall get all the service possible from it. It should be, and we think it will be a strong factor in knitting the different provinces closer together and assist in the creation of a national sentiment that will help materially to make the Dominion of Canada a great and prosperous country.

Correspondence.

To the Editor of THE TRADER :

SIR,—

In your last issue a letter appears from one who signs himself "Protection." In his letter he asks how he is to be guided in placing goods for his firm so that none may handle them but those who have a legitimate right to do so. I think the answer to that is: that all who carry a stock of clocks, watches and jewelry should be considered as legitimate dealers.

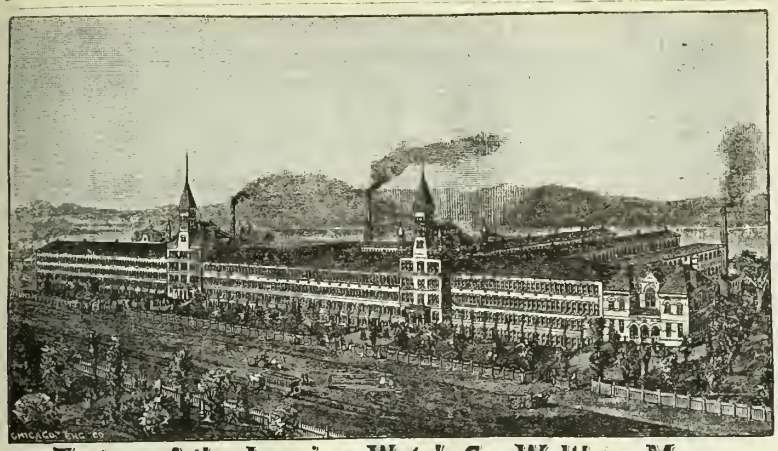
"Protection" says, Mr. Beale is quite as much a stationer as a watchmaker or jeweler. Allowing such to be the case, it does not follow that the other stationers are entitled to be classed as watchmakers and jewelers if they do not carry a stock.

The great trouble is just this: If outsiders are allowed to buy an odd watch or piece of jewelry, they give it to their customers to entice them to buy other goods from them, thus preventing the regular dealer from selling his goods and hurting his trade. I would ask "Protection," as a commercial traveler, how he would like to be told by one whom he calls upon, that they can buy movements and cases at the same rate as the firm for whom he travels. I fancy both he and the house he represents would think the manufacturers were mean men to take the trade out of the hands of the jobbers.

"Protection" wants the watch butchers killed off—a plan that will not benefit the jobbers, as by that the watches would wear too long. He appears to speak rather slightingly of Mr. Beale. I am not acquainted with either of the gentlemen, but I should suppose that Mr. Beale has trodden upon his corns. Mr. Knox tried a Horological School. Is "Protection" a graduate from Knox College of Horology? If so, I do not wonder at his superiority over the common watch butchers. But, joking aside, it is not the qualifications of watchmakers as workmen we have to do with. The public will judge that, and the incompetent workmen will have to get out of the trade. The real question at issue is simply: Are the wholesale men willing to give the legitimate dealer the same protection as the manufacturers give them? And are the retail dealers willing to have a uniform price for movements and cases, and allow none to sell below those prices—just as the jobbers do—and bind themselves by the same rules? If so, let the retail and wholesale men agree to the prices for the different grades and cases, and if any are found selling below those prices shut them off from American movements and cases. Some may want more profit than the regular prices; if so, the public will be the judge. I see Messrs. Lee & Chillas speak in the last TRADER, and I know others who are just as willing as they are.

Is the retail trade in earnest? If so, let them move in the matter is the advice of a

RETAILER.



To the Editor of THE TRADER :

SIR,—In connection with the discussion now going on in your columns *re* watchmakers' grievances, I think the matter should be discussed from a broader stand point.

The design of the scheme advocated in certain sections is to stop the supply of watches from dealers not practical watchmakers. Well, Mr. Editor, before any man has the right to cause any branch of another man's business to be taken away on the score of its "interference," he should first give up all lines not strictly within *his own business*. We all know what a watch is, and jewelry has been described as articles made of metals and stones for personal adornment. In what sense is a pickle castor an article of personal adornment, or what connection with putting a main spring in a watch? As a matter of fact, silver ware belongs to the house furnishing or hardware trade, spectacles to the optical man or druggists. Besides these, jewelers sell musical sundries, pipes, plush goods, etc. It don't meet the case to say that jewelers *generally* sell plated ware, and have done so, *as a rule*, for that is only saying that they, *as a rule*, sell lines not strictly within the limits of their business.

If watchmakers have the right to add lines within the scope of the hardware trade, then, for exactly the same reason, the hardware man has the right to add lines within the watchmakers' trade, and so on. I say then, on the ground of personal freedom, any man has an undoubted right to buy a *stock* of watches, jewelry, silverware, stationery, hardware or any other line or lines he chooses, and to sell them without hindrance, whether he knows how to repair a watch or not. Understand, Mr. Editor, I claim the carrying of stock to be necessary, not merely selling from list or sample. The practical man has always an advantage, and, under a system of uniform prices for staples, he would have a still greater advantage. Even as it is, there are comparatively few general dealers throughout Ontario, in places having a practical watchmaker, who deal in watches, and any attempt to cut them off would only compel them to employ a watchmaker and thus repairing as well as sales would be distributed. The remedy is not in cutting them off, but in making a uniform price list.

I quite agree with watchmakers, in

Factory of the American Watch Co.-Waltham, Mass.

their objection to allowing general dealers who carry no stock, to sell watches from list or sample, thus making a vexatious opposition for many persons, but this is fast being remedied by the wholesalers.

Within recent times watchmakers have had four controllable grievances. First, the supplying of city dealers at lower rates than country dealers, thus enabling the city men to flood the country with catalogues and lists, at prices which the country dealer could not afford to sell at, on account of his paying more for his goods. This has been remedied by the Manufacturers' Association. Country and city dealers are now on the same footing so far as the cost of watches is concerned. Second, the selling by job bers at retail to outside dealers, who sell from list or sample, carrying no stock. This is being remedied by the J obbers Association. Third, the bringing in of watches by private parties from the U. S., for the use of themselves or their friends, avoiding the duty. And now, Mr. Editor, let me digress so far as to say, that you would be doing the trade generally a great favor if you would fully explain the law on this point. Many citizens and indeed many jewelers themselves believe that this kind of smuggling is within the law. If so, we can only "grin and bear it," but, if, as I believe, it is contrary to the law, the watchmakers have the remedy in their own hands. Let any one interested bring a few cases to justice and the evil will be considerably lessened. Fourth, the spirit of hostility among watchmakers in the same town and section. That spirit which causes one to run down a purchase made elsewhere, and name a sum, as its value, about the wholesale cost, simply because it was bought at the opposition store; that spirit which causes them to cut an article to the cost to take a sale from the other man. Many are not guilty in this respect, but I ask, Mr. Editor, is there a single watchmaker who does not know of such things being done? The remedy for this lies in strangling that spirit. Let the watchmakers and dealers in each district come together and agree on a general price list for all staple articles, and let every one abide by it to the letter. Should any refuse to accept this list, "boycott" him by informing the wholesale trader of the fact. The price list should be a fair one between dealer and consumer, and, I believe, there is not a wholesale firm in the Dominion who would not willingly back up the district against the individual in such a cause. Should, however, any wholesale firm refuse, "boycott" that firm by all refusing to patronize them. This plan would very soon bring any dissenting dealer into line. For this and all general purposes section associations would be more advantageous than a *large general* association, but space won't admit of my naming reasons in detail.

My object in this letter, Mr. Editor, is to bring the whole matter under discussion, with the hope that the result will be a broad comprehensive scheme, acceptable to the Manufacturers' Association and conducive to the welfare of the trade. The necessity exists and the watchmakers can formulate such a scheme. Will they?

Yours truly,

EQUITY.

Selected Matter.

THE SCIENTIFIC SALESMAN.

Fine salesmanship requires brains. The mere art of selling goods is simple enough, but the knowledge of moving large quantities, of understanding how to deal with customers, to make them feel well disposed, to retain this feeling and continue their patronage, is as much a science as any taught by scholars or studied by students.

In the first place, true salesmanship requires a keen and ready insight into human nature. There are no two men alike and each one of us has peculiarities. It is necessary to study these peculiarities. One is jovial and hearty, and wants to be treated in the same spirit. Another is quiet and dignified, and must be handled with gloves. A third likes to chat and cannot be hurried, while his neighbor may be short and quick in his manner and anxious to get through. Some need to be treated to lead them into a buying mood, while others would take such an offer as a signal insult. Hence, the salesman must be thoroughly acquainted with all his customers, must know their peculiarities, and treat each in such a way that he will feel well disposed towards the salesman. The personal characteristics of a salesman, of course, constitute an important element. Some men possess the knack of making themselves popular, and popularity is one of the essentials in the science of selling goods.

One of the most important aids towards the sale of goods is sincerity. Let the buyer be convinced that he is being dealt with in a fair and honest way, and he will not hesitate to buy liberally if he is in a mood to buy; if he can be got to accept the recommendation of the salesman on one article, he will most likely accept it on others; but let there be a suspicion of trickery or underhand work, and he will be strongly influenced to keep aloof.

A conversation with a most successful dry goods salesman in this city brought out some points that are worthy of mention. An evident desire to help the buyer in selecting goods, and pointing out the best patterns, goes a long way. "After two or three well posted men in the trade have looked through my line," remarked the salesman referred to, "I can pretty well see which are going to be the popular styles, and I give subsequent buyers the advantage of the first selections, and truthfully inform them that such and such patterns are taking. The result is that they obtain goods that move more readily; they sell them and re-order; a superstition arises that there is luck in the goods, and they always remember me, and give me a hearty welcome and a good order." Nothing will so disgust a man as to see styles grow old upon his hands, and nothing will so hinder the chances of the man who sold them in subsequent transactions. Hence, sincerity and an honest lookout for the welfare of customers are not only necessary to accomplish sales, but also the best policy in the long run. The dealer who has once been "stuck" and discovers it, as it will not take him long to do, never forgives the one who has sold him the goods, and so the one lucky sale may prove the last.

A wise salesman will never enter into an argument with a customer, be it on religion, politics, or any other subject. If you disagree at the start, you are very sure to disagree just as much at the finish, and usually stir up considerable excitement and some feeling of animosity, with nothing to show for it. The safe plan is to steer clear of all forms of controversy.

A few words of advice once given by an older brother to a young man just about to start out on the road are well worthy of repetition here, and, we fancy, should apply in the main to the young salesman behind the retail counter as

Meriden Britannia Co.

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

well as to the commercial traveller:—"First of all be courteous and obliging, if a man is busy do not bother him; if there is any little favor you can do him, do it unasked. Always be as cheerful as you can—I don't mean blustering or boastful. Do not endeavor to sell him anything you know he cannot sell and another man can. When you know he has goods enough let him alone, and above all, get his confidence, so that when you say a thing he will believe it. Always try to get a chance to show your goods, but never forget that you are a gentleman, and do not assume familiarity with people unless you really know them. If you follow these rules, and have the right goods, you must succeed."—*The Merchant.*

MY WATCH.

When I was unmarried, and could do as I pleased, I never carried a watch. I never could understand the value of a watch, except as an article that might be hypothecated in a pecuniary emergency. I could always ascertainthe time, because every church and sample room boasted a clock, and what was the use of purchasing what could be had for nothing?

By my system of consulting these public time-pieces I always managed to make my connections right. I never entered a theatre after the curtain had risen, or reached the station at the moment when the train was vanishing.

I was made happy in more ways than one by not having a watch. I didn't have to tell fifty people the hour every day; and I never worried about the safety of the contents of my vest pockets in a crowded horse-car.

One night I was awakened rather suddenly. I felt a strange hand under my pillow. It was a burglar's, feeling for my watch.

"I have no watch," I remarked, as politely as I could; "but you'll find a dollar brass clock in the kitchen, if you want to know the time."

In his great hurry he passed through the window, and I shuddered as I heard him trickling down through the arbor below.

But after marriage it was different. I was told that I should wear a watch, in order not to appear poverty-stricken in the eyes of the world. I argued that it would place me on a par with weasel-headed clerks whose bangs and eyebrows meet. I was told that if I wore no watch everyone would think I had one drawing interest for an avuncular relative.

This seemed a very subtle argument in favor of having a watch. And, besides, it completely upset me. I imagined that on the same basis people would fancy I had all sorts of things in pawn that I didn't wear, such as a seal-skin overcoat, diamond rings, etc.

As a tentative measure, I got what I call to this day a "patent-medicine watch," because I bought it in a drug store. It was an advertising scheme to attract people to the patent medicine. I should much prefer to swallow the contents of a drug store than carry one of those watches a week. It had to be wound up every night, and took nearly all night to wind it. It didn't keep very good time, but I continued to wear it, that I might wind it for exercise. It superseded my dumb-bells until the stem wore the skin off my thumb and forefinger. When buried in profound meditation, it was my custom to take the watch out and wind it in an abstracted manner, just as others in a similar mood pick their teeth or whittle. I stated at home that I merely purchased the patent medicine watch to learn how to take care of and manipulate one before getting a more expensive specimen.

This bit of news gave great satisfaction. I was looked upon as a good-natured, self-sacrificing being, who would soon wear a long watch chain stretching all the way across the chest, and emptying into two pockets. As a reward I was presented with a watch.

The first day I wore it I was told I was wrong by a man who had just set his watch at some jeweler's. So I changed mine to make it agree with his. It seems it lost time, and I missed my train that night, a thing I had never done when I did not possess a time-piece.

Every few minutes I was asked the hour, to get me accustomed to pulling it out, and inside of a week I had acquired an artistic negligence and indifference of manner that was pronounced beautiful.

But the watch became eccentric. The eggs that were timed two minutes by it came out as hard as cobble-stones, and trying to regulate it by tapping it against my boot-heel, I thoroughly disorganized it, and was obliged to leave it for a week with a jeweler, who lent me in its stead, a great silver machine that I was ashamed to take out of my pocket in daylight.

In short, when I got it back I did nothing but miss trains, It was never right. It was either too fast or too slow. Sometimes I would start for the cars thinking I had ample time, and reach the station after their departure; or else I would start on a run and half kill myself to get there in time, only to ascertain that I had arrived half an hour too soon.

It would take too much ink to tell how many sorrows and tribulations that watch brought upon me. I protested against wearing it many a time, but my protests were in vain. Finally I concluded that I would allow myself to be martyred, so I still carry it, but not for use. I wind it up about once a month, and never look at it. I go by the clocks I see around me, as I did before, and catch my trains and make all other time connections right. I don't like to say anything harsh of it, because it is a nice watch, and it would be simply perfect if it could only keep the right time.—*Puck.*

HOW CROOKS WORK.

The following narrative, told by a jeweler, is full of interest, and opens up another clever scheme of those who hate to work for a living:—

"I had a novel experience not long since with one of the crooks. Not, however, as a victim, but in the way of business. Two young fellows came into my shop, and one asked me if I engraved rings. I said that I did. 'Then,' said he, 'cut some letters in these for me,' piling out of his pocket upon my showcase a handful of rings. 'What letters?' I asked. 'Oh, anything you like, M. to R. and F. to B. and C. to W., and all that sort of thing.' I saw at a glance what the rings were and told him: 'The engraving will cost you ten cents a letter which will be three times the value of the rings, which are only base metal, very thinly plated.' 'That's all right,' he replied very placidly; 'I know what they are.' 'Come,' I said; 'there is something crooked about this. What do you mean to do with those rings?' 'Well,' he answered, 'I don't mind making a clean breast of it to you. Me and my pal here have tried hard to get along working, and we don't seem to make a go of it. We can't get no work. Now we're going to play the smarties for a living awhile until we strike something better. Those rings are for the dropped-ring trick. It is pretty well played out

REPRESENTATIVE.

here, though the fools ain't dead yet in New York, not by a large majority. But it's bully game yet out in the country, in towns of 1000 or 2000 inhabitants. One of us sees a lady walking along in a quiet sort of street, and going up close to her, pretends to pick up a ring, and says to her: 'Excuse me, lady, but did you drop this ring?' holding it out to her. Well, you may believe me or not, but it's God's truth that three out of five of them, after hesitating just a little, will say, 'Why, yes. Dear me! how could I have let it slip off my finger and not notice it?' Then one of us that is working her says that he is hard up, and hints at a little reward for his honesty. We hardly ever get less than a dollar, and sometimes two or three that way. If the lady don't bite on the bait that it's hers, then we try to sell it to her, saying that we are looking for work, tramping through the town poor and hungry, and would rather have a two dollar note than a pound of gold rings to wear. Either she says to herself that it's a good chance to get a heavy gold ring for one-fifth of its value, or, if she's a real straight one, she thinks: 'I know pretty much everybody in town, and can find out who lost it, so I'll return it to the owner and get my money back with thanks for saving a keepsake.' So, however the lady figures it out, we are mighty likely to get the two dollars, and then we dance along to look out for somebody else's daughter.' 'Then you play this trick only on women?' I asked. 'No,' he said, 'mostly on them because they are the easiest; but where we see a fellow that looks like a subject we give him the crop with the glove and ring.' 'What do you mean?' 'Drop a lady's little kid glove, with a ring nicely tucked down in one of the fingers and, pick it up near him. When he says it ain't his we accidentally-like find the ring and shake it out before him. That is pretty sure to throw him off his guard, and when we come the necessity dodge on him he goes to the slaughter like a lamb. Sometimes we get a V that way. Men that look real good, clerical-like, are pretty sure meat for us, but they're not liberal in buying."—*Exchange.*

ANDREW CARNEGIE, the Pittsburg millionaire philanthropist, has just made a magnificent present to the men in his employ. It is a large house and land, worth $25,000 or $30,000, to be used as a library and meeting place, with a handsome sum of money to purchase the necessary books.

IMPROPER FAMILIARITY.

A correspondent of the *Jewelers' Circular* calls attention to a practice that he has sometimes found objectionable, which is that travellers occasionally make too free with his employees. On more than one occasion he has returned to his store after a brief absence to find a travelling man engaged in conversation with his salesman or his watch repairer, and making himself as familiar with them as though they were old friends or boon companions. All work is suspended while this chat is going on, and the employer is losing the services of his paid assistants. Then there is always the suspicion that the suave and chatty traveller is slyly pumping the employees as to the business affairs of the dealer, seeking to obtain information regarding him in a surreptitious manner. Of course, the dealer is antagonized at once, and does not hesitate to say no when solicited to purchase from the samples the traveller is so anxious to exhibit. The correspondent says, further, that it is not an uncommon thing to find a traveller hobnobbing with employees after business hours, visiting saloons with them and "seeing the sights." All this, dealers naturally regard as an underhand way of obtaining information about themselves and resent it accordingly. They are suspicious, too, that these interviews may be preliminary to the workman setting up in business as a competitor, and that the traveller is encouraging him to "branch out for himself" in order that he may have another customer to sell to. A dealer will resent anything that he regards as an intermeddling with his affairs, and many a traveller who has been surprised at the cool reception a dealer has given him and his failure to obtain an order, may find the reason in the fact of his being found in conversation with the employees. The correspondent says he has several times refused travellers solely for this reason. The head of a house likes to have his position recognized, and any attempt to exalt a subordinate into prominence is sure to arouse the opposition of the one who regards himself as slighted. Travellers not only injure themselves, but the business of their employers, by following this reprehensible practice. Another complaint we have frequently heard made against travellers is that they are prone to make the store of the dealer a loafing place while they are waiting for a train or for some other cause. A courteous dealer feels bound to entertain his visitor, thus losing time that should be devoted to business, but he feels all the time that he is being imposed upon. Of course, these offenses against good business practices are unintentional, resulting from thoughtlessness; but they betray a lack of consideration not creditable to him who indulges in them. But no man has a right to be thoughtless or inconsiderate in business matters; business has its laws and customs, and a plea of ignorance is of no more avail regarding them than it is regarding the general laws of the country. If a traveller knows the customs of business, he has no excuse for offending against them; if he does not know them, he has no right to be on the road. Among the most pertinent business mottoes are these: "No talking with employees;" "No loafing on these premises."

PROMPT PAYERS.

A reputation for prompt pay is worth more to the retail trader than his store, stock or the good-will of his business. Unlike the intangible "good-will" of the law merchant, it cannot be the subject of barter. The inexorable laws of the world of commerce, which created this invaluable property have also made inalienable. Go where he may, through town, county, or State, the retail merchant who is known as good pay, possesses a talismanic influence which makes him the peer of the merchant princes of the commercial world. The choicest stocks of manufacturers and jobbers are at his command. Prompt pay and good credit go hand in hand. Good credit piles the shelves of the trader with fresh, bright goods, and prompt pay repairs the breaches made by the army of buyers in their inroad on the stocks of the smiling trader who counts in his capital the indefeasible advantages of a reputation for prompt pay. In the past year prompt pay has done great things for many of our interior traders. If changes in terms of sale have become necessary, they have never pressed with much severity upon the trader known as good pay. He comes into the market as a buyer, on a first-class basis. His request is a command to the jobber. His goods are always shipped promptly, and are never detained on the road. If he buys by sample his goods are uniformly up to the standard of the sample or several degrees

[ADVT.]

PROTECTION TO RETAILERS.

A HEARTY RESPONSE FROM THE JEWELRY TRADE OF THE DOMINION TO SMITH & FUDGER'S CIRCULAR.

Letters of Congratulation and Approval from all Parts, in French and English.

JEWELERS THOROUGHLY ALIVE TO THE IMPORTANCE OF THE ACTION.

THEY HOPE THE EXAMPLE OF SMITH & FUDGER WILL BE FOLLOWED BY ALL JOBBERS, AND ALL WITH ONE CONSENT PLEDGE THEMSELVES TO SUPPORT THE MOVEMENT.

On the 1st of November a circular was issued by Messrs. Smith & Fudger, of this city, announcing what has proved to be the most popular movement for the regulating of the retail watch and jewelry trade which this country has known for many a long day. Readers of the TRADER need not be told that there has of late been a growing dissatisfaction on the part of watchmakers with the existing state of affairs which enabled shop-keepers of almost any denomination to purchase watches and jewelry in Montreal, Toronto or Hamilton at wholesale price, and so become rivals of the watchmaker, over whom they had the advantage of being able to take a smaller profit because they carried no stock of watches, and gave no guarantee with watches sold. That this grievance was not confined to Canada may be seen by reference to recent issues of United States trade journals, and a similar announcement to that of Smith & Fudger was made in October by a leading firm in Chicago. Dealers in this country may congratulate themselves that any advantages enjoyed by their neighbours across the line may be their own also, as doubtless the jobbing trade here will follow the example of Messrs. Smith & Fudger, which is wise and timely, and in the best interests of both wholesaler and retailer.

We annex a copy of the circular, and a few of the complimentary letters received in reply thereto. This matter now rests largely with the retailers themselves, as what Messrs. S. & F. have undertaken to do will be on their part faithfully carried out. Would it not be worth the while of *every jeweler in the Dominion* to show his approval by dropping a line of encouragement to the enterprising firm who have inaugurated this new movement, and it might not be amiss to include a small order as tangible evidence of appreciation.

CIRCULAR.

To the Retail Jewelry Trade:

Believing it to be in the interest of the Retail Jewelry Trade that protection be afforded against the unfair competition of dealers who carry no stock, we have concluded that from this date (Nov. 1st, 1885) we shall sell only to such as are legitimately in the Watch and Jewelry Trade. We shall urge upon the Association of Canadian Jobbers such legislation as shall prohibit its members from selling to any dealers who cannot be classed under one of the following heads:

WATCHMAKERS ACTIVELY ENGAGED IN BUSINESS.

FIRMS OF WHICH AT LEAST ONE MEMBER IS A WATCHMAKER, OR WHO EMPLOY A WATCHMAKER.

FIRMS THAT MAKE WATCHES AND JEWELRY THEIR EXCLUSIVE BUSINESS.

We shall absolutely refuse to sell any goods at retail, and shall use our vote and influence in the Association to prevent retailing by any of its members.

Since our firm has been established, we have endeavored to prevent any intermingling of the watch and jewelry business with other lines. This has heretofore been difficult, but we are now about making such further alterations in our premises and in our methods as shall guarantee the complete isolation of our watch and jewelry business from any other lines in which we may be interested.

We confidently invite the continued and increased patronage of the trade. Feeling satisfied that our course is the proper one to pursue, we shall stand by it to the letter. We will thank our customers if they will write us whether or not they approve of our action. All suggestions and criticisms will have careful attention and consideration, and we hope that our endeavors will be supported by the trade until finally *all* watches and jewelry will find their natural channel to the consumer, viz.: through the watchmaker and jeweler.

Yours respectfully,

SMITH & FUDGER,

48 Yonge Street.

Toronto, 1st. Nov. 1885.

From the Capital.

OTTAWA, Nov. 6, 1885.

To Messrs. Smith & Fudger, Toronto.

DEAR SIRS,—Your circular to hand. If you could bring such a thing about, so as to induce every wholesale house to join you in your determination not to sell to anyone but the "legitimate trade," as you express it in your circular, you will, I am sure, deserve the thanks of every watchmaker and jeweler in the dominion.

I am, dear sirs,

Yours very truly,

A. ROSENTHAL.

From the "Limestone City."

KINGSTON, November 1885.

Messrs. Smith & Fudger.

GENTLEMEN,—In reply to your circular sent, respecting the protection of jewelers, we beg to say, we think it a good idea, and are pleased to see the wholesale men are taking the interest they are in the protection of the retailer. It is time some such steps were taken, as the watch trade of late years has fallen into the hands of unscrupulous dealers, who would sell at any price, thereby not allowing the legitimate dealer a chance to make a living and pay one hundred cents on the dollar. Thanking you, gentlemen, for your timely interference in such an important matter.

We remain,

SMITH BROS.

From the Forest City.

London, Nov., 1885.

Messrs. Smith & Fudger.

Gentlemen,—I have much pleasure in adding my signature to the intended change advocated by the wholesale jewelers, and know that it would be of much benefit and a justice to legitimate retailers.

Andrew Morphy.

From the Eastern Metropolis.

Montreal, 6th Nov., 1885.

M.M. Smith & Fudger, 48 Yonge Street.

M.M.—Je vous félicite de la bonne idée que vous aver eu dans la circulaire que je veins de recevoir et concours complétement dans les idées que vous emettez, esperent que vous aurez tout le succès possible.

Je demeure, M.M.,

Fortier et Cié.

Hamilton Speaks.

5 James St. N., Hamilton, Nov. 18, '85.

Messrs. Smith & Fudger.

Dear Sirs,—In reply to your circular to the retail jewelry trade of Nov. 1, 1885. I am well pleased with the maxims it contains, and hope you will be able to get the rest of the Association to agree with you in carrying them out, as it would benefit both wholesale and retail dealers.

I remain, yours very truly,

Thomas Lees.

Brantford Concurs.

Brantford, Nov., 1885.

Messrs. Smith & Fudger.

Dear Sirs,—Your circular received and I must say I fully endorse its contents, and I hope, at the next meeting of the Association, that your vote and influence may succeed in making the motion unanimous, which, if *faithfully carried out*, must prove a benefit to retailers. But a greater evil to the trade exists than the one you mention in your circular, and that is the *long* and *loose* credit that is given to parties, which is very discouraging to those who pay one hundred cents to the dollar.

Yours very truly,

G. H. Fawkes.

Congratulations From St. Thomas.

St. Thomas, Nov. 7th, 1885.

Messrs. Smith & Fudger.

Dear Sirs,—Your circular to hand and contents noted. You say you will stand by it to the letter, and so say I. I will not buy a dollar's worth of any house that sells to others than those mentioned in your circular if I know that they do so. I approve of your action in every respect, especially for being *the first to take it up.*

Yours truly,

A. B. Remey.

Stirling Testimony.

Stirling, Nov. 19th, 1885.

Messrs. Smith & Fudger, Toronto.

Gentlemen,—In reply to your circular (in the interest of the retail watch and jewelry trade), I must say that I highly approve of the action you have taken in our behalf, for it cannot be otherwise than a benefit to all retailers of watches, and hope they will look at it in the same light that I have.

Respectfully yours,

W. H. Calder.

From the Far West.

Minnedosa, Nov., 1885.

Messrs. Smith & Fudger, Toronto.

Dear Sirs,—*Re* circular: You wish opinions as to above. It is a step in right direction. Retailers would no doubt co-operate. There is a difficulty in sparsely settled districts, where there is no watchmaker for hundreds of miles, as in the N. W. T. A great assistance, I think, would be a differential rate to the trade, with a refusal to serve store-keepers when a watchmaker is within 20 miles, whether served by one firm or another, and a definition as to what goods properly belong to the watchmaking and jewelry trade, viz.: such goods as spectacles, silver and electro-plated ware, gold rolled plate and gilt jewelry, &c. Being out here and having some experience in these unsettled districts, would write fuller upon it if you desire it.

Yours, &c.,

Wm. Pearson.

On the Grand Trunk East.

Whitby, Ont., 9th Nov., 1885.

Messrs. Smith & Fudger, Toronto.

Gentlemen,—Your circular of the 1st. inst. came to hand, and your intended action relative to the protection of the legitimate Watch and Jewelry Trade meets with my most hearty approval. I would suggest that your limit be extended so as to include any working jeweler who may desire to engage in the retail business beyond that the limit should be inexorably fixed.

The retail trade will, I am sure, support those wholesale houses that speedily and heartily adopt this measure.

Those engaged in our business who regard it as a highly honorable trade, and who desire to free themselves from the unsavory imputations, under which the respectable part of the trade suffers, from the conduct of the peddler and the auctioneer, will hail the movement as one likely to help to "that consummation most devoutly to be wished for."

I am, yours very truly,

John S. Barnard.

Cobourg, Nov. 7th, 1885.

Messrs. Smith & Fudger, Toronto.

Gentlemen,—We received circular yesterday,(Friday)and were very much pleased to know some one was trying to protect the watch and jewelry trade; but we are of the opinion nothing of much value will be accomplished till all wholesale houses refuse to sell to certain firms in your city who advertise single watches at wholesale prices. You look in last Saturdays *Mail* and you will find watches advertised at less than we pay for them. We are at a loss to know how this is done. Kindly inform us how anyone can sell watches at such low prices. We think if a stop could be put to it by the Canadian Jobbers in some way it would be about the best thing that could be done to protect the watch and jewelry trade. However, we think the steps you are taking are very good, if carried out, and we wish you every success.

We remain, yours truly,

W. H. Scott & Co.

BRIGHTON, 21st Nov., 1885.

Messrs. Smith & Fudger, Toronto.

GENTS,—Respecting your circular of the 1st inst., I beg to assure you of my hearty sympathy with the object of the same, and am of the opinion that if the Jobbers' Association adopt the platform you have laid down it will be beneficial to the trade.

I am, yours truly,

W. W. PORTE.

From the Ottawa District.

ALMONTE, Nov. 10th, 1885.

Messrs. Smith & Fudger.

GENTLEMEN,—Your circular of the 1st inst. to the retail jewelry trade came duly to hand, and in reply would say that I heartily approve of your action in the matter, and I am sure that all wholesale dealers engaged in the same kind of business that you are would be benefited by strictly adhering to such an action; the retail dealers would also be benefited, and would have more confidence in the wholesale men, and in saying this I believe I speak the sentiments of the majority of the retail dealers.

Respectfully yours,

J. H. THRALL.

From a House of 25 Years Standing.

GANANOQUE, ONT., Nov. 9th, 1885.

Smith & Fudger, Toronto.

DEAR SIRS,—Allow me to congratulate you on the course you have adopted (circular of Nov. 1st, 1885). I fully approve of your action in this matter, and will give you a liberal portion of my trade.

Yours truly,

G. N. ASSELSTINE.

From the Western Peninsula.

MITCHELL, Nov. 10th, 1885.

Messrs. Smith & Fudger, Toronto.

DEAR SIRS,—Your notice of protection to hand. I think it is only just and fair that we should be protected against wholesale houses selling retail. I think the retailers will be only too pleased with the action you have taken.

Hoping all other houses will follow the same example.

I remain, yours truly,

E. F. DAVIS.

Repairing Needs Protection.

PORT ROWAN, Nov. 13th, 1885.

Messrs. Smith & Fudger.

GENTLEMEN,—With regard to the circular you issued, I am afraid the undertaking is too great a job, as nearly all Millinery, Fancy Goods and Fancy Dry Goods men carry jewelry and sell to the general stores. If the trade can be confined to the jewelers in small places, the trade would pay well in places the size of this. If the jobbers selling material would confine themselves exclusively to those having a jewelry business it would benefit us greatly; but nearly all jobbers sell material to anyone and fix watches at trade list prices for a farmer if he gets their address and sends his watch down. The repairing is what we depend upon mostly for our living, and that is cut to pieces by outsiders. If the Secretary of the Association of Canadian Jobbers could get a list of these outside repairers, and forbid the members selling material to them it would help us more than what jewelry is sold, if carried out to the letter.

Yours, etc.,

H. B. WICKENS.

PORT COLBORNE, Nov. 12, 1885.

To Messrs. Smith & Fudger, Toronto.

GENTS,—*Re* your circular to the retail jewelry trade, I hereby endorse all said therein and believe that trade would be benefited by the united action of wholesale houses. I think I have the neatest fitted up watch store between here and Toronto, and, for a practical watchmaker, won't take a second place. I have outlasted opposition for the last thirteen years, and firms who do what they can to put down these jewelry peddlers, will receive my humble support.

Yours, &c.,

H. R. CUDDON.

From the North.

COLLINGWOOD, 9th Nov., 1885.

Messrs. Smith & Fudger, Toronto.

DEAR SIRS,—We are pleased to note in your circular that you have determined to confine your wholesale prices to the legitimate trade in watches and jewelry. We do not think it justice to dealers making those goods their specialty that they should be sold to outsiders. Your circular gives us confidence in asking a fair profit henceforth.

Yours truly,

F. H. NETTLETON & Co.

MARKDALE, 17th Nov. 1885.

Messrs. Smith & Fudger, Toronto.

SIRS,—I am pleased with your resolutions as per circular issued to retailers. I have no fault to find with your firm. During the two years we have done business, I have not found you interfering with me, directly or indirectly, and I purpose to stick to you.

Yours truly,

W. A. BROWN.

MOUNT FOREST, Nov., 1885.

Messrs. Smith & Fudger.

GENTLEMEN,—Your circular to hand and contents noted. Mr. Dale is unable to write, but he wishes me to tell you that he hopes that you and all other wholesale dealers in jewelry, &c., will adhere to the rules laid down in your circular. Just anyone being able to get a watch or article of jewelry wholesale has been the greatest annoyance to him, so much so that he has made a point of dealing as little as possible with any wholesale dealer he has found who did so. He says he has had the greatest satisfaction doing business with you in every other way.

Yours respectfully,

MRS. R. J. DALE.

From Otto Young & Co., who Inaugurated the Movement in the United States.

CHICAGO, Nov. 16, 1885.

Smith & Fudger, Cor. Yonge and Wellington Sts., Toronto.

GENTLEMEN,—Your favor at hand. In reply say that you will not only find this method the right one, but will also find it profitable.

We have this day forwarded to your address one of our pamphlets, wherein you will notice a portion of the commendatory replies received from our circular from Oct. 1st.

Yours very truly,

OTTO YOUNG & CO.

Per K.

EXCERPT FROM THE CIRCULAR OF OTTO YOUNG & CO. TO THE RETAIL WATCH AND JEWELRY TRADE.

Since issuing our notice to the jewelry trade of the United States, dated Oct. 1st, in which we notified them that we would hereafter strictly confine ourselves to and sell only to the legitimate jeweler, as defined in our circular, we have come to the conclusion that the step we then took was the right one, but unless we have the co-operation in this important move of the principal manufacturers and jobbers, together with the retailer, we alone will not be able to obviate the existing evils. We, perhaps, have benefited ourselves, by having obtained the good will of the watchmakers and jewelers, and thereby may eventually gain trade. However, this was not our main object, and certainly is not now, after having perused several thousand answers to our circular.

To place the jewelry business on a better footing, it first becomes necessary to state specifically the causes of its retrogration, and then the great question is before us, how to find the remedy.

Evils, as existing between retailers, we shall not now attempt to discuss; nevertheless, we have no doubt that they are numerous. We, therefore, shall confine ourselves strictly to the inconsistencies existing among manufacturers and jobbers in their dealings with the retail trade. The principal causes of complaint are that some of the manufacturers, and nearly every jobber, have been too anxious for business, and have been short-sighted enough to overlook the fact that there is only a certain amount of goods consumed; whether these goods have been distributed by the legitimate jeweler, or through other channels, the amount of goods finally disposed of remains the same. If anybody is entitled more than another to the final distribution of watches and jewelry, it is the person who has been educated to the business, viz., the watchmaker and jeweler. He has made that line of goods his exclusive study, not only as a merchant, but also as a mechanic, consequently has the necessary knowledge, and therefore is entitled to what profit there is in the distribution of these goods.

The promiscuous and careless distribution of catalogues and price lists, together with the quoting of net prices, has done great injury.

The invitation by jobbers to other merchants to embark in our line, having been accepted by a great many, has divided the trade, and the consequence is to make the volume of trade so much smaller for the retail jeweler.

Many jobbers, not being satisfied to do a wholesale business, also sell all they can at retail, and in many instances make very little or no difference between the wholesale and retail price.

Having specified the evils as existing in the trade, the more difficult task of how to find a remedy, is before us.

After due deliberation, and having taken ample time to mature our ideas and thoughts, if they should not meet with your approval, we will ask you to at least credit us with an honest desire to benefit the whole trade.

We will now proceed to the fountain head, the producer, *i.e.* the manufacturer.

The manufacturer has the power, makes the goods; they are his, and he can sell them to whom he pleases, and he can also make it a condition, and say if you want my goods you must only sell them to such parties as we shall designate, and if you do not agree to this we will not sell you, or if you agree to our conditions and do not live up to them, we will not sell you again. We consider this plan entirely feasible in a great many lines of goods. As you all know, the manufacturers of watch movements, and several lines of cases dictate to the jobbers now the price he shall charge to the retail trade, and if they can do that successfully, why can't they go one step further, and say to whom they shall sell?

Would this be an encroachment on the rights of jobbers? We say no! and will state our reasons for that answer.

Who are jobbers is the next question. Jobbers are individuals or firms who are supposed to conduct a wholesale business; that means buying goods in wholesale quantities and selling them again at a profit in such quantities as the retailer desires to purchase.

Does he receive concessions in prices from the manufacturer simply because he purchases a large quantity? No! Not only for that reason, because there are a great many retailers use larger quantities of goods than what a small jobber does.

Does he pay his cash to the manufacturer when he receives the goods or within a few days, should he for that reason buy goods cheaper? Some pay cash, but the majority of jobbers take time; therefore, that is no reason why he should receive goods at a lower price than the retailer, even should he not use as many goods as some of the larger retailers.

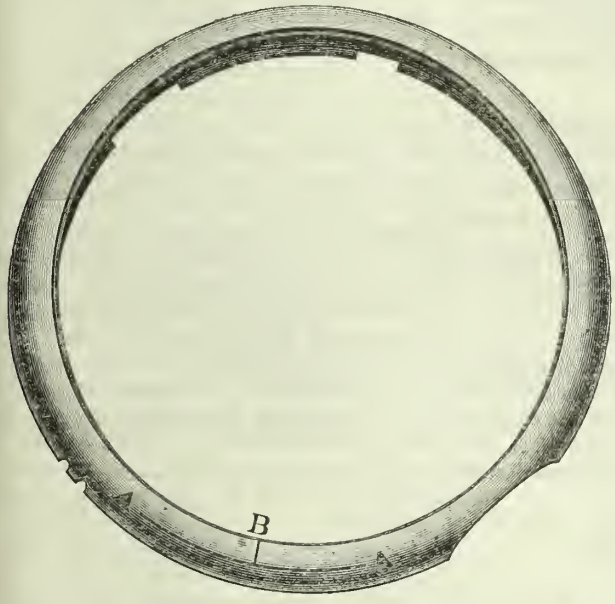
The principal reason is, the jobber is a convenience whom the manufacturer uses to distribute his goods, and as such he is entitled to receive fair returns for his capital invested, and for the labor that he bestows upon his business. He, the jobber, is also a great convenience to the retailer, because the retailer can buy of him, or perhaps several of them, the full line of goods that he deals in, while if the jobber was not in existence, it would involve too much time to get a suitable stock of goods together, and some purchases between retailer and manufacturer would be so very small that it would not pay to open the account.

Therefore, the jobbers are necessary, but not indispensable, and if they confine themselves to their legitimate calling, they become not only a great convenience, but also a benefit to the whole trade.

The line that we have drawn as to who is a legitimate jeweler, we shall strictly adhere to, and until such time as the retail trade will organize, and until they will define (perhaps with the co-operation of manufacturers and jobbers) who are entitled to the sale of these goods.

ONE OF THE GREATEST IMPROVEMENTS EVER MADE IN WATCH CASES.

An Adjustable Bezel for Hunting Cases !



THE FITTING OF GLASSES MADE EASY.

THE KEYSTONE FACTORIES STILL AT THE FORE.

The fitting of crystals in Hunting Cases has always been an annoyance. The great variation in sizes of glasses (for frequently at least three different sizes are found in one package, all numbered alike), defective edges, and difference in shape between the edge of glasses and groove in the bezel, all tend to make easy and proper adjustment a difficult task, and often the attempt costs more, in the breaking of glasses, than is received for the job.

Again, the groove in bezels is often of a size between glass sizes; consequently one size glass will be too small, the next too large, and the effort to fit them must end in an irritating failure.

To obviate these drawbacks is the province of the

KEYSTONE ADJUSTABLE BEZEL.

As will be seen in the above cut, the bezel is slitted vertically (B) and laterally (A) for a short distance in such a manner as to give it elasticity or spring without impairing its strength, but permitting the ready and effective insertion of crystals of different sizes, defective edges, or not perfectly round. To illustrate: An adjustable bezel for which a medium 19 11-16 glass is the correct one will not only take any glass in a package of 19 11-16, but it is also adapted to a 19 12-16 if required.

The arrangement which secures this very desirable result is so minute as to be comparatively invisible to the naked eye, and in no respect mars the uniformity of surface of the bezel. The liability of dust to work in upon the dial is no greater than with the ordinary bezel, as the lateral cut (A) is made below the top of the dial-plate.

The advantages of this great improvement are so plain, reducing to the smallest extent possible the danger incident to fitting glasses, that it is but reasonable to assume that

THE KEYSTONE ADJUSTABLE BEZEL

(the name of the great improvement) marks the introduction of an invention at once ingenious, practical, and exceptionally valuable.

This improved bezel is patented, and can only be obtained on Boss, Keystone and Leader cases, but without any advance in price.

THE KEYSTONE WATCH CASE FACTORIES:

NEW YORK, 14 JOHN STREET. CHICAGO, 100 STATE STREET.

above it. If a job lot of goods is to be sold at a bargain, prompt pay is given the first opportunity to purchase. If there is an advantage to be first in the field with some new article or some new line of goods, the jobber and manufacturer naturally secures that advantage to prompt pay. Prompt pay is a power, as these few points very plainly proclaim.—*Exchange.*

HANDY THINGS TO KNOW AND KEEP.

Here are some figures and rules very handy to know and have at hand, in the mind or on paper. We advise every young reader to learn most of these "by heart" so thoroughly as to always think of them in an instant. Do it while your minds are young and impressible, and they will stay by you like the marks in the clay of brick, or dough of bread or cake before it is hardened by heat. Older people who do not preserve their papers can cut this out and keep it handy for ready reference.

A Rod is 16½ feet or 5½ yards.

A Mile is 320 rods.

A Mile is 1760 yards.

A Mile is 5280 feet.

A Square Foot is 144 square inches.

A Square Yard contains 9 square feet.

A Square Rod is 272¼ square feet.

An Acre contains 43,560 square feet.

An Acre contains 4840 square yards.

An Acre contains 160 square rods.

A Section, or Square Mile, contains 640 acres.

A Quarter Section contains 160 acres.

An Acre is 8 rods wide by 20 rods long.

An Acre is 10 rods wide by 16 rods long.

An Acre is about 208¾ feet square.

A Solid Foot contains 1728 solid inches.

A Pint (of water) weighs 1 pound.

A Solid Foot of water weighs 62½ pounds.

A Gallon (of water) holds 231 solid inches.

A Gallon of milk weighs 8 pounds and 10 ounces.

A Pint (of water) holds 28⅞ solid inches (28.875).

A Barrel (31½ gallons) holds 4⅛ solid feet (4.211).

A Solid Foot contains nearly 7½ solid pints (7.48).

A Bushel (struck) contains 2150 solid inches.

A Bushel (heaping) contains 1¼ struck bushels.

A Struck Bushel contains about 1¼ solid feet.

A COMMON ERROR.

How frequently do storekeepers carelessly recommend and urge their customers to buy an article they happen to have in stock, or close at hand, or on which they make a little more profit, instead of the article the customer actually wants, and which the merchant knows he came for. In doing this the dealer, though he may be recommending a more meritorious article than that enquired for, takes all the responsibility and risk of the transaction upon himself; for, while the customer buys, the chances are he goes away dissatisfied, and when he has used the article in question, if it does not answer every purpose and expectation, he naturally feels that the storekeeper has cheated him, and loses confidence in him. These little acts committed by storekeepers, without dreaming of injuring themselves, create a sentiment in the community which, in the process of time, undermines their business.

Many dealers have found out, when it was too late, that by recommending base imitations or substitutes, when the genuine was in demand, they have lost a good customer and friend. Verily, "honesty is the best policy."—*Exchange.*

SPECIAL NOTICE.

Jewelers throughout Canada will oblige the Editor by sending in to this office for insertion in these notes any items of news pertaining to the Jewelry business that they think would be of interest to the Trade generally.

BUSINESS NOTES.

Mr. A. C. Anderson, of the firm of Lowe & Anderson, has just returned from Manitoba, where he has been pushing business for his firm.

C. D. Edwards, the safe manufacturer of Montreal, after a long up hill fight, has again been compelled to assign. It looks as though Ontario enterprise and competition were too much for Quebec safe manufacturers.

Dissolution.—Most of our readers will be surprised to learn from this issue of our paper that the firm of Thayer & Ellis, Wholesale Jewelers, has been dissolved by mutual consent. Each of the partners will carry on business on his own account in this city.

Mr. Chas. H. Taisey, the Manager of the American Waltham Watch Co., at Boston, dropped in to see us when on his last visit to the city. He looks well and reports the prospect for Waltham watches as being brighter than ever.

Music Hath Charms.—We received a few days ago from Mr. E. W. Whitney, the genial Canadian representative of S. Brainard & Sons, musical house, a choice lot of high class music published by his firm, for which he has our best thanks.

A Large Failure.—The firm of C. T. Picard & Co., wholesale watch importers of Montreal, have made an assignment. Their liabilities are principally in Switzerland. The prospects are at present that the firm will be able to get a settlement with their creditors and resume business.

Flattering.—*The Merchant*, of this city, which we regard as one of the ablest of our mercantile exchanges, does us the honor to reprint in full in their editorial columns, with some flattering comments, our editorial article on "Tribunals of Commerce," published in our November number.

The Lightning Traveller.—Mr. R. Russell, representing the firm of Lowe & Anderson, has been dubbed by his friends "The Lightning Traveller," as they claim that he covers more territory than any jewelry man in Canada. As he sells goods from Halifax, N. S., to Regina, N. W. T., his claim seems to have a pretty solid foundation.

New Jewelry Paper.—*The Jewelers' Weekly* is the name of a new publication lately issued in New York in the interests of the jewelry trade. This new accession to the craft is very tastefully printed, and its editorial and other original matter well worthy of perusal. It aims to give the jewelry trade of the United States trade news weekly instead of monthly, and should win success on its own merits. The Trader wishes it long life and prosperity.

T. C. Carrol, jeweler, of Hamilton, has lately had both the sheriff and the customs' inspector looking after his stock; the former to satisfy unpaid creditors, and the latter to see that Her Majesty's customs had not been defrauded of revenue. It is openly hinted that Carrol himself gave the information which led to the customs' seizure, in order to keep his creditors out of their money, but fortunately they were too quick for him, and the scheme miscarried.

Works of Art.—The lithographed show cards now being sent out by Messrs. P. W. Ellis & Co., to their customers, are beautifully executed in colors, and are artistic enough, if properly framed, to adorn the walls of any house in the country. Not being wealthy enough to spend twenty dollars each for framing them, we have hung them on the walls of our sanctum, as sent out by the firm. We need hardly say they are much admired, and that we have had to buy a revolver to keep our visitors from carrying them away.

A Good Sheppard.—We had a flying visit from Mr. John Sheppard, the New York manager of the Boss Case, about a week ago. Mr. Sheppard has been over in England all summer, initiating the Britishers into the secrets of the Boss Case, and we should judge with tolerable success. A filled gold case appears to be a curiosity in that quarter of the world, and he was often met with the query, "Well, what is your bloomin' case made of anyhow?" Mr. Sheppard reports this fall's trade in filled cases as the best they ever had.

Recovery of Stolen Goods.—We are very glad to learn from undoubted authority that Mr. A. M. Gilpin, jeweler, of Uxbridge, whose

safe was burglarized about a year and a half ago, has, through the efforts of Detective Rogers, been enabled to get almost the entire stock back again. Detective Rogers has done some splendid work during the past year and is one of the rising men in his profession. If success is any criterion of ability, he should soon be at the top of the tree. We congratulate Mr. Gilpin on the fortunate recovery of his valuable stock.

Captain Howard.—We had a call from Captain Howard, of "Gatling Gun" fame, a few days ago, while on his way to Ottawa to interview the Government regarding the establishment of a cartridge factory in Canada. He has selected a place at Lachute, Que., for his operations, and if the Government grant him some small and very reasonable concessions, he will at once proceed to erect and equip the buildings required for such an undertaking. Probably no man in America has had more experience in the manufacture of cartridges than Captain Howard, and if he once gets fairly going in Canada, it will soon make us independent of outside factories for such goods. If his ideas are carried out, the volunteer force should be greatly benefited by the change in the quality and price of the ammunition they use.

The Captain of the Ill-Fated Algoma.—We regret to learn that Captain Moore, the captain of the Algoma that was lately wrecked on Isle Royal, in Lake Superior, is lying at Port Arthur almost at the point of death, from injuries received during the shipwreck. At the time of the catastrophe some unfavorable comments were made by the papers regarding Captain Moore's conduct, but subsequent evidence has fully vindicated the Captain's reputation for courage and self-sacrifice. All accounts now agree that but for Captain Moore's heroism and devotion, that not a man would have been left to tell the tale.

Messrs. John Segsworth & Co., the well-known wholesale jewelers of Toronto, have removed to their new warehouse on Wellington Street east, next door to the Bank of British North America. Their new premises are very centrally situated, on the ground floor, and when fully finished will be one of the best in the city. We are sure that neither Mr. Segsworth, nor the trade who patronize his firm, will regret the want of the two pair of stairs that graced the approach to the old premises. If any more jewelers locate on Wellington street we shall have to get up a petition to the Council to have the name changed to "Maiden Lane."

A Dishonest Express Messenger.—An express messenger named Greene, connected with the National express company, was last month arrested by the customs authorities and committed to stand his trial for systematically smuggling into Montreal large amounts of valuable jewelry and other things without paying a cent of duty. It is said some extensive firms there are involved in the swindle on the exchequer with the prisoner. This is one of the cases in which the customs authorities should have a thorough investigation and punish the guilty parties. A few months in gaol would do these smugglers no harm, and would act as a deterrent to others of that ilk.

A Good Thing.—We have been shown the model of a spectacle and eye-glass case patented by the Montreal Optical and Jewelry Co., which they intend putting on the market early next year. The importance of this case to jewelers can hardly be estimated, as it enables them to keep their stock in first-class order, avoid duplicating unnecessary numbers, and always know when they are out of any line of goods. Jewelers as a rule do not seem to recognize the importance of keeping up the spectacle trade, and consequently the country is overrun with pedlars, who very often make sales that they would not make if the jeweler kept his stock nicely. Spectacles are a good paying line, and if kept in a show case such as invented by the M. O. & J. Co. will give very little trouble to the seller.

A Good Investment.—A well planned but unsuccessful attempt to burglarize the banking house of A. W. McIntyre, at Dutton, Ont., was made since our last issue went to press. Mr. McIntyre personally seems to have closed his bank about eight o'clock on Saturday evening, and on Monday morning when his clerk opened the doors he was surprised to see a number of tools scattered around the office and the door of the vault broken. An examination showed that the burglars had been foiled in their attempt to break into the safe which was in the vault. It was one of Goldie & McCulloch's steel burglar-proof safes. A hole had been drilled into the door a short distance, until the steel was reached, but the cracksmen, although apparently professionals at the work, could get no further and had to abandon their task. There was $5,000 in the safe at the time, and that the fellows did not secure this rich booty is to be ascribed to the excellence of the safe which is of novel construction and especially made to resist any such attempts that might be made upon it.

Bull Proof Safes.—Everyone has heard time and again of burglar proof safes, but a bull proof safe is a new wrinkle in the safe line. A few weeks ago while a large herd of cattle were passing along Front street, a wild bull who had been cavorting around much to the terror of our citizens generally, suddenly took the notion into his head to explore the interior of Messrs. J. & J. Taylor's show room and put their safes to a practical and unusual test. Dashing through the door he fiercely attacked a monster safe just ready for shipment and battered it with his head to his heart's content. It was no go, however. The safe stood its ground in great style and didn't scare worth a cent. The upshot of the engagement was that his bullship finally got discouraged and made a hasty exit through the plate glass window without stopping to give the firm a certificate of the durability of their safes or paying for the damage he had done. Messrs. J. & J. Taylor can now announce that their safes are fire, burglar and bull proof, and look to a discriminating public with renewed confidence for a liberal share of their patronage.

Mummy's Eyes.—The other day while we were talking to Mr. P. W. Ellis, the well-known jewelry manufacturer, that gentleman produced something from a recess in his cabinet and asked us if we could tell what it was. The nearest guess we could make was that it was the half of an onion that had been pickled in curry and then hardened by some process; an absurd guess, but it was the best we could do. Mr. Ellis then informed us that it was one of a number of petrified mummy's eyes, which had been left with him by a returned missionary from Peru, for the purpose of having them mounted up as ornaments. He explained that these eyes are taken out of the mummies that are to be found in the old burial mounds of that country. It appears that the mummies—unlike those of Egypt—were not regularly embalmed, but owing probably to some peculiarity of the soil have become completely petrified. These eyes, which are of an opalescent yellow color, are now used in the manufacture of jewelry, and it is said that when polished and properly mounted they have a pleasing effect. Perhaps our taste may be depraved, but if Mr. Ellis ever wants to present us a testimonial as a slight token, etc., we fancy we would just about as leave have a first quality diamond of the same size as a mummy's eye. Probably that is where he and ourselves would differ.

Don't Wear an Overcoat.—The London, England, *Lancet*, probably the highest medical authority in the world, in a recent issue condemns the practice of wearing overcoats as injurious to the health and asserts that more colds are contracted from this cause than any other. It recommends the wearing of one coat of sufficient thickness to keep the body comfortable, and that instead of wearing an overcoat in cold weather that a heavier undercoat be substituted for the lighter one. This advice may be all very well for the editor of the *Lancet*, but if he were in the same financial condition as the editor of The Trader whose funds only enable him to sport one coat of any kind at a time, he would vote the ordinary Canadian overcoat a great invention. The public generally, let alone the editors of trade papers, are rarely millionaires, and until they arrive at that stage of independence so that they can buy as many coats as there are days in the year they had better follow our plan and hang on to the reliable old overcoat.

Our Old Friend Sam Hughes, editor and proprietor of the *Victoria Warder*, of Lindsay, has some very kind things to say about The Trader in a recent issue of his paper. He also refers in a very kind manner to the enterprise of P. W. Ellis & Co., of this city, also old friends of his. We notice Mr. Hughes has got himself into some trouble by his outspoken remarks about the small-pox epidemic at Montreal. We back the *Warder* up in its remarks anent the French people and the small-pox, and if people are so thin skinned that they cannot bear to hear the truth kindly but pointedly spoken, then the sooner they are translated to a brighter and better world (provided always that their mode of exit does not interfere with the health of their neighbors)the better for the country. Talking about French bigotry in reference to vaccination as a preventive, if the disease is not speedily stamped out in that city we shall advocate the interference of the Dominion Government and the application of such rigid measures as are used to stamp out

THE

R. F. S. & Co.

ROLLED PLATE CHAINS

—ARE THE—

BEST.

the foot and mouth disease amongst cattle or the cholera amongst hogs. If such people have no regard for their own lives they should at least be made to have some regard for that of their neighbors. Like all Ontario people we have nothing but sympathy for our fellow countrymen in Montreal, but we should like to see them wake up to the realization of the fact that this is the nineteenth century and that small-pox is a preventable disease if cleanliness and common sense are exercised.

A Strange Case.—Davis & Petty were a firm of jewelers doing business in the town of Lindsay, Ont. Mr. Davis, the senior partner, becoming tired of the business sold out his interest to his partner, who paid him part in cash and part in a patent right to sell the Culp Motor in a specified district of Ontario. Mr. Culp, who is a brother-in-law of Petty's, then took a chattel mortgage on the entire stock belonging to the business (which has since been carried on in Petty's name) as security for a previous account and the new liability incurred by the advances of cash and patent right made to Petty when buying out his partner's interest. At the time the above transaction was effected the firm of Davis & Petty owed money to several other wholesale houses besides S. T. Culp, and these jobbers have therefore found themselves out in the cold, Mr. Petty refusing to pay any money except to the holder of the mortgage. A few months ago these jobbers entered an action at law for the purpose of setting the mortgage aside as illegal, on the ground that the transaction although apparently between Davis and Petty was in reality between Davis and Culp. They contend that Mr Culp had practically bought out Davis' interest and then sold it to his brother-in-law and thus constituted himself a partner in the business. The case was tried a few weeks ago and a decision rendered against Mr. Culp and in favor of the other creditors of the estate. This decision of the court we understand Mr. Culp has appealed against so that it has now to go before a higher court for a final settlement. The case is a very important one to the trade, and its decision will be looked forward to with a great deal of interest. We shall have something further to say about this when we know how the appeal has been decided.

One Year's Work and its Results.—Such is the heading of an open letter to the people of Lindsay, and recently published in the *Victoria Warder*, by Mr. George W. Beall, jeweler, of that town. After referring to the fact that it was just one year since he had lost his all from burglary, and that he never knew how many friends he had until his time of trial came, Mr. Beall tells how generously his creditors dealt with him and how staunchly his friends stood at his back and helped him through. This letter has the true ring about it, and we reprint the following extract from it to show not only that Mr. Beall has great cause for thanksgiving but that honest and upright dealing with the public is bound to bring its reward. He says: "The past year has been one of unusual anxiety to all business men. I have certainly not made a fortune, but I have great cause to be thankful for the moderate prosperity attending me, when so many wealthier and stronger houses have barely held their own, and others failed and have been wiped out of existence altogether. I have gained confidence in myself; I have proved myself worthy of the confidence and trust reposed in me by my friends who helped and assisted me with the use of ample capital. I find my store filled with the finest and most valuable stock of watches and jewelry ever brought to this town. I owe no man an overdue account; no man has had to ask twice for his money." We are glad to be able to congratulate Mr. Beall upon his past success and future prospects, because we are satisfied he fully deserves them. When he was robbed he did not sit down and commence to whine, but faced the situation like a man and made up his mind to retrieve his fortunes as soon as possible. In the face of the fact that jewelers not a thousand miles from Lindsay, who have had no drawbacks of such a kind as he has experienced and are still unable to pay their honest debts, Mr. Beall's success seems like an emphatic endorsation of the old adage that "Honesty is the best policy," and we are sure that the trade generally will join with us in wishing him continued success.

Skipped.—Probably nothing in the jewelry trade has occcasioned more comment than the closing up of the Woltz Bros.' business and the skipping out of A. S. Collver, the late proprietor of that business. The facts of the case appear to be that Mr. Collver owed the firms of I. Joseph & Son, and Schwob Bros., both of Montreal, somewhere in the neighborhood of $20,000, they having sold the business of Woltz Bros. to him for that amount last spring and taken his unsecured notes therefor. Finding that the speculation was not likely to be a successful one for himself, Collver opened negotiations with the firms above mentioned for the purpose of selling the business back to them. Failing to come to terms at once, Collver in the meantime, while negotiations were still going on with Messrs. Joseph and Schwob, sold the entire business to a distant relative of his, Mr. Frank L. Culver, of Bay City, Michigan, for the sum of $9,000, and then discovered that he had important business across the line. If this sale is a legal one it leaves all his creditors out in the cold and is one of the sharpest things that has been done in Canada since we landed in the country. Messrs. Joseph and Schwob are hard at work at present fighting the validity of the sale and with apparent ground for success. They say that if there is law and justice in Canada they will see this case through if it takes all there is in the estate to do it. In the meantime the sheriff has possession of the business and will continue to hold it until the case is finally decided, which will probably not be before January next. While we have nothing to say about the present proprietor who may have bought the stock in all innocence of the true state of affairs, it must be confessed that on the face of it the whole thing looks like a job to do the creditors out of their money. Considerable sympathy has been expressed for Mr. A. S. Collver, on the ground that before he went into the Woltz business he was an independent farmer worth some $60,000, and that he has lost it all in this very business by magnanimously giving up his security when the Woltz Bros. failed. While this may be the case, and Mr. Collver has paid dearly for his experience, we cannot see how any honest person can condone such a palpable swindle on his creditors as this act of his undoubtedly is. We have no language too strong with which to characterize such conduct, and for the good of the trade generally, if for no higher motive we shall be glad to hear that the sale has been set aside, and that Mr. Collver has been made an example of.

WORKSHOP NOTES.

Bows.—Whalebones can be reduced in strength or rendered more uniform by being filed with a fine rasp, or by scraping their surface with a piece of broken glass. If, instead of fixing a brass end with a hook to the bow, it is desired to form a hook of the whalebone itself, hold the extremity in boiling oil for a short time, when it will soften; then form the hook, maintaining the whalebone in the required position until sufficiently cool to set. Recently, a form of bow has been introduced that consists of a brass handle into which slides a steel wire bent into the requisite form; the strength of course, depending on the thickness of steel wire used.—*Saunier.*

Plaster of Paris Casts.—The article is copied in soft yellow wax. Then take gypsum flour, as much as you think necessary, and stir it with water into a liquid paste. Take a fine camel's-hair brush, and cover the cast first with a thin layer of this paste, then fill the cast full with it, and let it harden. If you do not take the precaution of first coating your cast, you will never have a clean copy; will always be full of air blisters and holes, originating from the confined air. Should the gypsum flour be old and refuse to set, add one or two drops of sulphuric acid, and it will act as if fresh.

To Temper Case Springs.—Draw the temper from the spring, and fit it properly in its place in the watch; then take it out and temper it hard in rainwater,(the addition of a little table salt to the water will be an improvement), after which place it in a small sheet-iron ladle or cup, and barely cover it with linseed oil; then hold the ladle over a lighted lamp until the oil ignites; let it burn until the oil is nearly, not quite, consumed; then cover again with oil, and burn as before; and so a third time, at the end of which plunge it again into water. Main and balance springs may in like manner be tempered by the same process; first draw the temper and properly coil and clamp, to keep it in position, and then proceed in the same manner as with case springs.

To Test a Balance Spring.—A correspondent writes: "I send you the following method for mounting a hair spring, which I think is as good as any I have ever seen or read: I select a spring of the proper size, fasten it on the upper pivot of the balance with a small piece of beeswax; then with my tweezers, taking hold of the coil that lies between the regulator, I vibrate the balance, resting the lower pivot on the glass top of the movement box, in which there is a movement running, the balance vibrates the same number of times as the one I am at work on. You will perceive the result. The going

An Open Letter to the Trade.

OFFICE OF

THE ACME SILVER CO.,

9 & 11 Church St., Toronto, Ont.

We have received (from friends and customers, during the past two months) information that two representatives of a foreign plating concern, located in Canada, have been spreading reports detrimental to THE ACME SILVER COMPANY.

Among these reports are the following that, (in the interest of our customers), we are compelled to notice:—

"That we do not produce first-class goods, but that all of our goods are light plate.

"That we are not manufacturers, but only have a repairing and plating shop.

"That we have no financial standing, and will not exist six months."

To those who have handled our goods, or have been in our factory, no explanation or denial is necessary, but to such of the Trade that are not so well acquainted with us, we beg to say:

That these men are stating what they know to be false. One of these individuals represents himself as the agent of The Meriden Silver Plate Co., that has ceased to do business in Canada, and should therefore be treated as an imposter.

The well known reputation that the goods of the Meriden Silver Plate Co. attained, while under the management of the present officers of The Acme Silver Co, is a guarantee of their ability to produce goods equal to any in the market, and we can assure the trade that we shall be as careful of our own reputation as we were of that of The Meriden Silver Plate Co.

It is a well known fact, that as soon as a domestic Company attempts to compete for a share of the plated-ware trade of Canada, the foreign Company before alluded to, assail them with all manner of abuse, and circulate rascally reports, calculated to forestall the good opinion of the trade, and the representatives of this concern are only too willing tools in the hands of an unscrupulous management, and endeavor to make up for their lack of ability to sell goods, by misrepresenting and depreciating the productions of other makers. Both representatives and management, have rendered themselves liable for criminal action for libel, which, in self defence, we may have yet to enforce.

All makers of Silver Plated goods, buy more or less in metal from other factories. We are no exception to this rule, but the greater part of our goods are manufactured by us on our own premises from the raw material.

We are now putting in some new and improved machinery, and intend to further increase our line of home productions. All goods bearing our trade mark are plated quadruple plate on hard, white metal, and warranted for twice their cost, to wear as long, and give as good satisfaction, at far less price than those of most other makers.

If a demand for goods is any criterion of their appreciation, the trade must have a good opinion of our efforts to give them reliable goods at fair prices.

Our goods are stamped with our own name. We do not rely upon the posthumous reputation of a bygone age.

We are here to answer for the quality of our goods, and are content to accept failure or success, according to our merits.

Yours truly,

THE ACME SILVER CO.

balance is directly under the glass and the balance I hold is directly over, and the least vibration can instantly be detected. Move the tweezers until the beats are alike. The right place for the regulator pins is a little in front of the point where you grasp the balance spring. Since I have used above method, I have never had to pin a spring the second time."

THE BENCH OR BOARD.—Cl. Saunier says that the bench or board should be fixed in front of a large window that affords a good light. The various hooks, recesses, etc., for holding the bows, files, hammers, etc., as well as the drawers, should be well in sight, not only in order that the hand can at once take hold of whatever tool is required, but also to enable the workman to restore them to their place immediately after use. By doing so he will have no occasion to retain on the bench any but those tools that are frequently or constantly in use. It is an excellent habit, conducive both to well-planned and rapid work, and which can be easily acquired by a little attention during an apprenticeship, to place the same tools always in the same places, as the bench will then never be encumbered. By this means loss of time in turning over a number of objects in order to find one that may be small is frequently avoided. This observation is of minor importance to specialists who require but a small number of tools; but it is of the greatest importance to a workman who is engaged in the repairs of watches.

OTHER NOTES.

A Cincinnati man claims to have a wife so hot-tempered that he can light his cigar from the flash of her eyes. He made a good match when he married her.

A Thorndale doctor the other day got in a fresh supply of vaccine points and some of them happened to be exposed to view on his counter. A burly farmer from that neighborhood was in at the time and amused himself by using one of the points as a tooth pick, pricking his gums in the operation. It "took" in the most approved style, and the man is now in possession of a mouth that is crowding all the other features of his face out of shape.

TURPENTINE IN INFECTIOUS DISEASES.—H. Vilandt writes in the *Ugeskrift for Laeger*, concerning the value of oil of turpentine in the treatment and prophylaxis of diphtheria and the exanthematous diseases. He states that he has never seen any of these diseases spread from a sick child to other members of the family when this remedy was employed. In many of his cases no isolation could be attempted, as the mother was the only female in the family, and was obliged to take care of both the sick and the well, continually passing back and forth from one to the other. His method was to pour from twenty to forty drops of a mixture of equal parts of turpentine and carbolic acid into a kettle of water, which was kept simmering over a slow fire, so that the air of the sick room was constantly impregnated with the odor of these two substances. He claims also that by this means a favorable influence is exerted upon the exudation of diphtheria, although it is by no means curative of the disease, and should never be relied upon to the exclusion of other remedies.

Gold and Silver Watch Cases.

The attention of the Retail Jewelry Trade of Canada is directed to the Watch Cases, both of Gold and Silver, manufactured by the American Watch Case Company, of Toronto. Every Case made by this Company, and bearing any. of the above Trade Marks, is guaranteed to be of the quality stamped upon it, according to the U. S. Mint assay.

The American Watch Case Company invite the Trade to carefully examine their goods and compare them with those of other makers, and recommend them as being equal in quality, workmanship and finish, and lower in price, than any other Cases sold in this market.

These reliable goods can be obtained from any of the Wholesale Jewelers belonging to the Canadian Association of Jobbers in American Watches, at the prices and on the terms laid down in the Company's printed Price Lists. They are guaranteed to be the best value Watch Cases now offered for sale in Canada, and dealers will consult their own interests by insisting on getting them and no others, whenever they are in want of any goods of this kind.

Remember that by keeping Cases made by the American Watch Case Co., of Toronto, you are not only saving money, but dealing in Cases that are guaranteed to be as represented, and to give satisfaction to both dealer and wearer.

THE TRADER.

TORONTO, ONT., JANUARY, 1886.

The recognized organ of the Jewelry and kindred Industrial Trades of Canada.
Published on the first of every month, and sent free to every dealer in Jewelry and kindred goods in the Dominion of Canada.
Our rates for advertising will be found very low, and will be made known upon application.
We shall be glad to receive correspondence from all parts, and will publish such letters as will be of interest to the Trade. We do not, however, hold ourselves responsible for the opinions of our correspondents. The name and address must invariably accompany the communication, not necessarily for publication, but as a guarantee.
All business and other communications should be addressed to

THE TRADER PUBLISHING CO.,
57 ADELAIDE ST. W., TORONTO, ONT.

SPECIAL NOTICE.

To ensure insertion, changes or new advertisements must reach this office not later than the 20th of each month.

EDITORIAL.

OUR NEW YEAR'S GREETING.

The year 1885 is now a thing of the past, and we have already crossed the threshold of the New Year 1886. There is no secession or retrogression in the march of Time, it is always "onward," "onward." Few of our readers, we trust, that look back upon the year that has just passed away, have cause for any other feeling but that of thankfulness for the blessings that they have enjoyed during its continuance.

As a people, we have ample cause for rejoicing. Although the early part of the year was overshadowed by rebellion and bloodshed, every true Canadian is proud to know that the loyalty and devotion of our citizen soldiers was amply sufficient to quell it in a very few weeks. While we are proud of their valor, and have emblazoned their deeds upon the pages of our national history, we must not forget to perpetuate the memory of the heroes who fell in defence of law and order, and to sympathize with those whom they have left behind. In some cases their widows and orphans are in destitute circumstances, and it should be one of the country's privileges to keep them from feeling the loss of their natural protectors. The rebellion, although unfortunate in many respects, has not proved entirely a curse. It has shown to ourselves and others that we are a power not to be despised; it has knit our provinces closer together and done much to promote a national feeling, and it has also brought our country more prominently before the world's notice than it ever was before.

Our people are beginning to have faith in their own country and its resources, and what is better, to have faith in themselves.

The opening of the Canada Pacific, giving as it does an all rail route through our own territory from ocean to ocean, cannot fail to be productive of great results in the near future.

The season's crop, taking everything into consideration, has been more than usually abundant, and prices are high enough to warrant a fair return to the farmer for his labor. Although trade generally has been somewhat depressed, we think that Canada has cause for thankfulness, inasmuch as she has not felt the depression nearly as severely as many other countries. Trade with us has been fairly good, and those dealers, who, profiting by past experience, have kept their expenses down and their business well in hand, have very little cause of complaint.

The outlook, although not particularly rosy, promises a fair return to those who run their business on strictly business principles. Someone has said that "success is the greatest of virtues," but be this as it may, success can almost invariably be conquered by those who go into the fight properly equipped and with the determination to win.

For ourselves, forgetting the dark days and remembering only the sunshine, we look back to the past with thankfulness, and as we think on all the way through which we have been led, we look forward to the future with renewed courage and hopefulness.

We trust that to every one of our readers, this year on which we are just entering may bring prosperity in a very large measure and health to properly enjoy it. To our readers, one and all, we metaphorically hold out our hand and wish them, in all sincerity, "the Compliments of the Season and a Happy New Year."

OURSELVES.

To most of our readers the present form of THE TRADER will be an unexpected, though we trust not an unwelcome surprise. We have long been of the opinion that the jewelry trade of Canada should have a representative journal worthy of them in every respect; but hitherto, financial reasons made the carrying out of the idea an impossibility. Without being egotistical, we think that, as far as regards paper and typographical work, THE TRADER will now bear comparison with any of the jewelry journals on the continent; it certainly is a great advance on anything of the kind ever before attempted in the Dominion, and therefore, all the more worthy of the support and co-operation of the trade. One unique feature of this journal is, that we furnish it to our readers free of charge, and all that we ask of them is to read it through. If they do that every month, and we aim to make it so interesting that they will do so on account of its merits, we shall feel ourselves amply repaid so far as they are concerned. The changes and improvements which our readers will notice in this number have not been brought about without large expense, which outlay we trust will be recouped by the increased advertising patronage that we expect to receive in consequence of the greater interest that our readers will take in the improved journal.

As we have said half-a-dozen times before, we have always aimed to make THE TRADER useful to the jewelers of Canada, and to run it in such a manner as to promote their best interests. What the measure of our success has been we leave to the trade themselves to say.

We have always advocated fair play as between the Manufacturer, Jobber and Retailer, and we are glad to know that in the greater protection now afforded to retail merchants, this journal has played no unimportant part. Our columns are now, and have always been, freely opened to the members of the craft throughout Canada for the purpose of discussing any trade abuses or topics on which they think an interchange of ideas would be profitable. While they have not taken advantage of the publicity thus afforded as fully as they might have done, we are glad to see that the practice is growing. It is of almost incalculable advantage to any trade to have an organ which circulates through its entire membership. By such means an interchange of ideas can be effected that could take place in no other way. We trust, therefore, that in the future

our columns will be more frequently used by jewelers than ever before, and that the discussions which follow therefrom will be productive of benefit all around. Our jewelers are as intelligent as those of any other country, and many of them—as the columns of our back numbers will testify—are capable of writing letters of which any person may be proud. This gift should be cultivated, and we therefore say to any of our friends : if you have anything that you want to say to your fellow-craftsmen put it on paper and send it to THE TRADER, and we will see that it is brought to their notice.

" Our Help Column " is a new feature that we think should be of great benefit to the trade. If you want to sell your stock, or any special article ; if you want a journeyman watchmaker or salesman ; if you want a situation yourself, we offer you the use of " Our Help Column " free of charge. As THE TRADER is sent each month to every dealer in jewelry and kindred goods in the Dominion of Canada from the Atlantic to the Pacific, our readers in want of such help will see that our columns offer them a publicity amongst the very people they want to get at, as large as all the ordinary newspapers combined. We offer its aid free of charge to the trade, and we trust that they will avail themselves of it as freely as it is offered.

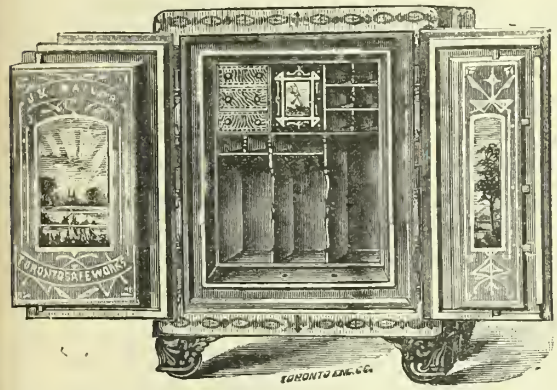
We need hardly say to our readers that we trust that the advertisements of the many first-class houses who use our columns as a means of reaching them may be read with increased interest. Such advertisements are practically monthly messages from our manufacturers and wholesale dealers to the trade, and it is to the interest of every retail merchant to know who are the live men in the trade, and what are the right kind of goods to buy. To a wide-awake merchant our advertisements should be neither dry nor unprofitable reading, but he may find in them hints that may save him money when he wants to buy goods. We have always refused to insert the advertisements of houses of doubtful reputation or standing, and our readers may rely upon it that we shall be as careful in the future in this respect as we have been in the past.

JEWELRY AUCTIONS.

Never since we can remember has the jewelry trade in this city been so thoroughly demoralized. One firm after another has commenced auctioning off their goods, until at the present time of writing, there are no less than five reputable establishments selling off their entire stocks in this way, for the benefit of the general public and the ruin of their competitors. If there is any one thing that is more calculated than another to demoralize the jewelry trade, it is an auction sale of good stock by a reputable man; and the higher the standing of the firm running such a show the worse for the trade generally. While it may for the time being benefit the merchant who does it at the expense of his opponents who refuse to sell goods outside of the regular methods, we are strongly of the opinion that such sales act as trade boomerangs, which will assuredly rebound in such a way as to do the promoter more harm than the transient excitement and sales can possibly do him good. Such sales are usually a fraud. If fine quality goods are offered, money is sure to be lost by the seller; as a rule therefore, the goods offered in this way are specially got up for such trade, and are in the long run ruinous to the reputation of the person selling them. Because of the reputation of the house, people may be caught once, but they are rarely fooled a second time. To put the matter concisely and in plain English, if a merchant sells fine goods by auction on which he knows he is bound to lose money, it is because he is in difficulties and is forced to sell; if he sells by auction of his own option and for the purpose of making money out of such sales, he must and does sell inferior goods in order to make it pay. In either case the ultimate effect is a disastrous one so far as his regular trade is concerned. We regard auction sales by the Sheriff or other properly constituted authorities as bad enough, but when the members of the trade themselves deliberately set about such a thing, surely it is time to cry a halt. We have before had occasion to condemn in language as plain as we could make it, this demoralizing and unbusiness-like practice, and we think that if the retail trade form an association, one thing they should ask of the jobbing trade is, that they should refuse to sell a man watches and jewelry who deliberately demoralizes the trade by offering them to the public by auction. We think that such a rule would be to the benefit of the jobbers themselves, as it would encourage legitimate and careful dealers to lay in better stocks of goods with the feeling that they could fairly expect to sell them at a reasonable profit. As things are at present going on in this city legitimate dealers are finding themselves left almost out in the cold by the auctioneer merchants, and bound either to follow their example or carry over a lot of goods into stock-taking that they should have sold during the holiday season. We notice that a strong move in this direction is at present being made by the retail trade in the United States, and we think that if the jobbers do all in their power to carry such a reform through they will benefit themselves fully as much as they will the retail trade.

PROTECTION TO RETAILERS.

The retail jewelers of Canada will, no doubt, by this time, have made up their minds that, so far as the Canadian jobbers are concerned, they will henceforth be amply protected from those two trade abuses about which they have so long and bitterly complained, viz.: retailing by jobbers, and selling at wholesale prices indiscriminately to dealers other than jewelers. This is a matter for sincere congratulation, and we have no doubt but that the trade will very soon feel the benefit of this protection in the shape of increased sales and better prices. When the Canadian Association of Jobbers in American Watches have made it one of their rules that a persistent violation of the above articles of Protection to Retailers shall disqualify them from the benefits which accrue from its membership, all they can then do is to see that their own regulation is strictly carried out.



But while their part ends here, that of the retail merchants themselves only commences. If the jobbers enforce these safeguards ever so faithfully, it will go but a short way towards making the retail trade healthier, if the retail jewelers do not immediately bestir themselves on their own behalf. What our retailers want to do now, is to form district organizations for their own benefit and mutual interest, and we believe we are safe in saying that if they are willing to do so in a fair and impartial manner, they can do far more for themselves than any other body can do for them. In our opinion, the worst of all trade abuses is due to the actions of retailers themselves, and were they to mutually agree to reform these abuses, it would

H. ELLIS,

make the jewelry trade a healthier and far better paying business than it now is.

Our correspondent, H D., whose letter will be found in another part of this issue, has had in his experience a practical knowledge of more than one of these abuses, and everyone who reads his letter must admit that such things can only be regulated by concerted action amongst the retailers themselves.

Nine-tenths of the abuses and drawbacks in the jewelry business are occasioned by the greed or shortsightedness, not of the jobber whose interest is identical with that of the retailer, but of the retailers themselves, and with themselves alone lies the remedy.

Will they band together and look into these matters and then take steps to counteract them, or will they sit quietly by with folded hands and expect others to do it for them?

So far, we are afraid our retail jewelers have quietly let things drift, and been content to kick only in a mild way; but all such kicking has been done by individuals and in the quietest manner possible.

Things in the retail trade have now reached such a stage that prudence demands that there should at once be vigorous and concerted action amongst the retailers themselves if they want to make their business financially healthy and worth following.

Of course we do not want our readers to infer that the jewelry business can't be made to pay under the existing circumstances, but we do wish very plainly to state, considering the skill and capital required for its successful carrying out, that on account of abuses that can easily be cured by united action amongst retailers themselves, it does not pay one-half as well as it should do.

As several of our correspondents have plainly pointed out, many of our jewelers are selling not only their goods, but their services as skilled mechanics at about cost, instead of at a fair living profit, and are thus spoiling their neighbors' business without doing their own any good.

This is not as it should be, nor as it might be were the trade to put their heads together and insist upon having a fair return for the skilled work of their hands and brain and the capital they have invested in their business.

In our opinion, retailers want to be protected against themselves as much, if not more, than anyone else, and the sooner they set about reforming these trade abuses, the better for them. The remedy lies in their own hands, will they apply it?

In this connection we have a suggestion to make. Perhaps in no place in Canada is the trade more cut up, on account of competition, than in Toronto, and certainly in no place are those curses of legitimate business, auction and discount sales, more frequently to be met with. Now then will the retail jewelers of Toronto, who have probably more abuses to contend against than any other city in Canada, set the example and organize for the purpose of putting the trade upon a common sense basis ? If there is not life enough in the members of the trade to help themselves, they must continue to suffer, but let it be in silence, for no one will take any heed to the complaints of those who, having the power, are either too timid or apathetic to help themselves.

We could, did space permit, enlarge considerably on this important subject, but we withhold anything further at present; in our next we propose to point out a few of the abuses that are demoralizing the retail trade, and show how they can be remedied.

CUSTOMS SEIZURES.

As long as people in their haste to get rich, will persist in smuggling, so long will the customs authorities, in the discharge of their legitimate duties, be compelled to make seizures of goods thus fraudulently brought into the country. Instead of being blamed, these customs authorities are deserving of credit, and honest traders should at all times render them whatever aid they can in helping to bring the guilt home to those parties violating the law. By so doing, they are not only crippling unfair and injurious competition, by making such competitors buy at the same prices as law-abiding merchants are compelled to do, but they prevent the demorilization of trade that is sure to take place where smuggled goods are put in cut-throat competition with regularly imported stock.

When we say, however, that the customs authorities are therefore entitled to consideration and respect in the performance of the necessary though disagreeable duty of seizing smuggled goods, we do so with the qualification that such seizures should be made on good grounds, and that the details are carried out in a business-like and gentlemanly manner. Customs officers are invested by the law with a great deal of power, and may, if they choose, exercise it in a very arbitrary manner, to the hurt and discredit of those whose goods they are compelled to attach. We are glad to say that so far as Canada is concerned, our Customs officials as a rule, are not only thoroughly painstaking and honest, but where seizures have to be made, it is done in such a manner as to cause as little friction and loss as possible.

We are sorry to say, however, that to this high standard there are some very notable exceptions, the worst of which is probably Mr. Mingaye, Collector of Customs at the City of Winnipeg. We have had occasion to refer to this gentleman before, for he has made himself a terror to every merchant, whether honest or dishonest, that has been unfortunate enough to have anything to do with the Winnipeg Custom House. Winnipeggers, as a rule, are not noted for tame submissiveness, but they seem to have put up with their collector's tyranny and impertinence until patience ceased to be a virtue, and a few weeks ago, their Board of Trade, many of whom are in political accord with Mr. Mingaye, unanimously passed a resolution "that in the interests of the mercantile community, as well as of the Dominion Government, the present Collector and Surveyor of Customs be removed."

It is probable that the Government will be compelled to listen to the appeal of their friends in regard to this matter, and that ere long the City of Winnipeg may be freed from one of the greatest martinets that ever infested it. If the Government can not afford to dispense with his services, we would respectfully suggest that he be translated to our northern border line and commissioned to prevent our Indians from smuggling fire-water and other luxuries from Alaska into the Dominion. The man is evidently a crank of the first water.

During the discussion in the Winnipeg Board of Trade at the meeting above alluded to, considerable stress was laid upon the seizure of Mr. Wm. Perret's jewelry stock by the collector, and the unjust and arbitrary manner in which he has acted towards that gentleman in the matter. Although this seizure was made about the middle of July last, Mr. Mingaye has steadily refused to proceed any faster than his own contrary

pig-headedness was pleased to allow, and Mr. Perret has, time and again, been refused any chance to vindicate his fair name, by proving that the goods were legitimately bought from some of the most reputable wholesale houses in Canada. He denied point blanc the charge of smuggling preferred against him, and asked for an immediate investigation. He offered to produce invoices and witnesses if necessary to prove his contention that many of the goods seized were of Canadian manufacture, and that the rest of them were bought from Canadian dealers. For reasons known only to himself, Mr. Mingaye refused to allow Mr. Perret to have anything to say in the matter, and treated him with the utmost disrespect. Some of our Toronto wholesale merchants, of undoubted standing in their own city, when in Winnipeg, interviewed Mr. Mingaye in reference to the seizure, and tried to find out from him whether there was any ground for his action, but they were received by that gentleman in a most uncivil and boorish manner, and gruffly told to mind their own business and let "His Mighty Highness" alone. The probability is that Mr. Mingaye thought that Mr. Perret would get tired of waiting and finally compromise with the officers in order to get his goods back, but in this he was disappointed. Through the assistance of some wholesale friends in Toronto, the Minister of Customs was communicated with, and he instructed the collector to furnish to a Toronto jeweler, visiting Winnipeg on business, all the facts in the case, and on his getting possession of them, and giving the collector some pretty plain talk, Mr. Mingaye was kind enough to permit Mr. Perret to take possession of part of his goods, holding the balance, however, for further proof. The Toronto wholesale jeweler referred to informs us that he went carefully through all the goods seized, amounting to about some $6,000, and that, with the exception of a few hundred dollars' worth of old jewelry that had been cleaned and recarded, he had been able to completely identify every piece of the goods as having been legitimately bought from Ontario wholesale houses. The Customs officers were themselves so well satisfied about some of the goods that they, some time ago, gave up about $500 worth of them. Of English jewelry, which can only be bought from Canadian wholesalers, they had seized about $2,000. Of watch movements and cases, every one of which this gentleman had checked off and found to correspond with Canadian invoices, there were about seventy; thirty of which were gold and forty silver. The balance of the goods was old stock, the numbers of which had been lost in recarding, and which, he had no doubt, had been in Mr. Perret's store for years.

This gentleman also states that both himself and the Winnipeg retail jeweler who was called in to assist him to identify the goods were of the opinion that the seizure was a most unfair one in every respect. When the goods were taken from Mr. Perret's store, they were thrown promiscuously into valises, and fine colored gold lockets, brooches and earrings were mixed up in delightful confusion with steel watch chains and other common truck but little calculated to improve either their value or appearance. The opinion of these gentlemen, both of whom are practical jewelers of many years' standing, is that, even though Mr. Perret succeeds in getting all of his goods back again, they will not be worth within twenty per cent. of what they were when they were taken from his store. When to this is added the loss that Mr. Perret's business has sustained from the want of his stock, and the bad effect that such a seizure necessarily must have upon the buying public, we think that that gentleman has a good case against the Government for damages.

We have not now, and never had, any sympathy for smugglers, and would be pleased to see the authorities enforce the penalty to its fullest extent by putting all such people in prison for the second or any subsequent offence; but while we think thus strongly on the subject, we would also be careful to have the person accused of smuggling receive only the fairest kind of play, and be convicted only on the clearest proof. We do not think that the authorities should make seizures simply for the purpose of obtaining information, but should have some substantial grounds to work on before they commenced proceedings at all. Once a seizure is made, it should be pushed through at once; the whole charge against the accused should be squarely made, and if he could not refute it satisfactorily, the goods should at once be confiscated.

If Mr. Mingaye's action is strictly legal the sooner the law is changed the better, for as it at present stands, it lies in the power of such a man to ruin almost any merchant against whom he has a grudge.

The case of Mr. Perret is one of the most glaring acts of injustice that we ever heard of, and we can scarcely conceive it possible that such a thing could be done in the nineteenth century, and in such a free country as Canada. It smacks more of mediæval France than anything we ever heard of on this side of the Atlantic, and one cannot help recalling the Bastile and the *letters-de-cachet* of Louis and his favorite, when hearing of such tyranny.

There is an old saying that if you give a scoundrel rope enough, in the long run he will be sure to hang himself, and we think that Mr. Mingaye has practically been his own executioner, so far as personal reputation and prospects are concerned. When he is kicked out of his present situation, as he certainly deserves to be, the feeling amongst the merchants of Winnipeg will be one of extreme thankfulness, that they have got rid of a petty tyrant, whose place can be profitably filled by some fair-minded gentleman, who can be just to the Government and at the same time courteous to the public.

CORRESPONDENCE.

THE PEDDLER NUISANCE.

Editor TRADER:

SIR,—It is high time the retail jewelers were getting roused up and making an effort to put down the peddlers who are daily robbing the people and killing many a legitimate business. Who encourages the peddlers? Is it not the wholesaler who sells to the gents' furnishing stores, &c.? Then it is the duty of every retail jeweler who employs a journeyman watchmaker, or does the watch repairing themselves, to put their shoulders to the wheel and boycott all who will not agree to sell to none others than a legitimate jeweler. I have worked in quite a few towns and cities before locating here, but must confess this is the worst town for peddlers of every description I ever saw. Cheap plated-ware and snide jewelry, with slick-tongued peddlers, find many a victim in this border town.

In conclusion, I would say that I heartily approve of your ideas of protection to the retail trade, and trust that every

wholesale house will take the same stand as Messrs. Smith & Fudger have taken.

I am yours, very truly,

Niagara Falls, Ont., December 14th. D. FENWICK.

P.S.—I think another matter that should be stopped, is travelling agents selling watches, &c., to friends. Only last week I was trying to sell a gentleman a watch, when he told me he had promised to buy of an agent at wholesale price.

ANOTHER OPINION ON PROTECTION.

Editor TRADER :

SIR,—For the first time, I will take courage to express my feelings in regard to our Canadian jeweler's paper, THE TRADER. I really think the Trade would feel lost without its appearance. In answer to your editorials in December number, as regards co-operation amongst retail jewelers, I think it would be a blessing to the regular trade if such an organization could be formed and carried out ; but I think it would be another case against the honest dealer. For instance, the public will find the Trade has only one price for American watches, and then, as is generally the case, the customer has a second-hand watch which the jeweler has to take as part pay ; then comes the question, who will allow him most for the second-hand article ? If watches were always sold for cash, it would be easier to come to a uniform price ; but if the customer is positive our prices are uniform he has us by the forelock, and the man who allows him most for his old watch is his man. Then again, on the other hand, about ten months ago, a customer of mine came to me and priced my watches, and in particular a Wm. Ellery stem-wind, 5 oz. case, engraved, silver cap, American Waltham case, and then he sat down and wrote to one of the leading retail firms in Hamilton, fully describing the watch as I had described it to him. I read his letter, in fact he asked me to read it, and I told him I would sell him a watch as cheap as they would ; but when the answer came, he gave it to me to read, and behold the answer was $16. I told him it was a falsehood, and that they would never sell him such a watch for the money. However, he went to the city, and they pleaded a mistake, but they sold him a 4 oz. case, Wm. Ellery movement, stem-wind for $16, with a guarantee for two years, mainspring and case-spring included, which was at that time a profit over net cost of 70 cents for wholesale prices. Who will blame jewelers then to cry out against each other, when a large retail house is ready to take the bread from a country jeweler's table, even without any gain to themselves ? Now, Mr. Editor, the above statement, I believe to be correct, as my customer is a particular friend of mine, but in the above case he valued the dollars a little too much for me. Now, the question is, would such work as the above be stopped by an organization, or would such dealers try to draw trade to the city in case of such an organization ?

As to my ideas on protection to retail jewelers, and what is a retail jeweler, I think there need be no difference of opinion at all. I think all those that make jewelry their special line of goods are jewelers, and not those that make drugs, or hardware, or dry goods their specialties, and certainly not such men as I have here for opposition. My grievance against them is this, they have been importing jewelry of the shoddy kind for about three years, and lately they have gone into watches. My curiosity was to know, did they pay duty ? Their business called them to the U. S. quite frequently, so my only way open, that I could see, was to inquire of the customs officers whether they paid any duty, and after repeatedly inquiring of the officers, thanks to our Government officials, one made his appearance and dearly he made them pay for their dishonesty. So much for smuggling. I think it would be a good idea if THE TRADER would give us a little advice once in a while as to what steps to take in detecting smugglers on the small scale, for if they are found guilty, they will have to pay dearly, as in the above case. And now, Mr. Editor, in answer to your editorial on Riel, I think you have hit the nail squarely on the head. In answer to Retailer's correspondence, I quite agree with him in the first part of his article, but not in the latter part of it, because I believe it is utterly impossible for every retailer to have uniform prices in watches and jewelry. Once in a while we buy a watch or a piece of jewelry that does not take the eye of our customers, the consequence is the article lays around the shop and gets shop-worn or damaged, but yet a good useful article. Somebody may want it, but only if they get it cheap enough. Now, would it be right if I were obliged to keep the said article in case a man would offer me cost for the same. I think every retailer knows his own business best. All I ask of him is to be a man ; but a man selling staple and fresh goods at cost, in order to hinder somebody else from making a sale, I would surely not call a gentleman. I do not believe in selling one man a watch at cost and make the next one pay two profits, just because he is not so sharp on a deal as the first one.

Now, in reply to Equity, in December number, I cannot help but differ with him in the beginning of his article. In the first place, a watchmaker only ought to be allowed to sell such goods as he repairs, and silverware is more suitable in a watch shop than in a hardware store, but yet, as it is the custom, let hardware merchants keep silverware, because silverware merchants are not very plentiful, therefore, there will not many grumble. What we watchmakers want is only fair play. We cannot step into a wholesale clothing store and pick out a suit and pay wholesale price, nor get a pair of shoes, nor tea, coffee, sugar, nor anything of the kind. Why ? Because we are not dry goods merchants, nor hardware merchants, nor tinsmiths, nor grocers, nor shoe merchants, nor clothiers, nor druggists. We are simply jewelers ; we carry the most dead stock of any business there is, and one that is very often expensive goods. But would you, for one moment, think it just and right for any of the above merchants to walk into a first-class wholesale jewelry house and buy a few staples, for instance, a few collar and cuff buttons and a watch for a friend, right down at rock bottom wholesale prices ? That is what we are kicking about. With the rest of the article I agree, especially the smuggling business. A man has no more right to go to the United States and buy a watch and bring it over for his own use than a man would have to buy a reaper or a threshing machine without paying duty. My article is already too long, and by the time this will reach its readers, Christmas and New Year will be over, so I will end by wishing you all "A Merry Christmas and a Happy New Year." H. D.

ASSIGNED.—Henry Lavallee, jeweler, of Montreal, on demand of William Eaves, has assigned. The liabilities will not exceed $1,400, while the assets consist of the stock in trade.

GEO. F. BOSTWICK,

REPRESENTATIVE.

OUR JEWELERS AND BANKING.

Editor TRADER :

SIR,—I have been somewhat surprised in discovering that many of our jewelers do not keep a bank account, even where there are branches of good chartered banks, and consequently the most efficient means, for obtaining those useful advantages, which banking facilities afford.

Banking and commerce have become so closely allied, that it may be said that the one cannot exist without the other, *e.g.*, suppose one has a note due in Toronto, 10th Dec., for $50. If the amount be remitted by registered letter, there is anxiety on the part of the sender until he hears that it has duly reached its destination. Why? Because the Government is not responsible if the money should find its way into other unknown quarters than where you intended it should.

A short time ago, one of our jewelers, in an eastern town, whom I met, was in a state of perplexity from this very cause, or rather he had received no reply from two registered letters, one posted to Montreal the other to Toronto.

The Post Office order system is good, but established by the Government for remitting only small amounts, and this is exemplified in the fact that the cost of remittance, beyond a limited amount, greatly exceeds that of the ordinary bank draft. Even in buying a bank draft, much time is often consumed in waiting until it has passed through those mystical stages, from the receiving teller, through the note clerk, on to the manager, who, after leisurely finishing some other writing he may be occupied with, converts it by his signature or initials into the thing which you are desirous of obtaining; when your patience is exhausted, and you inquire for it, you are only then informed that it is waiting for you at the farthest pigeon hole from where you are standing. And further, you are obliged to pay away your money to the bank or post office to meet the note quite a few days before you would be required to do so, if you had an account at the bank; for then you would simply have to fill up your check on the 9th December, pay to the order of —— fifty dollars, in full for note due 10th December. The last line is important, as it constitutes a receipt. The check is mailed, and you need have no anxiety about it, for while it is as good as money in the possession of the proper owner, it is a very awkward possession in the hands of a thief. It has to be endorsed to convert it into money, and the endorsation must be fully identified. It may be a week, or even longer, before that check returns, to be charged in your account, during which time you still have the money to your credit, neither does it cost you anything for collection. For I think all the wholesale jewelers are either dead or have left the country who would insist on receiving the extra quarter or so for collection, and it's against human nature to pay a firm an account, even if the firm is a little off—I mean distance off—and be taxed a small sum for doing so, while the firm who receives the money ought not only to be satisfied to pay the collection, but stand treat as well.

If you will permit me space, in a future number I would like to speak a little upon the interesting nature of the relation between the customer and his banker, and what my experience in financing has taught me to be the best means to adopt in order to win the confidence of the bank, and thus secure all its advantages.

Yours respectfully,

JNO. W. CAMPBELL.

BUSINESS NOTES.

OUR HELP COLUMN.—We trust that this new feature of THE TRADER, will be liberally made use of by the trade. If you want to put your want before every jeweler in Canada, free of charge, our help columu is the way to do it. Don't be bashful ; come right along.

ENTERPRISE.—We are in receipt of some very elegant illustrated Christmas circulars, issued by our old friend, Mr. Thomas Lees, jeweler, of Hamilton. They are very attractive and should make his shop busy during the holiday season. Such enterprise usually pays.

CHARLIE ELLIS has just returned from the maritime provinces, where he reports doing a fair share of business for his firm. It is needless for us to say that Charlie wasn't the drummer that was quarantined on account of the small-pox. He is too wide awake for that.

COMPLIMENTARY.—From all parts of Canada we have received copies of papers containing our editorial article on Riel in last month's issue. As we are known to be outside of politics altogether, our article is referred to in very flattering terms, which modesty forbids us saying more about.

LOOK OUT FOR THEM.—In our next issue we will commence the publication of a series of papers written specially for THE TRADER by one of the foremost opticians in Canada upon " Spectacles, and How to Sell Them," that will be of great value to our retail jewelers, if they will but take note of them.

A BIG JEWELRY STEAL.—On the night of Sunday, the 20th Dec., the jewelry establishment of Ramsay & Co., of Milton, Ont., was burglarized and nearly two thousand dollars worth of goods stolen. It is thought that the job was done by Toronto cracks, and that the goods have been sent here to be disposed of.

GLAD TO SEE YOU.—We were favored last week by a visit from Mr. Sheppard, the genial New York manager of the Boss Watch Case Co. He reports 1885 as being the most successful year his Company ever experienced. So much for a strict adherance to quality, and a desire to give customers full value for their sheckels.

THE S. E. F. BRACELETS are now recognized in the United States as the standard for style and quality. In spite of the many cheap imitations the makers wisely keep to their original standard of quality, and have their reward in the confidence with which dealers all over the country handle their goods. Their trade-mark is always a guarantee.

GETTING UP IN THE WORLD.—Wm. Ashall, the well-known jeweler, and marksman, of Toronto, is getting up in the world. Only last week the city council awarded him the contract of looking after the clocks in the city and fire hall towers. We trust that William's sudden elevation will not cause him to look down with disdain upon his old friends.

SIMON SCHRECK, jeweler, of St. Thomas, after a business career of some five years, has been sold out by his creditors. This business has never been a paying one, although Mr. Schreck has been carefully " nursed " by the wholesale houses, who stood sponsor to him. Excessive competition and expensive habits are probably the greatest factors in his want of success.

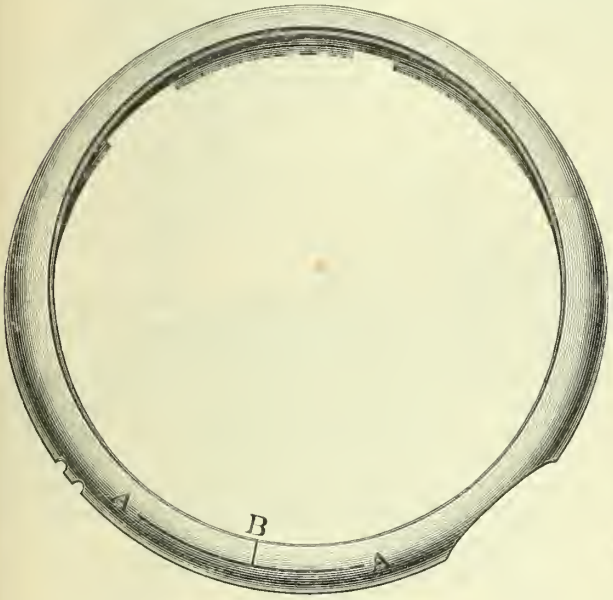
MEANS PROSPERITY.—Unless all the grain experts are sadly astray in their calculations, Canadian farmers may expect before many months to see a considerable rise in wheat prices. The world's supply, it is said, falls many millions of bushels short of its requirements, consequently there will be a draw upon the hoarded surplus of previous years to make good the deficiency.

GOLD DOLLARS.—The demand for gold dollars for bangle-making is unusually brisk. This fact, coupled with the fluctuations in the price of silver, has placed gold dollars at a premium of between 20 and 25 per cent. A premium on gold currency carries one's memory back to war times. In our individual experience, gold has always been at a premium, even in the best of times.

WE WERE FAVORED a few days ago by a call from Mr. Aaron Buckler, jeweler of Bowmanville, one of the best known retailers east of Toronto. Although nearly seventy years of age, forty of which have been passed in the jewelry business in Bowmanville, Mr. Buckler is still hearty and active, and gives promise of seeing the close of this century at least. He says business in his town is good considering everything.

ONE OF THE GREATEST IMPROVEMENTS EVER MADE IN WATCH CASES.

An Adjustable Bezel for Hunting Cases !



THE FITTING OF GLASSES MADE EASY

THE KEYSTONE FACTORIES STILL AT THE FORE.

The fitting of crystals in Hunting Cases has always been an annoyance. The great variation in sizes of glasses (for frequently at least three different sizes are found in one package, all numbered alike), defective edges, and difference in shape between the edge of glasses and groove in the bezel, all tend to make easy and proper adjustment a difficult task, and often the attempt costs more, in the breaking of glasses, than is received for the job.

Again, the groove in bezels is often of a size between glass sizes; consequently one size glass will be too small, the next too large, and the effort to fit them must end in an irritating failure.

To obviate these drawbacks is the province of the

KEYSTONE ADJUSTABLE BEZEL.

As will be seen in the above cut, the bezel is slitted vertically (B) and laterally (A) for a short distance in such a manner as to give it elasticity or spring without impairing its strength, but permitting the ready and effective insertion of crystals of different sizes, defective edges, or not perfectly round. To illustrate: An adjustable bezel for which a medium 19 11-16 glass is the correct one will not only take any glass in a package of 19 11-16, but it is also adapted to a 19 12-16 if required.

The arrangement which secures this very desirable result is so minute as to be comparatively invisible to the naked eye, and in no respect mars the uniformity of surface of the bezel. The liability of dust to work in upon the dial is no greater than with the ordinary bezel, as the lateral cut (A) is made below the top of the dial-plate.

The advantages of this great improvement are so plain, reducing to the smallest extent possible the danger incident to fitting glasses, that it is but reasonable to assume that

THE KEYSTONE ADJUSTABLE BEZEL

(the name of the great improvement) marks the introduction of an invention at once ingenious, practical, and exceptionally valuable.

This improved bezel is patented, and can only be obtained on Boss, Keystone and Leader cases, but without any advance in price.

THE KEYSTONE WATCH CASE FACTORIES:

19th and BROWN STREETS, PHILADELPHIA.

NEW YORK, 14 JOHN STREET. CHICAGO, 100 STATE STREET.

SAVAGE & LYMAN'S FAILURE, which occurred last month, has not taken many people by surprise, as it has been generally known for some time that they have been losing ground. The liabilities amount to $30,000, with assets about $22,000. This firm were years ago, before their former failure, considered to be the leading retail house in Canada, but since that time they have fallen behind the age. Seems to be another case of mercantile dry rot.

A. S. MURRAY'S & CO.'S FAILURE.—The many friends of A. S. Murray will hear with regret of his failure, as the house was one of the oldest and best known in western Ontario. The liabilities are over $50,000, with assets of $75.000, but it is hardly probable that when the stock is finally disposed of, that the business will more than pay one hundred cents on the dollar. It is probable that Mr. Murray will start with a clean sheet on a smaller scale.

A SENSIBLE RETAILER.—J. P. Mill the well-known Yonge St. jeweler of this city, has done a very sensible thing in securing from Messrs. J. & J. Taylor a first-class burglar-proof safe that the makers guarantee able to resist anything in the shape of a midnight mechanic. Jewelers, from the nature of their stock, are more exposed to burglary than any other dealers we know of. He who makes himself secure against such attacks, only does what common sense business prudence would dictate.

SHERIFF'S SALE.—The stock of John Petty, jeweler, of Lindsay, was sold by the sheriff in consequence of the action of his unsecured creditors, referred to by us in last month's TRADER. The stock, which it is said was badly run down, was bought by Mr. Culp at thirty and a half cents on the dollar, a pretty good price, it was thought by competent judges. The proceeds of the sale will remain in the hands of the sheriff, pending the decision of Mr. Culp's appeal against the other creditors' judgment.

OF INTEREST TO JEWELERS.—We understand that the Waltham Watch Company have discontinued the manufacture of all key-wind movements, except the Broadway grade. It seems to be only a question of time when a key-wind watch will be a thing of the past and a curiosity worthy of a place in some museum. The coming watch seems to be an open face stem winder, and it is said that at the present time in the United States, eighty per cent. of the stem winds used are open face. In Canada the proportion is not at present over twenty per cent.

"THE TRAVELLER."—Our old friend, Mr. John Goss, for many years editor and manager of the *Commercial Traveller*, has just issued a new paper called *The Traveller*, on his own account. Besides being an old commercial traveller, Mr. Goss is a thorough newspaper man and has push, energy and ability enough to make his new venture a success. The initial number is very neatly printed on fine toned paper. Its matter is brief and to the point, and it gives every promise of a long and useful career. We wish Mr. Goss the success he so richly deserves.

"THE AMERICAN POTTER AND ILLUMINATOR" is the title of one of the best publications issued in the interests of the crockery trade that we have ever seen. This journal is published in Chicago by Albert J. Fisher, 15 Washington street, Chicago, U. S., and is exceedingly cheap at the subscription price charged for it. The original matter is practical and concise, and its clippings well selected. It also contains a lot of very valuable lists of "prices current," that cannot fail to be of advantage to any merchant in that line of goods. We welcome the *Potter* amongst our exchanges.

A STRANGE THIEF.—We learn from the *Victoria Warder* that Mrs. James Howden, of Lindsay, is the happy possessor of a tame crow, which is a great pet and has the run of the whole house, but his crowship is now in disgrace Mrs. Howden placed a valuable gold watch and chain in a velvet-lined box, but neglected to close down the lid. Mr. Crow noticed her movements and as soon as her back was turned he opened the case and taking the watch and chain in his beak, he flew off and deposited the valuables in some hidden place so that the most diligent search up to the present time has failed to discover them.

WESTWARD HO!—We had a note a few days ago, dated at Winnipeg, Man., from our esteemed friend, Mr. W. F. Ross, who was visiting there on business for the firm of Schwob Bros., of Montreal. Writing of the C. P. R., over which he passed on his way up, Mr. Ross says: "I was delighted with the road and its equipment, and as far as an humble drummer may judge, it is well and solidly built, and rides as easy as any portion of the Grand Trunk, with one or two short exceptions." Mr. Ross corroborates the reports that business in the North-West is in a healthier condition at present than at any time since the boom.

HOW MUCH PROFIT HAVE THEY?—On account of the number of auction sales going on in the city, some of the other retailers are out with special discount signs. Our attention was directed to one the other day which read as follows: "Goods at 30 per cent, 40 per cent. discount and at cost." As forty per cent. off is only a trifle less than seventy per cent. advance on the cost of the goods, we are somewhat curious to know how low "cost" is. In our opinion, such sweeping discounts tend to give the public an exaggerated idea of the profits in the retail jewelry business, and are almost as demoralizing to legitimate trade as auction sales.

IS CANADA IN THE U. S.?—We always had the impression that Canada was a foreign country so far as the United States was concerned, but the following from the title page of a much valued exchange, has considerably shaken our belief on the subject: "Subscription—In the United States and Canada, $2.00; for foreign countries, $3 00 per year." From the above it seems that in well-informed circles in the U. S., Canada is not regarded as a foreign country. If it is not a foreign country, then must it not be a part of the great and glorious Union? We will have to put this friend in the same category as the *London Post* if he don't reform.

AN ENTERPRISING JEWELER.—We had a visit a few days ago from Mr. A. V. Galbraith, the enterprising jeweler of Shelburne, Ont., who was on a safe buying expedition. As Mr. Galbraith has had some experience with burglars, he determined to get a first-class safe that he could depend upon resisting any such attempts in future. Before leaving the city he bought from Messrs. J. & J. Taylor, the large burglar-proof safe that took the medal at the Toronto Industrial Exhibition last fall, and says that in future he won't give himself any uneasiness about the safety of his goods when he is absent from the store. We think he is sensible.

HOW ARE YOU, S. P.?—We were very much astonished a few days ago to receive from Mr. S. P. Kleiser, formerly of Toronto, but now of Victoria, British Columbia, a letter asking us to send him THE TRADER to his new address, as he wanted to know what the jewelry trade in Ontario was doing. Enclosed were some very beautiful samples of B. C. sea-weed, artistically arranged on the back of one of S. P.'s business cards, for which we tender him our best thanks. Mr. Kleiser says he likes the country immensely, is doing a jobbing trade in watch material and watches, and thinks he will be able to make a success of his new venture. We trust he may.

FRAUD IN R. P. CHAINS.—We were shown the other day by a retail jeweler a rolled plate chain that had been returned to him by a customer on account of the plating being almost entirely gone, although it had only been in use for about six months. He said he had paid almost as much for it as he should for guaranteed goods, but did so on the representation of the seller that it was of the best quality, but sold at about cost. He said that heretofore he had always used the R. F. S. chain and never had a complaint, and that after this experience he proposed to go back to them again, as he would not sell goods he could not guarantee. We think his head was level.

OUR SUPPLEMENT.—The Supplement to this number of THE TRADER by Messrs. P. W. Ellis & Co., of this city, is a very appropriate, as well as a very beautiful way of sending their good wishes to their many customers and the trade generally. Things in the U. S. and Canada give promise of brighter and better times, and their artist has very neatly expressed this idea in the handsome engraving which they send out with this issue of our paper. We trust that every one of their customers and our readers may find themselves flush of diamonds, or their equivalent, before next year closes. For our part we will take ours just as soon as the firm can get it mounted in their new patent iridium pivot setting.

THE FAILURE OF MUSCAT & CO., formerly Muscat & Sapery, jewelers, of this city, is no surprise to any person that knew anything about the firm or their antecedents, and is only another illustration of the danger of giving credit to weak men, whose capital is utterly inadequate for the business they attempt. If our jobbers were more conservative

Supplement to Trader
NEW YEAR
1886
wish you A happy & Prosperous
P.W. ELLIS & Co.
1885
P.W.E. & Co.
D.S. BARCLAY 41 KING ST TORONTO

HAPPY NEW YEAR.

1886.

We take this opportunity of thanking our friends and customers, one and all, for the very liberal patronage bestowed on us since our amalgamation.

On this, the beginning of a New Year, which we trust will be a very happy one to all our patrons, we send our greetings, and wish them

THE COMPLIMENTS OF THE SEASON

And hope that the year 1886, on which they have now entered, will be the most prosperous they have yet experienced.

We assure our customers that the principles we adopted when starting business of only selling to

THE LEGITIMATE JEWELRY TRADE

Will be still maintained, and we are glad to see other wholesale houses following our example.

Lowe & Anderson,

WHOLESALE JEWELERS, TORONTO.

in giving credit, they would not have so many losses of this kind, and it would be very much better for the prompt-paying retailer. As a rule the worst cut-throat competition in any business comes from weak houses that are forced to sell at any price or find themselves closed up. If our wholesalers make a few examples of such cases it would equally benefit the retail trade and themselves.

A NEW SAFE GUARD.—Although the new vault built by Goldie & McCulloch for P. W. Ellis & Co. is regarded by that firm as absolutely burglar-proof, they lately conceived the idea of putting a patent folding gate on the inside to prevent sneak thieving. When the mechanic came down to fasten it on, Mr. M. C. Ellis pointed out to him that he would have considerable difficulty with the steel plates and advised him to be careful of his drills, which advice seemed to amuse him very highly, as he said he had never come across any steel that he couldn't drill easily. However, after he had broken nearly a dozen drills, he came to the conclusion that he had better fasten it to the inside iron plate and let the steel alone. The Messrs. Ellis are now better satisfied than ever that they can bid defiance to burglars of any kind.

THE AMERICAN LEVER.—Messrs. Howard & Son, the manufacturers of the celebrated American Lever Cuff Button, have recently added some unique patterns in sterling silver to their already extensive line of goods. We notice also that in self defence they have had to enter an action against certain competitors who were infringing upon their patents and have secured judgment against them. Now that the ball has been opened, they intend to make it hot for any manufacturer that infringes upon their rights. The American Lever Button has very justly come to be regarded by the trade as thoroughly reliable both in quality and workmanship and has practically revolutionized the button trade of America. Dealers buying Messrs. Howard's goods can always depend upon the quality—a good recommendation now-a-days.

A RISING CANADIAN AUTHOR.—We have just been presented with a copy of a new and valuable work by James Ryrie, of Toronto, otherwise known as "Ryrie, the jeweler," entitled "Ryrie's Christmas Annual." The work is divided into seven chapters, and is of absorbing interest to anyone wishing to get full value for their money. Chapter I Tells what to buy for a gentleman; Chapter II, How to make a lady happy; Chapter III Shows how to give a child pleasure; Chapter IV, Don't forget the baby; Chapter V, How to add to the comfort and elegance of Home; Chapter VI Treats of things in general. As brevity is the soul of wit, as also the measure of literary talent, this little work must take high rank in the Canadian literary world. It is almost needless to add that although the author disinterestedly points out that Ryrie's is the best place to buy jewelry of all kinds, his advice is none the less to the point.

WHO IS MR. FORSINGER?—Well, a few weeks ago hardly any person in Canada could have told you; now we very much doubt whether there is a jeweler in Ontario but could give you a pen and ink sketch of this gentlemanly representative of the American Waltham Watch Co. Mr. Forsinger has been doing missionary work for his Company in this province for the past two months, and apparently with good success. If he hasn't called on you yet, you may expect a visit from him soon. If a tall, athletic gentleman, with an eagle eye, black side whiskers (*a la* the late W. H. Vanderbilt), and an extra fine, fur-trimmed overcoat, enters your store with the free, springing step of an alpine chamois hunter, you can bet your bottom dollar, that without making any mistake, you can safely say, "How are you, Mr. Forsinger? He has our best wishes during his sojourn in Canada.

CUT OFF.—Just as we go to press, we are informed that at a special meeting of the joint executive committee of the American Watch Movement and Case Manufacturers and the Canadian Association of Jobbers in American Watches, held at New York on Tuesday, the 22nd Dec., the firm of Rothschild & Co., wholesale jewelers, of Toronto, was struck off the list of recognized Jobbers in American Watches. Messrs. Rothschild & Co. were accused by the Canadian Association of violating their contract with the manufacturers, by selling watch movements at less than regular tariff prices, and the special meeting above referred to was held for the purpose of ascertaining whether or not the charge was well-founded. As this is the first case in which any Canadian jobber has been "cut off" by the Manufacturers' Association, who will hereafter refuse to supply them with goods (unless reinstated), the trade were considerably interested in the result.

A DIFFERENCE that you will find out by experience:

When you are young, how well you know
A little money makes great show,
Just fifty cents will cause you bliss,
'Tis then a dollar looks like this:

$

But when you're old and bills come due,
And creditors are dunning you,
And every cent you spend you miss,
'Tis then a dollar looks like this:

$

LOOK OUT FOR BURGLARS.—We notice from our exchanges that two heavy burglaries have taken place in the United States during the past month. In Chicago, Ill., E. N. Marks, jeweler, had his vault broken into and diamonds and jewelry to the value of $8,000 stolen. In Providence, R. I., Messrs. Harvey & Otis had a first-class safe forced open by the use of wedges and about $3,000 worth of jewelry stolen. In commenting on these burglaries the *Jewelers' Weekly* says that "neither of these unfortunate firms is a member of the Jewelers' Security Alliance, and to this their loss may in a measure be ascribed; cracksmen have a wholesome respect for a safe over which hangs the Alliance certificate of membership." In this connection we migh mention that not a safe belonging to a single member of the Canadian Security Alliance has been molested since the formation of the organization. After the lull usually comes the storm, so that our jewelers had better look out for squalls in the burglar line.

HARD LINES.—A jewelry drummer, visiting Charlottetown, P. E. I., got, by mistake, into an hotel that was quarantined on account of the small-pox. Once in he could not be allowed to mingle in ordinary society and he was therefore detained there against his will. After standing it for a couple of days, he broke loose and, grip in hand, started for the station, and boarding a train that was just leaving, he got away out into the country and stepped off at the first place of importance. He had just ensconced himself in an hotel and was congratulating himself on his good fortune, when a policeman entered and arrested him for breaking quarantine He was then sent back to Charlottetown, and although there was no charge against him and he was free of the small-pox, the authorities were hard hearted enough to keep him in durance vile, until he could get a clean bill of health This is hard lines, but it's only a sample of what the indefatigable drummer has to go through in the pursuit of his calling.

ENGLISH KNOWLEDGE OF CANADIAN GEOGRAPHY.—We learn from the *London* (England) *Morning Post*, that at a show of apples held in London, the quality of our Canadian fruit was an eye-opener to the natives. The *Post*, after a glowing tribute to the quality and variety of these apples gravely says, that the first, second and third prizes went to Nova Scotia, while the fourth went to Canada. We were under the impression that Nova Scotia was one of our Provinces, but it seems, according to the British authorities, which the *Globe* has lately been holding up as infallible on the "Riel" and other questions on which they saw eye to eye, that we have been laboring under a delusion. We had the privilege of telling a leading London journalist a couple of years ago, that if the average Canadian school-boy made half as many mistakes about English Geography as British statesmen and writers do about Canada, he would be well spanked and sent home to his mother. The above extract don't seem to make us want our opinion very materially.

PERSONAL SMUGGLING.—We had intended fully answering the enquiry of "Equity" in this issue, regarding personal smuggling, but pressure on our columns prevents it. We may say, however, that in the eyes of the law, smuggling any article for one's personal use, is regarded exactly the same as if it were smuggled for sale. The law demands that every article coming into Canada shall pay the amount of duty levied upon it, and if this is evaded, the Customs officers can at any time seize the article and confiscate it. All that our readers have to do in order to stop the smuggling of watches and such goods by persons who go to the United States and buy them in order to escape the duty, is to quietly inform the Customs' authorities of the matter. They will seize the goods, and it rests with the party to clear himself by proving that they have paid duty. If they can't do this the

THE
R. F. S. & Co.
ROLLED PLATE CHAINS
—ARE THE—
BEST.

goods are confiscated and sold for the joint benefit of the person laying the information and the officer making the seizure. A few examples of this kind would do a great deal of good, especially along the borders. We shall explain the law regarding smuggling fully in our next issue.

STEPPING STONES TO SUCCESS.—Learn your business thoroughly. Keep at one thing—do not seek change. Always be in haste, but never in a hurry. Observe system in all you do and undertake. Whatever is worth doing at all is worth doing well. One to-day is worth two to-morrows. Be self-reliant ; do not take too much advice, but rather depend on yourself. Never fail to keep your appointments, nor to be punctual to the minute. Never be idle, but keep your hands usefully employed except when sleeping. Use charity with all ; be ever generous in thought and deed—help others along life's thorny path. Make no haste to be rich ; remember that small and steady gains give competency and tranquility of mind. He that ascends the ladder must take the lowest round. All who are above were once below.

LEVANTED.—When our last issue was in press, it was generally expected that Messrs. C. T. Picard & Co., the insolvent jewelers of Montreal, would get a favorable settlement with their creditors and continue the business. Recent developments, however, seem to verify the assertion made some time ago, that the whole thing was simply an attempt to beat their creditors for their own advantage. These creditors decided to have Mr. Picard up for examination, and rather than face the ordeal, he skipped out of Montreal in the disguise of an old man, taking with him a considerable quantity of valuable stock. To add further to the complications of the unfortunate affair, the Customs officers almost immediately afterwards seized the balance of the stock for alleged smuggling. Mr. Picard has heretofore had the reputation of being an honest merchant and an honorable man, and while we are always sorry to hear of such a person going wrong, we cannot allow our personal sympathy to disguise the fact that it is all the more necessary in such a case to make an example of him. If he were punished as he certainly deserves, the commercial atmosphere would probably be freer for some time to come.

THE WALTHAM AT THE FRONT.—We learn from the *Sporting Hour* that one of the great attractions of the New Orleans Exhibition, just closed, was the special exhibit of the Waltham Watch Company, among whose numerous articles of interest shone forth conspicuously an enlarged model of the Company's split-second chronograph, with split-minute attachment. This model had been built especially for the New Orleans Exhibition, and proved of interest to thousands of visitors, among whom the sporting fraternity especially evinced the greatest delight at the wonderful contrivance. At first it seemed rather difficult to unravel the exact working of the mechanism ; but quick to see and quick to learn, they readily understood it with but little explanation on the part of the attending watchmaker, and they expressed much surprise at the simplicity of its construction. The durability of the parts was greatly tried, inasmuch as the model was kept going through its multiplicity of performances from early morning until closing hour. At the end of the exhibition it worked as accurately as on the first day it was shown—a test which in itself was a triumph.

OUR BEST ADVICE to our readers regarding their Christmas and New Year's dinner :

The day of feas'Ting draweth nigh,
And scores of Turkeys soon must die.

Get one that's yoUng and sweet and fat,
And stuff it fUll of this and that.

With fruits and beRries sauces make,
And add preseRves and pies and cake.

Ask friends and Kindred all to come,
And spend their Kristmas at your home.

Let not the carEs of life distress,
But fill each guEst with happiness.

Revive the joYs of youthful days,
And for thY blessings offer praise.

EVIDENTLY NOT POSTED.—A very good joke is told of a large retailer not a thousand miles from Toronto, who has lately been buying gold cases from a jobber on the supposition that they were American cases that had been got over by way of the underground railway, and were therefore sold at a reduction on that account. He thought he had a big bonanza on these cases until he discovered the other day that they were made in Toronto by the American Watch Case Company, and that he could buy them from any jobber at the same price that he had been paying. He now fails to see where the favor comes in on the jobber's side at least, but forgets that if he had kept himself posted and abreast of the times he could not have been so easily imposed on. In this connection, also, both of these gentlemen appear to have been ignorant of the fact that under the Customs Act, officers can seize and confiscate any goods that are sold or offered for sale under the representation that they are smuggled goods. no matter whether they have been smuggled or not. The simple fact of thus misrepresenting them renders them liable to confiscation.

NO CHEATING HERE.—We are pained to notice amongst retail jewelers a tendency to exalt themselves at the expense of their opponents, and to question the honesty to say nothing of the capability of everyone in the same line of business outside of their own shop. This is not only wrong, but foolish in the extreme, and, as a rule, does the person doing it more harm than good. When a man advertises that he is the only honest jeweler in any place where he has opposition, it is equal to an assertion that his competitors are rogues. No one believes that all the honesty in any business is carried under one hat and therefore they conclude that such accusations are often made in order to give the maker a chance to practice himself what he denounces in others. Such advertisements remind us of the Chinese signs in Pekin and elsewhere in the flowery land, which read somewhat in this style : " Don't deal with Hung Loo across the street, he will cheat you, but come and deal with an honest man ; no cheating here." In our experience of the jewelry trade in Canada, we have found that honesty is generally pretty evenly distributed and that no one dealer has a monopoly of it. Most of our friends keep it on tap all the time.

PRINCIPLE WAS EVERYTHING.—During the past month our sanctum was enlivened for a short half hour by the genial presence of Mr. Sheppard, of Boss Case celebrity. After telling how the Boss Case was sweeping everything before it in the States, Mr. Sheppard got back to his experiences in England last summer, and some of his reminiscences are well worth preserving. While missionarising Her Majesty's subjects, he came across an old English watchmaker, one of the real old school by the way, who was awfully down on modern watches in general and American made watches in particular. Mr. S., as a true Yankee always does, did his best to uphold the national reputation, but being only a watch case maker and not a practical watch movement maker, he was rather at a disadvantage with this ancient supporter of the watches of his fathers, who pointed out the beauties of the old fusee and other intricacies of " ye old time watch " with an ardor worthy of their inventor. Leaving technical argument, Mr. S. essayed a *coup-de-main* by bringing the issue on to general grounds instead of particulars, and pointing out how the American watch had made its way against all opposition, in every part of the world, wound up by saying, " Sir, all the facts are against you." Mine ancient rose equal to the occasion, however, and looking the adventurous foreigner straight in the eyes, he exclaimed, " Tut, tut, the facts be blowed ; I don't care a fig for facts, the *principle* of the American watch is wrong." This volley was too much for Sheppard ; he couldn't discuss principles half so well as facts, and therefore beat a hasty though honorable retreat, leaving the old Englishman master of the situation.

HOW THEY SELL SO CHEAP.—We have had several letters recently from retail jewelers throughout the country, complaining of the very low prices at which the large retail houses in some of our large cities sell watches. We have looked into the matter thoroughly and find that in nearly every case the prices quoted are for American movements put up in Canadian made cases. Both cases and movements are Association goods and cannot be bought by those advertising them one whit cheaper than by any other legitimate retail jeweler. Taking the lowest prices furnished us, we find that any retailer can sell his customers the same goods at the same prices, and make from ten to twenty per cent. profit. These large retailers never sell at or below cost, but they seem willing, and probably can afford to work on a smaller margin of profit than those dealers who do a very much smaller trade. As we have said several times in these columns, the days of the Dutchman's one

THAYER & CO.,

3 WELLINGTON ST. EAST, TORONTO,

MANUFACTURERS' AGENTS AND DEALERS IN

Watches, Clocks, Material and Jewelry of all Kinds.

We beg to inform the trade that our **MR. FRED. A. THAYER** has just returned from New York, where he has succeeded in buying for SPOT CASH, some of the biggest bargains in Jewelry ever secured by any Canadian buyer, and of which we propose to give the trade in this country the full benefit. A look through our Stock, which is entirely new, will convince any Jeweler that he can save money by dealing with our house.

In addition to Watches and American Jewelry, we make specialties of the following lines, in all of which our Stock will be found very complete :

WATCH AND CLOCK MATERIALS OF ALL KINDS, WATCH GLASSES AND GENERAL JEWELERS' SUNDRIES.

☞ Our **MR THAYER** will call on you during the month, and we trust that you will reserve for him a share of your esteemed orders.

per cent. profit are past, and we are living in an age when things are down at hard pan. If one dealer is content to sell at ten per cent. profit while another wants one hundred, it is natural to suppose the cheapest man will get the bulk of the trade whether he makes any money out of it or not. This method of selling watches does not cause any more to be sold than if those selling them made a fair living profit, and is only another proof of the necessity of an organization amongst the retailers themselves, to force such dealers to sell at a fair price. The remedy lies entirely with the trade themselves, and they must make up their minds either to organize and effect this desirable reform, or sell at the same prices on the smaller profit.

WORKSHOP NOTES.

Gold ink, as it is called, is made of gold leaf crumbled into gum arabic water. When dry it will take a fine polish by gentle friction, a fact not generally known.

To make brazing solder, ordinary brass is mixed or melted with about one-sixth its weight of zinc. Pour out of the melting pot, cool, and granulate by crushing with a hammer.

A paste formed of whiting and benzine will cleanse marble from grease, and one made of whiting and chloride of soda, spread and left to dry, in the sun if possible, on the marble, will remove stains.

A VERY USEFUL CEMENT FOR CAOUTCHOUC.—Macerate pulverized shellac in ten times its weight of strong aqua ammonia. When not in use keep air tight. If allowed to stand in hot water a few moments the mass becomes liquid.

Doors are now made of paper in imitation of mahogany and other expensive woods. They are quite as cheap as wooden doors, better because they do not shrink or swell with the heat or weather, and are lighter and more durable.

To cleanse soiled chamois skin rub soft soap into the leather, then soak for two hours in warm water containing a small amount of soda; then rub it until clean, and rinse in a very mild solution of soda, soap and warm water. Never rinse in clear water, as that will leave the leather hard. After rinsing wring well in a coarse towel and dry quickly.

A thin film of tin can be put on iron, say iron wire, and it will have a resemblance to silver. First put the wire in hydrochloric acid, in which is suspended a piece of zinc. Afterward place it in contact with a strip of zinc in a bath of tartaric acid, two parts of which are dissolved in one hundred parts water and to this is added three parts of tin salt and three parts soda. Let the wire remain for about two hours in this bath and then polish.

OTHER NOTES.

The watch carried by Louis XIV. was so small that it was set in on of that luxurious monarch's finger rings.

In Cannon Ball Creek, Dak., are millions of peculiar stones rounded by the action of the water so that they look like bombs. Some of these natural cannon shots would weigh a ton.

Ladies' bustles are used so extensively as a means of smuggling that the Bernese customs officers have published a notice declaring that "these appendages must henceforth be searched, though with the necessary politeness."

If, says The Railroad Gazette, 282,240 pounds of coal will propel a ship and cargo weighing 5,600,000 pounds 3,380 miles, an ordinary letter burned in the boilers will generate sufficient energy to transport one ton of freight one mile.

Right in the midst of a political campaign intellectual Boston is trying to find out whether an air-tight box, filled with air and containing a goose, will weigh as much when the goose is flying as it will when the goose stands on the floor of the box.

Edward I. died in 1307, and 463 years after his body was not decayed. Canute's body was found fresh in 1766, and he died in 1017. In 1569 three Roman soldiers were dug out of a peatmoss, and were found fresh after about 1,500 years. Many other instances like these are related.

WISE AND OTHERWISE.

"A little nonsense now and then
Is relished by the wisest men."

WHEN you spill soup on the table cloth set your tumbler on it when your wife is not looking, and trust to providence for the thereafter.

HANGING brass clocks, eight day time, have been introduced with great success. They are genteel and modest, with their hands always before their faces.

A BEAUTIFUL example of the force of habit is to see a blue ribbon man fill his glass with water, and dreamily blow the froth off the innocent water before drinking.

DEGUY: "Ah, Toggle, old boy, how do? What are you doing now?" Toggle: "I'm living on my father just at present." "You are—I thought your father died long ago?" "So he did, but I have a new one—Government pap."

"THAT's a great watch, Hobs. I paid only $2 for it and it keeps time to a minute." "Ah, indeed! Why, it's four o'clock, Nobbs, and your time-piece says it's only 12.39." "Well, that's the minute it keeps." This must have been a *Globe* watch.

"PLATES six inches thick are rolled at Pittsburg," read Mrs. Litteral in her paper. "My gracious!" was the good lady's comment; "what do they want with such clumsy plates? The last I got were not an inch thick, and Bridget has only broken two in a month."

A YONGE STREET auctioneer's buggy happening, the other day, to obstruct for the moment the private carriage of a prominent Toronto personage, an occupant of the latter desired the auctioneer to clear the way, at the same time calling: Mr. ———, your buggy is a-going, a-going, it's gone!"

A ROBBER met a coal-dealer on a lonely road and stopped him "Your money or your life," said the robber. "Who are you?" asked the coal-dealer. "I'm a highwayman," replied the man. "Good enough," continued the coal-dealer; "I'm a low-weight-man. Shake. We should be friends." And they were.

A GASCON and Provencal were each extolling the productiveness of their native provinces. "At Bordeaux," said the former, "you drop a match in a field: next year you will see a forest!" "At Marseilles." rejoined the other, "you drop a brace button; a week after you have a ready-made pair of trousers."

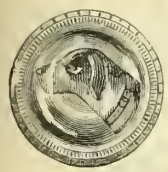
WHY, how wonderful lifelike," said Mr. Derrix, gently caressing a bumblebee which reposed among the artificial flowers and insects of his wife's new bonnet. "If it was a garden flower I'd swear it was al—G-r-eat Cæsar-r!" he suddenly shrieked, inserting a wounded finger in his mouth and dancing around like a whirling dervish. "Why, the blamed thing is alive."

"REBECCA, you shall nod shpeak mit dot Moses Levi vonce more."

"Oh, fadder, you preak mine heardt; ve vas almost engaged. Vy shall I not shpeak of him?"

"He haf sheated me. He half sold me a paste diamond for a shenuine shtone."

"Oh, fadder, dot should recommendt him to you as a son-in-law. If he can fool a vise man like you, see vat a fortune he haf in der chewelry piziness."



"Vell, Rebecca, you vas schmarder as I thought. Get married yen you like. I am ankchious to go in bartnership with mine son-in-law."

HOW HISTORY REPEATS ITSELF.

THE CZAR'S PRESENTATION WATCH AND HOW IT PANNED OUT.

A story illustrating the official dishonesty prevailing in Russia at the time of the Emperor Nicholas is told by Karoline Bauer in her memoirs. An acquaintance of hers, the Berlin artist Kruger, had been sent for to paint a portrait of the Emperor, who commanded that Kruger should receive, as a special mark of his satisfaction, a costly gold watch set with diamonds. But this watch had previously passed through the hands of several Russian officials. To the one pair stuck fast the diamonds, to the other the gold, so that Kruger received a very ordinary silver watch. When he thanked the Emperor for the present, he purposely pulled out the watch so that the donor might see it. "There, you see now, dear Kruger, how I am robbed," the Czar said in agitation, "but if I would and could punish all the thieves in my realm, as they deserve, Siberia even were not large enough to receive them, and Russia would be a waste as Siberia is now." Kruger of course received another watch from the Emperor's own hands.

While we don't wonder that such a thing could be done in semi-civilized Russia, it is hardly credible that cases almost parallel are occurring almost every day in our own country. The following, which we clip from the catalogue of one of the leading Case Companies in the United States, is pretty conclusive evidence that, in that country at least, the trade stand an equal chance with the poor Czar of being victimized, and thus making history repeat itself:

"THE OLD WAY OF SELLING GOLD CASES.

We lately heard of a "diamond cut diamond" transaction in every sense of the word; and the incidents are founded upon actual facts, and occurred between well-known watch dealers and manufacturers:

B, the country banker, goes to J, the country jeweler, and gives him an order for a Gold Watch Case, eighteen karats fine, agreeing to pay the regular rate asked by J. But J, being of an avaricious turn of mind, thinks he will still further increase his profits, and orders the case from the jobber, C, to be sixteen karats fine, but stamped 18-k. Now J stands well with C, the jobber, pecuniarily, but has the reputation of being very close, and hard to make any money out of. Therefore, seeing from the order of J, that a fraud and swindle is intended, he thinks that he may add to his profits a little, and, therefore, orders the manufacturer to make the case fourteen karats fine, but still stamp it 18-k. "Birds of a feather flock together," and C, the jobber, had driven many a hard bargain with M, the struggling manufacturer, and M scans with eager eye the order from C to make the case in such a manner that he knows he is perfectly safe in making his illegitimate share of profit out of the transaction; and on the principle that there is "honor among thieves," and consequently no danger of discovery, actually makes the case twelve karats, and stamps it 18k., colors and gilds it up nicely to look like eighteen karats, and completes the swindle. In due course B gets his watch case and shows it with much pride to relatives and friends; but the final catastrophe approaches, when, upon visiting a near-by city, he meets the well-known ——, who can tell the quality of gold almost in the dark, by intuition, and showing him the case, he is thunderstruck to hear the word "bogus" offered to what he fondly considered a master piece in the way of a watch-case. Explanations follow, and like the child's row of bricks, the different parties through whom the case was purchased, in their efforts to escape blame, throw the responsibility from one to the other, until finally the poor and struggling manufacturer, whose original crime was in following the path already pursued by his customers, is saddled with the entire load of guilt; and with upturned eyes and long-drawn faces the others stand about and say: "Thou canst not say I did it.'"

REAL PROTECTION TO THE TRADE.

In order to prevent any such imposition or fraud in goods of their manufacture, The American Watch Case Co., of Toronto, determined when they commenced business to make their Trade Marks an absolute and recognized guarantee of quality. They, therefore, laid down the following platform, which they have strictly adhered to in the past, and propose to continue in the future: (1) To make no goods without their own Trade Mark. (2) To stamp no goods of higher quality than they really are. (3) To guarantee the quality of every case they made to be of the quality stamped upon it.

In order to ensure this the following Trade Marks were adopted by them and registered in the office of the Hon. the Minister of Agriculture, at Ottawa:

These stamps will be found upon all the goods of their manufacture, according to quality. They ask the Jewelers of Canada with confidence to buy their cases, whether of gold or silver, for three reasons: 1st. Because they are up to the standard and guaranteed as to quality. 2nd. In design, workmanship and finish they are fully equal to any goods in the market. 3rd. Because they are much lower in price.

For the above reasons dealers will find it to their advantage to buy these cases in preference to all others.

JOBBING AND RETAIL.

THE ILLINOIS WATCH COMPANY

HAS secured a new and important advantage in the manufacture of its celebrated Watch Movements. We possess the SOLE and EXCLUSIVE RIGHT and USE of the Patent granted to Ide for his SYSTEM OF TIMING AND ADJUSTING BALANCES.

We apply this system to ALL grades of our Movements, HIGH, MEDIUM and LOW.

Other Companies engaged in the manufacture of Watch Movements have nothing to compare with this system ; and the cost to them of applying the old and inferior method of timing and adjusting balances is so great that they cannot, in justice to themselves, apply even that to their LOW as well as their HIGH grades.

By Ide's System the LOWER grades of **ILLINOIS WATCHES** are timed and regulated more carefully before leaving our Factory than are the MEDIUM grades of other Companies, while our high grades are superior to theirs in the same degree.

Our LOW and MEDIUM grade of Watch Movements are thus subjected to a process of treatment in timing which other Companies give to their HIGH GRADES ONLY, and that too by the old method far inferior to the one employed by the **ILLINOIS WATCH COMPANY.**

Moreover, the System we employ is SCIENTIFICALLY CORRECT AND ACCURATE, while the old method must depend—to a very great extent—upon guess-work and approximation. It cannot be denied that in this System the **ILLINOIS WATCH COMPANY** possesses a decided advantage over all competitors, and to it is largely due the popularity and increased demand for Watches of its present manufacture.

This "POINTER" is worthy of your CAREFUL CONSIDERATION. Think of it.

We also solicit the careful and critical inspection of the Jobbing and Retail Trade of all Canada upon our new, improved and popular Movements, which we now have ready for the market.

Our No. 5 is the BEST ADJUSTED MOVEMENT EVER OFFERED FOR THE MONEY. It has Fifteen Jewels in Settings, Oreide Screws in the balance, and Patent Regulator. It is an accurate timer, and wherever it is in use it gives PERFECT SATISFACTION.

Our "Special No. 101" is manufactured ONLY on SPECIAL ORDERS, and very recently put upon the market ; but its flattering reception by the Trade gives assurance that it is already the FAVORITE LOW-PRICED NICKEL MOVEMENT before the public. It has Eleven Jewels, the top plate being jeweled in Oreide Settings, Patent Regulator, new and beautiful pattern of Damaskeen Finish, Circled or Double Sunk Dial, as desired. TRY ONE AND YOU WILL ORDER AGAIN.

Our No. 150, Ladies' 8 Size Watch is still in the lead of all low-priced 8 Size Movements, and IS THE BEST LADIES' WATCH OF THIS CLASS EVER PRODUCED. It has Eleven Jewels, is carefully finished, closely timed, and we guarantee it to give satisfaction.

These Movements are all new. They have all the latest improvements. We warrant them. Every Jeweler in Canada wishing for something fresh, novel, attractive and certain to please and satisfy his trade, should ask his Jobber for one of the new and improved **ILLINOIS WATCH COMPANY** Movements. All our Movements have Patent Pinions, and all are Quick Train. All Stem Winders are made to fit Hunting and Open Face Cases, the latter bringing the figure XII at the pendant.

Order for Movements with special engraving in grades above I. W. Co., received in lots of Five and upwards WITHOUT EXTRA CHARGE.

EDITORIAL.

WILL IT PAY?

A good deal of cheap talk has of late been indulged in regarding the way in which wholesalers, who are members of the Canadian Association of Jobbers in American Watches, have been living up to their contract to sell at the prices and on the terms laid down by the Manufacturers' Association. It is not an uncommon thing to hear a retailer say, "Oh, this list price is all very well for the young fellows, but you can't fool old heads like me; why, I can get all the goods I want at ten per cent. discount off the list price." While such things may be done in the future, and no doubt have been done in the past, we think that the genuine cases are very few and far between, and we do our jobbers only justice when we say that the most of them have lived faithfully up to their agreement in respect to prices and terms. It is possible, when retailers make such sweeping misstatements as the one we have quoted, that there may be found travellers, or even jobbers themselves, so weak in the back, that they take such talk for pure gospel, and determining not to be undersold by an opponent, actually sell the goods at the price the retailer claims he can buy them at. Our honest opinion is, however, that in nine cases out of ten, such statements are deliberate falsehoods, and the buyer knows he is only trying the jobber when he makes them. Our advice to all jobbers and travellers is to trust implicitly in the integrity of the members of your Association, unless the buyer can back up his statements with written proof in the form of an invoice of goods delivered. In any such case, take a memorandum of the date and other particulars, and report at once to the Secretary of the Association, and have the offender cut off.

A great many persons in the retail trade appear to believe that they are doing a big thing if they can induce a jobber to break his contract and cut the price of watch movements and cases to them. We think, however, that if they would look at the matter in a proper light they would see that it is their duty, as well as in their own interest, to prevent any such violation on the jobber's part. If the Association is any good at all, and we certainly think that any organization that makes a definite and uniform price for such staple goods as watches undoubtedly are, is a benefit, it is because that by its working, retailers are certain that if an opponent sells goods below the regular rates it is not because he buys them lower, but because he is sacrificing part of his profit. The experience of the retail trade throughout the United States and Canada is that since the organization of this Association, retail prices have become more uniform, and, as a consequence, profits have increased. In addition to this benefit the Canadian Association has protected the retailer by making it impossible for anyone but a jobber to buy these goods at wholesale prices. They have also opened a crusade against jobbers selling at retail, the result of which will probably be that the retailer will be amply protected against this evil in future. Now, these safeguards to the retail merchant on the part of the jobber, which are far in excess of those enjoyed by retailers in the States, can only be secured to them by the co-operation of such an organization as the Jobbers' Association, and we argue, therefore, that it is to the direct interest of every retail jeweler in Canada to see this institution live and prosper.

The jeweler, therefore, who tries to, or who does induce any member of the Association to violate his contract, is thus breaking down a very strong safeguard to the retail trade, and one moreover, whose protection cannot be secured in any other way. He may argue however, that although this may be quite true, the direct advantage he receives in the way of a reduction of price, by far outweighs the indirect benefits he can secure by having the members of the Jobbers' Association keep their contract inviolate. While at the first blush this may appear to be correct, we think a very little reflection will convince any thinking person that even this advantage is more apparent than real. Any retailer who buys his goods from a jobber who thinks so lightly of an agreement entered into with others, and which he is in honor bound to carry out faithfully, may be pretty sure of the fact that if he will thus practically perjure himself in such a case, his word, to put it very mildly, is not to be depended upon in any other case. They may rest assured that the man who, under pressure, cuts five per cent. to them, will, if the inducement be sufficiently great, cut ten to their neighbor, or lower still if it seems to be to his own interest to do so. He could never be sure, therefore, that he was buying at bottom figures, or that whatever cut he had induced the jobber to give him, some opponent would not possibly be buying at lower prices.

Taking it altogether, as far as we can see, it is to the interest of the retail trade to discourage any violation of their contracts by jobbers, and to do everything that lies in their power to help the members of the Jobbers' Association to keep their pledges inviolate. If they could possibly induce enough of jobbers to go back on their word of honor to break up the Association or make its operation a dead letter, we think they would find the condition of trade very much worse than it is at present. The large dealer would, as before, be able to buy very much cheaper than the small one, and, as a result, would be able to sell at the other's cost and still make a profit. Under such a system, prices would quickly become demoralized, and the average retailer would find it very much harder to make money than he does at present. Our disinterested advice to retailers, therefore, is to weigh this matter fully before being led away with the idea that they can derive any real or lasting benefit from the violation of a jobbers' contract, and to distrust thoroughly any one who offers of his own accord to violate his solemn word of honor.

IMPORTANT ANNUAL MEETINGS.

During the past month there were held by jewelers, in the City of Toronto, two annual meetings, each of which were of the utmost importance to the members of the trade in general. The meetings referred to were the first annual gatherings of the "Jeweler's Security Alliance of Canada," and the "Canadian Association of Jobbers in American Watches," full reports of both of which will be found elsewhere in this issue. We are glad to see such meetings take place in our midst, for they indicate very plainly that the day of individual trade isolation is past, and that more good fellowship and feeling is bouud to be found amongst our jewelers in future. Isolation begets selfishness and distrust, while organization and communication, on the contrary, usually brings out what is best in people. The more we mingle with our opponents, the more we should find in common with them, and although trade is a perpetual warfare, in which the weakest is always forced to go to the wall, such conflicts are better to be carried on good humoredly, and with a due appreciation of the good as well as the bad points of our opponents. How often do we find, when we come to know our opponents better, that they are not such bad hearted fellows after all, and that if they were in any other line of trade, we might positively take a liking to them. For such reasons, as well as for the fact that the organizations whose meetings are above alluded to, are of almost incalculable benefit to the jewelry trade, we are pleased to chronicle the prosperity and progress of these Associations. All the more do we congratulate them, on account of the sneers and cavils with which some members of the craft heralded their inception. While neither of them have yet reached maturity, they both exhibit a vigorous and healthy vitality, which should keep them alive and working in the best interests of the trade for many years to come. They should both have the cordial support and best wishes of every member of the jewelry trade in this country.

SELF PROTECTION.

In one of our editorials last month we ventured the assertion that the present demoralization of the retail jewelry trade was beyond the reach of any remedy that the jobbers could offer, and that if the business was to be put upon a healthy and paying basis the retailers would have to depend mainly upon themselves to accomplish it. In the outset we may say we are firmly of the opinion that the greater part of the causes which tend to make the jewelry business depressed and unremunerative are to be traced directly to the unbusiness-like methods employed by retailers themselves. The most of these abuses are inspired by a desire to get ahead of competitors in the race for business, but many of them can be traced to an utter ignorance of the first principles of business.

For example: while excessive competition may induce a man to sell goods at or about cost, the same thing does not force him to take the general public into his confidence and tell them what his goods cost, who he buys them from, and all the other things about his business that a level-headed business man usually keeps to himself. Yet these things are told to the public every day with the idea that by posting them they can get their confidence and induce sales. Can any retail jeweler tell us what earthly reason there is for initiating the public into what should be the secrets of the trade; why they should explain to the intending purchaser of a watch that the movement they offer him has a patent pinion, expansion balance, breguet hair spring, four pairs of jewels, why the 18k. gold case should be worth so much per dwt. for the gold, so much for making, so much extra for stem wind and engraving. Is there any reason why the retailer should quote the public gold chain by the dwt., or silver spoons by the ounce? We know of no earthly reason why they should do so, but we can find twenty against such a suicidal course. The information that is thus so glibly shot off by many of our jewelers is part of their capital. They did not acquire all this knowledge by intuition; in most cases it took them years to learn it thoroughly, and cost them money in addition. They might better give away part of their stock than this knowledge, which, while it is of practical value to themselves, only serves to make the customer more independent of them by posting him about prices. For example, to take a very common instance, a man goes into a jewelers to purchase a gold vest chain. The retailer shows him a lot, and although they are all as different as can possibly be in pattern, quotes him say one dollar per dwt. for them. "All 10k. chains cost alike," he tells his customer, "and we buy and sell them entirely by weight, just as the grocer does his sugar." The purchaser after inspection leaves, and promises to call again, but he is now posted about gold chains. He knows that no matter what the pattern is it should not make any difference to the price, that 10k. is worth one dollar per dwt., 15k. one fifty per dwt., and so on, according to the quality. Now all that he has got to carry in his head is the price per pennyweight, instead of the price and pattern, weight and size of each individual chain in the jeweler's stock. He can talk business to the second jeweler he visits sure. When he called on the first jeweler he was green at the business, now he is thoroughly posted. He now asks what is the quality of these chains; what do you charge per dwt. for them? If he is any good at driving a bargain, and the seller is not gifted with plenty of back-bone, he very soon makes him feel that if he is going to sell him a chain it must be cut mighty fine, and, therefore, down goes the price five or ten cents per dwt. If he has half-a-dozen stores to go to, and can set the one quotation against another's, he usually gets the chain so near cost that the jeweler who sells it to him at that price, *rather than be undersold*, has little or nothing left for himself out of the transaction.

Now what is true of gold chains is equally true of the sale of watch movements, silver spoons, clocks, and a dozen other staples of the trade that everyone knows are cut down so close to the quick that there is not a living profit in them. The fault is not with the business, for the jewelry trade is a profitable one if properly conducted, nor yet with the purchaser, for he would be indeed a foolish man were he to refuse this gratuitous information, by which he can easily save from ten to twenty per cent. on his purchase. As we said at first, the fault rests entirely with the jewelers themselves. When they sell goods in this way they violate every principle of business, and yet they are surprised that they are compelled to cut goods so fine to make sales. A watch movement should be sold as a movement and priced accordingly; a watch case by the piece, and not so much for the gold in it and so much for the making and other extras. A gold albert, guard, or necklet should be sold just the same as a locket or a brooch: so much each, and nothing whatever said about weight or price per pennyweight. Silver

spoons should be so much per dozen, and not so much per ounce and engraving thrown in, as is usually the case.

If goods were always sold by the piece, instead of by the weight of metal and value of workmanship, we think that it would go a very long way in making the jewelry business more prosperous. No buyer could possibly carry all the prices and patterns in his head, and could never be certain which was the cheapest place to buy. By this means, although no more goods would be sold, very much better prices would be realized, as the retailer would find himself in many cases making money instead of losing it.

This is a reform, however, that can only be brought about by united action amongst the retailers themselves. The best way that we know of to accomplish it would be to do as suggested by one of our correspondents in last month's issue : form district associations. These associations could decide what would be a fair retail price for all staples, and if the members stuck to the agreement and sold only by the piece this evil would be remedied in a large measure.

Now what are our retailers going to do about these abuses, which are of their own making? Will they make an effort to root them out, or will they let them go on ruining the business by taking all the profit out of it?

Such associations could also regulate the prices for watch repairing, and put this on a very much better paying basis than it now is. As this watch repair business is one of the biggest, as well as one of the worst abuses in the trade, we propose to open out on it more fully in our next issue.

ANNUAL MEETING OF THE CANADIAN ASSOCIATION OF JOBBERS IN AMERICAN WATCHES.

The Annual Meeting of the above Association, was held at No. 1 Wellington Street East, Toronto, on the 18th January, 1886. There were present :

Messrs. E. Scheuer, (in the Chair), T. H. Lee, M. C. Ellis, J. Segsworth, W. F. Carrier, W. G. H. Lowe, J. H. Jones, G. Chillas, L. E. Battegay, H. Benham, R. Y. Ellis, S. Frenkel, Thos. Marshall, H. H. Fudger.

The Vice-President, Mr. Scheuer, having read the Report, as follows :—

GENTLEMEN,—

It is with pleasure I meet you again, and I have to congratulate you on the successful working of the Association during the past year.

I have to report that on the 22nd July, your Secretary attended a meeting of the Joint Executive Committee, held in New York, for the purpose of recognizing the members of this Association, when twenty-five names were accepted.

At a meeting of the Association held in Toronto on 13th August, the Secretary was instructed to obtain from the Movement Companies letters agreeing to sell only to members of this Association in Canada, and in accordance with these instructions, obtained such assurance from the American Watch Co., Elgin National Watch Co., Hampden Watch Co., and Illinois Watch Co.

On the 2nd September, the Joint Executive Committee held a meeting in New York, when a resolution was passed that no member of this Association should sell American watches at retail, of which you got due notice by circular dated 2nd September.

The only unpleasant matter on which I have to report is the violation of contract and consequent cutting off of Messrs. Rothschild & Co. On the 10th November, the Secretary received a communication signed by five firms, members of this Association, stating that a certain firm in the West had stated to their representatives that they had bought Elgin Movements at less than prices allowed by the Elgin Co., and desiring an investigation. The Secretary at once laid the matter before the Directors representing the West, Mr. E. Scheuer and Mr. John Segsworth. After due investigation they found that Messrs. Rothschild & Co. had sold the movements in question. Messrs. Scheuer, Segsworth and Chillas called on Messrs. Rothschild & Co. for an explanation, and made their report to the Joint Executive Committee. A meeting of this Committee was held in New York, December 22nd, at which the President and Secretary, as members representing this Association, were present. The Committee decided that the case was fully proved, and ordered that Messrs. Rothschild & Co. should be cut off, due notice of which you received by circular dated 24th December.

The account of the Association stands as follows :

Total receipts, as per C. B. and Interest, - -	$731 23
" disbursements, - - - - -	382 10
Balance on hand, - -	$349 13

E. SCHEUER,
Vice-President.

TORONTO, 18th January, 1886.

It was resolved, That the Report be accepted as read.—Carried.

Resolved, That Messrs. R. Y. Ellis and J. Segsworth do audit the accounts.—Carried.

Resolved, That Article 4, Sec. 1 of Constitution, be amended to read as follows :

ARTICLE 4, SEC. 1.—The Annual Meeting of this Association shall be held on the third Monday in January, each year, alternately, at Toronto and Montreal.—Carried.

Resolved, That Article 8, Section 1 of the By-laws, be amended to read as follows :

ARTICLE 8, SEC. 1—Application for membership in this Association shall be made to the Secretary on the printed form to be supplied by him, accompanied by a draft for $25, which amount shall be returned to applicant if he is not accepted.—Carried.

Resolved, That Messrs. Scheuer, Chillas and Fudger be the Directors for the West for the ensuing year.—Carried.

Resolved, That Messrs. Schwob and Jones be the Directors for the East for the ensuing year.—Carried.

Resolved, That the Secretary of this Association notify each of the Watch Movement and Silver and Filled Case Companies in co-operation with this Association, that it is the desire of the Canadian Association of Jobbers in American Watches, that all goods bought by Canadian Jobbers shall be shipped by express direct to Canadian ports of entry, and that the Secretary shall obtain assurance from each Company that they will comply with this request.—Carried.

Resolved, That this Association express its entire sympathy with the question of protection to retail watchmakers, and are

prepared to co-operate heartily with any organization the retail trade may form to carry out their views.

Resolved, That the Report of the proceedings be sent to THE TRADER for publication.—Carried.

Resolved, That the thanks of the Jobbers' Association are due and are hereby tendered to Mr. George Chillas for the admirable manner in which he has discharged the duties of Secretary, and that he be requested to accept the sum of seventy-five dollars.—Carried.

Resolved, That the Secretary shall convey to the Board of Fire Underwriters the thanks of this Association for their kindness in allowing us the use of this room for our meeting to day.

GEORGE CHILLAS, *Secretary.*

JEWELERS' SECURITY ALLIANCE.

The annual meeting of the Jewelers' Security Alliance was held on Thursday, January 14th, 1886, at 4 o'clock, in the office of John Segsworth & Co., Wellington Street East, a fair representation of the trade being present. The President in the chair.

The Minutes of last Meeting were read and confirmed.

The withdrawal of Messrs. Crell & Battegay was presented and accepted.

The Treasurer's Annual Statement, showing a surplus of $588.06, after being audited by Messrs. Ellis & Ryrie, was received and adopted.

The election of officers for the coming year was then proceeded with, and resulted in the following appointments :

President, John Segsworth ; Vice-Presidents, R. Y. Ellis, E. Scheuer and John H. Jones ; Secretary-Treasurer, James Ryrie, the retiring Secretary-Treasurer, W. K. McNaught, finding it impossible to act for the coming year ; Committee, H. H. Fudger, W. G. H. Lowe, C. H. Robinson, Max. Saunders, John Welsh (Stratford), S. Spangenberg (Belleville), B. Chapman and W. K. McNaught.

Upon resolution, the Secretary was instructed to renew the agreement of the Society with Detectives Curtin, of Buffalo, and Gates, of Hamilton, for the coming year.

Upon motion of W. K. McNaught, seconded by R. Y. Ellis, it was decided to issue a new Certificate of Membership.

It was also decided, that inasmuch as the finances of the Society are in so flourishing a condition, for the present the annual fee shall not be called for, but shall be subject to the call of Committee should occasion demand it.

Upon motion of B. Chapman, seconded by Geo. Chillas it was decided, since THE TRADER is so thoroughly circulated amongst the jewelry trade of Canada, that this Meeting send a report of its doings, with the request that they be published in its pages.

The Meeting then adjourned.

JAMES RYRIE, *Sec'y-Treas.*

GOLD.—One cubic inch of gold is worth $210 ; one cubic foot, $312,380, and one cubic yard $9,797, 762 (counting the ounce at $18). At the commencement of the Christian era there were altogether $427,000,000 worth of gold, but at the time of the discovery of America only $57,000,000 remained. At present the value of all the gold in the world is counted $6,000,000,000.

CORRESPONDENCE.

RETAIL JEWELERS' ASSOCIATION.

Editor THE TRADER :

As it is very essential that some preliminary steps should be taken at once towards the formation of a "Retail Jewelers' Association," in order that the jewelers may be better protected from those wrongs that have been perpetually practiced upon them by the wholesalers, both directly and indirectly, and which they have not been able to overcome so far, I offer a proposition which I am sure will lead to the most sanguine anticipations, if the course is adopted ; and it is beyond question that either the method which I will shortly bring forward, or some *such* similar one, must be carried out before any progress can be made towards forming an alliance.

I do not intend writing a long article upon this subject—it is unnecessary, because the grievances to which I refer are too well known by all those who represent the legitimate trade, without enlarging upon them. But I will briefly ask, through the valuable medium of THE TRADER, with your permission, Mr. Editor, for the co-operation of the retailers ; and it is to be hoped that all will heartily and readily respond, for I presume it is obvious to all that something must be done very shortly in this direction, if the jewelry trade in Canada is to be preserved as a distinct trade in the future.

I am taking upon myself the responsibility of this action, merely to ascertain how the general feeling is in regard to an Association, and also in order that a definite idea may be formed of the number who will extend to it their aid, by attending any meeting that might be called, &c.

Hence, I earnestly ask all those who are in favor of forming a "Retail Jewelers' Association," and also those who would be willing to become members of the same, to send me their names.

Now let every retailer, whether he resides in a village, town or city—who is favorable to the plan—answer, so that some decided action may be taken towards the accomplishment of our object.

It is the duty of each and every one to lend his assistance in repressing a system which is causing a great amount of harm amongst the retailers, and which, if not stopped, will ultimately be the ruin of the retail trade.

Yours truly,

Guelph, Ont. A. A. DAVIDSON.

ED. NOTE.—Although we think Mr. Davidson is wrong in charging the evils that retail jewelers are laboring under against the wholesalers, as the reports in another part of this issue will testify, we regard his idea as a good one. We are glad to publish his letter, and will do all that lies in our power to make such an organization a success.—ED. TRADER.

SPECTACLES, AND HOW TO SELL THEM.

WRITTEN SPECIALLY FOR THE TRADER.

PAPER NO. I.

We do not propose in this, our first article on Spectacles, to give a scientific treatise or description, but simply to consider their relation to the jewelry trade, and by what means their sale can be increased. The ordinary jeweler considers the sale of Spectacles simply as an incident in his business. He buys a

MANUFACTURERS OF
SILVER AND ELECTRO-PLATED WARE
OF THE FINEST QUALITY AND DESIGN.

SPECIAL NOTICE.

The Toronto Silver Plate Company is in thorough running order, and is the First Silverware Factory in Canada to manufacture the goods it sells from the raw material.

Their machinery is of the latest and most improved design, their labor as skilled as any in America, their designs are elegant and original, and they use all the newest processes for quality and finish now in use in the best United States factories.

TRADE MARK.

They guarantee the quality of their goods to be equal to anything made in America. Prices will be found as low as for any goods of the same quality.

Their Flat Ware is all plated upon a base of 18 per cent. nickel silver, and guaranteed to be 25 per cent. heavier plating than the regular standard quality of the best makers.

They will be pleased at all times to show their Customers the very interesting process of manufacture in all its details, from the melting of the metal ingots to the finishing of the article.

They guarantee all goods bearing their Trade Mark.

They have now in stock Shelf and Hollow Ware of their own design and workmanship.

few here and there from different jobbers, keeps a badly assorted stock, and reckons Spectacles as a line not worth handling. We could, however, in many instances reverse this picture, and point out jewelers who find Spectacles a good profitable line to keep. These latter keep a good stock ; they generally buy their goods from one house, that deals exclusively in Spectacles and makes a specialty of the Optical trade ; they sort up their stock continually and keep every focus ; they avoid unnecessary duplicating of the numbers, and only buy those that they are out of ; they do not, in order to force a sale—as a good many jewelers do—fit a person badly with a number which is not suitable, thus injuring their reputation as reliable dealers ; but keeping a full supply they take a little trouble in fitting, and reap the reward of a gratuitous and valuable advertisement from their satisfied customers.

A great many jewelers think that a 25 cent Spectacle is all that is demanded. They don't stop to consider the reason why a 25 cent article is wanted. It lies mostly in the fact that it is because that is the Spectacle they keep, and that nine cases out of ten if they keep a proper stock they would sell a better article, *instead of the peddler doing so.*

It is a very simple matter to fit a person of ordinary sight, and in a future article we will treat of that subject ; but at present we will consider :

Firstly, The advisability of keeping Spectacles and Eyeglasses in stock.

Secondly, How to buy the stock. (Where to buy we will leave to the dealer's own judgment).

Thirdly, How to keep the stock.

Fourthly, How to make the Spectacle trade a success.

Firstly : If a jeweler stops to consider the immense number of Spectacles and Eyeglasses worn, and that at least one in every twenty of the population requires them, he would at once try to cater to this trade, which assumes larger dimensions every year. The demand is rapidly increasing. In fact more than one oculist has said that 40 years hence we shall be a spectacled nation, and it must be remembered that, unlike jewelry, Spectacles are an article of necessity and cannot be dispensed with. The writer, who has had over 13 years' experience of the trade in Canada, begs to state that as far as that experience goes it convinces him that the trade is a profitable and increasing one, and that $100 properly invested in Spectacles will pay better than any other line a jeweler can handle ; the profits are good and the sales, although not extraordinarily large, are steady.

We now come to the second point : How to buy a stock of Spectacles and Eyeglasses. Choose a first-class house to buy from—one that devotes its full energies to the Spectacle trade, and does not sell them as a side line only ; in fact from a house that will fill all special orders for you—a very important matter in this line. Lay in a stock on the following plan : Spectacles, convex, to sell retail at 25 cts., 50 cts., $1.00, $1.50, and pebbles at $3.00 per pair, respectively. Eyeglasses, convex, to sell retail at 25 cts., 50 cts., $1.00 and $2.00 per pair. In Spectacles take of each kind : 2 pair of each No. from 5 to 7, 4 pair each from 8 to 18, 2 pair each from 19 to 30, and 1 pair each from 32 to 60. In Eyeglasses you will require from No. 10 to 48 principally. Of concave or short-sighted glasses an assortment of 3 dozen Spectacles and 3 dozen Eyeglasses will suffice for ordinary requirements in country stores. Have your higher grades of goods made *interchangeable*, so that you can fit gold Spectacles with lenses from your steel Spectacles made on the same gauge, and never allow your stock to run down so that you are out of any number.

How to keep your stock : Don't keep it out of sight. Remember out of sight out of mind. Get a good show case, made up so that each focus number is kept separately, and so that by looking at your case you can tell at a glance what you have in stock. Keep your goods clean and neatly arranged, and you will find half your work in selling Spectacles done. It is a very bad plan to keep your numbers all mixed up, so losing time in looking them out.

How to make your Spectacle trade a success : Never misrepresent your goods. Sell your Spectacles for what they are. Do not sell a common Spectacle for a good one. Never sell a good Spectacle for a pebble when it is not one. Sell it on its own merits. Get a good line of goods from a reliable house. Keep a good assortment, and if you have not got what your customer requires get it for him. Advertise judiciously yourself, and you will know what you are paying for it. Don't buy from houses that profess to advertise for you gratis, as they can't do it for nothing, and you pay for it half-a-dozen times over in reality. And last, but not least, fit your customers carefully.

H. G. LEVETUS.

"RETAILER" SPEAKS AGAIN.

Editor THE TRADER :

SIR,—Your correspondent H. D. seems to have his share of grievances in his letter. He says he agrees with "Retailer" in the first part of his letter, but not in the latter. All "Retailer" proposed was to have a uniform scale of prices for American movements, whether it be ten or twenty per cent. or whatever the trade may determine, and all bind themselves not to sell below the prices agreed upon ; and if found so doing shut them off from buying any more movements.

It is true that the great difficulty is in taking old watches in exchange, but the remedy for that is : allow no more for them than they are worth ; and if others do so they will soon find it a losing game.

Let there be no petty jealousies between brother craftsmen. Let all endeavor to raise the trade to its proper standing, and all will be well satisfied with the result.

In the first place let there be a meeting of the retail trade called—say in Toronto—and organize an association of retail dealers on the same basis as the Jobbers' Association, and let there be a set of rules laid down for the approval of the trade.

And then at the next meeting let them be either accepted or rescinded, just as the members may think good. If such is done all would have a voice in the making of the rules by which they would be governed.

I think there are men enough in Toronto of sufficient mental calibre to draft a set of rules for the good of the trade, subject to the approval of the whole association.

Your article "Protection to Retailers" is to the point. Retailers must organize if they are in earnest to correct abuses.

My opinion has been expressed before, viz. : Let us have a uniform scale of prices laid down for work and all abide by the scale, as the public don't bring me or Mr. Jones a job for charity—to keep us from starving ; they bring it because they cannot do it themselves ; and if we do not give them satisfaction we lose their custom. I hear tell of some who profess to

OFFICE OF

THE KEYSTONE WATCH CASE FACTORIES

NINETEENTH AND BROWN STREETS,

PHILADELPHIA, Jan. 1, 1886.

DEAR SIR,

The Firm of C. N. Thorpe & Co. was dissolved by mutual consent on the 31st ult., the business and assets of the Firm having been bought by the Keystone Watch Case Company, a corporation organized under the laws of Pennsylvania.

We will continue our interest in the said Company, of which Mr. Thorpe is President, and we ask for the Company a continuance of your kind favors.

Yours respectfully,

GEORGE W. CHILDS.
CHAS. N. THORPE.

THE Keystone Watch Case Company is the same concern as formerly, but continued under a changed title. The name Keystone is a good and suggestive one, with which the Trade is thoroughly familiar, and it has long been the practice of many of the patrons of the Keystone Factories to speak of and address the late Firm as the Keystone Watch Case Company. The title, therefore, is peculiarly fitting, because of extensive usage and the fame and popularity of the Keystone Factories and their products.

The Keystone Watch Case Factories, as is well known to the Trade, have always been recognized in connection with thoroughly made, perfectly reliable, and in all respects satisfactory goods.

Under the operations of the Keystone Watch Case Company, that enviable position will be loyally maintained.

The opening of the new year finds the Keystone Factories admirably equipped for business, and the management confidently rely on the co-operation of the Trade in a greatly enlarged output from this time forward, satisfied that their joint efforts will be mutually advantageous.

clean a watch for twenty-five cents. (It is not in the town in which I live you will understand).

There is a storekeeper in King who makes his boast that he can sell American watches cheaper than any watchmaker—a boast that he will not be able to make good when he has sold his present stock, for he does not keep anything in the trade but a watch or two, which is kept to draw his farmer friends' custom from the opposite store.

I would say to the trade generally, if they have any suspicion that any of the jobbers are not following out the principles laid down by Messrs. Smith & Fudger, Lowe & Anderson, and Lee & Chillas, and in fact all the jobbers in Toronto, or if they find storekeepers or others selling American watches, let them take the No. and send the same to the factory, when they will be able to find who it was that sold it; or, if smuggled, the Customs should be apprized of the same.

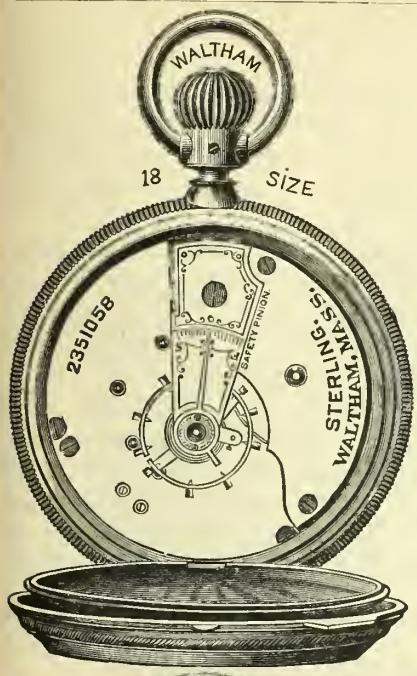
Your correspondent, Mr. Fenwick, objects to peddlers carrying watches, etc. I think, while it is their regular stock in trade, they should be reckoned as legitimate dealers, for we may rest assured that the general public will sooner buy from a regular dealer than from a peddler who is not an expert.

I have already trespassed too much upon your space, and conclude by wishing you a Happy New Year, and hope the retail trade will do their part as faithfully in the matter as THE TRADER is the wish of Yours truly, RETAILER.

SELECTED MATTER.

HE WANTS PIE.

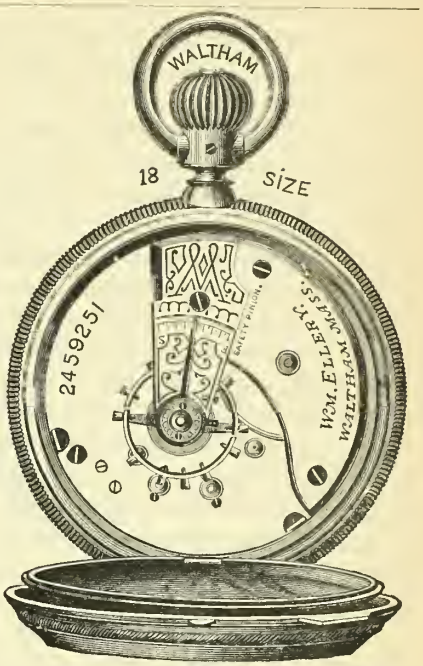
A little, with content, is much
To him who'll not refuse it,
Who takes it as the Lord hath sent,
And then doth rightly use it.
Most men, with nothing, have a thought
That life would be a pleasure
If they could share, in smallest part,
With those who have the treasure.
But is it true? Experience shows
That, in this world of sorrow,
The man who fights for bread to-day
Will fight for pie to-morrow.



He vows he does not want the earth;
His thoughts are far above it;
The gold of Ormus and of Ind
His simple tastes don't covet.
A very little meets his wants;
Enough to yield a living,
He says, is all a man should ask,
And thank the Lord for giving.
But, is it true? Well, if it be,
The truth you'll have to borrow;
The man who fights for bread to-day
Will fight for pie to-morrow.

Of wealth, a fraction's all he asks,
With smallest numerator
Set out in unit bold, above
A large denominator.
This makes the sum of all his joys,
Of all his hopes and blisses:
'Tis all he needs, 'tis all he prays;
'Tis bread and cheese and kisses,
But, is it true? You bet 'tis not,
For, in this world of sorrow,
The man who fights for bread to-day
Will fight for pie to-morrow.

THE SUCCESSFUL SALESMAN.



If we have been correct in assuming that there has been something in the nature of a revolution in the ordinary conduct of the country store business in Canada during the last twenty years, the change is not less marked in the character of the salesman than in that of the buyer and the business man. The grumpy, uncouth, general purpose attendant, who lazily left his concealment behind some overtopping pile of nail barrels and biscuit boxes, at the summons of the bell, sprung into clanging activity by the opening door, to ascertain the wants of the occasional purchaser, is no longer the rule, but the exceptional type of the modern salesman. What he is, is perhaps less to the purpose of this article than what he must needs be in order to attain the highest rung of the ladder as a salesman. And, first of all, he must needs have a competent acquaintance with the merchandise he offers for sale. A perfunctory knowledge gained in a passing way is only sufficient to betray his ignorance to the first customer of perception with whom he comes into contact. Here, as in every other walk in life, "knowledge is power," and no amount of address, tact and patience will compensate for the lack of a thorough, complete and technical acquaintance with each article, and which must extend to every variation of size, width, weight, quality, description and name, its relative value and peculiarity, the manner in which it is put up, bought, sold, etc., and all these must be at his fingers' ends, naturally, for the benefit, assistance and guidance of his customer, to the end that doubt and difficulty may be removed, and a sale effected. Could we reach the ears of the numerous class of young men seeking to qualify themselves to-day, for salesmen and merchants, we would ask them with all earnestness, as they value their future, to aim at *thoroughness*. One branch of trade, one department, one class of goods known completely, exhaustively, is of supreme importance. Not that the acquisition of knowledge should cease there, for, in a new country, an acquaintance with many kinds of merchandise may be extremely helpful, but the man who has but a smattering, a crude and imperfect knowledge of many things, without being thoroughly conversant with one, as a rule, achieves little success.

Assuming, however, that as the result of careful training, and the cultivation of habits of perception and observation, he knows his goods, and can speak about them with authority; a like amount of study must be given to human nature, so as to adapt himself to every variety of disposition, peculiarity and idiosyncrasy of the customer. Here the exercise of tact, skill, diplomacy and patient industry come to the assistance of the salesman. Address, urbanity of manner, imperturbable good humor, and long-suffering are all needful, and these are usually found in the highest perfection in the man enjoying good health, as the result of abstemious and regular habits. The man of quick temper, short, irritable, too anxious for results, is as likely to fail as the ungracious, angular crank, from whom the customer is intuitively repelled. Neither does success usually attend the loquacious parrot, whose dictionary of adjectives is so speedily exhausted, any more than the man who stretches exaggeration into falsehoods, which are speedily detected, and the salesman discredited. Just as a thorough knowledge is essential to the successful advocacy of the salesman's wares, so is truth the key and channel to confidence and esteem, without which there can be no permanent hold upon the customer.

ROBBINS & APPLETON

GENERAL AGENTS,

BOSTON. CHICAGO. NEW YORK.

LONDON. SYDNEY.

This analysis of the successful salesman may be supplemented with a few illustrations:—Mr. P. was one of the most successful travelling merchants we ever knew. Of fine physique, to a more than ordinary share of good looks, he combined a gentlemanly address and extraordinary cheerfulness, as the result of excellent health. The buoyant, elastic step with which he entered a merchant's store arrested immediate attention, and the cheery, radiant salutation, never too familiar, and always respectful, frequently put the merchant, blue over the tightness of money or quietness of trade, into instant good humor, inspired him with hope that issued in a determination to persevere, drove away the despair, and an order to the visiting inspirer almost invariably followed. It is needless to add that the salesman "knew his business," and was not strange to the art of displaying his wares, nor to the efficacy of a manly advocacy of the respectability of his firm, and the merchantability of their goods. From the memoirs of "George Moore, Merchant and Philanthropist," we extract the following:—

Mr. Moore had, of course, many rebuffs to encounter in the course of his journeys as a commercial traveller. With sufficient confidence in his own abilities, he had no personal pride. Though rebuffed a dozen times, though bowed out of a shop again and again without an order, he would call again with his "Good Morning" as brisk and cheerful as ever. He used to say that it was a bad plan to fall out with a customer, however rude he might be. He talked with them, he joked with them, he amused them, and finally he brought them round to his side—which was to order a good parcel.

Many are the stories still told by commercial travellers about George Moore's determination to get orders. He would not be denied. If refused at first, he resorted to all sorts of expedients until he succeeded. On one occasion he sold the clothes off his back to get an order. A tenacious draper in a Lancashire town refused to deal with him. The draper was quite satisfied with the firm that supplied him, and he would make no change. This became known amongst the commercial travellers at the hotel, and one of them wagered with George Moore that he would not obtain an order.

George set out to try. The draper saw him entering the shop, and cried out: "All full! all full, Mr. Moore! I told you so before!" "Never mind," said George, "you won't object to a crack." "Oh, no!' said the draper. They cracked about many things, and then George Moore, calling the draper's attention to a new coat which he wore, asked what he thought of it. "It's a capital coat," said the draper. "Yes, first-rate; made in the best style by a first-rate London tailor." The draper looked at it again, and again admired it. "Why," said George, "you're just my size; it's quite new, I'll sell it you." "What's the price?" "Twenty-five shillings." "What? that's very cheap." "Yes, it's a great bargain." "Then I'll buy it," said the draper. George went back to his hotel, donned another suit, and sent the "great bargain" to the draper. George calling again, the draper offered to pay him. "No, no," said George, "I'll book it; you've opened an account." The draper afterwards became one of his best customers.

On another occasion a draper at Newcastle-upon-Tyne was called upon many times without any result. He was always "full." In fact he had no intention of opening an account with the new firm. Mr. Moore got to know that he was fond of a particular kind of snuff—rappee, with a touch of beggar's brown in it. He provided himself with a box in London, and had it filled with snuff. When at Newcastle he called upon the draper, but was met as usual with the remark, "Quite full, quite full, sir." "Well," said Mr. Moore, "I scarcely expected an order, but I called upon you for a reference." "Oh, by all means."

In the course of conversation, George took out his snuff box, took a pinch, and put it in his pocket. After a short interval he took it out again, took another pinch, and said, "I suppose you are not guilty of this habit?" "Sometimes," said the draper. George handed him the box. He took a pinch with zest, and said, through the snuff, "Well, that's very fine!" George had him now. He said, "Let me present you with the box; I have plenty more." The draper accepted the box. No order was asked; but the next time George called upon him he got his first order, and numerous others followed.

—HENRY W. DARLING, in *The Merchant*.

HALF AN HOUR TO SKIP.

A clock-cleaning tramp observes: "Cleaning clocks is another good fake, only it has been worked to death. One of us goes ahead and tinkers up the clock, taking it partially to pieces, tickling it up with a feather, and anointing it with ile or lard or something. I always, when I'm on the tramp, carry boa-constrictor ile or yak ile for the purpose. It's coal ile or lard, just as it happens. When I comes to put it together, if I don't know exactly where all the wheels go, I do the best I know how, and if there is any overflow of wheels without holes to put 'em in, as is usually the case, I jest quietly slip 'em in my pocket. I then handspike the hands ahead a half hour, and tells the folks it is unhealthy to turn them back, and that they had better wait until the time comes as pointed by the clock before they start it running. This saves disarrangin' the innards, I tells 'em. That half hour lets me out, and I goes if the clock don't."—*Exchange*.

STEPPING STONE TO SUCCESS.

Learn your business thoroughly.

Keep at one thing—do not seek change.

Always be in haste, but never in a hurry.

Observe system in all you do and undertake.

Whatever is worth doing at all is worth doing well.

One to-day is worth two to-morrows.

Be self-reliant; do not take two much advice, but rather depend on yourself.

Never fail to keep your appointments, nor to be punctual to the minute.

Never be idle, but keep your hands or mind usefully employed except when sleeping.

Use charity with all; be ever generous in thought and deed—help others along life's thorny path.

Make no haste to be rich; remember that small and steady gains give competency and tranquility of mind.

He that ascends a ladder must take the lowest round. All who are above were once below.

BEST.

BUSINESS NOTES.

MEMBERS OF JEWELERS' SECURITY ALLIANCE.—SPECIAL NOTICE.—In case of burglary, telegraph at once to John Segsworth, 4 Wellington St. East, and James Ryrie, 113 Yonge St.

Mr. A. W. Dixon, formerly with Samuel Stern and afterwards with the late John Zimmerman, is now on the road for Messrs. P. W. Ellis & Co.

LOWE & ANDERSON are out with a very neat calendar and Christmas card which they have distributed broadcast amongst the jewelry trade. If you haven't got one ask the firm, "Why is this thus?"

FIRE.—Last month, the store occupied by Mr. J. A. T. Caton, wholesale jeweler, of Victoria, British Columbia, caught fire, but was extinguished before a great deal of damage was done. The loss was about $100, fully covered by insurance.

HOW TO SELL SPECTACLES.—If you want to get a few good, practical points about spectacles and how to sell them, be sure and read the series of papers that are being published in THE TRADER, commencing with this number. They will repay careful perusal.

W. F. DOLL. jeweler, late 55 and 57 Yonge St., Toronto, has removed to 525 Main St., Winnipeg, in Clements' new block, opposite city hall. Mr. Doll is now visiting New York and the eastern markets, picking up new lines, and will return to Winnipeg about the 1st of March.

SALE OF A BUSINESS.—We understand that the stock and fixtures of the business of Simon Schreck, jeweler, of St. Thomas, has been sold at thirty-five cents on the dollar to Mr. Fox, jeweler, of this city. Mr. Fox intends bringing it here to dispose of. Experts say that it was no great bargain even at that low figure.

THE ACME SILVER CO., of Toronto, not to be out-done, have sent out one of the handsomest calendars that has appeared this season. It is handsomely lithographed in colors and is good enough to frame. We should say that if the demand for the company's goods were as general as the demand for the lithograph they would need to double their capacity in the near future.

A LUCKY JEWELER.—We understand that Mr. Simon Shreck, whose stock and business were recently sold by his creditors, is starting again in his wife's name next door to his old place of business. It is rumored around St. Thomas that Mr. Shreck's better half was, only a few weeks ago, lucky enough to win a $3,000 prize in the Hamburg, German, lottery. The moral to every jeweler about to fail is obvious! Get your wife to go in for German lotteries.

ARREST OF A JEWELER.—We see by our Hamilton contemporaries that T. J. Carrol, jeweler of Hamilton, has been arrested by Messrs. Thomson & Co., of that city, for larceny. From the evidence before the magistrate it appears that Messrs. Thomson & Co. gave Carrol a couple of watches to sell for them and he refused either to account for them or the money. The firm had him arrested and we understand that the police magistrate has committed him for trial.

A NEW WATCH CASE.—The American Watch Case Co., of Toronto, have just secured the patent for a new and improved cheap dust proof silver watch case, which they have dubbed the "Perfection," and which bids fair to create a revolution in the trade. They have just supplied the jobbing trade with samples, and are ready to fill orders for them as fast as they come in. It is the cheapest case ever sold in Canada, and every dealer should ask his jobber to send him a sample of it at once.

A TASTY SOUVENIR.—One of the most elegant Christmas souvenirs that we have seen this year was sent us by the Illinois Watch Co., of Springfield, Ill., U.S., and consisted of a beautifully lithographed series of views of their factory and of the principal places in the capital of the State. No price-list marred its attractiveness, but in its place was a very neat and well written treatise on the adjustment of watches and the superiority of the system used by the Illinois company over all others.

BETTER THAN GOLD OR EVEN WHISKEY!—We learn from an exchange that Mr. Gage, formerly a jeweler of Kingston, Ont., but latterly a resident of California, U. S., has discovered a very fine spring of pure drinking water near the city where he resides, which he has disposed of for the sum of $65,000. Prospecting for water springs in California seems at present to be a better paying investment than prospecting for gold. We doubt if in such a "glorious climate as California" that a spring of pure whiskey would have brought a much higher price in an open market.

FLATTERING.—Our esteemed contemporary *The Metallurgist*, of Chicago, says of us:—"One of the brightest and most welcome jewelry publications that comes to our table is *The Trader*, of Toronto, Ontario. It is wide awake and pretty level headed on current topics of interest to the jewelry public." If we hadn't a bad cold in our head, we would take off our hat. As it is we can only say, Thanks!

SERIOUS ACCIDENT.—We regret to learn that Mr. William Ellis, brother of P. W. Ellis and foreman of their factory, met with what might easily have been a fatal accident on Saturday afternoon last, while coasting on the hill near the Don. As we go to press he is considerably improved, and although badly shaken, expects to be able to resume work in a few days.

THE TORONTO SILVER PLATE CO.—We had the pleasure of going through this superb factory a few days ago under the guidance of the enterprising manager Mr. E. G. Gooderham, and were very much surprised at the advance which they have made in every department of manufacture during the past few months They are now turning out goods of original design, beautiful finish, reliable quality and at prices almost as low as the same class of goods are sold at in the United States. Such factories as this are a credit to any country and if this is the way the present tariff tends to ruin the country we say like Oliver Twist, "Give us more" of the N. P.

THE ARREST OF TOBIAS EPSTIEN, who was formerly in the jewelry business but latterly engaged in the gents' shirt and furnishing trade, has created no small comment amongst those who knew him in the city. Mr. Epstein, who has been endeavoring to compromise, is charged by his creditors with having made way with some $30,000 worth of his assets. At the preliminary investigation before the Police Magistrate a few days ago he was committed to stand his trial at the next court but was allowed out on bail being given for $35,000. We trust Toby may clear himself, but at the present time things look rather squally for him.

THE ANNUAL MEETING of the American Watch Case Co., of Toronto, was held at the Company's office on Wednesday, the 20th January, when the old Officers and Board of Directors were re-elected for the current year. Although only eleven months have elapsed since this Company was organized, they are now thoroughly equipped with the very latest and most improved machinery known to the business, and are in a position to fully meet the demands of the trade, both as regards quality and quantity. They will in future continue their policy of making no goods without their own stamp, and of fully guaranteeing the quality of every case bearing any of their trade marks.

DEATH OF MR. THOMAS ATKINSON.—We regret to have to record the sudden death of Mr. Thomas Atkinson, jeweler of Newmarket, Ont. Mr. Atkinson was in Toronto only a few weeks ago on business connected with his firm and at that time no one would have for a moment supposed that he was so near the end of his life. He was an honest, upright merchant of a school that was old-fashioned enough to believe in paying one hundred cents on the dollar, and that a gentleman's word should be as good as a bond. He will be much missed in the town in which he lived and where he was highly respected. We understand that the business will be carried on by his only son Lemuel Atkinson who is a practical jeweler.

THE ELLIS TRADE MARK.—Messrs. P. W. Ellis & Co., in order to put an end to the misrepresentations often indulged in regarding the quality of gold jewelry, have for the future determined to stamp all the goods of their manufacture with a trade mark, (fully described in their advertisement) which, while serving to identify all goods of their make, will also, so far as the trade is concerned, act as an absolute guarantee of quality. This we regard as a wise step, and from the integrity and reliability of the firm using it we have no doubt that in a very short time our Canadian jewelers will look upon the E stamped maple leaf with as much confidence as if it were the Hall mark of the English Government Assay office.

525 MAIN ST., WINNIPEG.

(Late 55 & 57 Yonge St., Toronto)

THAYER & CO.,

3 WELLINGTON ST. EAST, TORONTO,

MANUFACTURERS' AGENTS AND DEALERS IN

Watches, Clocks, Material and Jewelry of all Kinds.

We beg to inform the trade that our **MR. FRED. A. THAYER** when in New York last month, succeeded in buying for SPOT CASH, some of the biggest bargains in Jewelry ever secured by any Canadian buyer, and of which we propose to give the trade in this country the full benefit. A look through our Stock, which is entirely new, will convince any Jeweler that he can save money by dealing with our house.

In addition to Watches and American Jewelry, we make specialties of the following lines, in all of which our Stock will be found very complete :

WATCH AND CLOCK MATERIALS OF ALL KINDS, WATCH GLASSES AND GENERAL JEWELERS' SUNDRIES.

☞ Our **MR THAYER** will call on you during the month, and we trust that you will reserve for him a share of your esteemed orders.

MONSTER SAFES.—We learn from a British Columbia exchange that the arrival of two monster safes, manufactured by Messrs. J. & J. Taylor, the well-known safe makers of this city for the Bank of British Columbia in Victoria, created quite a furore in that place. *The Colonist* devotes a full column of what it terms "these masterpieces of mechanical skill" and refers in very flattering terms to the makers. Although Solomon's saying that "a good name is better than great riches" is now over two thousand years old, the experience of Messrs. J. &. J. Taylor proves that he was quite right in making such an assertion. Their name is regarded all over Canada as a synonym of fair dealing and honest work, and we are therefore, not surprised that the arrival of two of the finest safes they ever turned out of their works should be so loudly heralded by our far away countrymen in British Columbia.

A NEW DEPARTURE.—As will be seen from our advertising columns, Messrs. Smith & Fudger in fulfillment of their promise to the Retail Trade made last November, have separated their jewelry entirely from their fancy goods business. The jewelry business will hereafter be a distinct business, they having sold it out en bloc to a joint stock company, consisting of themselves and several of their oldest employees. We trust that the change will be a beneficial one to all concerned, and we offer our sincere congratulations to their employees who have thus obtained a partnership in such a prosperous business. If the new company carry out their promise of selling only to bona-fide retail jewelers, as we have no doubt they will, they should be able to secure a large share of the legitimate jewelry business. They have our best wishes for the success of their new venture.

A LIVE RODGERS.—Meeting the genial manager of the Acme Silver Plate Co. the other day, we asked him in banter if it was true that he had the real Rodgers chained up in his back yard He assured us, upon his word of honor, that there was not a single particle of truth in the story, but that if we had an opportunity of coming down, he would show us the real, live Rodgers working in the factory and superintending the manufacture of the plated knives, spoons and forks which bear his name. They say it's better to be born lucky than rich, but if we were to have any control over our advent into this sublunary sphere, we would prefer being born a "Rodgers" in preference to being the son of a prince or any other profession, except that of a plumber. There's money in it, so long as you can do good honest work.

THE KEYSTONE WATCH CASE CO.—As will be seen from the advertisement on another page, the firm of C. N. Thorpe & Co., of Philadelphia, manufacturers of the "Boss" and "Keystone" cases, have turned their business into a Joint Stock Company, under the appropriate name of The Keystone Watch Case Company. With the exception of a larger working capital, and increased facilities for doing business, the change is in name only, as the management of the new Company will remain as before in the hands of Mr. C. N. Thorpe, Mr. H. L. Roberts and Mr. Chapette, the three gentlemen who made the reputation of the old concern, and who may safely be trusted to preserve and enhance it in the new. The "Boss" case has more than a continental reputation, and if the management of the new Company still adhere to their old idea of making only first-class goods and giving the public full value for their money, they may reasonably expect to increase their trade very largely. We wish the new Company a long and successful career.

PLEASE TAKE NOTICE!—We have frequently of late been in receipt of communications from various parts of Canada, which, for the most part, consist of personal attacks, either upon offending jobbers or retail opponents in business. While there may be some—nay, a great deal of truth in many of these charges, we desire to say right here that the columns of THE TRADER is not the place in which to ventilate such grievances, and we do not propose to constitute ourselves a vehicle for the conveyance of abuse. If the jobber with whom you have dealt does something you don't like or consider fair, settle the matter with him directly. If he won't make the *amende honorable*, you can refuse to have anything to do with him, that is if you don't owe him anything; if you do you had better poney up before you say too much. There are any amount of jobbers to buy from, and if one will not use you fairly, perhaps another will. If your grievance is against some local opponent, you must find some other way of getting even with him, for although your difference may be important to you personally, it is not so to the trade in general, and won't interest them in the least. For the ventilation or exposure of any trade abuse, such as may be of interest to the trade in general, or any section of the trade in particular, we have always room in our columns, and will do all in our power to help to correct them, but we can't go into the personal abuse business. For such communications we have a large waste basket, and our "devil" says they come in very handy for lighting the fire.

WARNING!—We are informed upon undoubted authority, that the Government have decided to protect themselves, and at the same time protect honest dealers from the unfair competition of jewelry smugglers, whether wholesale or retail, and to this end have detailed several private detectives to make a thorough investigation of all and sundry jewelers suspected of such practices. We are glad that this is the case, as such a proceeding on their part to enforce the law, cannot fail to be of benefit to every honest, law-abiding merchant who pays the duty. It is the duty of every honest jeweler, whether wholesale or retail, to give the Government all the information in his possession that may help to stamp out this practice. They will consult their own interest and the good of the trade in general by doing so. We expect to hear of some striking examples being made by the Government before the year is out.

CAN IT BE TRUE?—A special dispatch to a city contemporary says:—"The barefaced swindle perpetrated upon the customs authorities in Montreal, and discovered by the guardians of the estate of the absconding jeweler, C. T. Picard, who is supposed to be hiding in New York, has caused no little gossip amongst the trade. The full extent of the swindle is not known, but so far as discovered amounts to over 170,000 francs, and the authorities expect the amount will reach at least as much more. The most astounding feature of the affair is that a large, wealthy and presumably respectable house in Europe should have been guilty of aiding and abetting the firm here. It is asserted that the well-known watch manufacturing house of E. Sanderz & Co , Geneva, Switzerland, have been guilty of such conduct They have, it is said, supplied Picard & Co. with three sets of invoices. In those for the customs authorities, the goods were entered at from 50 to 70 per cent. lower than the invoices sent to the firm. The invoices containing the real values were addressed to Picard's private residence, where he kept a separate set of books and in which he debited Sanderz & Co. with the difference in invoices." In reference to this dispatch, we may say that the trade can scarcely conceive it possible that any honest man could so far lower himself as to take the false oaths that such a system of cheating must necessarily entail. Of the two evils, we think regular smuggling the lesser, and from a business standpoint, would certainly prefer to deal with a sneaking smuggler, who risks his personal liberty in cheating the Government, than with the able bodied liar, who effects the same object by committing perjury, either personally or by proxy. Both are bad enough in all conscience, and should be stamped out by the Government with an iron heel. These developments came none too soon, and the only pity in the Picard case is that it is the absconder's creditors and not himself who will have to pay the piper, if the Government insists on "its pound of flesh" in his case.

THE DEARDON SMUGGLING CASE.—Following close on the heels of the Picard Case, comes the intelligence that the customs authorities at Montreal have made another large seizure of jewelry, the "victim" this time being Mr. Deardon, one of the oldest wholesale jewelers of hat city. This seizure, which reflects the highest credit upon the officials at that port, has only been accomplished after three years' strict surveillance of the importer by a tide waiter here, whose suspicions were aroused by information he received. The difficulty in the way of unravelling the mystery as to how or by what route the goods were brought in, was the great obstacle that postponed the seizure until the present. It appears that everything was brought out on the Allan Steamships from England without being entered on the freight list, this having been done, it is alleged, systematically, in winter to Halifax, and in summer to Quebec, where the owner received the goods himself, and by concealing them on his person had no difficulty in getting them to his place of business. He admits the fraud, so the goods will be confiscated, and a fine of fifty per cent. of the legitimate duty imposed, or he will have to go to jail in default of payment. This looks as though the department meant business. It is also said that

Deardon made a clean breast of the whole concern, and gave the customs authorities a full list of his accomplices and the retailers who bought from him. As the customs people have a direct interest in every seizure, a share of the spoils going to them, it is probable that there will be "wigs on the green" ere long.

SOMETHING ABOUT R.F.S. & Co.—We clip the following interesting item from *The Metallurgist*, which we think will be of interest to our readers:—"The house of R. F. Simmons & Co., Attleboro Falls, Mass., was established in 1873, and the present members of the firm are Messrs. R. T. Simmons, E. L. Hixan and J. L. Sweet. Mr. Sweet is the Vice-President of the Jewelers' Board of Trade of Providence. They at present employ over one hundred and eighty workmen, and although I hear other manufacturers claiming to employ as many, yet after having covered the jewelry manufacturing districts of the East pretty thoroughly, it is my belief that this house "leads the van" in the number of employees. Their specialty is gold stock plated chains. They carry in stock over 2,000 different styles. Messrs. Simmons & Co. run several patented chains and among others their patent box link. They were the first originators in plate of the "California" chain, This has always been a hard chain to make in plate as it is apt to run up to too high a price in making. The "California" chain was probably first imported and is made in bright and Roman gold. As per a patent process, with Messrs. Sweet & Co., these two materials are now united without solder, and this process has given the firm almost the entire trade in this chain. They have a very large sale for it on the Pacific coast."

WHAT IS A MINOR?—Louis Sapery, a young man of a speculative turn of mind, embarked in business in Toronto some four years ago as a jewelry peddler, and for some time did a snug little business, buying exclusively for cash, on account of the scarcity of credit. Subsequently, however, young Sapery entered into partnership with his brother-in-law, a Mr. Muscat, under the style of Muscat & Sapery, and in addition to his peddling trade, the new firm opened out a retail jewelry store on King Street East, almost opposite the St. James' Cathedral. As the new firm for a while met their engagements very promptly, it was not long before they were favorably regarded by the jobbing trade and getting all the credit they wanted, and, as it now appears, a great deal more than they deserved. Last fall, after laying in an unusually large stock of goods, young Sapery started on a trip to Manitoba to dispose of his stock. Later on he returned to Toronto and informed his creditors that he had sold nearly all his goods up there, but while in a house of ill-fame, in the prosecution of his business, he was drugged and robbed of the entire proceeds of his sales. His creditors, not taking this for gospel, commenced to make inquiries, and the result was that Messrs. P. W. Ellis & Co., one of the largest of them, got out a *capias* and had him arrested and put in jail. His friends have moved in court for an order to set the *capias* aside, on the ground that he is a minor, but their application has been thrice dismissed with costs, they having so far failed to convince the hard-hearted judge that the poor little fellow should have been tied to his mother's apron strings instead of selling jewelry these few years past. It is usually charged against this country that our youths are too precocious, but certainly if what Sapery's friends allege be true, here is at least one authentic case, where a young man of about twenty-one, who for four years has hoed his own row as a jewelry peddler, has suddenly relapsed into an irresponsible child, who should be pulling away at the feeding bottle instead of being put into jail by his hard-hearted and unfeeling creditors. Messrs. Ellis say that they are going to fight this thing out to the end on the line they have started on, come what may, and we think they are to be commended for so doing. A few such examples would clear the moral atmosphere in the jewelry trade and make it healthier for some time to come. In the meantime, if being a minor is going to save them from paying their legal obligations, some of them may suddenly discover that they are under age and act accordingly. If, however, they are as successful as Mr. Sapery has been, it will scarcely pay them.

WORKSHOP NOTES.

TO TEMPER STEEL.—Steel tempered in oil is not as hard as when tempered in water; softer in tallow than in oil; softer in sealing wax than in tallow. Small drills hardened in sealing wax require no annealing; very thin ones may be tempered by drawing them with a quick motion through the air; they, too, need no annealing.

TO HARDEN PINIONS.—I have for several years used petroleum for hardening pinions with best results. The steel parts to be tempered are first heated upon charcoal in the customary manner, then annointed with ordinary washing soap, heated cherry red, and quickly immersed in petroleum, without anticipating that the latter might ignite. Steel articles heated in this manner do not warp whatever, no matter how thin, and remain almost entirely white.

THE FUNCTIONS OF OIL SINKS.—Oil sinks are formed in watch and clock plates so that by capiliary attraction the oil is kept close to the pivot instead of spreading over the plate, and back slopes are formed on the arbors, so that the oil may not be drawn all up the body of the arbor. The "attraction" is sometimes negative and becomes a repulsion, as is the case of mercury in a glass tube. It is still called capiliarity whether the fluid is raised above its natural level or depressed below it.

REVARNISHING CLOCK CASES.—It is often incumbent on the country watchmakers to revarnish clock casings and other objects; we therefore publish a few recipes of easily-prepared varnishes. *Common Varnish*: 16 parts mastic, 2 parts Venetian turpentine, 24 parts sandarac, 120 parts alcohol. *Black Varnish*: 20 parts alcohol, 1 part sandarac, 2 parts shellac, 1 part elemi, 1 part seedlac, 1 part mastic, 1 part boneblack, 1 part Venetian turpentine. *Red Varnish*: 50 parts alcohol, 1 part dragons' blood, 4 parts Venetian turpentine, 4 parts shellac, 8 parts mastic, 2 parts elemi. The ingredients are put into a bottle and filtered through a fine cloth, and the varnish is ready for use. For a colorless varnish, use 1 part mastic, 2 parts bleached shellac, 2 parts sandarac, and 20 parts alcohol.

BURNISHER.—The surface to be burnished must be free from scratches, which the burnisher would not remove, but render more distinct by contrast, and the burnisher must be kept highly polished, for the surface burnished can never be smoother than the burnisher. Burnishing polished pivots with the glossing burnisher preserves them from wearing. Very little, if any, of the metal is removed by burnishing in the ordinary way, although watchmakers sometimes use what are called cutting burnishers to form pivots. The cross section of these burnishers matches the outline of the pivot it is desired to form, and they are roughened by rubbing on a lead block charged with coarse emery. The pivot is finished with a smooth burnisher of the same form as the cutting are. Silversmiths use burnishers of agate.

WEAKENING THE SPRING.—The balance spring is best placed upon a piece of glass, not too thick, which lies upon a piece of white paper, whereby the disturbing shadow is prevent altogether. Much twisting of the spring is injurious, and no exact regulating can be had with one that is bent. Shonld it ever become necessary for the repairer to weaken an over-strong spring, for want of a suitable one, let him do as Cut a medium-hard holly, narrowed flat, press the spring carefully within it, lay it upon a plate of glass, and apply the oilstone with gentle pressure, or coarse redard oil, and thus remove as much as consistent. When much has to be taken off, it is better to shellac the spring upon the plate for flat grinding and polishing—of course set the screws very exactly to obtain a uniformity; after finishing, remove the spring. with alchohol and boil. The spring coils must lie in their natural position, neither twisted nor cramped. I wish to state in this connection that this desperate remedy should only be used when the repairer has no other means at command, and only then in watches of low grade. Of two evils choose the lesser. The spring is not *improved* by such treatment.

OTHER NOTES.

A watchmaker in Newcastle is said to have completed a set of three gold shirt-studs, in one of which is a watch that keeps excellent time, the dial being about three-eighths of an inch in diameter. The three studs are connected by a strip of silver inside the shirt bosom; and the watch contained in the middle one is wound up by turning the stud above, and the hands are set by turning the one below.

Engines of war are short-lived now-a-days. Three years ago no praise was too high for the machine-guns which had brought to a close the bombardment of the forts of Alexandria, by driving the gunners from the guns they were serving. Now those same guns of Mr. Nordenfeldt's invention are pronounced obsolete, and no longer fulfilling

the necessary requirements. Recent experiments carried out in Weymouth Bay by the Polyphemus against dummy torpedo-boats have shown that the quick-firing gun manufactured by Messrs. Hotchkiss is the only one at present whose results are satisfactory.

The total number of watches produced annually in the entire world is estimated to be about 3,000,000. The annual production in the United States is now 1,000,000. The total number of key-winding watches made in this country since the introduction of machinery in their manufacture, or since about 1850, is 3,250,000. Probably over 2,000,000 of these were made during the last ten years.

The interest factor is one of the most potent features in all business transactions. Money will double itself at ten per cent. in about seven years, at nine per cent. in eight years, at eight per cent. in nine years, at seven per cent. in ten and a half years, at six per cent. in twelve years, at five per cent. in fourteen years, at four and a half per cent. in sixteen years, and at four per cent. in eighteen years.

WISE AND OTHERWISE.

A NAVIGATOR'S most dangerous strait is a whisky straight.

EVERY angry man thinks he's right, and nine out of ten can see that they were wrong when anger cools. The tenth man is a fool.

PROFESSOR—"Is the intensity of gravity greater at the Poles or the Equator?" Sophomore—"Yes, sir." Professor—"Which?" Sophomore—"It's greater."

"THE mouth of the Amazon," said a professor of geography in a St. Louis female seminary, "is the biggest mouth in the world—present company always excepted."

A SCOTCH schoolmaster having repeatedly and at last angrily demanded of the pupils, "Who signed Magna Charta?' a little girl tremblingly replied, "Please sir, it was na me."

A CERTAIN little damsel, being aggravated beyond endurance by her big brother, fell down upon her knees and cried: "O, Lord! bless my brother Tom. He lies, he steals, he swears. All boys do; us girls don't. Amen."

ON a recent trial a witness was asked as to the common sense of Joseph Buckley. "When Buckley was sober," he said, "he was very sensitive—as sensitive as any other man; but when drunk he was very much exaggerated."

Two Irishmen were proceeding in company to witness an execution, when one said to the other: "I say, Pat, where wud yez be if the hangman had his dues?" "Begorra," said Pat, "I'd be jist walkin' down this shtreet alone."

A MAN who had filed a petition for a divorce was informed by his counsel that his wife had filed a "cross petition," as lawyers call it. "A *cross* petition!" exclaimed the husband! "that's just like her; she never did a *good natured* thing in her life."

A FATHER lately induced a croupy little boy to make a healthy meal of buckwheat cakes and molasses, but the latter proved to be syrup of squills. The boy said he thought something ailed the molasses the very minute his father told him to eat all he wanted.

"TEN dimes make one dollar," said the schoolmaster. "Now, go on, sir. Ten dollars make one—what?" "They make one mighty glad these times," replied the boy, and the teacher, who hadn't got his last month's salary yet, concluded that the boy was about right.

OUR HELP COLUMN.

THE TRADER aims to be of practical value to the Retail Jewelry Trade.

NO CHARGE is therefore made for advertising in this column, but the subject-matter should not exceed five type lines, or about 60 words.

When requested, these advertisements will be published in successive numbers of the paper.

If you have a Store, Stock, or any Special Article to sell; if you wish to buy an Established Business, or enter into Partnership; if you want a Journeyman, Clerk, Salesman, or Foreman; if you want a situation yourself—communicate the fact to THE TRADER PUBLISHING CO., 57 ADELAIDE ST. WEST, TORONTO, and it will be inserted in this column free of charge. This is the only way by which you can reach the entire Trade, and we shall be glad to help you.

SAFE FOR SALE.—Outside measurement, 4 ft. 6 in. x 3 ft. x 2 ft. 7 in.; inside measurement, 3 ft. 4 in. x 1 ft. 10 in. x 1 ft. 2 in.; also two nickel counter cases, 8 ft. and 9 ft.; and two walnut wall cases, 9 ft. long. Apply to JOHN PEEBLES, jeweler, Hamilton.

SALESMAN WANTED.—By one of the largest retail jewelers in Toronto. A first-class salesman, who thoroughly understands the business. References required Address, stating salary required, JEWELER, care THE TRADER Publishing Co., 57 Adelaide St. West, Toronto.

WANTED.—SITUATION AS WATCHMAKER, by the 15th of February, by a young man just out of his time. Can do all kinds of watchwork and jewelry repairing. Address, E. G. TAYLOR, care of G. D. Pringle, Guelph, Ont.

THE TRADER is printed by R. G. McLEAN, 13 Adelaide St. E., Toronto, who makes a specialty of Jewelers' Work. Samples and estimates on application.

SPECIAL NOTICE.

To ensure insertion, changes or new advertisements must reach this office not later than the 20th of each month.

EDITORIAL.

AN OFFER TO OUR RETAILERS.

We have been asked many times by prominent retail jewelers throughout Canada to publish in our columns, a reprint from the *Jewelers' Circular*, of the articles of "Excelsior on Watchmaking." As most of our readers are aware these articles are conceded by all competent authorities to be the best treatise on this subject ever written. They were never published in book form, and it is therefore impossible to obtain them except by purchasing the back numbers of the paper in which they originally appeared. These are now so scarce as to be practically unobtainable and are almost worth their weight in gold, and their owners can hardly be induced to part with them at any price.

We are now offered a complete set of these articles by a gentleman well-known to the trade in Canada, on the condition that we publish them in the above manner for the benefit of the practical watchmakers of this country. This we have almost decided to do, provided the jewelry trade desire their publication. We will therefore take it as a favor, if every jeweler in Canada who wishes us to publish these invaluable articles will signify their desire by dropping us a post-card at once on receipt of this paper.

If it seems to be the wish of the majority, we shall commence their publication forthwith and continue them every month until they have all appeared in our columns.

If however the trade is indifferent, or do not appreciate the benefits which may accrue from their re-publication, we shall not bother with them.

We leave the matter now in the hands of the retail trade and shall govern ourselves by the verdict they render upon the suggestion above thrown out.

AMERICAN JOBBERS' ASSOCIATION.

The annual meeting of the United States National Jobbers' Association was held in the Jewelers' Board of Trade Rooms, New York, on the 9th, 10th and 11th of February, and was largely attended by the leading wholesalers from all parts of the Union. The discussions were many and exhaustive (especially to the listeners) but with all, a large amount of wise and practical legislation was passed, which must have a good effect upon the jewelry trade if faithfully carried out. If an outsider might be allowed to offer a suggestion, we would say that the principal trouble seemed to be that most of the business was, as it were, sprung on the delegates, and they had to discuss it at once, without any time for consultation and mature consideration. The result of this was a lengthening of the debates and a want of relevancy in the discussions, that even the chairman, able as he was, found it at times very hard to confine within proper limits. It seems to us that if, say a month's notice of any proposed changes had to be given to the Secretary, and communicated by him to all the members when the notice of the meeting was sent out, that the delegates would come to the convention prepared to discuss the proposed changes a great deal more advantageously for the interests of the Association and their own. Another thing that we noticed was that a great many of the delegates seemed to be there in order to legislate for their own individual interests. This, in Association matters, we do not consider right. The proper way to consider any and all such questions is, (1) Is it right? (2) Is it best for the Association as a whole? (3) Is it best for our individual interest?

Apart from these strictures, which we trust the good nature of our cousins will excuse, we saw much to commend and to imitate. The impersonality of the debates, the good feeling exhibited by every speaker without a single exception, the orderly and decorous conduct of the meeting, the strict impartiality of the chair and the obedience to its rulings, and above all, the liberality and fair-mindedness displayed to their smaller competitors by the wealthy jobbers, and by all the delegates to the retail trade, were worthy of the calling and the country they were there to represent. In addition to the members of the American Silver Watch Case and Movement Mfrs. who were present by invitation, the courtesy was also extended to Mr. George Chillas, Secretary of the Canadian Jobbers' Association, and W. K. McNaught, of the American Watch Case Co., of Toronto.

SMUGGLING.

We do not know that smuggling is getting more common in Canada than formerly, but one thing is certain, public attention is being directed towards it more pointedly on account of the greater number of seizures made by the Customs department. We are glad to think that as a rule our jewelers, both wholesale and retail, are guiltless of this offence against the law, and that they have no sympathy for people who practice it. Although smuggling is the exception rather than the rule, there are, as our columns have at various times, and especially lately, testified, some notable exceptions. It is scarcely worth while mentioning these delinquents by name or scorching them on the end of our editorial toasting fork in the fire of public scorn and ridicule. Such people are usually impervious to public opinion and provided they can make money, the public may think as they please. The only way to touch such people is the method adopted by the Custom authorities, that of bleeding them in the pocket which is the only vital part about them.

If smugglers were content to bring their goods surreptitiously into the country and make an extra profit by selling them at exactly the same prices asked by honest dealers, their crime would not be one-half as bad as it usually is. Not only do these gentlemen (?) cheat the Government and evade their fair share

of the public burden of taxation, but as a rule they demoralize trade by giving away the money they have cheated the country out of to their customers. By this means they probably expect that their greatly increased trade will repay them for their increased risk, and so it probably would if they were never detected. It is an old saying that "The pitcher that goes often enough to the well is sure to be broken," and so it is only a question of time when the smuggler comes to grief. "The mills of the gods grind slowly but they grind to powder," and many a person who has practiced this illegal calling undetected for years has at length been brought up with a round turn when he least expected it.

The smuggler usually goes to work with his eyes open because he makes it his business. He knows or ought to know the risk he runs and what will follow in case he is detected, and therefore when he is caught we do not think any sympathy should be wasted upon him. It ought to be looked upon by outsiders as a matter of course that the Government should strip him of all his ill-gotten gains, and punish him just the same as for any other offence against the law and society.

In order that our readers may have a clearer idea of the penalties for smuggling and the powers vested in Customs officials for the detection of it, we append a few extracts from

THE CUSTOMS ACT OF 1883.

Penalty and forfeiture for smuggling goods, using false invoices, etc.

SEC. 153. "If any person with intent to defraud the revenue of Canada, smuggles or clandestinely introduces into, or attempts to pass through the Custom House any false, forged, or fraudulent invoice, or in any way attempts to defraud the revenue by evading the payment of the duty, or any part of the duty on any goods, such goods shall be seized and forfeited; and every such person, his aiders and abettors shall, in addition to any other penalty or forfeiture to which he or they may be subject for such offence, be deemed guilty of a misdemeanor, and on conviction shall be liable to a penalty of not less than fifty dollars and not more than two hundred dollars, or to imprisonment for a term of not less than one month nor more than one year, or to both fine and imprisonment within the said limits, in the discretion of the Court before whom the conviction is had."

Misdemeanor. fine and imprisonment

Forfeiture and penalty for offering for sale goods pretended to be smuggled.

SEC 154. "If any person offers for sale any goods under pretence that the same are prohibited, or have been unshipped and run on shore, or brought in by land or otherwise, without payment of duties, there and in such case all such goods (though not liable to any duties nor prohibited) shall be seized and forfeited, and every person offering the same for sale shall forfeit treble the value of such goods, or the penalty of two hundred dollars at the election of the prosecutor, which penalty shall be recoverable in a summary way, before one or more Justices of the Peace; and in default of payment on conviction, the party so offending shall be committed to any of her Majesty's gaols for a period of not exceeding sixty days."

Imprisonment for non-payment.

Penalty for harboring or selling smuggled goods.

SEC. 155. If any person knowingly harbors, keeps, conceals, purchases, sells or exchanges any goods illegally imported into Canada, (whether such goods are dutible or not) or whereon the duties lawfully payable have not been paid, such person shall, for such offence, forfeit treble the value of said goods, as well as the goods themselves."

From the foregoing it will readily be seen that if the Customs department choose to exercise the powers vested in them, it would be almost impossible for any merchant to keep smuggled goods on his premises, even though he experienced no difficulty in getting them into the country. The trouble is that heretofore the department has simply shut its eyes to the fact that any great amount of this dishonest evasion has been going on and if by accident they caught any one *in flagrante delicto*, they were content to confiscate the goods and let the culprit go.

Now, however, that so many and such flagrant breaches of law have been brought before their notice, the department has resolved to uphold the dignity of the law and to mete out punishment to all and sundry who can be convicted of such dishonest practices. To this end they have secured the services of highly trained detectives who will be given carte-blanche as to their manner of working up the cases entrusted to them.

This action of the department is highly to be commended and should prove a most effectual check upon smugglers of all kinds, who may rest assured that if the government allow them apparent immunity for a season it will only be for the purpose of making a more complete example of them when they are ready to shut down upon them.

This action on the part of the Customs authorities cannot fail to be of great benefit to all honest dealers, as it will have no small effect in doing away with the cut-throat competition that unchecked smuggling is sure to bring about. For this reason every honest dealer whether wholesale or retail should do all that lies in their power to help the authorities to stamp out this evil.

Before closing we cannot help asking our retail merchants throughout the country to look out carefully for smuggled goods in the hands of unscrupulous so-called jobbers. As they will see by the foregoing extracts from the Customs Act, no matter whether they buy smuggled goods innocently or not they are just as liable to have such goods seized and confiscated as the original smuggler. There are so many reputable jobbers in Canada whose standing is above reproach, that they would be indeed foolish to purchase dubious goods from people of little or no responsibility simply because they appeared cheap. Such goods may often prove very expensive to the purchaser before he gets through with them.

A NEW METALLIC STANDARD OF VALUE.

Probably no question is to day receiving such universal attention as the depression of trade. Go where you will, whether to free trade England, or to the protected countries of Europe or America, the same complaint is heard, business is depressed, and as a consequence thinking men everywhere are looking for some panacea to this seemingly universal difficulty. As is usual in such cases, there are not wanting theorists who pretend with certainty to account for the prevailing stagnation, and as a rule, each advocate has very plausable reasons in support of their pet contention. The two most in favor, however, seem to be the

"over production of manufactured goods" and "the appreciation of gold." Our own belief is that while there is much force in the arguments advanced by the supporters of each of these theories, that in neither of them is the whole truth contained. We think rather that the cause can be found in a combination of both theories, although in our opinion the growing scarcity of gold is the more serious of the two. The able article of Mr. Morton Frewen in the October number of the *19th Century Magazine*, has, we think, demonstrated beyond a peradventure that the excess of consumption of gold over its production, or, in other words, its growing scarcity is one of the most disturbing elements, if not the principal factor in the present universal depression. Mr. Frewen's contention is that as the demand for gold exceeds the supply by some $65,000,000 per annum, it is only a question of time when gold will become so scarce that it cannot be used as the recognized standard of values, but must give place to something else. That his view is not confined to himself, is evident from the persistent efforts that have been put forth from year to year by those advocates of a bi-metallic standard, both in Europe and America, who wish to see silver placed on the same platform with gold as a recognized standard of value. We fail to see, however, that it is possible to have a double standard such as is proposed by these bi-metallic advocates. You might just about as well try to have two yard measures as two standards of money value. The value of gold or silver, like everythingelse, depends upon the laws of supply and demand, and it is just as possible to make the earth stand still as to regulate by Act of Parliament or Congress, the relative values of gold and silver. If anything were wanting to prove the soundness of this contention, the present anomolous position of the American silver dollar would amply establish it. This coin, when first minted, was supposed to be worth one hundred cents in gold; to-day, however, owing to the depreciation in silver and the appreciation of gold, it has shrunk in value so as only to be worth eighty cents. The person, therefore, who is innocent enough to sell either goods or labor for it at its face value, loses twenty per cent. on every dollar he thus exchanges, and has literally to take the advice the Government has stamped upon its face, "In God we Trust," for the other twenty cents If gold were as plentiful as silver, it would be of no more value than that metal, while if silver were to become as scarce as gold now is, it would materially appreciate in value. The same reasoning would hold if the supply were reversed. A few years ago seventeen pennyweights of silver would buy one pennyweight of pure gold, but to-day it takes twenty pennyweights of silver to buy that quantity. This depreciation in silver arises from two causes, partly because gold has become scarcer and increased in value, and partly because silver has become more plentiful, and consequently cheaper. Thus it is, the law of supply and demand, acting in opposite directions upon the two metals which are used as money by all civilized nations, is slowly but surely forcing them intrinsically apart. From present appearances, we should say that the relative positions of these metals is not liable to any startling change that will serve to bring their values any closer together. On the contrary, everything points in the opposite direction. The production of gold is slowly but surely decreasing, with little or no prospect of any great addition to its ordinary annual output, while on the other hand, silver is being found in increased quantities, and unless its production is in some way restricted, bids fair to become a glut in the market. In the meantime, most civilized countries are adhering to the gold standard, and hence the appreciation of gold and the apparent shrinkage and cheapness of silver as well as of everything else. Exactly the same causes which are tending to depreciate the value of silver, are at work in lowering the values of natural products and manufactured goods of all kinds, for it is a self-evident proposition that the scarcer gold is the greater must its purchasing power become, as long as it remains the sole standard of value. As Mr. Frewen quaintly puts it, "If all the gold in the world had shrunk to five sovereigns, and it still remained the standard of value, the owner of one of them would be able to buy Koh-i-noor diamonds for shirt buttons." Speaking on this subject a few weeks ago at a public banquet in Chicago, Mr. L. T. Gage of that city, and one of the leading bankers of the United States, in the course of his remarks said that when "gold becomes worth a premium of twenty per cent. as it certainly will in the couse of time—I do not say how soon—the banker can then sell his reserve for the full equivalent. It is true that his profits may be realized in a kind of money that will have purchasing power of twenty per cent. less than the kind of money that he now realizes his profits in. But isn't that true of you all? Isn't it true of every laborer in the United States? Isn't it true that the savings fund of the laboring people, the humble classes of the United States, now amounting by statistics to $1,100,000,000 in the savings banks, will shrink in purchasing power $200,000,000? That is as certain as water is to run down hill"

To our mind, the present indications seem to point to the fact that, owing to the demand for gold, and its inadequacy to meet the wants of commerce, a new metallic standard will shortly have to be decided upon, if we are to have a return to solid commercial prosperity, instead of continued or spasmodic depression. The producers, and those interested in its production, are naturally anxious that silver should be the coming standard, but its bulk, combined with its rapidly decreasing value, furnish weighty reasons why it should not be adopted. As we said before, we believe that a dual standard is as impracticable as two yard measures, and that we must seek for the new standard in some one metal or alloy of metals, which shall dethrone gold as king of metals and arbitrator of values. For this purpose we would suggest an alloy of the two metals at present used by all civilized countries, gold and silver. We think that if adopted it would not only settle this vexed question for centuries to come, but give trade the world over an impetus equal to that caused by the discovery of the gold fields of Australia and California. If say one dwt. of gold, valued in round numbers at one dollar, were alloyed with one oz. of silver, valued at the same price, the result would be a coin the size of the American dollar, the value of which would be two dollars. One dollar of this alloy would be the size of half a dollar; half a dollar of a quarter dollar, and a ten cent piece the size of a five cent. piece. The advantages of such a coinage would be numerous. Although about ten times more bulky than gold, it would be only one-half the bulk of silver, and for ordinary commercial transactions it would be more convenient than either. Its adoption would have an effect upon trade equivalent to the doubling of our present reserve of gold. Its principal advantage however, would be its perfect equilibrium as a standard of value. In this respect it would act somewhat similar to the compensation balance of a chronometer, which is composed of two metals, the expansion

of one of which is conteracted by the contraction of the other, and thus, no matter to what extreme of heat or cold it is subjected, a perfect equilibrium is maintained. This standard would work precisely in the same fashion; if gold got scarcer and silver more plentiful, as now appears likely to be the case, this coinage would still remain at par, for the depreciation of its silver half would be offset by the appreciation of its gold half. No matter how these metals might fluctuate, the loss of the one would be offset by the gain on the other, and, as a consequence, it could at all times be taken as a certain and unwavering standard of value. If such a coinage could be made universal it would be a boon to commerce such as the world has never before seen. While each nation would probably desire to retain their usual well-known designating names for their own coins, they might easily, if some understanding were arrived at, have their values based upon the decimal system, similar to the French or American. Each coin ought also to be worth its face value as bullion when the standard is fixed, and the standard once defined, say taking them at their present values: twenty parts of gold to one part of silver, it should remain unalterable, so that, take it where you might, it would pass current at its par value, without deduction or exchange in any shape or form. While the minting of such a coin would entail a loss upon each Government, which should be charged to "expenditure" instead of being deducted from the coinage itself, this apparent loss would be a real gain to every person handling it.

While the adoption of such a standard of value could not fail to benefit materially every nation using it, it would affect the United States more favorably than any other. The United States being at the present time the greatest producer of silver in the world, it follows that any change by which her languishing silver mining industries can be stimulated, as they cerainly would be by the creation of a universal market for this product, must bring about a new era of prosperity, fully equal to the palmiest days of the California gold fever. We think if the United States were to adopt this or some such coinage as a standard of value, and make it take the place of the present gold coinage as legal tender for duties, taxes, and payment of debts of all kinds, that its adoption by other countries would only be a question of time. Great Britain is moving in this direction now, and though like all large bodies, public opinion in that country moves slowly, it is bound to get there in time. Once the commercial world is fairly alive to the growing scarcity of gold and its consequent appreciation, it will set about for a remedy and not rest contented until a suitable one is found. We may be mistaken, but in our opinion some such plan as we have outlined above is certain to be adopted in the near future.

ISOCHRONISM OF BALANCE SPRINGS.—A balance spring, of whatever form, to be isochronous must satisfy the following conditions: Its centre of gravity must always be on the axis of the balance, and it must expand and contract in the vibrations concentrically with that axis. When these conditions are secured in a properly made spring it will possess the quality of isochronism—that is, its force will increase in proportion to the tension, and it will not exert any lateral pressure on the pivots. M. Phillips, in his memoir, demonstrates these conditions, and proves theoretically that the terminal curves deduced with the view of satisfying the one condition, verify at the same time the other.

CORRESPONDENCE.

SPECTACLES, AND HOW TO SELL THEM.

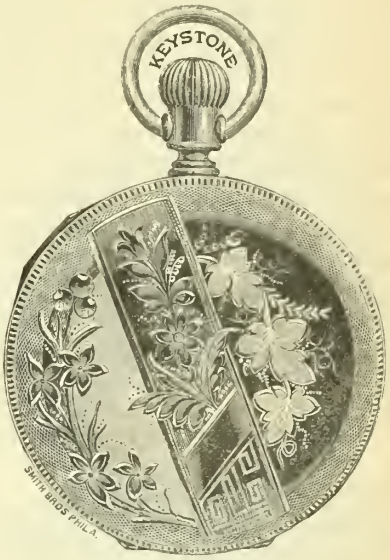
WRITTEN SPECIALLY FOR THE TRADER.

PAPER NO. II.

In our last we simply showed the dealer what to buy in spectacles; in this article we propose telling him what the glass or lense is made of. The material of which lenses are made is either glass or Brazilian pebbles.

If glass is elected, it must be transparent and colorless, sufficiently hard to bear a good polish, and not liable to lose that polish by damp or exposure. All these qualities are possessed by what is called crown glass, specially made for that purpose; whereas the ordinary plate glass often used for that purpose especially where cheapness is a consideration, fails to possess many essential qualties, and is consequently condemned by the conscientious optician. Nearly all glass used by American manufacturers is plate glass, owing to a duty of forty-five per cent., which makes the crown glass too high in price. The duty on the glass coming into Canada is only twenty per cent., thus the dealer buying from a Canadian manufacturer can get the crown glass at the same price he pays for the plate glass of the American manufacturer. The American manufacturer makes the best and lightest frames, but they all use a cheap lense, especially for goods sent to Canada, as there is another duty of twenty-five per cent. coming into this country. The dealer will, therefore, see that he gets the best value, although the article may seem to cost more from the Canadian manufacturer. The main objection to glass of any kind for this purpose is that it is so easily scratched.

Deep scratches or indentations are not here referred to, but to the innumerable fine scratches scarcely visible, except under the microscope, which are produced more or less each time of wiping. After a few months such a lens becomes unfit for use, straining the sight and paining the wearer, although to the naked eye the polish appears as perfect as when new. To remove this serious objection, lenses are employed made from rock crystal, and commonly termed pebbles, and this material being in hardness only exceeded by the diamond, is not liable to be scratched in use, and, moreover, it takes a higher polish, hence the strain to the eye is reduced to a minimum, and one cause of irritation removed.



Pebbles are mostly imported from Brazil, and are found native in both mosses and crystals. They are cut into slices of the requisite thickness by diamond powder, no other material being found to answer this purpose.

Unfortunately, even in this article, "cheapness without consideration of quality" acts prejudicially; for the direction in which the section of crystal is cut affects the quality of the resulting lens. One direction yields us a clear, transparent section, which admits the passage of every description of light, without undue refraction or interference, whereas a section in the opposite direction shows color under polarized, and sometimes even under ordinary light, and from its interference is totally unfitted for spectacle lenses.

We often see special advertisements of pebble spectacles, but they prove a dear investment to the unfortunate dealer who buys them. They generally claim to be the best, but are generally the cheap ones at high prices. Testimonials as to the

quality of an article are easily got, and my advice to dealers is to beware of an article too highly advertised, and for which they pay twice the price of an ordinary article.

The crystal from which such lenses are made is cut at random, in every direction that will yield the greatest number of slices, hence they often produce lenses worse than useless, and to irreparable mischief to the wearer. The way to tell a good pebble is just by seeing if you can file it. A file will not make the slightest impression on a pebble. After being sure it is a pebble, wipe it carefully and hold it up to the light; should there be any bubbles, waves or scratches, it is an imperfect article and should not be sold by any conscientious dealer. We will resume this article next month, showing the difference between Periscopic, Plano, and double convex lenses.

H. G. LEVETUS.

JOHN BULL HAS THE FLOOR.

Editor THE TRADER:

I was agreeably surprised to see the improved appearance of your esteemed publication. I quite agree with the editor of the *Metalurgist* in his description of it, and if every one of the craft looks for its arrival as earnestly as your humble servant, there ought to be a few more testimonials to its merits, from the trade, by contributing to its columns. The retail trade are supplied with it free of charge, which, perhaps, is one reason why they do not appreciate it as they ought. There are none so wise nor any so simple that an interchange of ideas would not benefit. And as your pages are always at liberty to correspondents, it does seem strange that more do not embrace the opportunity to communicate their ideas to the trade regarding matters of importance to the craft.

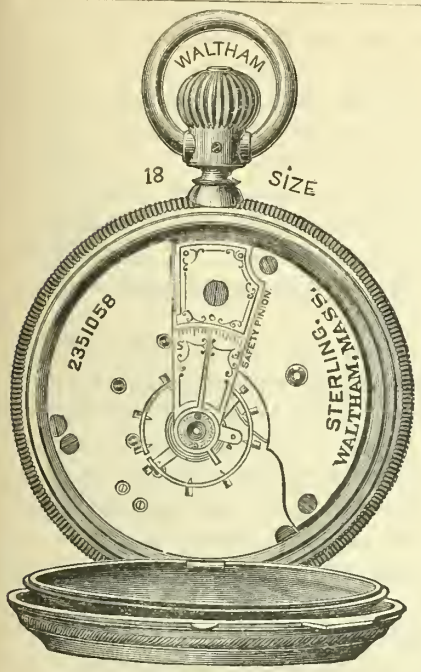
I see Mr. Davidson, in his letter in your last number, wants the names of all willing to organize a society. A post card will not be much expense but I am afraid that he is too far west if we are to have more than one society, but it is a move in the right direction, and I will give it my humble support. My idea is that a meeting should be called in Toronto, that is if Toronto men are willing to join in the movement. They have not yet spoken, so far as I know; perhaps they are afraid they will not have a chance to do all the business and get all the work. If they look at the matter squarely, they will see that we all stand on the same footing as regards buying goods, thanks to the Jobbers' Association. And as for repairing, it is to the interest of the whole trade to have a uniform scale of prices, for our customers do not bring their work unless they want it done. And why should any one be so foolish as to allow a granger to set a price on his work, I ask? Does said granger give his produce for less than market price? I trow not. If he brings a bag of potatoes or a cord of wood, you have to watch him if you get what you bargain for.

I think it would be a good idea to invite some of the wholesale men to come to the meeting, as our interests are so blended with theirs, that I think their advice and counsel would not be amiss.

I have trespassed too far on your space already, so will close my epistle by thanking you for your kind support of the matter, and subscribe myself,

Yours truly, JOHN BULL.

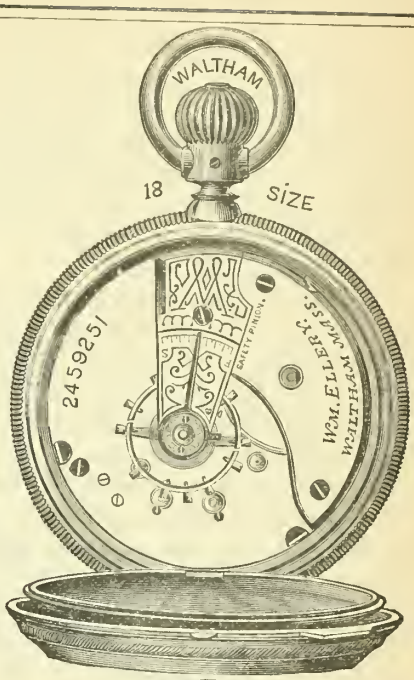
P.S.—What has become of your correspondent "Protection?" He promised us more from his pen. Has he got all the watch-butchers cleaned out, or have they butchered him?



SELECTED MATTER.

BANQUET OF THE NATIONAL JOBBERS' ASSOCIATION.

The banquet tendered by the New York members of the National Jobbers' Association to the visiting delegates was held at Delmonico's, on Wednesday evening, February 10. It was in every way a success. The tables were loaded down with good things, and presented an attractive appearance as the fifty-four banqueters sat down to the feast. The courses, which were many, were interspersed with strains of lively music, which added their influence to increase the good feeling already prevailing. There was a noticeable absence of professional after-dinner speakers. The speeches were all made by members of the trade. They treated of trade topics, and although they were extemporaneous, they were listened to with much interest and received with hearty applause.



At the head of the U-shaped table sat President Henry Hayes, with Mr. Joseph Fahys and Mr. S. H. Hale at his right and left. After proper attention had been paid to the menu, President Hayes arose, and in a few well-chosen words expressed his pleasure at viewing the splendid gathering around him, and in the name of the home members extended a hearty welcome to the guests. Mr. S. H. Hale occupied the position of toast-master and fulfilled his duties in a highly satisfactory manner. Mr. Keller, of Pforzheimer, Keller & Co., was the first one called upon and responded to the toast of "Our Association." His remarks were particularly happy and well chosen, and called forth frequent and prolonged applause. He spoke of the utility of the Association in regulating matters of interest to the trade, of its benefits in the way of allaying petty jealousies, and of the means it offered of producing harmony and encouraging friendship among its members. He made a number of allusions to those seated about him, which were received with special favor. Pointing to Mr. Hall, of the Waltham Company, he called him the Chancellor and Bismarck of the Association; Mr. Avery, of the Elgin, he designated as the type of Father Time, with one foot on each hemisphere, sweeping all competitors before him; Mr. Fahys was ofthe pioneer the case-makers; Mr. Pierson, of the Howard Company, was the type of an adjustment to heat and cold; Mr. Hellebush was the type of dignity, and his surroundings (corporal) substantiated the justness of the remark; Mr. Muhr was designated as Simon Pure, of the Quaker City, Quaker-like in his bearing yet anything but ancient in his habits; Mr. Hayes, who claimed to be just old enough to vote, was complimented with the reremark that he possessed the wisdom of a centenarian, but the activity of the youthfulness which he claimed; Mr. Otto Young was hailed as Vulcan, the thunderer of the west; the younger men present he regarded as the very escapements of the movements, to whose energy and perseverance much of the success of American enterprise was due. Mr. Keller concluded with a toast to the Association, whose usefulness had only begun, and whose future promised great and beneficial results.

Mr. Avery, of the Elgin Company, made a very interesting speech, in which he traced the history of the company, from its disastrous condition in 1876 to its present satisfactory state. He called attention to the policy, which had at first been cried down, but which had finally triumphed and brought with it success.

ROBBINS & APPLETON

GENERAL AGENTS,

BOSTON. CHICAGO. NEW YORK.

LONDON. SYDNEY.

Mr. Joseph Fahys sketched the growth of watch-case making. He recalled the time when he started in with a bar, pair of tongs and an anvil; spoke of the early struggles, the gradual development and the present gigantic scale of the industry which had so small a beginning and so limited a field.

Mr. George Chillas, of Toronto, replied to the toast of the Canadian Association of Jobbers in American Watches in a very neat and effective speech.

Mr. Simon Muhr remarked that he looked upon the gathering as a very serious affair, and one which had to consider weighty matters. He had made arrangements to go to Europe, but had postponed his trip in order to be present. He prophesied great strides in business, and called attention to the vast markets yet to be opened to American industry and the large export trade to be done in the future.

Mr. Louis Strasburger was called upon to speak on the subject of Dissolution. He expressed his surprise at being asked to discuss this topic, as he had but recently admitted a new member to his firm. If the matter referred to the dissolution of Swiss and American watches, he would say that, in his opinion, the American watches had a bright future before them, due to the fact that prices had been reduced from time to time, and also because they had been so liberally advertised. The demand for these watches was but natural. Seeing about him so many intelligent business men who had associated for the purpose of protecting the sale of American watches, he felt assured of the future prospects and success of the Association. His personal interests ought to incline to the Swiss watches but his patriotic feelings toward this country, which gives equal rights to all, prompted him to waive all such sentiments, and he most heartily wished the Association a successful career.

Mr. W. K. McNaught, of Toronto, spoke of the friendship which Canada felt toward the United States and the interest she took in all American movements. He expressed the hope that Canada would some day become independent, and felt sure that the friendly relations now existing would always continue. There were a number of other toasts, all of which were listened to with great interest. Among those who spoke were: Messrs. Allen, Young, Thorpe, Cutter, and Morrill. Everyone was pleased with the banquet, and at its close it was voted a thoroughly enjoyable affair and a complete success.—*Jewelers' Weekly.*

A DETECTIVE'S WATCH.

"About the slickest theft of which I have personal knowledge," said the veteran detective, John Sharkey, yesterday, "was played in this city during the Centennial by a Baltimore thief, and the man he robbed was one of the Mayor's detectives, who was sent specially to look for this very thief."

"I can't tell you; I will not give him away. He is still living," said Mr. Sharkey, in refusal of the request for the name of the outwitted detective. "A series of adroit robberies had been committed in Baltimore during the months just preceding the opening of the Centennial Exposition in this city. A man named DuBarry, a Chicago crook, who was known to be in Baltimore, was suspected, but the officers could not get the dead wood on him until a bold confidence game was worked on a Richmond merchant in which a handsome young woman named Beck Richards played a prominent part. The Richmond man squealed, and it was discovered that the young woman had months before been placed to board in a disreputable house by DuBarry, whom he visited as a 'friend.' The pursuit became too warm for the pair, and they decamped so suddenly that part of the young woman's baggage was left behind. A search revealed pawn-tickets for goods which, when examined, were identified as portions of those which had been stolen, and for the theft of which DuBarry had been suspected. The pair left the city in a hack, but whether they took at some outlying station a train bound north, south or west the officers could not tell.

"Of course, a description was sent around to the different cities, and the Philadelphia authorities were especially notified, because it was believed that the pair would work the Centennial at some time before its close. In consequence, among the detectives detailed for work on the grounds was our friend—let us call him Jones. One day Jones was lunching at the 'Three Brothers' alone at the only table which had not one or more occupants, when a gentleman with a Milesian accent asked permission to occupy a seat at the same table. The pair naturally fell into conversation, in the course of which the stranger mentioned to Jones his familiarity with Chicago criminals, especially pickpockets and confidence men and women. His name was McCartney, and he was within a year retired from the official detective force of that city. Jones proclaimed himself ,and the pair fraternized over the Frenchman's generous wine. Jones promised to put McCartney on the Philadelpha crooks and show him the whole elephant, and McCartney agreed to point out the Chicago crooks, including DuBary and his mistress, the former of whom he said he knew well.

"Meeting Jones a few days afterwards McCartney said he had the DuBarry game in his hand; that he had seen the girl, who proved to be a woman named Lyons, and that where she was DuBarry could not be far distant. He was rather surprised, because it was understood in Chicago that she had reformed. Jones was rather incredulous.

"'Her name is Lyons, I tell you,' said McCartney. 'Come and lunch with me and you shall see her.'

"'You seem certain,' observed Jones.

"'I am, and for the best of reasons.'

They went to one of the more pretentious of the hundred restaurants clustered outside the Centennial grounds, and the conclusion was arrived at between them that the woman should not be disturbed, in the hope of capturing her companion in crime. A half dozen young women waited upon the customers of the restaurant. Pointing to one of them, McCartney said:

"'There's your game.'

"'Nonsense!' exclaimed Jones.

"'No nonsense about it. She was Chicago's most infamous operator, and was known all over the west, but out there all the officers are under the impression that she has reformed. I suppose she could not keep straight, and DuBarry has secured her employment here as a cover for work.'

"They sat down and watched her, but saw nothing suspicious. Her every action was modest and reserved. In a short time McCartney remarked, 'You may as well know her. Let me call her over.'

"In response to a signal the young woman approached the table with apparent reluctance. She looked timidly at the Chicago ex-detective. He said, coldly:

"'You are all right, Hattie.'

THE
R. F. S. & Co.
ROLLED PLATE CHAINS
—ARE THE—
BEST.

"'Oh, thank you, sir,' she replied; "I'm doing my best, God knows sir.'

"'Join us in finishing this bottle, and tell my friend about yourself,' said McCartney.

"The young woman sat down, and between her sips of champagne she told the story of her life. When she hesitated McCartney would prompt her. He evidently knew as much about her as she did herself, and her dread of her old foe was openly displayed. She closed her narrative with:

"'But I have reformed, Mr. McCartney. You know I have, sir.'

"'Of course,' replied McCartney, with a wink at Jones. 'We know that. That is what makes your history so interesting now.'

"The restaurant was crowding up and the girl excused herself.

"While the Chicago man was advising Jones to arrest the girl, as she was the one he wanted, a man came to the table where they were sitting and whispered to McCartney, who immediately begged Jones' pardon for leaving him so abruptly, but he was urgently needed by a friend. He stepped to the desk, paid the bill for the party and left with the messenger. Jones finished the bottle, and strolled back to the grounds with that glow of satisfaction which is always the result of a good digestion and a stomachful of palatable eatables and drinkables.

"It was not long until Jones had occasion to consult his time piece. It was gone, and it was a valuable one. He went through his clothes. His rather well filled wallet was gone. He returned to the restaurant. The reformed pickpocket was gone. He visited his friend McCartney's lodgings. He was gone. Search was instituted for the messenger. Here was success. He was arrested that evening at the Thirty-first and Market street depot. He confessed.

"He was a member of the gang of which DuBarry, alias McCartney, was the chief, and the young woman Belle Richards alias Hattie Lyons, was the most expert of pickpockets. They had worked the Centennial for a week, and were between $8,000 and $9,000 ahead. He had been paid his one-sixth by DuBarry before they had gone thirty yards from the restaurant where Jones was left sipping his champagne. He said:

"'They knew when they had enough, but I, like a consummate fool, didn't.'

"DuBarry and his accomplice were not found, and they have never turned up in Philadelphia since," concluded Mr. Sharkey.—*Exchange.*

HUMORS OF MAIDEN LANE.

Occasionally there wanders into Maiden Lane one of those individuals carrying a small tray, upon which are usually displayed wonderful bargains. For hours he whines forth his tale of "Here you are now, fine rolled gold buttons! Three cents apiece; two for five. Only a few more left. Here you go!" Right in the centre of the jewelry district—in the shadow of some of the largest jewelry houses in the country, he calmly which she gazed steadily for a moment, and then entered the establishment of a well-known jeweler. A polite clerk came forward and wanted to know what he could do for her. She placed her bundle carefully upon the counter, adjusted her takes his stand, and, as he looks upon passers-by, wonders why they cast such looks of scorn upon him. His winsome call attracts no buyers, and after a time he moves on, apparently convinced that Maiden Lane is no place in which to sell jewelry.

* * *

An old lady from the backwoods of Jersey came struggling down the "Lane" a few days ago, with a large package under her arm. Her eye was presently arrested by a placard, at glasses, seated herself deliberately, and wanted to know how much it would cost to send her package to Philadelphia. The astonished clerk informed her that it was not in their line of business to forward packages.

"Be'ant this the express office? queried the old lady sharply. "Guess not," answered the indignant clerk.

"Wall, wat you put them signs out fur?" and the old lady gathered herself and her bundle together, and walked out in high dudgeon.

* * *

On turning the corner from Broadway into Maiden Lane a few days ago, we met an excited individual, watch in hand, hurrying up the street. Thinking that some sudden failure must have taken place, we grasped our note book in haste, expecting to jot down all the details of the news.

"Is this what you call the great watch and clock street?" demanded the excited gentleman.

"Yes," we answered proudly, "in this short thoroughfare there are over three hundred jewelers and watch dealers. It is world renowned; within its narrow limits——"

"Well, what in thunder," interrupted the perspiring individual, "is the matter with all their clocks?"

"What happened?" we demanded eagerly.

"Happened? I came down here to set my watch. I found a chronometer on this side of the street and set it to the second, then I looked across and there was a big clock in a window, and that was a minute and a half fast, then I saw another further down the block and that was three minutes behind, and there's one down at the corner—I walked down to look at that, and when I reached there I found it had no hands at all. How is a man ever going to set his watch here, I'd like to know?"

We promised to investigate the matter, and have a committee on clocks appointed to secure harmony among the timepieces.—*Jewelers' Weekly.*

WANT OF SELF-CONFIDENCE.

Some people never seem to believe themselves capable of anything; they see others press forward to attempt and achieve, and sink back into a desponding inactivity. Having no faith in themselves, they undertake nothing and effect nothing. If they are convicted of some fault or bad habit, they have so little hope of being able to cure it that they scarcely make an effort. If some avenue of usefulness and honor opens up before them, they draw back, almost sure they will not succeed, and decline to enter. If some duty presses upon their conscience, they try to quiet its promptings by pleading inability. Thus their lives pass away in uselessness, their faculties do not develop or their characters improve, their abilities are wasted, they dwindle into insignificance, not for lack of power, but for the want of a confidence and courage that would set that power into good, practical working order.

THAYER & CO.,

3 WELLINGTON ST. EAST, TORONTO,

MANUFACTURERS' AGENTS AND DEALERS IN

Watches, Clocks, Material and Jewelry of all Kinds.

Our house will be found head-quarters for any of the above goods, and we guarantee to meet any honest competition, either in quality or price. We buy cheap for cash, and propose to give our customers the full benefit of our buying. A look through our stock which is entirely new, will convince any jeweler that he can save money by dealing with our House.

In addition to Watches and American Jewelry, we make specialties of the following lines, in all of which our Stock will be found very complete:

WATCH AND CLOCK MATERIALS OF ALL KINDS, WATCH CLASSES AND GENERAL JEWELERS' SUNDRIES.

☞Our **MR. THAYER** will call on you during the month, and we trust that you will reserve for him a share of your esteemed orders.

WELLINGTON'S WATCHES.

An exchange says that the Duke of Wellington was extremely fond of watches, and at all times had fully half a dozen ticking their liveliest lying around him. Fearing that some ill might befall those just under his eye, orders were given that whenever he travelled to have as many more stored away in a portmanteau made to fit his carriage. One timepiece was, above all others, his acknowledged favorite; it was of old-fashioned English construction, and had once been the property of Tippoo Sahib. Another of the Duke's treasures had a strange history. Napoleon had ordered it of Breguet for the fob of his brother Joseph, and, as an extra courtesy, directed a miniature map of Spain to be wrought in niello on one side and the imperial and royal arms on the other. Just as this lovely gift was finished, Joseph was driven out of his kingdom by the Duke, and the Emperor, for reasons best known to himself, refused to take or pay for the costly bauble. At the peace it was purchased from Breguet and presented by Sir E. Paget to the Duke of Wellington. Another watch owned by the Duke was made by Marshal Junot, and a great horological curiosity it is. There has never been known more than two others like it. They are constructed to mark both lunar and weekly movements.

The great Duke gave preference to certain *moutres de touche*—of which he had several—a contrivance of Breguet's, having sundry studs or knobs by which one could feel what hour it was, and this merely by what seemed "just fumbling in his pocket."—*Exchange.*

EDITORIAL NOTES.

SPECIAL NOTICE.

Jewelers throughout Canada will oblige the Editor by sending into this office for insertion in these notes any items of news pertaining to the Jewelry business that they think would be of interest to the Trade generally.

MR. W. G. H. LOWE, of the firm of Lowe & Anderson, has just returned from a business trip in Manitoba and the North-West. He reports business fair, with good prospects ahead.

IN THE DEPTHS.—The following jewelers are reported to be in difficulties: C. L. Bass of Kingston, J. E. Freeman, Madoc, C. Aitcheson, Orangeville, and W. Perret, Winnipeg.

JOHN SEGSWORTH & Co. have secured the services of Mr. S. F. Glover, lately with Messrs. C. T. Picard & Co., of Montreal, to travel for them east of Toronto. Mr. Glover has made a good record for himself, and we wish him continued success in his new sphere.

OUT OF BUSINESS.—Mr. S. T. Culp, of Toronto, writes us to say that for the present at least he has retired from the wholesale jewelry business in Canada. He has been suffering lately from a severe bronchial affection, and has gone to a dryer climate for the benefit of his health.

GLAD TO SEE YOU.—We were pleased to receive a visit a few days ago from Mr. W. H. Scott, jeweler, of Cobourg, Ont., one of the best known as well as one of the most skilful men belonging to the jewelry craft in the Dominion. Mr. Scott reports trade in Cobourg as fairly good. Call again Mr. Scott.

MR. C. N. THORPE'S SPEECH.—We are very sorry that pressure on our columns prevents us from publishing this month the speech of Mr. C. N. Thorpe at the Chicago jewelers' banquet. A good thing often improves with age and we therefore propose to give our readers the benefit of it in our next issue. It is well worth a careful perusal.

THE "PERFECTION" Watch Case, put upon the market last month by the American Watch Case Co., has proved to be the biggest success of any Case the Company ever made. The demand is unprecedented, and everybody pronounces it the best cheap Watch Case they ever handled for the money.

OUR LIST.—In reply to a Western Retail Jeweler, who complains that THE TRADER is being sent to people in his town other than legitimate dealers, we desire to say that we will take it as a favor if the trade will promptly notify us of any such cases and we will at once stop their paper. We desire to make THE TRADER the organ of the Jewelry Trade of Canada and have no ambition beyond it.

A BIG FINE.—It is stated on good authority that Dearlen, the recently detected Montreal jewelry smuggler has paid the Customs authorities $24,000 in hard cash as an equivalent for the duty he had cheated the country out of. We think that every honest dealer in the country will say it served him "jolly well right." Truly honesty is the best policeman.

A CHANGE OF BASE.—Messrs. P. W. Ellis & Co, have secured the services of Mr. J. J. F. Houghton, late of the firm of Hill & Houghton, manufacturing jewelers of this city, to assist them in the order department of their business. Mr. Houghton's thorough knowledge of the jewelry business should make him invaluable in such a position of responsibility.

WHO WOULDN'T BE AN ABORIGINE.—It is said that Sir George Stephen has presented Crowfoot, the Blackfeet chief, with a handsome locket and chain, the locket containing a perpetual pass over the Canadian Pacific Railway. Next summer Crowfoot will be able to take his family free of cost to the fire-watering places. And still we wonder at crime.

ABSQUATULATED.—We are informed by a correspondent that Mr. E. M. Blakeley, jeweler, of Campbellford, has sold out his stock and absquatulated, whatever that word means. On asking some of our Toronto jobbers to explain the meaning, we were informed that it meant that he had cleared out. Several of them are desirous of interviewing him.

SILVER WEDDING.—Mr. A. L. Skeele, jeweler, of Richmond Hill, Ont., and his wife, celebrated their silver wedding on the 6th day of February. The Editor of TRADER was unable to accept Mr. Skeele's kind invitation to be present, but learns from a local exchange that the guests had a very enjoyable time. We trust to be present at Mr. and Mrs. Skeele's golden wedding, however.

SALE OF A. S. MURRAY & CO'S BUSINESS.—The stock of A. S. Murray & Co., the well-known jewelers of London, Ont., took place last month, the purchasers being Messrs. Schwob Bros., of Montreal, for the price of fifty-six and a half cents on the dollar. As the stock is a first-class one, and the stand one of the best in the city, it should not be hard to dispose of it to some enterprising jeweler with capital.

BY THE DEATH of Mr. Isadore Saunders, of the firm of H. & A. Saunders, of Montreal, which occurred a few days ago, Canada loses one of the oldest men in the wholesale jewelry trade. Mr. Saunders was looked upon by those who knew him as one of the most thorough men in the business, and his friends and those associated with him in business will not easily forget him. We understand that the business will be continued by the remaining partner, Mr. L. Saunders.

DISSOLUTION.—The well-known retail and manufacturing firm of Welch & Trowern, of Toronto, was dissolved during the past month, Mr. Welch retiring. Mr. Trowern will continue the old business as formerly, while Mr. Welsh is making preparations to commence again the manufacture of jewelry. Both of these gentlemen are hard working and deserving, and we wish them both success in their new responsibilities and undertakings.

A FALL IN PRICES.—The event of the past month, so far as the jewelry trade is concerned, has been the sweeping reductions made by all the leading American manufacturers in the prices of their jeweled movements. The effect of this will be to make American movements more pre-eminently than ever, the watch for the people of this continent, and should do much towards bringing the finer grade of goods into more general use.

THE SAPERY CASE.—In spite of all the efforts of Mr. Sapery's friends that "minor" still remains in durance vile. Messrs. P. W. Ellis & Co. inform us that although they have been approached in order to compromise the matter, they have decided to have full justice done them or take nothing for their claim. Come what will they propose to fight the case to the bitter end and if nothing else comes of it, an example will have been made which will have a healthy effect on such people in future.

- CLOCKS -

MARCH 1st, 1886

We desire to notify the TRADE that we have completed arrangements with the

"TERRY CLOCK CO."

to carry a full range of their goods, comprising Walnut, Nickel and imitation Marble Clocks.

The Terry Clocks need no commendation from us. Their METEOR Luminous and other grades have a deservedly high reputation in the States and Canada.

It shall be our aim always to keep a complete stock on hand and thus be able to fill orders promptly.

We will mail, in the course of a few days to the *Legitimate Trade* an *Illustrated Catalogue* which will embrace some new patterns of exceptionable value.

Our business is exclusively with the Watchmaker and Jeweler who will find it to their advantage to buy the Terry Clocks and not be compelled to submit to unfair competition, as experienced from the outside Trade buying from Fancy Goods Houses who sell indiscriminately.

LOWE & ANDERSON,

16 WELLINGTON STREET,

TORONTO.

HOW ARE YOU, TOBIAS?—Mr. Tobias Epstein, as we stated in our last issue, was a dealer in gents' furnishings on Yonge St., Toronto, and failed a few weeks ago. His creditors found a discrepancy in his accounts to the tune of some $30,000, and accordingly had him arrested for fraud. He was admitted to bail, and the grand jury found a true bill against him. It is now stated that Tobias and one of his bondsmen have folded their tents and silently stolen across to the land of the free and the home of the knave, after first having quietly turned all of their available assets into specie.

BY THE DEATH OF GEN. HANCOCK the people of the United States have lost the services of a truly honest public servant, and one of the most gallant soldiers the republic ever produced. Cast in heroic mould, keen of perception and firm of purpose, Gen. Hancock was one of the few successful Federal Generals, and has ever since that stormy period been elevated by common consent to the position of the ideal soldier of the Civil War. His sudden death following so soon after those of Generals Grant and McClellan, strongly emphasizes the truth of those oft-quoted lines, "The path of glory leads but to the grave."

BACK NUMBERS.—During the last few weeks we have had numerous enquiries for back numbers of THE TRADER. We print only a sufficient number to send one to every Jeweler in Canada, and are therefore unable to supply back numbers. We try to make THE TRADER "good enough" for Jewelers to preserve on fyle and bind in volumes each year, and we are glad to find that so many of them appreciate our efforts.

WATCH REPAIRING.—As we stated in our last issue we had intended pursuing the subject of the prices secured by the retail trade, for watch repairs, in this issue. We are sorry to say, however, that pressure on our columns compels us to hold it over until next month. In the meantime we desire to thank our retail friends throughout the Dominion for the many kind letters of approval our remarks regarding the protection of retailers have brought forth and also for the hints they have furnished us in connection therewith.

CONDOLENCE.—We regret to learn of the death of W. H. Ellis, Esq., C.E., father of P. W. and M. C. Ellis, the well-known wholesale jewelers of this city. Mr. Ellis was a gentleman of very retiring disposition, but very much beloved by the few with whom he was intimately acquainted. As a civil engineer he was entrusted with several very important undertakings in Europe and South America, and had acquired a high reputation in his profession that was more than Canadian. We beg respectfully to tender to the bereaved family our heartfelt sympathies.

NOT PECULIAR TO MONTREAL.—Judge Doherty, of Montreal, not long ago in open court sharply condemned the habit of lawyers in charging $1.50 as a fee for writing a letter for small claims. He called upon the bar to purge the profession of such unprofessional members. His remarks have caused a sensation among the "bum" lawyers at the Recorder's and Police Courts in that city, who live on such practices. In our opinion after the learned judge gets through with Montreal he might continue this good work in Toronto and elsewhere with great advantage to the country generally.

THE ANNUAL MEETING of the shareholders of the Toronto Silver Plate Co., was held at the Company's offices on Monday, 1st February, when statements for the past year were submitted showing a good year's business. The following were elected directors for this year, viz.: W. H. Beatty, Alfred Gooderham, Frank Turner, C. E., Glover Harrison, W. F. Kiely, Wm. H. Partridge, Wm. Thompson, David Walker, and Jas Webster. At a subsequent meeting of the Board Mr. W. H. Beatty was re-elected President, and Mr. Alfred Gooderham, Vice-president.

THE DISSOLUTION of the firm of John H. Jones & Co., the well-known wholesale jewelers of Montreal, will be quite a surprise to many of our readers. Mr. John H. Jones, the senior partner of the old firm who will now conduct the business alone, is one of the oldest and most popular men in the trade, having been for twenty years manager of the Montreal Branch of the Robert Wilkes business. At the death of Mr. Wilkes, Mr. Jones and Messrs. Chandler and Liffton bought out the business and have since carried it on under the style of John H. Jones & Co. The retiring partners, Messrs. Liffton & Chandler have commenced business as wholesale jewellers in Montreal on their own account.

ECHOES FROM THE MIKADO.

"A merchant alone in his desolate store
Sang "Willow, tit-willow, tit-willow!"
I said to him, "why are you pacing the floor,
Singing "Willow, tit-willow, tit-willow'?"

"Alas!" he said when smothered his cries,
"I thought it was nonsense to advertise,
And now I've no custom at all but the flies.
Oh, willow, tit-willow, tit-willow!"

COUNTERFEITERS ARRESTED.—Two men named John Hilton and Wm. Carroll, were arrested last week at St. Catharines, Ont., on a charge of issuing spurious coin and were remanded for trial at next court. Bail was refused. Counterfeit coin was found on both prisoners when arrested. The police burst in the door of their room immediately after the arrest, and found dies for the manufacture of 50 cent United States currency, 25 cent U. S. currency, and 25 cent Canadian currency, together with a complete battery for plating, some metal for the manufacture of counterfeit coin, and liquids, acids, etc., for the same purpose. Hilton is a practical machinist. Both men, on the advice of their respective counsel, pleaded not guilty to the charge preferred against them. Considerable spurious coin has been in circulation in that vicinity for over a year.

"RETAILER" ON THE FUTURE OF THE JOBBING TRADE IN CANADA.—We are in receipt of a letter from an esteemed retail jeweler regarding the future of the jewelry trade in Canada, in which he takes the ground that the jobbers are simply "caterpillars on the leaf," and are not a necessary adjunct of the business. After mature consideration we have decided not to publish "Retailer's" letter on this subject, because we think that jobbers are a necessity in distributing the product of the manufacturers, and this being the case it can serve no good purpose at this time to antagonize the wholesale and retail branches of the jewelry business. The fact that jobbers not only exist but are increasing in numbers is ample proof that they are a necessity at the present time at least, whatever the future may bring forth. In the present year of our Lord, the retail trade of Canada would find it almost an impossibility to get on without them.

CANADA HONORED.—One of the most pleasant features of the National Jewelers' Association Banquet held at Dalmonico's, New York, on the 10th February, a full account of which will be found elsewhere, was the right royal reception accorded to the speakers representing Canada, and the good feeling evinced towards their country by everyone present. The Canadian guests were made to feel at home, and it is needless to say they enjoyed themselves so thoroughly that the event will long linger with them as

"An Eden bright in fancy's flight
A heaven in memory's dream."

Their kind and flattering reception they took as more of a compliment to Canada than to themselves personally, although it was none the less appreciated on that account. Blood is thicker than water, and Canada and the United States are twins—only that the latter is about a century older than Canada.

DEATH ON ACCOUNT OF A BAD WATCH.—At the inquest on the body of fireman Little, of the Northern Railway, who was killed about three weeks ago by the collision of a "Wildcat" engine and a freight train, a verdict was rendered, that whereas it appeared that the accident had been caused on account of the defective working of the engineer's watch, by which the engine was timed to run, that the engineer Long be exonerated from all blame. Such a verdict makes it hazardous for persons to travel on this road if all their trains are run by watches which do not perform more satisfactorily than engineer Long's appears to have done. What they want, and what every road should be forced to have, are electric clocks in every station, which are absolutely correct and by which all trains should be run. Had such an arrangement been in operation, at least one valuable life would have been spared, and the Company saved more money than would have equipped the entire road with such an electric time service for half a century.

ANOTHER BONANZA FOR THE CUSTOMS.—The Customs officials at Halifax, N. S., last month struck another bonanza. The seizure consisted of three trunks belonging to William Dearden, containing a general assortment of jewelry, valued at between $10,000 and $15,000. These trunks Dearden brought with him from Montreal, but when he

FACTORIES: WALLINGFORD, CONN., U.S., AND MONTREAL, CANADA.

found that the cases sent by express had been seized he did not take the trunks to his hotel but got them secreted. After ten days' search the Customs officers finally discovered and seized them. Dearden claims that this is a portion of the goods upon which he paid $12,000 penalty in Montreal, and that he cannot be punished twice for one offence, but the books and documents found in the first two cases show that his smuggling operations have extended over a great many years, and his business connections were from the Rocky Mountains to Cape Breton. The Montreal fine was only for what the Montreal officers discovered, and by no means covered the whole of his operations or violations of the law in other parts of Canada. The officials have made several small seizures from jewelers in Halifax and Dartmouth, and all parties indebted to Dearden have been notified by the department not to pay him. If this warning to the retail trade to buy goods only from reputable jobbers is not sufficient, they will please hold THE TRADER guiltless if they get into trouble from any such source as mentioned above.

A SENSATION.—The sensation of the month is the expulsion of the Dueber Watch Case Manf'g Co., of Cincinnati, from the Silver Watch Case and Movement Mf'rs Association of the United States and Canada. The immediate cause of this expulsion was that the "Dueber Co." refused to conform to the wishes of the majority of the Association. In a nutshell, it appears to be a case of whether the dog shall wag the tail, or the tail wag the dog. In this case the Association very properly decided that the majority should govern and that the dog should wag the tail. The obstroperous tail was therefore amputated with despatch, and now the amateur surgeons are anxiously waiting to see whether the Association dog can live without his tail, or whether the tail will develop into an opposition dog. The outcome of this will probably be some lively times amongst the Case makers until this question has been fairly fought out. As the "Dueber Co." have been for some time under a strict boycott from the Knights of Labor, and are now under a boycott from all the respectable jobbers in the United States and Canada, it looks as though they were going to have an interesting season before them. While we think everyone is fully entitled to hold their own opinion, we have no sympathy with anyone who has a habit of kicking because he can't have his own way always. As this is the second time that the "Dueber Co." has kicked over the Association traces within the past three months, we suggest that if they are ever to be taken back again into the Manufacturers' fold, they should be compelled to furnish *bona fides* in the shape of bullion, which would act as a hostage for their future good faith. Such an action as that of the "Dueber Co." unsettles business entirely until it is settled, and no matter what the result may be it is not the honorable way of doing business. At present it looks like a stand-up fight, with the odds greatly in favor of the Association. However, the near future will show how the cat is going to jump, and the trade is awaiting its gyrations with a great deal of interest.

ON THE LIST.

The Ko-Ko of the Canadian Jewelry trade has sent us the following list of persons, of whom he remarks:

"We've struck them off the list,
They never will be missed."

The Watch Butcher.

The Jeweler who sells by auction.

Likewise those who are big on special discount sales.

The Jeweler who never meets his notes when due.

The enterprising burglar who burgles Jewelers' safes professionally.

The traveller who never sells any customer less than $1,000 at a time.

The Canadian Retailers who have skipped to Uncle Sam's dominions.

The Jeweler who wants to settle with his creditors at 40 cents on the dollar.

The man who advertises himself as "The only honest Watchmaker in town."

The Jeweler who can always buy goods fifty per cent. cheaper than any person wants to sell them to him.

The Jeweler who advertises and sells Watches at cost.

Likewise the Watch Butcher who repairs (?) Watches for the cost of the materials he uses.

The Jobber who violates his contract by cutting the prices of Watch Cases and Movements.

Likewise the Retailer who seduces the poor Jobber by telling him that he can buy Cases and Movements at ten per cent. off the list.

The Jeweler, retail or wholesale, who stamps 16k. wedding rings 18k., and deceives the blushing bride and modest bridegroom by selling them as the simon pure 18k.

The Retailer who thinks it an insult for the jobber to ask him to pay his bill when he knows "he is good for it."

The Jeweler who, after living on the fat of the land for years, fails and lets in all his creditors except his own relations, who invariably hold security.

The Jeweler who makes it a principle "never to give a note to anyone" in payment of goods, and who gets mad when four months afterwards the Jobber wants his money.

The Retailer who orders the same goods on approbation from half-a-dozen Jobbers, and after displaying them for about a month in his show window as his "newly imported stock," returns to the owners all that he has not sold (express charges unpaid).

The seductive Jobber who sells his goods on six months' credit, and draws on the innocent Retailer the moment they are shipped.

The Wholesaler or Manufacturer who doesn't advertise in THE TRADER.

Likewise the Canadian Retail Jeweler who doesn't read it.

WORKSHOP NOTES.

WATER-PROOF GLUE.—Soak in a cool place half a pound of glue for one night in a quart of good milk, and boil it the next day; it will resist moisture much better than glue dissolved in water.

TO CLEAN BRUSHES.—The best method for cleaning watchmakers' and jewelers' brushes, is to wash them out in strong soda water. When the backs are wood, you must favor that part as much as possible, for, being glued, the water may injure them.

GOOD MUCILAGE.—An adhesive mucilage for labels, suitable for bottles or glass, may be prepared by soaking glue in strong vinegar, then heat to boiling and add flour. This is very adhesive, and does not decompose, when kept in wide-mouthed bottles.

TO REMOVE TARNISH.—Silver or electro-plate ware that have been tarnished by exposure to tainted air can be restored to brightness in the following pickle: ½ pound of potassa cyanuret is dissolved in 2 gallons rain water, and the articles are immersed in it, until bright. Be careful to rinse off the alkali water, otherwise it will corrode the goods.

TO CLEAN DULL GOLD.—Dull Gold may be cleaned by immersion in a bath of 80 grams calcium hypochlorite, 80 sodium bicarbonate, and 20 table salt, which is dissolved in 3 quarts distilled water. It must be kept for use in well-corked bottles. Goods to be cleaned are put in a basin and covered with the mixture. After some time they are taken out, washed, rinsed in alcohol, and dried in sawdust. The articles then have the same appearance as if new.

TO PREPARE CHALK.—Thoroughly pulverize the chalk, then mix it with clean rain water, in proportion of 2 pounds to the gallon. Stir well, and let it settle for about 2 minutes. The gritty matter will now have settled to the bottom. Slowly pour the water into another vessel, so as not to disturb the sediment. Permit the whole to stand until entirely settled, and decant as before. You now have prepared chalk, ready for use when dried. Spanish whiting may be treated in the same way, and makes an excellent polishing powder.

PRECIPITATING GOLD IN OLD BATHS.—The baths when no longer fit for use are filtered into a white glass flask, rendered alkaline with a little bicarbonate of soda, and a concentrated alcoholic solution of magenta is added drop by drop until the liquid has taken the deep red hue of syrup of raspberries. The flask is then exposed for six or eight hours to the light of a bright window. At the end of this time the gold is found to be deposited as a violet powder, while the supernatant liquid has become colorless. It is carefully decanted, so as to preserve merely the deposit. When a sufficient quantity of protoxide of gold has been thus collected, it is carefully washed upon a filter, dried, and the filter is burnt. The dry residue and the ash of the filter is then dissolved at a gentle heat in an excess of aqua regia, and the solution (diluted with distilled water) is separated from the insoluble substances by filtration.

GUARANTEE NOTICE.

All Spoons and Forks bearing the stamp

G. RODGERS, A 1

are made of the finest nickel silver and are plated and hand-burnished under my personal supervision, and standard of quality—each article is guaranteed perfect in finish and durability.

All Knives bearing the stamp

G. RODGERS

12 DWT.

are plated on the best English cast steel with pure silver, and are hand-burnished and warranted to give perfect satisfaction. The well known reputation that the name RODGERS has attained all over the world have induced other makers to adopt a similar name, calcuiated to mislead the public. See that the trade mark reads and is spelled G. RODGERS, A1, on Spoons and Forks, or G. RODGERS, 12 Dwt , on Knives.

SOLD ONLY BY

THE ACME SILVER COMPANY,

TORONTO,

to whom all orders should be addressed. Send for quotations.

G. RODGERS,

Known to the trade in Sheffield, England, and on this continent since 1846.

OTHER NOTES.

IT has been estimated that from a single pound of steel, costing about 50 cents, there can be manufactured 100,000 watch screws, worth $11. Some of these machine-made screws are so small that an uneducated eye requires the aid of a magnifying glass to see what they really are.

A SOUTHERN philosopher observes—"There is an appreciable amount of hog in human nature. Hogs will squeal, and scuffle, and trot for miles after a leaky old wagon loaded with corn, but will not budge an inch after a wagon with a tight body. Civil service reform will tighten up the joints of the public crib, and we will have no hungry, noisy politicians hanging around it.

A RESIDENT of Burlington, Wis., has built a machine—a wheel within a wheel—and claims that he has solved the problem of perpetual motion. He also claims that his machine will accomplish anything that steam or water power will accomplish, and that he has been twenty-nine years working at it. This last claim is probably well founded.

DID you ever think of how much work is required to count a billion or the length of time it would take? An arithmetician makes this calculation: Had Adam counted continuously from his creation to the present day, he would not have reached a billion, for it would take 9,512 years. Any enterprising person disposed to doubt this statement can try the experiment.

A MARSEILLES merchant who started in business with $5,000 and became a millionaire, left his property to a friend with the condition that he should be buried with the sum of $5,000 placed in his coffin. The executor bewailed the reckless waste of money and was at his wits' end to know how to defeat the whimsical clause in the will. At length a happy thought came. "I will put a cheque," he said, "into the coffin for $5,000. It will be duly honoured when he presents it."

AT present the Rothschild family control the quicksilver supply of the world, but a new mine has now been found at Schupplastena, near Belgrade. There are only a few quicksilver mines known, the two largest being in Spain and California. Both are owned by the house of Rothschild, who only permit a supply, but never a glut of the market to issue from their mines, and thus they control an immense and very profitable monopoly. The yearly consumption of quicksilver is cut down to 100,000 bottles, the larger part of which comes from California, while Spain furnishes about 10,000 bottles.

THERE are more churches and chapels in London than the whole of Italy. It has 618 railway stations. Nearly 1,500 passenger trains pass Clapham Junction every day, while the underground railways run more than 1,200 trains a day, and carry 12,000,000 passengers a year. The omnibus companies run 1,000 stages, and carry 56,000,000 passengers a year. About 130 persons are killed and 2,000 injured every year by vehicles in the streets. There are in London 14,000 policemen, 14,000 cabmen and 15,000 persons connected with the Postoffice. The cost of lighting London by gas annually is $3,000,000. London has over 400 daily and weekly newspapers. Last year there were 2,314 fires.

WISE AND OTHERWISE.

IF your dinner bell has lost its clapper, you can still console yourself with your napkin-ring.

AN experienced boy says that he regards hunger and his mother's slipper as about the same, as they both make him holler.

"I sot me down in thought profound, this maxim wise I drew: It's easier for you to love a gal than make a gal love you!"

A NEWBURG goat the other day devoured an entire volume at one sitting. That's what you may call a swallow tale goat.

HELLER has a new coffee-and-milk trick, and the *creme de la creme* of society who flock to his mystic manifestations enjoy this kind of coffee-cup and sorcery.

A FATHER of three sons and five daughters was asked what family he had. The answer was, "I have three sons, and they have each five sisters." "Mercy!" exclaimed the interrogator; "such a family."

BEFORE beginning the second psalm for the day, a Glasgow minister reached down into his pocket and took a pinch of snuff. Even yet he cannot understand what there was in the first verse of the psalm to make the congregation laugh when he read: "My soul cleaveth to the dust."

As they were about to quaff, one of the party suddenly called out to the other, "Hello, Dougherty—you drinking whiskey? Sure it was only yesterday ye towld me ye was a taytotler." "Well," said Mr. Dougherty, evidently somewhat disconcerted, "you'r right, Misther Kelly—it's quite right ye are—I am a taytotler, it's true, but I-I-I'm not a bigoted one!"

ONE Irish laborer laid a wager with another that the latter could not carry him up to the top of a house in his hod, without letting him fall. The bet is accepted and up they go. There is peril at every step. At the top of the ladder there is life and loss of the wager,—death and success below. The highest point is reached in safety; the wagerer looked down humbled and disappointed. "Well," said he, "you have won; there is no doubt of that; worse luck to you another time; but at the third storey I *had hopes*."

OUR HELP COLUMN.

THE TRADER aims to be of practical value to the Retail Jewelry Trade.

NO CHARGE is therefore made for advertising in this column, but the subject-matter should not exceed five type lines, or about 60 words.

When requested, these advertisements will be published in successive numbers of the paper.

If you have a Store, Stock, or any Special Article to sell; if you wish to buy an Established Business, or enter into Partnership; if you want a Journeyman, Clerk, Salesman, or Foreman; if you want a situation yourself—communicate the fact to THE TRADER PUBLISHING CO., 57 ADELAIDE ST. WEST, TORONTO, and it will be inserted in this column free of charge. This is the only way by which you can reach the entire Trade, and we shall be glad to help you.

WANTED.—A SITUATION AS A WATCHMAKER.—By a young man about three months through his apprenticeship. Address, S. MATHERS, care of W. Watson, Jeweler, STAYNER, ONT.

SITUATION WANTED.—AS WATCHMAKER. Five years' experience. Can give best of references. Address, O. R. SUMNER, Oakville.

WANTED.—A SITUATION AS IMPROVER IN WATCH-making. Two years' experience. Address, Box 277, Barrie, Simcoe Co.

SITUATION WANTED BY A FIRST-CLASS PRACTICAL watchmaker of fifteen years' experience. Best of references furnished. Address, stating salary, &c., WORKMAN, care TRADER Publishing Co., Toronto.

SALESMAN WANTED.—By one of the largest retail jewelers in Toronto. A first-class salesman, who thoroughly understands the business. References required. Address, stating salary required, JEWELER, care THE TRADER PUBLISHING CO., 57 Adelaide St. West, Toronto.

Jewelry Business For Sale.

Rare chance for a young man to step into an established business in one of the healthiest towns in Canada, and a summer resort.

Stock reduced to $800 or $900.

Rent of store given with glass cases, benches, use of safe, and other fixtures.

Store the best in town, handsomely fitted up, and occupies the most desirable location in the place.

NO OPPOSITION IN THE BUSINESS.

Rent $9 per month. Stock all new and saleable.
American Hopkins Lathe fitted up also for sale.
Central Telephone office in connection. Terms cash.
For further particulars apply to

P. W. ELLIS & CO.,
TORONTO.

THE TRADER is printed by R. G. McLEAN, 13 Adelaide St. E. Toronto, who makes a specialty of Jewelers' Work. Samples and estimates on application.

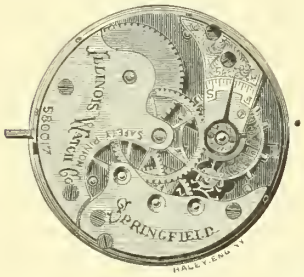
UNPARALLELED SUCCESS.

CANADIAN PATENT

JANUARY 15TH, 1886.

THE PERFECTION"



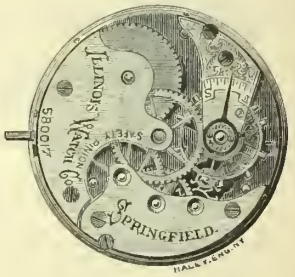
Dust Proof Watch Case, although placed by the American Watch Case Co., of Toronto, upon the Market one month ago, has already been pronounced by expert Watch Dealers to be

THE BEST AND CHEAPEST WATCH CASE EVER MADE.

The Perfection has been specially designed with a view to make a Watch Case which would at once be cheap in price, and at the same time afford sufficient protection to the movement. This idea has been admirably carried out by taking the excess of Silver from the centre and placing it in the backs, which will be found extra firm and heavy. Although the cheapest Watch Case ever made, it is warranted to give satisfactory wear. Ask your Jobber to show them to you; it is money in your pocket to handle them, therefore take no others instead. Every "Perfection" Case we manufacture bears our stamp and registered Trade Mark as above, and is fully guaranteed as to quality, no matter by whom sold.

OUR NEW PATENT UNBREAKABLE PENDANT SET.

☞ Dealers will please notice that we are now fitting all of our *regular* Open-Face Stem-Wind Cases with our new Patent Unbreakable Pendant Set, the simplest, strongest and best device for the purpose ever invented. They are made so as to take any regular American Full-Plate Movement with Female Winding Pinion.

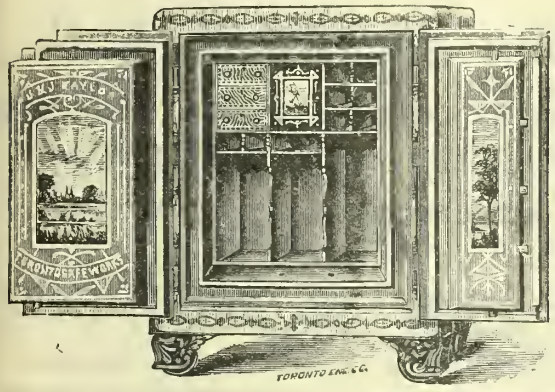


THE
ILLINOIS WATCH COMPANY
is now receiving orders for its new and beautiful
FOUR AND SIX
size movements, and is the ONLY Company now in the market with FOUR size movements.

PLACE YOUR ORDERS EARLY.

THE ILLINOIS WATCH COMPANY
warrants every movement of every size manufactured by it.

DON'T FAIL TO READ WHAT WE HAVE TO SAY TO YOU IN APRIL.



H. ELLIS,

WHOLESALE JEWELER,

THE TRADER.

TORONTO, ONT., APRIL, 1886.

The recognized organ of the Jewelry and kindred Industrial Trades of Canada.
Published on the first of every month, and sent free to every dealer in Jewelry and kindred goods in the Dominion of Canada.
Our rates for advertising will be found very low, and will be made known upon application.
We shall be glad to receive correspondence from all parts, and will publish such letters as will be of interest to the Trade. We do not, however, hold ourselves responsible for the opinions of our correspondents. The name and address must invariably accompany the communication, not necessarily for publication, but as a guarantee.
All business and other communications should be addressed to

THE TRADER PUBLISHING CO.,
57 ADELAIDE ST. W., TORONTO, ONT.

SPECIAL NOTICE.

To ensure insertion, changes or new advertisements must reach this office not later than the 20th of each month.

EDITORIAL.

WANTED.

The want of Canada is not politics so much as practical legislation. That is what representatives should be sent to parliament for, and that is what they should be paid for. One of the principal wants of the business community of Canada is an "Insolvent Act," and if the legislature ever get an opportunity to talk business for a few hours, they should put such a measure on the Statute Book

It is too late in the day to discuss the advisability or the need of such a law. Its necessity is recognized in almost every civilized country in the world, and it is only because that our legislators prefer party to the interests of the country, that we have not had one in Canada before this. The present state of the law, or rather the want of a general law, is demoralizing in the extreme. No two provinces are alike in their treatment of debtors; every province apparently makes its own laws, and the result is that in some cases they are framed so as to discriminate against the residents of other provinces.

What we want is a general Insolvent Act, that will at once be fair alike to the debtor and creditor, and which will obtain from one end of the Dominion to the other. The present hole and corner system is demoralizing trade because it localizes it by preventing the free interchange of products between the provinces that is absolutely necessary if Canada is ever to become a great and powerful country. From a patriotic as well as a commercial standpoint, we would regard the passage of a first-class Insolvent Act as one of the most desirable things that the present parliament could do, and we trust that before they draw their sessional indemnity they will see that something practical is done in reference to it.

SMUGGLING.

As if to give emphasis to our statement in last month's TRADER, that smugglers, no matter how smart, were bound to get caught if they kept at it long enough, our readers will find elsewhere in this issue the experience of two Canadian jewelers. We need scarcely, after our remarks of last month, say anything on the subject, further than that the parties in question are not deserving of any sympathy for the loss and disgrace to which they have subjected themselves by their breaking the law of the land. In both cases, however, while the principal actors in the transaction have met with just punishment, their accessories before the fact, have escaped scot free. We learn on good authority that at least three wholesale jewelry firms are implicated in these transactions, their part being to get American makers to ship the goods from their factory to some place on the border from whence the retail buyer could smuggle them over at his leisure and at his own risk. Although these firms are not actually guilty of smuggling the goods themselves, there can be no doubt but that they are abettors in the crime, for it was only by their action that the thing was made possible. We refrain from mentioning their names at this time, but if it becomes chronic we shall consider it our duty in the interests of business morality, to give their actions whatever publicity our columns will afford.

In this connection we are glad to learn that several of our leading wholesale houses who desire to see this illegal and ruinous competition stopped, have sent in to the Manufacturing Jewelers' Board of Trade (Providence, U. S.), a requisition asking them not to ship any goods to Canadian customers except to a Canadian port of entry, and to co-operate with them in helping to suppress the evils which must and do arise to honest traders from smuggling. We are in receipt of a letter from the Secretary of the Board regarding this requisition, in which after advising us of the fact that the Board had received such a communication, he says: "I am instructed by our Board of Directors to place in your hands for publication in your valuable magazine the following resolution: 'That the Directors are heartily in accord with the attempt to suppress the evils complained of, and that they will exert their influence to sustain the principles and objects desired.' I have given the editor of the *Manufacturing Jeweler*, (our official organ) a copy of the petition and our views upon the subject which will be printed in their next issue." In a postscript he says: "I may add that I consider the move a *grand good* one, and I trust the petitioners may succeed in their efforts. I will do all that I can individually." The sentiments of the Board and their Secretary are manly and honorable, and do credit alike to their honesty of purpose and business perspicuity. Like the Providence Board of Trade, THE TRADER sincerely desires to see this movement against smuggling crowned with success.

HIGH PRICED EMOTION.

It is a common saying that "Canada possesses more politics to the square mile than any other country in the world," and if one were to judge from the vaporings of any of our houses of parliament they would probably conclude that there was a great deal more of truth than poetry in the remark. We have often expressed the view that if we had less of party and more of country about our parliaments it would be a great deal better for the welfare of the people at large. The petty bickerings of the little legislative show which Ontario holds every year in Toronto is bad enough, but when contrasted with the unseemly wranglings of the big guns down at Ottawa, it becomes tame to a degree. A stranger listening to the debates of the past few weeks on the North-West affairs and not knowing anything of the rebellion or its leader would no doubt fancy that the fate of the country hung on its issue. If he knew anything about the debaters he would conclude that the whole thing was a farce of the most transparent kind and that neither party cared a rap

about Riel and were only making use of his case to get into office, or being in, to stay there. While much may be said in favor of the Government's action, we fail to see how any loyal citizen can censure them for letting the law take its course and ridding the country of one of the most dangerous men that ever lived in it. If Riel was sane enough to raise two very costly and bloody rebellions, he was plenty sane enough to hang say we, and no matter what nationality he sprang from, he was a Canadian and amenable to Canadian law and justice. In our humble opinion, he was not half as crazy as plenty of those who at present for their own purposes desire to make him out as such.

We have always held that the Government did right in hanging Louis Riel and are to be commended for letting the law take its course in the face of the terrible pressure that was brought to bear on them to commute his sentence. But while we do so, we are strongly of the opinion that their administration of the North-West affairs was not what it ought to have been, and therefore open to a searching investigation by parliament. Two wrongs don't make one right, and no matter whether the Government was wrong or not—Riel was guilty and deserved the punishment he received. If the Government were equally culpable the place to try them is in the House and not on the Champ de Mars, and the jury should be their co-legislators, and not an ignorant rabble. If the House is satisfied that they have betrayed the trust reposed in them, they should make them give place to others who have their confidence.

It appears to us that if the Riel debate is going to crop out much oftener, that that gentleman is going to cost the country about as much dead as alive. Riel's memory is all very well in its way and if the bolters and their friends in Her Majesty's loyal opposition think so much of him as they now profess,they should take about three months during midsummer to fall on each others' necks and sob out their praises of the deceased, but for goodness sake let them let up during the time parliament is in session, for their emotion is costing the country at the rate of about one thousand dollars an hour. Grief is sacred and should not be kept too freely on tap ; it is too high for general public use at the price charged for it by the House of Commons of Canada.

Since writing the above the action of the Government in executing Riel has been sustained by the handsome majority of 94. As all the prominent men in the Liberal party, Blake excepted, voted with the Government, it is to be hoped that the *Globe* will take their action as a quiet hint that in future that party proposes to manage its own affairs in its own way, instead of being bulldozed by an irresponsible clique of political heelers who happen to have fallen heir to a proprietary interest in the personal organ of a deceased statesman, whose shoe latchets they are unworthy to untie.

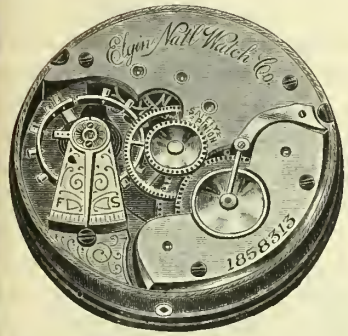
COMMON SENSE PROTECTION.

In our February issue we took occasion to point out a few of the methods by which the retail jewelry trade could protect their own interests. We then stated that in our opinion the jobbing trade of Canada had done all they possibly could for the retailers' protection, and that if the latter desired anything further in that direction they must look to themselves for it. We pointed out, in the article referred to, some of the advantages that combination would have upon the retail jewelry business so far as selling goods is concerned, and if our readers will bear with us further in the same direction, we will endeavor to show them how such a combination would advantage them in the matter of selling their own labor.

It is now a pretty well ascertained fact, that in any well regulated and prosperous retail jewelry business, the watch repairing department should at least pay shop rent and living expenses, leaving the profits of merchandise sales to go to the credit of capital account. We know of dozens of businesses in Canada whose watch repairs make more money than this, but we think this may safely be laid down as a guide for any ordinary jeweler to know whether or not he is doing a prosperous business.

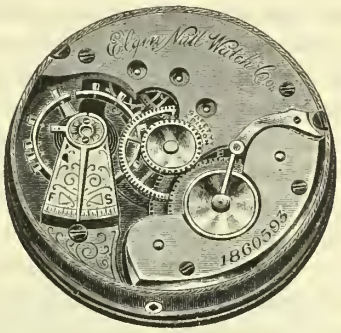
We are aware that there are a great many jewelers on the other hand whose watch repairs do not come up to this standard, and in most cases it will be found that unless in some populous centre where they sell large quantities of goods, such businesses are rarely profitable. As a rule the most of our retailers make money, in the first place, by their mechanical ability to repair watches, and it depends very much upon how they turn this ability to account whether or not they ever acquire capital enough to pay for the stock of goods necessary to the successful carrying on of a first-class business.

The trouble of a great many jewelers is that in order to draw trade they are willing to do this repairing work, which as we have pointed out should be one of their principal sources of income and usually the corner stone of business success, at almost the price of the material they use. By so doing they may think that they are getting ahead their competitors and drawing trade to themselves, but this we think is an error, for the general public as a rule can't tell whether such work is cheap or dear, although they may by experience know whether it is well or badly done. We do not think that in one case in ten where retailers pursue such a system of cut-throat competition in watch repairing, that it does their opponents much harm or themselves any good. If they were disposing of some well-known article, with the value of which the public were thoroughly acquainted, we could understand how capital could be made out of it, but in watch repairing which is more a sale of one's skill as a workman than of anything tangible in the way of material, such a policy is the utmost folly.



During the past month we have had sent us from various parts of Canada advertisements of jewelers who used printer's ink to boast of this kind of nonsense. They were anxious to have the public understand that they would clean a watch, put in a new main spring, new jewel, new balance spring, at from twenty-five to fifty cents, the usual charge for which by their competitors was one dollar.

Now this to us looks pretty much like a man's cutting off his nose to spite his face, for by such a course they were bound to do themselves no good, while doing their opponents very little harm. People don't expect to get something for nothing ; as a rule they expect to pay for what they get, and therefore, when one jeweler proclaims to work for half price of his competitors the public usually judge that he has rated his work according to its real value.



A good watchmaker is a mechanic of the very highest type, and does not learn his profession without a great deal of study and many years of hard and poorly paid toil. This being the case we fail to see why such a person should give away his skill for next to nothing and without advantage to himself. The doctor who makes you a professional visit when you are ill,

THE

ELGIN NATIONAL

NEW YORK OFFICE: 22 JOHN STREET.

WATCH COMPANY.

does not charge you merely for the time he thus consumes, but you and every other patient have to pay in part for the expense of his education and loss of time while he was learning his profession. If he simply charged you for his time as any ordinary laborer would at the rate of so much per day, he would not stay very long in the ranks of the medical profession. Like the doctor the watchmaker sells something more than simply material and the time of an untrained workman; whether or not he recognizes the fact, it is true, nevertheless, that he is selling his brains as well as the material he uses every time he repairs a watch.

A celebrated silversmith once told a customer in the writer's hearing, when the latter said to him that he could buy solid silver hollow-ware at so much per ounce. "Sir, our goods are more than mere bullion, they are the result of the highest order of mechanical intelligence and skill, combined with beauty of design, and we do not propose ever to sell our brains by the ounce." We have often thought of this remark since that time in connection with such subjects as we are now writing about, for it is only but too true that many of our best watchmakers by their method of selling repairs almost at the price of the material, are doing neither more nor less than "selling their brains by the ounce."

If anybody could take hold of a watch and repair it as well as a trained watchmaker, we could see some reason for his selling his services as many actually do "almost without money and without price." But the skill of the watchmaker is no common thing and the possessor of it is as much entitled to a benefit from it as a doctor, lawyer, or any other professional man who has spent time and money in the acquiring of his business.

If jewelers sold their merchandise, as many of them do their mechanical skill, at cost, there would be very much less money in the business than there is at present. But they might just as well do the one thing as the other. What's the difference? In our opinion there is none, and it is only because people don't recognize the fact that they persist in doing it.

As a rule the more difficult a profession or trade is to learn the more valuable it is to a person, once it is mastered. The watchmaker is, we contend, a skilled mechanic of the very highest type, and therefore deserving of a price for his work commensurate with its value.

We think we have said enough to show some of our readers who have never looked at this subject in this light, that they are not only violating the first principles of business by selling their mechanical skill at cost, but handicapping themselves very heavily in the race for commercial success. If a jeweler don't set much value on his own work, it is hardly probable that the public will do so. The result is that he generally remains "a hewer of wood and a drawer of water" to the public, and ends his business career as poor as when he began.

How shall the trade find a remedy for this state of affairs, which the majority of the trade admit is a bad thing? Our reply is by organizing local retail associations. Watch repairing is strictly a local business, and were such associations formed the trade would be able to get a fair price for their work without any difficulty. When once a jeweler found that he could just as easily get one dollar as fifty cents for cleaning a watch he would hardly care to throw his extra profit away without some very good reason. People don't get watches cleaned or repaired merely to give work to the jeweler, but because they are forced to have it done. The raising of the prices on watch repairing would not, therefore, have any tendency to make this branch of the trade any less in volume, while it would make it as it ought to be one of the best paying parts of the jewelry business. Such an action would also have a tendency to raise the standard of workmanship. If the customer paid more for his work, it would probably be better done. The jeweler could afford to spend more time and pains over it and really do it justice, whereas at the present time he often has to turn out work that he is ashamed of because he can't afford to do it better for the price he gets.

Almost every one can call to mind the story of their schoolboy days of the lark who had her nest in the field of grain. When the grain was ripe the farmer and his sons came to look at it and decided to invite their neighbors to help them to cut it. The neighbors failed to put in an appearance. They consulted together and then finally decided that although their neighbors had gone back on them they could rely on their relations, and consequently determined to ask their help for next day. The relations however failed to materialize, and in despair the old man said to his boys: "Now that everybody has gone back on us we will have to tackle it ourselves." The old lark's mind had been easy up to this time, but when she heard this she commenced to pack up and seek another dwelling place, for she knew that now that they were at the last ditch it was sure to be done. Our readers themselves can apply the moral of this fable to the present situation of the retail jewelry trade, and if they only make up their minds to set to work at once and depend on themselves, they will find their business and prospects very much improved by the venture.

CORRESPONDENCE.

SPECTACLES AND HOW TO SELL THEM.

WRITTEN SPECIALLY FOR THE TRADER.

PAPER NO. III.

Lenses or glass for spectacles and eye glasses are made in about a dozen different factories in the world and are rated according to quality of glass used for the purpose. The finest lenses made are French; next comes the English, and the commonest are made in Germany. They are made in plano, double convex and periscopic, of both plate and crown glass. Lenses are used in various forms and colors, according to the purposes they are intended to serve, and are sub-divided into the following five classes:

(*a*). Plain or Plano Glass, without color (usually termed "white"), or in smoke, blue, green or other colors used to protect the eyes against external injuries, or against the light when the eyes are sensitive or the light is too strong. They have no power, and are: 1. Parallel, straight surfaces on both sides, called *plano*. 2. Parallel, bent surfaces on both sides, hollow or *coquille*.

(*b*). Convex Glass, used mostly white. It concentrates the rays of light, and therefore magnifies, and serves to correct the most common deficiency of sight. *Weak or Far-sightedness*, usually the accompaniment of advancing age. It is used in the three following forms: 1. Double Convex or Bi-Convex. Both surfaces of equal convex curve (dcx). 2. Plano Convex. One surface convex, the other plain. 3. Periscopic Convex.

FAHY'S INITIAL AND SUBJECT

PATENT GOLD INLAID

SILVER WATCH CASES.

In addition to our Gold Inlaid Subject Designs, including LOCOMOTIVE, STAG, JOCKEY, BULL DOG, STALLION, LION and BEAR, we are making and will constantly carry in stock a complete line of GOLD INLAID INITIAL Silver Cases, in SENIOR, JUNIOR and SCREW BEZEL 3 and 4 oz. Open Face Stem Wind.

FOR SALE BY ALL CANADIAN JOBBERS IN AMERICAN WATCHES.

One surface convex, the other slightly concave (pcx). All three forms have approximately the same effect, but the double convex gives the truest image, and the difference is most striking in the higher power glasses. Periscopic glass is the highest in price, and is used largely in the finer grades of spectacles. Plano Convex glass is used the least in spectacles, and when it is used, the plane surface is usually neither ground nor polished; and this glass is, therefore, the cheapest, and used only in very low grades of Spectacles.

(*c*). Concave Glass, used mostly white. It disperses the rays of light, and therefore diminishes, and serves to correct the deficiency of sight known as *near-sightedness*. It is used in two forms as follows: 1. Double Concave or Bi-Concave. Both surfaces of equal concave curve (dcc). 3. Periscopic Concave. One surface concave, the other slightly convex (pcc). Both forms have approximately the same effect, but the double concave again gives the truest image, and the periscopic concave is the highest in price.

(*d*). Cylindrical Glass, used mostly white. It serves to correct deformity of the eye lens or of the cornea, known as astigmatism, and is: 1. Cylindrical Convex. Ground and polished plano on one side, and a convex cylinder on the other. 2. Cylindrical Concave. Ground and polished plano on one side, and a concave cylinder on the other. The convex cylinder magnifies; the concave cylinder reduces in the axis of the cylinders only. Cylinders are combined, as the case may require, with spheres or other cylinders, and are then called "compound cylinders."

(*e*). Prismatic Glass, used mostly white. It serves to correct cross-sightedness. Both surfaces are ground and polished plano, but intersecting each other at various angles from 1° to 15°. Prismatic Lenses turn off the rays of light according to the angle of intersection of their surfaces. Instead of plano surfaces, they may have spherical or cylindrical surfaces, and are then called compound cylindro-spherical prisms, according to the curves which they are given.

In the majority of the factories the lenses are all sold to an agent who supplies the spectacle manufacturers. We have never yet heard of a case of a spectacle manufacturer grinding the focus in lenses, although a great many claim to do so. The great trouble in the spectacle trade is the number of irresponsible dealers who have of late years crept into it. These gentry are a curse to the country. They get up a name for an article by advertising it largely, procure testimonials from people who know nothing about spectacles, but who they have happened to fit right through keeping a proper assortment of focuses in stock. They go round the country selling merchants goods at double the price they could buy them from a legitimate dealer in spectacles, making them sole agents for their line of goods and crowding them with large stocks, in a good many places totally unsuitable for the trade in the vicinity. If they stopped there it would not be so bad, but on their next trip round, finding that their victim has not sold enough, they appoint another agent, leaving a large stock of unsaleable goods in the hands of the first buyer, who has to encounter opposition that he never had before, as they generally select someone who never handled spectacles before for their agents. As these gentry do not live in the country but merely have on office here, redress is very uncertain as they never stop more than a few years in a country. Another favorite way of theirs is leaving their goods on commission, but of course they take the merchant's note, but when the note comes due they deny the commission part and force the dealer to pay up.

We have often noticed advertisements of spectacles stating that they are the only genuine English spectacles in the market, but on examination of the goods we have found them mostly American and German. The merchant cannot be too careful who he buys his goods from so as to get good value for what he pays. A great deal of the success of such people is owing to the fact that very few dealers keep a proper assortment of spectacles and eye-glasses preferring only to keep the most saleable numbers, and in order to effect a sale they very often fit their customers with unsuitable glasses. The parties so fitted fall in with these bogus manufacturers, who knowing what the matter is, fit their eyes all right, and tell them that no spectacles but theirs will suit them and that all other makes are worthless. They then ask for testimonials and get them.

Of course there are several good brands of spectacles in the market, but these are sold on their merits, and are good value for what is paid for them. We have often noticed jewelers who keep spectacles complain of not being able to sell them and say it takes too much time. Their invariable excuse is the old woman who wants a pair of spectacles for twenty-five cents and who takes an hour to fit a pair. Well this is caused by the jeweler keeping his numbers all mixed up instead of separate and allowing his customers to try and fit themselves by handing them a box which in most cases does not contain the number required. Of course it takes an hour, perhaps two, and generally the party will go out without getting suited. All this could be avoided if the dealer took a little pains to learn how to fit and kept his stock properly. In our next article we will treat about fitting spectacles.

H. G. LEVETUS.

Editor TRADER,—

DEAR SIR,—I see by the Goldsmiths' Company's advertisement on the cover of your last number they are the pioneers in protection to retailers in the clock trade. Good for you, gentlemen; you are worthy of the support of all in the trade.

It is true, that taking it on the whole, the wholesale trade are more willing to protect the retailers than they are to protect themselves.

There has been a great deal said by certain parties anent protection, but it seems as though the retailers of Toronto are either afraid that in the event of a league being formed their brethren of the country will have an equal chance with them, or they are afraid of one another; or it may be that they feel themselves of too much importance to join in league with the petty country retailers.

But let it be what it may, if they look at the matter squarely and weigh it well they will see it is to the interest of all to have a uniform price, both for work and goods.

Some may object to have a uniform price for work, upon the ground that all don't do their work equally well. Allowing that to be the case (and none will dispute the fact) those who fail in giving satisfaction will have less work, thus making it better for the best workmen. If Mr. Smith has to pay as much to have his work botched, he will go where he can have it done well. Whereas, as the case now stands, he says: I can get Jones to do a job for me for half what White charges, and I will run the chance.

As regards the selling of watches and clocks, where is the

THE NEW METAL CASE,

- SILVEROID -

The metal of which these cases are made is a new one, far superior to any other in use for low-price watch-cases.

It is stronger, is capable of a high degree of polish, has the lustre of silver, and will not tarnish.

use selling goods unless you get a fair profit for them, for there is a legitimate profit, and below that no one can do business and prosper; and prosperity is what we all want—it is both to the interest of buyer and seller.

Your offer to re-publish Excelsior, a treatise on Watchmaking, is a good idea, and one that will be appreciated, no doubt, by the trade.

Wishing you the prosperity you deserve, I subscribe myself,

Yours obliged,

RETAILER.

Editor TRADER,—

SIR,—It seems to me that if our Jewelers were to devote their attention a little more to the getting up of attractive window shows, it would be one of the best advertisements they could possibly have. The traveller for any wholesale house having, as he does, almost unlimited opportunities for observation, denied to Retail Jewelers who are compelled to confine themselves closely to their own stores, should be in a good position to give his customers many useful hints about this matter, and the best and cheapest way of carrying such ideas into practice. I feel that a salesman's duty is not merely to consider his own interests, but those of his customers as well.

And, sir, is not the success which your paper is enjoying to-day very largely the outcome of this very principle: Its gift-giving policy,—a free paper,—its liberal tone; its free advertising columns; and its admirable editorial matter.

Many Jewelers will remember that not many years ago attempts were made to keep alive a paper said to be devoted to the Jewelry trade; but their policy being "to gather up the fragments, that nothing be lost"—not according to the original dispensation, but that they might have all for themselves—they ate up all the crumbs and then died of starvation, from their own penuriousness.

Only a few days ago a prominent Jeweler, holding before him your paper, said most enthusiastically,—while shaking it good naturedly: "That paper, sir, why the Jewelers couldn't do without it, and any jobber or manufacturer who don't advertise in it is not alive to his own interest; that's where we go for information." I would stake a good deal in backing up this authority, and would venture further to say: that this is the registered Trade Mark opinion of all our Jewelers throughout Canada.

Yours respectfully,

JNO. W. CAMPBELL.

Editor TRADER,—

DEAR SIR,—I see the National Jobbers' Association have had their Annual Meeting, and from the report of it I should say it was a success in every sense.

It is not to the interest of the retail trade to have the prices cut so low that there is no money made by the manufacturer, for when such is the case the jobber and the retailer suffer also, and the public alone reap the benefit.

You will agree with me in saying that on an average, watch buyers don't buy more than two watches in a lifetime. Such being the case, it does not amount to a very great deal if they do pay a fair price for what they buy, whilst it means an immense sum to the manufacturer, and either fair wages to their employees or else small pay and no profit to the employer.

I see from your notice of correspondence received that "Retailer" seems to think that the jobbers are caterpillars on the leaf, and not necessary to the trade. It may be true as far as he is concerned, as it is quite likely that he can afford to buy on a large scale; and if so, it might pay him to visit the markets to buy his goods if he could purchase direct from the manufacturers. But it is otherwise with those in the small towns and villages. They have neither the time nor the capital to make it pay.

For my part I do not see why the Jewelry trade should not have men dealing as wholesalers as well as the dry goods and other trades.

I think that lawyers are a necessary evil, and the less that Jewelers have to do with them the better, is the opinion of,

Yours truly,

JOHN BULL

APRIL FOOL.

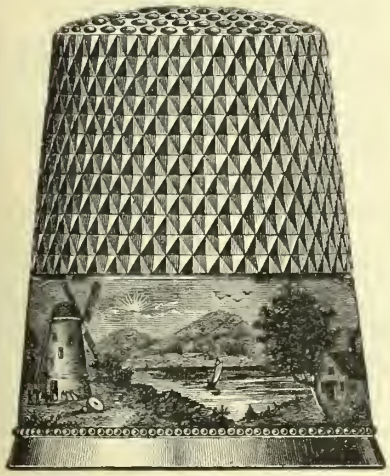
The first of April is at hand,
The mischievous boys are seen
To lay the bait and then to stand
Behind some friendly screen.
On the sidewalk they have tacked
A hat over a stone.
They've tied up an empty box so that
A parcel neat is shown.
Nor is this all that they have done
The innocent to lure.
Ten or twelve yards farther down
They've provided for the "poor,"
They've nailed a well-filled purse, you see,
Upon the planks secure.
This trick is good for more than one;
Of that you may be sure.
A dude comes along, he spies the purse,
Forgets it is the rule
To-day to watch a man stoop down,
And then yell "April Fool."
He sees the parcel, passes by,
He'll not be caught again.
He feels that some one should be kicked
For playing him this game.
His blood is up, he hurries on,
He's ready for a spat.
And what would be more natural
Than kicking at the hat?
He gives one long tremendous kick;
His tooth-pick shoes the tool,
He comes down solid as a brick,
The boys yell "April Fool!"
From this we may a lesson learn.
All we who jewelry vend,
Learn that an honest, virtuous man
Will fare best in the end.
The man who cheats the Government
Out of its lawful dues,
Who thinks to pay the duty is
To him no earthly use,
May find, some day, that sharper men
Are on his track, and that
He put his foot in terribly
When he kicked at the hat.
The law is placed just like the hat,
Over a heavy stone,
And though it may look innocent,
Kick not, but leave alone.
There's the good-natured, lazy man,
Harmless and forgiving,
He takes things easy, seems to think
The world owes him a living.
He says he trusts to Providence;
It may be well to tell
That God helps those who help themselves,
Who use their talents well.
He is like the man who finds the box
The boys have laid for him,
A bonanza he expects to strike,

HOW TO MAKE MONEY!!!

THIS is what every Jeweler wants to know, and I may tell them, without beating around the bush, that they can make money easiest by buying their goods properly. "Goods well bought, are half sold," runs an old proverb, and that is exactly what every Jeweler says who buys goods from me.

I keep the largest and most complete stock in Canada of American Gold, Rolled Plate and Gilt Jewelry. I am headquarters for American and Swiss Watches, and Cases of all kinds. I have a larger stock, and sell spectacles and optical goods cheaper than any other house in the trade.

I buy in larger quantities than any of my competitors and pay spot cash for all my goods, and I will sell away down at rock bottom to cash customers, or to good men who can pay their notes when due. It will pay any Jeweler to call in and examine my goods and compare my prices with those of other houses. They will buy from me because I sell cheaper than any other house in Canada.



S. FRENKEL, Wholesale Jeweler.

Remember the Address, 55 and 57 YONGE STREET, Above the American Express Co.'s Office.

SIMONS, BRO. & CO.

MANUFACTURERS OF FINE JEWELRY,

No. 76. 5/8 in.

And filled up to the brim.
When he quietly reviews his life
He finds to his chagrin,
That though the box looks fine outside,
Alas! there's nothing in.
The man who sells a "fine gilt"
For a first-class roll-plate chain
And swears that it will color keep
In sunshine and in rain ;
Who sells a plated ring for gold,
The stamp is 18 K.
Who always finds the jewels "broke,"
A couple of dollars to pay
For repairing a watch that an honest man
Would clean and never dream
Of charging more than the current price,
He would not be so mean.
Such a man in the end too often finds
That he has grabbed a purse,
Which nailed fast and stuffed with cotton rags
For wear is much the worse.
A true man does not expect to make
A living without trouble,
At every obstacle he clears
He finds his courage double.
He does not falter by the way
When fate it seems perverse,
He feels that he has nobler aims
Than own a well-filled purse.
He knows his talents, uses them,
Is diligent, persevering,
And feels as he is toiling on,
His home he's daily nearing,
He beats a straight road to his goal,
Though slow may be his "mule,"
You'll find he gets there all the same.
He has not been a fool.—G. K., Elmira, Ont.

SELECTED MATTER.

C. N. THORPE ON MANUFACTURERS.

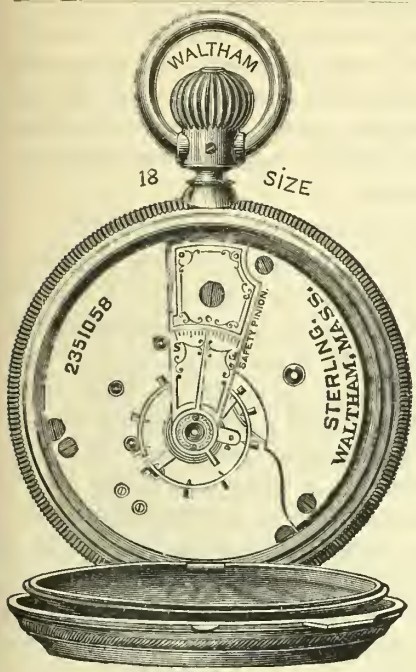
At the ninth annual banquet of Chicago Jewelers' Association, held on the evening of the 7th of January, the following interesting speech was delivered by Mr. C. N. Thorpe in reply to the toast of "Manufacturers." They hazard much, and though often censured do great good by the application of skill in enhancing the value of nearly everything we appreciate and enjoy in life :

MR. PRESIDENT AND GENTLEMEN OF THE CHICAGO JEWELERS' ASSOCIATION,—In responding to the toast "The Manufacturers," I feel some delicacy at this banquet, because, being a manufacturer myself, I am not at liberty to say all the agreeable things that might be said concerning that large and influential body of citizens. If manufacturing was dead and a tribute were to be paid to its memory, and eloquent things said of the men who had died with it, I am sure I would rise to the occasion with comparative ease. But manufacturing is not dead, indeed, as a part of the world's industry, it is very much alive, and as any other infant soon lays off its swaddling clothes and asserts the strength of its various parts, so this has begun to be a powerful factor in our civilization, and even promises to attain giant proportions.

But your toast calls for something about the men themselves. It is well worded. Looking over the lives of manufacturers, one never comes across any of whom it is not true that they hazard much, and though often censured, do great good by the application and direction of skill in enhancing the value of nearly everything which we appreciate and enjoy in life.

CONCENTRATION OF MANUFACTURES.

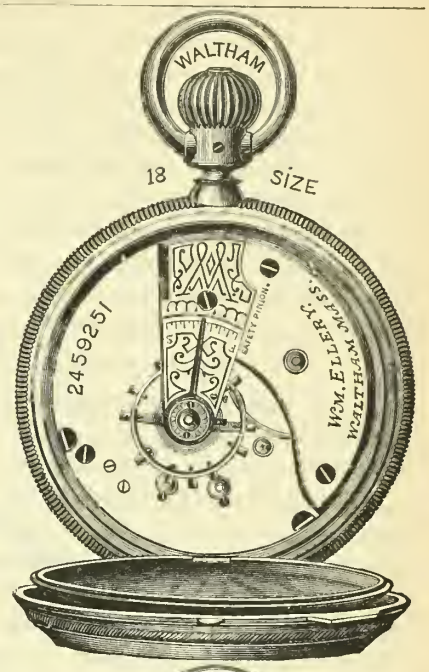
It will be well in beginning this subject to look for a moment at the census of 1870 and 1880, to see how much the small manufacturer ventured. In 1870 there were 252,148 establishments employing 2,053,000 operatives, and in 1880, 253,852 establishments employing 2,732,000 people. Census for 1870 gives twenty-six establishments making clocks, employing 1,330 hands; that of 1880 gives twenty-two establishments, employing 3,940 hands. It gives the number of watch case establishments as forty-nine, employing 703 hands; and in 1880, twenty-seven establishments, employing 1,758. The number of jewelry establishments in 1870 was 681, and the number of hands 10,091 ; and in 1880, 739 establishments, employing 12,697 hands. In 1870 it is stated there were thirty-seven establishments making watches, employing 1,836 hands; and in 1880 eleven establishments employing 3,336. (The large number of establishments in 1870 was probably due to the fact that a number of watchmakers still made a few watches by hand). The number of hands in the cooper's trade increased eleven per cent. from 1870 to 1880, but the number of cooper's establishments decreased twenty-two per cent. The number of cotton mills has also diminished since 1850, but the the number of hands employed has doubled. *These figures show the extinction of the smaller establishments and the concentration into larger factories.*



REQUISITES NECESSARY FOR SUCCESS.

Whether the manufacturer controls the operations of a large or small plant, he knows full well, if possessed of ordinary business experience, that danger lurks sometimes in the least suspected places. A correct estimate of economic conditions, and understanding of the market for his specialty, the strength or weakness of his competitors, are considerations that must of necessity enter into his calculations. There are times, and these, too, when he considers himself posted in these particulars, when his estimate of the situation miscarries. He has manufactured in excess of the demand; stored up goods not immediately salable, and collections have been slow. Hazardous experiences like these have occurred to us all, and must, in view of the frequently eccentric laws that govern trade, occur again. But that man who is ever on the alert, who keeps abreast of the times, who is quick to perceive the advantages of sensible innovation upon old and cumbrous processes, who is pushing the introduction of his goods, and only claims for them exactly what they are, and makes no misrepresentations, will certainly minimize hazard in his undertakings.

HOW ENGLAND FOSTERS MANUFACTURE.



Your toast goes on to say that manufactures do much good. One needs only to go to England and visit the towns in which have lived and served the great manufacturers to see recorded in substantial monuments the names of these benefactors. It would be a pleasant task, were there time this evening, to run over some of the great names of England, such as John Crossley, who first used the power loom in carpet manufacturing and increased his production fourteen fold at a stroke, and the Horricks, who first spun cotton with the spinning jenny; the Platts, of Oldham, who have large works covering fifty-five acres and employ eight or nine thousand hands.

It is to England's credit that she has fostered these industries, not, to be sure, in the same manner as America has ; but would it not be well for us to follow her example, and not only honor individual manufacturers, but encourage them as she does by extending foreign trade? England pays annually millions of dollars as subsidies to her steamship lines who carry her

productions to all parts of the world, bringing back in exchange their value in some form to enrich her people. She pays nearly $2,000,000 as subsidies to her steamship lines that carry her mails to China and to the East Indies, markets that stand ready to-day to absorb the surplus product of our manufactories. She pays nearly $500,000 to carry the mails to Brazil, Mexico and the West Indies, whereas the United States paid to Mexico and the West Indies less than $10,000, and every manufacturer knows that he can pay the freight to Brazil *via* England as cheap as he can send it from New York direct.

AMERICA'S TRIBUTE TO ENGLAND.

A short time ago every manufacturer who had opened a trade with that great Continent that lies in the Pacific south and west of us was threatened with the possibility of having to send all his letters to England in order to get them to Australia, because our own country refused to pay one-quarter, or $100,000 of the $400,000 needed by the steamship lines running from our western shores to New South Wales, when that country of less than 2,000,000 inhabitants would pay $300,000 or three-quarters of the total sum herself. Here is a line of splendid steamships struggling for existence, running to a country very like our own, whose tastes are similar to ours, and will take in ever larger quantities our cottons, hardware, jewelry, watches and silverware. We want our government to furnish us as good consular agents an equal chance with England to reach foreign markets. When we have these, and when we have our ships commanded by American sailors, who carry with them the American flag and the energy and enterprise characteristic of our country, men ever on the alert for the interest of their principles—when we have these we will not say, as we have during the past dull years, that $12,000,000 or $13,000,000 worth of cotton goods make an overloaded market, and consequently shut up our mills, but we will share in the benefit which England derives from the export of $400,000,000 of cotton goods annually. When we have these we shall not oblige our farmers to send their wheat to London to compete with that raised by the "Felleh" of India, who is glad to work for six cents a day.

HONOR AMONGST MANUFACTURERS.

But we must not linger on this while there is so great a host of honorable names stretching like a milky way across our great country. First among these captains of industry are the Ames, the McCormicks, the Sprague, the Fairbanks, Baldwin, Dobson, Pullman, the Bigelows, Carnegie the cultured iron worker, Robert Patterson, at one time the largest cotton manufacturer in this country, and Disston, whose saws and hammers go to all parts of the world. But illustrious as these names are, and adding as they do to the renown of our own country, they do not yet tell us all there is to be said about manufacturers, that large class of citizens who, doing with their might what they have to do, keep before them exact business methods, never stooping to any measure, however full of promise, that is not a right way, and so conserving the honor of their country and the best interests of mankind. I believe the inner history of our own watch and jewelry business will reveal a noble purpose to do that which is right and honorable for honor's own sake. Never shall I forget the remark of the manufacturer of gold watch cases, while discussing the practice in former years of debasing the quality or gold and the great improvement in that respect in recent years, when he said, "I had hard work to get the extra price necessary to make the improved quality, but at last my efforts were appreciated, and never since that time have I made a single case that will not assay full what it is stamped." It is this spirit that has given American manufacture the fair name it has wherever American watches, clocks, cutlery and silverware are sold.

HOW MANUFACTURES BUILD UP A COUNTRY.

One of the greatest opportunities a manufacturer has to do good is in building up industries in new places. If you will watch a village in which a new and successful manufactory has been started, you will see new life in that dullest of all places, the country store. New buildings go up on all sides, corner lots are sold as if each one contained a gold mine, and the surrounding country is surveyed for miles into village lots. The very blowing of the whistle at a given hour every day is educational. If the manufacturer is of a benevolent turn of mind, he founds a library, contributes largely to the building of new churches, and is always ready to make up that deficiency which is ever occurring in enterprises and entertainments for the education of the people. He is often censured, even by those for whom he is doing the most good, his workmen. How often the manufacturer is held responsible for the reduction of wages, when he may be paying out to his hands every dollar he is getting for their labor; but I consider it, as your toast says, one of the highest privileges of the manufacturer. He develops the skill of workmen. How many boys and girls go into factories knowing nothing at all; in a few years they are not only proficient workmen but artisans of the highest order. To be sure they have had within themselves a ready intellect and willing hands, but their employers have opened for them opportunities to visit schools of drawing and mechanical handiwork at night; have imported from Europe skilled artists who have become their foremen and teachers, and, more than that, made a market for their skill. The manufacturer must always have before him his responsibility as a brother to those who work for him, for upon him depends the fortunes and happiness of hundreds of his workmen. Even as a question of expediency he cannot disregard his employees or fail to listen to their demands for justice.

THE MANUFACTURER'S POSITION.

Finally, your toast says he does much to improve that which we enjoy and appreciate in life. How true this is you know full well, and that is why "poor years" in business, as they are known are not an unmixed evil, for they incite to greater effort and force men into new lines of thought. How many hours of the night are spent devising schemes to get up wooden nutmegs, alarm clocks to wake you up, light the candle and build the fire, to get up silver watch cases made out of albata. But, gentlemen, I have stepped over the bounds; this is the inventor and not the manufacturer. I will stop here. I would not attempt to describe the recent inventions upon the different kinds of silver watch cases, or I should keep you here until to-morrow morning; but manufacturing is continually improving and cheapening the things we use, until the humblest homes of to-day have more conveniences than the grandest mansions of the time of our grandfathers.

The manufacturer not only sets the fashion, but must also be prepared to supply the demand when it comes. He must feel cunningly and accurately the pulse of the times; he must take the initiative in introducing new things. Because of his

THE
R. F. S. & Co.
ROLLED PLATE CHAINS
—ARE THE—
BEST.

position, he is a man of peculiar power and responsibility. He holds in the United States to-day the balance of power. He owns a large share of the world's wealth, and his influence over his fellow men is incontestably larger than that of any other class of men, unless it be the clergy.

As a class the manufacturers are too busy to legislate for their country, but their influence sends many a man to legislative halls, who represents them in all he does. Wherever we look over our country, from the Lakes to the Gulf, from Plymouth Rock to the Golden Gate, we see the smoke of thousands of chimneys ascending, indicative of the industry within ; but do we stop to consider that all this has been the growth of the present century, for not until the age of steam power was it possible to accomplish these results.

THE FUTURE OF OUR MANUFACTURERS.

The era of large factories began about 1815, and within two generations we saw the investment of $30,000,000,000 in steam power. There is no doubt in my mind, that some time we shall become the manufacturing country of the world. To-day we are an agricultural country, but with the natural aptitude of American minds for mechanics and organization, taken in connection with the rapid development of population, the goal is not so far distant as one would imagine.

Daniel Webster said when we had but 20,000,000 of population, "I do not know whose imagination is fertile enough, I do not know whose conjectures I may almost say are wild enough, to tell what will be the progress of wealth and population in the United States." We can judge of the future growth of our population only by the past. Daniel Webster saw the population of the country grow from 3,000,000 to 25,000,000. Since that time we have seen it double, and it is certain that within the past two hundred years we have doubled it about every thirty years, so if many of us that are here this evening shall live to see the year 1910 (and many of us will not then be old men) we may hope to see a population of 100,000,000 of people. What a grand outlook! What great possibilities! Let us brother manufacturers and merchants lay well the foundation for such a magnificent structure.

WHY MAIN-SPRINGS BREAK.

Many causes have from time to time been assigned by watchmakers for the breaking of main-springs. The following are a few, in the order of their importance :

1. Winding with a bad key, with too much force, or carelessly.
2. Changes of temperature.
3. Projecting of the barrel arbor hook beyond the thickness of the spring. This may be the principal cause, in the watch itself, of main-spring breaking, and more especially where no stopwork or other check is used, as in such a case, the coils press tighter around the barrel arbor, and a projecting hook distorts the steel more. To plainly see the effect caused by such a hook, take a French clock main spring out of the barrel, put the arbor square through the outside hole, and secure the arbor in the vice, between copper clams. Draw the spring away to its full length, and if it has withstood breakage through softness, projections produced by pressure on the hook, will be found along the spring, the highest near the innermost part.
4. Insufficient spring in the barrel ; for if without check, the spring is much more likely to break than otherwise.
5. Bad winding square—too short, or too thin for the power of the spring.
6. Bad ratchet—improperly shaped, or with missing teeth.
7. Bad click or click spring.
8. Bad spring, imperfectly tempered or badly coiled.
9. Barrel arbor body of too small a diameter.
10. Unreliable stopwork, causing indecision and overwinding.
11. Spring becoming rusty through omission of oil, or through the oil being forced from between the coils out to the edges.
12. Bad barrel hook, or barrel arbor hook—causing an unsafe catch of the spring, and a slip.
13. Careless removal of spring from the barrel—letting it fly out suddenly.
14. Barrel comparatively too small in diameter, and too low—necessitating a thick, narrow and cramped-up spring.
15. Removing a spring from the barrel after it has been confined in it a long time.
16. Letting the spring down suddenly with a jerk.
17. Poor sticky oil which hinders the spring in its development.
18. Star-wheel screw end touching coils of springs.
19. Barrel hook projecting too far.
20. Barrel band out of round.
21. Dropping the watch.

There have been other causes given, but thoughtful consideration will not allow that a "hand rubbing the glass" or the "electricity produced by coil friction" is a valid one.—*Jewellers' Weekly.*

A WATCH WITH A HISTORY.

David Minthorne, of Pamelia, N.Y., is the owner of a watch that was made by Thomas Linford, of London, in 1626, and which, according to the records of the Minthorne family, has the following history : It was presented by George III. to Sir William Johnson when he left England to take charge of his majesty's affairs in the colony of New York. Sir William presented it to Joseph Brant, the famous Indian chief, with the remark that it was "surely worth at least forty rebel scalps." When Brant had his headquarters in the Schoharie Valley, the watch was taken from him, with other booty, by Evart Van Epps, of Fultonville, who was paymaster in the Continental army. Van Epps was afterwards taken prisoner by Brant, and the chief recovered the watch. The grandfather of the present owner of the watch became a warm friend of Brant's in Canada after the war, and Brant made him a present of the time piece. It has been in the Minthorne family ever since.

PERILS OF THE WATERBURY WATCH.

Quite a prominent Danbury citizen carried a Waterbury watch, and as he is a little sensitive about the fact we indulge him to the extent of withholding his name. He had heard and also read in the book of instruction that accompanied his watch that he must not, under any circumstances, open the inside of the watch. But it stopped, and he thought he would see if he could discover the matter. He succeeded in opening it, and out sprang—not glided—a main spring, which went for him with all the vengeance of a thing of life, and the end struck him in the eye, and now there is a possibility of his losing it.—*Danbury (Conn.) News.*

T. WHITE & SON,

MANUFACTURING JEWELERS,

LAPIDARIES & DIAMOND SETTERS,

New Styles for Spring Trade, 1886.

The above illustrations are a sample of my New Goods for this Spring's Trade. I am making a large variety of these brooches, and retail dealers throughout Canada will find it greatly to their advantage to send for samples and prices. I make and guarantee all the goods I sell, and you will find my prices lower than any other House in Canada. Call and see me when in the city.

A. M. WELLINGS,

MANUFACTURING JEWELER AND ENGRAVER,

26 ADELAIDE ST. EAST, TORONTO.

FOR SALE.

STOCK, FIXTURES, TOOLS, MATERIALS, SAFE, Etc., of a good paying JEWELRY BUSINESS in one of the finest towns in Ontario. A bargain will be given to a cash purchaser, capital required not to exceed $1,500.

SAFE, fire-proof, Taylors, 4 years old, outside measurement 5½ feet high, 3 feet 2 inches wide, 2 feet 5 inches depth, cost $300. Stock light but staple, no fancy goods. The most complete material stock outside of the large cities. The fixtures, materials and tools will be sold at a great reduction on cost.

The store has a large run of work, good prices, best location in town. Reasons for selling, am in another business that requires all my attention.

Address **J. F. BERINGER, Picton, Ont.**

THAYER & CO.,

3 WELLINGTON ST. EAST, TORONTO,

MANUFACTURERS' AGENTS AND DEALERS IN

Watches, Clocks, Material and Jewelry of all Kinds.

Our house will be found head-quarters for any of the above goods, and we guarantee to meet any honest competition, either in quality or price. We buy cheap for cash, and propose to give our customers the full benefit of our buying. A look through our stock which is entirely new, will convince any jeweler that he can save money by dealing with our House.

In addition to Watches and American Jewelry, we make specialties of the following lines, in all of which our Stock will be found very complete:

WATCH AND CLOCK MATERIALS OF ALL KINDS, WATCH GLASSES AND GENERAL JEWELERS' SUNDRIES.

☞Our **MR THAYER** will call on you during the month, and we trust that you will reserve for him a share of your esteemed orders.

EDITORIAL NOTES.

SPECIAL NOTICE.

Jewelers throughout Canada will oblige the Editor by sending into this office for insertion in these notes any items of news pertaining to the Jewelry business that they think would be of interest to the Trade generally.

J. R. Harper & Co., jewelers, of Montreal, are removing their business from Notre Dame to St. James Street.

MR. M. C. ELLIS, of the firm of P. W. Ellis & Co., has just returned from New York where he has been for the past fortnight on business for his firm.

WE REGRET TO LEARN of the death of John A., only son of Mr. Harry Richardson, jeweler of Ingersoll, and tender to the bereaved parents our sincere sympathy.

REMOVAL.—Thomas Wicks & Son, jewelers, of Cobourg, Ont., are removing to Toronto, where they propose to open upon Yonge St., just north of King Street.

IN THE TOILS.—Nicholas Smith, of Tilbury Centre, Ont., and E. Todd, of Barrie, Ont., both jewelers, have been compelled to make an assignment for the benefit of their creditors.

MR. GEORGE HEPINSTALL, of St. Thomas, brother of "Hepinstall, the Jeweler," gave us a call as he passed through Toronto on his way to Oshawa where he intends to run his uncle's watch repairs.

S. H. HALE, the popular New York general manager of the Waltham Watch Co., and Mr. Duhme, of the Duhme Watch Case Co., of Cincinnati, have been spending a few weeks in the West Indies for their health.

REMOVAL.—Messrs. Crell & Battegay, wholesale jewellers of this city, announce that they are about removing their business to Chicago, Ill., U.S., and that after the 1st April their address will be 205 La Selle St. of that city.

HONORED.—We are pleased to learn that the Commercial Travellers' Association of Canada has elected Mr. W. G. H. Lowe, of the firm of Lowe & Anderson, as one of its three representatives on the board of the Toronto Industrial Exhibition Association.

MR. WILL PARKER, late with Messrs. E. & A. Gunther, has made an engagement with F. Thayer & Co. to represent them on the Eastern road. Mr. Parker is a practical watchmaker and a popular salesman. We wish him success.

MR. FORSINGER, who has been representing the Waltham Watch Co. in Canada during the past six months, has been transferred to their Chicago office. He extends a general invitation to the jewelers of Canada who visit Chicago to call in and help him to tint that village with carmine.

CALLS.—We were honored with a visit from Mr. Leo, of the Montreal Optical Co., last week. Mr. Leo visited Toronto for the purpose of procuring a first-class engine, the Company having decided to use steam extensively for the grinding of lenses and other work connected with the manufacture of spectacles.

DOUBLY PROTECTED.—Lowe & Anderson have the vault which they have heretofore considered burglar proof thoroughly protected by Holmes' Electric Protection, so that it is now absolutely impossible for any burglar to get into it without giving an alarm at the Company's central office. They don't lose any sleep over their vault now.

HOW IT PAYS.—Smuggling is a costly business sometimes. A Kingston merchant lately detected in this mode of free trade has been fined $300, and the goods, valued at $3,000, and horses and sleigh used in conveying them across the river, will be sold by public auction, and still some people fancy it pays them to smuggle.

A. M. GILPIN, jeweler, of Uxbridge, has again been compelled to assign. Two years ago he was entirely cleaned out by burglars and although he got a compromise, has found it up hill work ever since. Mr. Gilpin has always borne a good reputation and we trust he may succeed in getting a satisfactory settlement with his creditors and be able to resume business again.

BACK AT HIS OLD BUSINESS.—Mr. A. H. Welsh, lately of the firm of Welsh & Trowern, has now fairly established himself in his new factory at 31 Adelaide street west. This factory is run by steam power and is one of the most complete in Canada, and we trust that Mr. Welsh, who is one of the pioneer working jewelers of the Canadian trade, will make a big success in his new venture.

INITIAL WATCH CASES.—The new line of gold inlaid initial silver watch cases put upon the market last month by Messrs. Fahys & Co. are very artistic, and being low in price should command a ready sale. Jewelers in want of something new in cases should not pass them over when making up their orders.

A SUPPLY OF SILVER AND COPPER.—The Assistant Receiver-General has received at the Government Savings Bank here a large supply of silver and copper coin with which he is ready to fill orders from the banks. The coin was struck at the Birmingham (England) mint, and bears the date of 1886. The amount of silver is $85,000, made up in $500 bags, and the copper $8,000, put up in $100 boxes.

T. H. FITZSIMONS, jeweler, of St. Catharines, has again been compelled to go into insolvency on account of the depression of trade in that city during the past year. Not being able to say "no" to the genial jewelry drummer, seems to have been one of the causes which led to his embarrassment. It is not always better to have too much credit than none at all.

J. BUNN, JR.—During the past month we received a visit from Mr. J. Bunn, son of the President of the Illinois Watch Co., of Springfield, Ill. Mr. Bunn was visiting Canada on business for his Company and expressed himself much pleased with the prospects for the Illinois Watch in Canada. Their new four size ladies' watch he says is taking splendidly and they have large orders ahead for them.

ENTERPRISE.—We were pleased to receive a call from Mr. M. Cochenthaler, the well known retail jeweler of Montreal, last week. Mr. Cochenthaler has just removed to his new premises on St. James Street, next the St. Lawrence Hall, which he is fitting up in superb style. He visited Toronto for the purpose of buying his show cases and fittings, and left an order for them with Millichamp.

MILITARY FUNERAL.—James Anderson, of the 46th Batt., who was buried at Oshawa last month with military honors, was once a jeweler in that town. Besides being a first class workman he was an excellent rifleman and just previous to his illness had been practicing for a place on the Wimbledon team. He leaves a wife and three children to mourn his early demise.

A DISHONEST EMPLOYEE.—W. Millichamp & Co., the well-known Show Case manufacturers, had an employee named Mortimer Hays arrested for stealing goods from them. When the detectives searched his residence they found material of various kinds such as German silver, scratch brushes, etc., to the value of $200. The Police Magistrate sentenced him to six months in the Central Prison for his dishonesty.

ELGIN WATCHES.—As will be seen by the advertisement in another part of this issue, the Elgin Watch Co. have decided to make a big push in Canada. "Elgin" watches have achieved a world wide reputation and the Company are bound that the high standard they have reached in the past will be even excelled in the future. In their case a strict adherence to quality and sound business principles has brought them well earned success.

HOW ARE YOU, MR. SHERRY?—Mr. Sherry, the genial representative of Mr. Joseph Fahys & Co., called on us during his last visit to Canada, and did us the honor to stretch his legs under our mahogany. The Editor of THE TRADER and most Canadian Jobbers have to acknowledge the many courtesies of Mr. Sherry in New York and he was therefore, only too glad to have an opportunity of reciprocating his kindness in a small way. Come again, Mr. Sherry. Glad to see you.

ROBBERY.—A farmer named Leonard Ash while paying an account to Mr. W. Hopper, jeweler, of Cobourg, took occasion while the proprietor's back was turned to steal a valuable gold watch. Mr. Hopper had him promptly arrested and he has been committed by the magistrate to stand his trial for the crime at the spring assizes, being allowed out, however, on $1,000 bail. The probabilities are that this will be the most expensive watch Mr. Ash ever handled before he gets through with it. Truly honesty is the best policeman!

THE failure of C. Moodie, jeweler, of Hamilton, has given rise to a considerable amount of unfavorable comment amongst the jobbing trade

- CLOCKS -

MARCH 1st, 1886.

We desire to notify the TRADE that we have completed arrangements with the

"TERRY CLOCK CO."

to carry a full range of their goods, comprising Walnut, Nickel and imitation Marble Clocks.

The Terry Clocks need no commendation from us. Their METEOR Luminous and other grades have a deservedly high reputation in the States and Canada.

It shall be our aim always to keep a complete stock on hand and thus be able to fill orders promptly.

We will mail, in the course of a few days to the *Legitimate Trade* an *Illustrated Catalogue* which will embrace some new patterns of exceptionable value.

Our business is exclusively with the Watchmaker and Jeweler who will find it to their advantage to buy the Terry Clocks and not be compelled to submit to unfair competition, as experienced from the outside Trade buying from Fancy Goods Houses who sell indiscriminately.

LOWE & ANDERSON,

16 WELLINGTON STREET,

TORONTO.

He shows assets $3,800, and liabilities of $5,800, the principal part of which appears to belong to his wife, who was in the jewelry business on her own account before he married her. The creditors think that her claim is almost double what it should be, and as the transaction has rather a fishy look they propose to get at the bottom of it before they give him a settlement.

MR. THORPE'S CHICAGO SPEECH.—Elsewhere in this issue we reprint from the *Jewelers' Journal* a verbatim report of Mr. C. N. Thorpe's speech at the Chicago Jewelers' banquet. This speech possesses much merit and fairly bristles with facts, and we are sure it will pay every jeweler in Canada to read it carefully. Mr. Thorpe, as one of the leading manufacturers in the United States speaks *ex-cathedra*, and his words will no doubt carry with them the importance to which all his utterances are entitled.

"TORONTO VS. WINNIPEG.—W. F. Doll, importer and wholesale Jeweler, late 55 and 57 Yonge Street, Toronto now in commodious quarters on first floor of Clements' Block, 525 Main Street, has for the last fifteen days been unpacking, opening up and generally getting into shape the largest and most varied stock of watches, diamonds, jewelry, clocks, silver and electro plated ware, optical goods, novelties, etc., yet shown in the North-West. Mr. Doll has had a very wide and successful experience in his line of business and we bespeak for him a large and ever increasing trade."—*Winnipeg Free Press* (advt).

HIGHLY COMPLIMENTARY.—We were shown two letters the other day by the manager of the American Watch Case Co., of Toronto, one from what is probably the largest jobbing house, and the other from one of the largest retail houses in Canada, both of which agreed in stating that the new gold cases made by the Company were perfect specimens of workmanship and better than any goods of the kind they had ever had before. As may be imagined this unsolicited testimony was exceedingly gratifying to the Company, and proves that a faithful adherence to principle is bound to be appreciated.

A SAFE EXHIBIT.—One of the principal exhibits at the Colonial Exhibition, at London, England, this year, will be that of Messrs. J. & J. Taylor, the well-known safe makers. This firm has sent some forty of their safes over, and we are satisfied that when the British public see them they will come to the conclusion that they never knew what a good safe was before. Canadian made safes are ahead of those of any other country in the world, and we think that the Messrs. Taylor will be able to open up a large export trade to Europe in their goods. These safes will paralyze the genial British burglar sure.

NEW WATCH PRICE LIST.—The committee appointed by the Canadian Jobbers' Association are hard at work on the new watch movement and case list about to be issued by that body. This price list promises to be the most complete thing of the kind ever published in Canada, and will have this advantage over all ordinary lists issued by private firms, in that it will be official. As each retailer will get only one copy it will be well for them to look carefully after it. As this is a long step in the direction of prohibiting the indiscriminate issue of watch price lists it has our heartiest approval.

W. F. CARRIER & Co., wholesale jewelers of this city, made an assignment to the Sheriff last month. The reason given for this step is said to be some heavy losses on account of land speculations. We understand that their liabilities are in the neighborhood of $30,000, the principal creditor being Mrs. Carrier. In 1879 the firm of which Mr. Carrier was senior partner failed, owing about $35,000, and settled with their creditors at 35 cents on the dollar. Since then it has been generally thought that the firm were making money rapidly, hence the surprise that this assignment has created in jewelry circles.

HONOR TO A CANADIAN.—We learn from an Australian exchange that Mr. Donald Manson was the recipient of a complementary banquet on the eve of his departure from that country to America. Mr. Manson has for the past seven years held the important position in Australia of General Agent for the American Waltham Watch Co., and has succeeded in building up a splendid business for his employers. It is very gratifying to be able to chronicle the success of a fellow-countryman in a far off land, and we trust that he may long live to enjoy the reward that his indefatigable efforts should bring to himself as well as the Company he represents.

THE ACME SILVER CO'S EXHIBIT for the Colonial Exhibition was on view at their show rooms for a few days just previous to its being sent away and attracted a large number of visitors who were highly pleased with its variety and beauty. The goods were all manufactured on the premises and are a credit to any country, and it seems to us to be only a question of time when Canada will not only not import any outside goods of this kind, but will compete with foreign countries for a share of their export trade. We understand that their manager, Mr. J. Blackburn, will attend the exhibition and carry the war into England by trying to open up a trade in that country. Such enterprise deserves success.

WILL HE TAKE IT?—Mr. C. O. Perrault, of Montreal, having resigned the Vice-Consulship of France, we understand that strong efforts are being made by his friends to get Mr. Maurice Schwob to accept the position. Mr. Schwob is a native of Alcase, France, and besides being one of the leading wholesale jewelers in Montreal, is also president of the St. Jean Baptiste or French National Society. He would make a first-class vice-consul, and we trust he may see his way clear to accept the position. In our opinion he will honor it as much as it will honor him.

THE GOOD SHEPPARD is once more to the front. This time we fancy the presence of Mr. John Sheppard, of the Keystone Watch Case Co., who was on board of the C.P.R. train that went over an embankment between Montreal and Toronto, saved the lives of the passengers. John says they got a pretty good scare but not very much material damage. When he found, however, that his "Boss" case had improved by the tumbling it had received, he concluded that it was a special dispensation of Providence for the advancement of the Company's interest. The improved railroad disaster proof watch case can now be seen at the Company's office, 22 John St., New York.

A SPLENDID PRODUCTION.—We think that every jeweler in Canada will agree with us in saying that the Watch Material Catalogue lately issued by the Waltham Company is the best, handsomest and most complete thing of the kind ever published by any firm in the world. Every piece of material of every series of watches that the company has ever turned out is illustrated by a wood cut of the exact size, and so well executed as to be recognizable at a glance. As every piece of material is numbered consecutively the trade can have no difficulty in ordering the exact thing they require for repairs without the trouble of sending the broken piece. The increased facilities for repairs which this gives the Waltham watch should make it more popular than ever.

IMPORTANT CUSTOMS SEIZURE OF JEWELRY.—An important Customs seizure was made at Brampton, Ont., by Chief Constable John Hurst and R. P. Campbell, collector of that port. It appears that a school teacher, of Churchville, named A. McPhail, has for a number of years been selling jewelry among his country friends after school hours, and during the holidays, and it is said his sales have been exceptionally large. Chief Hurst, a few weeks ago, heard that McPhail was making frequent trips to Buffalo, and conceived the idea that he might be smuggling. McPhail was arrested and brought before the Customs authorities in Toronto, and goods amounting to nearly $1,000 confiscated. Comment is unnecessary.

ANOTHER OF THE SAME KIND.—Says a London, Ont., exchange: "A Richmond street jeweler got caught with a parcel of watch movements, chains and cases amounting to about $500, a few weeks ago. The goods were purchased in the U. S., shipped to Detroit, and brought across the river *sub rosa*. A parcel was put in the Windsor Express Office addressed to a music dealer of this city, and the Customs detective examined and seized it. The music dealer knew nothing of the contents of the parcel when interrogated by a Government agent, but the name of the *bona fide* consignee being stamped on the plates made the mystery a very transparent one. The chains were stamped "W. A.Y.," but it is thought all the contents of the parcel were for one man. The case has been reported to the Government, and as yet no decision has been given. It is probable that the goods will be confiscated without any further fine being imposed." Since the above was in print it transpires that the owner of the goods above mentioned was Mr. A. Morphy, jeweler of that city. The Customs department have confiscated the goods seized and fined him in addition. It is to be regretted that an old house with an untarnished reputation should be found engaging in such a disreputable business. As we pointed out some months ago it is only a question of time when such transactions are bound to come to light and then the financial loss and business disgrace make it appear a very poor speculation.

SIMPSON, HALL, MILLER & CO.,

WALLINGFORD, CONN.

—MANUFACTURERS OF—

Artistic and Useful Hollow Ware,

No connection with any concern in Waterbury, Meriden, or Hartford using name of Rogers in any form.

FACTORIES: WALLINGFORD, CONN., U.S., AND MONTREAL, CANADA.

TECUMSEH, the new poem by Charles Mair, of Toronto, has taken this country by storm, and in our opinion will rank as the best thing of the kind ever produced by any Canadian author. It treats in heroic verse of that stirring time in Canadian history when England and the United States were at war (1812) and Brock and Tecumseh were the leaders of the Canadian forces. Did space permit we would be glad to give some of the gems from this admirable work, but as we are short of space we simply say to every one of our readers, buy the book and if you don't think when you have read it carefully through that it is well worth the money to know that Canada has amongst her sons those capable of producing such a meritorious work then write us down for anything you please.

JEWELER, STRATHROY.—In answer to your letter regarding the cutting of prices by large retail houses we cannot see very well how such a thing can be stopped. It is not always the large retailers who are the worst sinners, for we could point you to half a dozen towns and villages not a thousand miles from Strathroy, where watches have been advertised and sold at their actual wholesale cost price. We think you are in error in saying that these goods you refer to cannot be bought in the United States at the advertised prices; most of them can be bought from Canadian Jobbers at regular prices and sold as advertised and give a fair return to the retailer. As regards the circulation of THE TRADER, we send it at present as we have always done, to jewelers and those in kindred trades, but we propose very shortly to revise our list and confine it exclusively to the jewelry trade. We trust this will be satisfactory.

THE REASON WHY Mr. G. H. Levetus, of the Montreal Optical Company, was not killed in the accident on the Grand Trunk Railway last month at Hastings, was not because he was not there, but because—well, we don't know why, as he was in the car that jumped the embankment and rolled over half a dozen times before it stopped. All that he knows is that he felt himself and his gripsack mixed up and rolled over something less than a thousand times and when he became conscious he was still alive and has remained so ever since. The last time we saw him he was as lively as a cricket and as ready to take an order for spectacles as ever. He has changed his quarters from Montreal to Toronto and opened an office for the company on Front Street.

A HANDY NOVELTY.—The Goldsmiths' Company have just sent out to their customers a very useful novelty in the shape of a book called "The Jewelers' Record of Work and Repairs." This little work is neatly bound in a cloth, gold-lettered cover and contains sixty-four pages, each of which is perforated so as to tear out and leave a printed stub with particulars of repairs, similar to the ordinary bank check book. By this system the jeweler has a first-class record of his repair work and can at any time find out all the particulars regarding it. We fancy that this novelty will be much appreciated by the trade who in many cases find it difficult to keep track of the many jobs that are constantly passing through their hands. If you have not received a copy by mail write and get one.

ENTERPRISE.—Speaking of the exhibits for the Colonial Exhibition the Toronto *World* says: "Among the many exhibits Toronto is sending to England the display of the Toronto Silver Plate Company must take a foremost place. The firm is sending $3500 worth of silver plated ware, which we are safe in saying will be an ornament to the exhibition. The collection consists of epergnes, orange and nut bowls, a rifle cup, curling cup, fireman's trumpet, cruet stands, tea setts, and numerous articles suitable for presentation by societies and other bodies. The beauty and gracefulness of the different designs were refreshing to look upon. The Toronto Silver Plate Company has made great progress during the four years since its establishment. They now employ a staff of eighty-five men."

A LEVEL HEADED JEWELER.—Mr. R. J. E. Scott, the enterprising jeweler of Carleton Place, has just purchased a safe from Messrs. J. & J. Taylor of this city. Our Carleton Place contemporary says of it: "The safe stands 5 feet high, is 3 ft. 3 in. broad and 3 feet deep, and weighs 3 tons. It is both fire and burglar proof. The outside door is fastened by the ordinary combination lock with three bolts, and inside of this is a steel door 1½ in. thick, with a four wheel combination lock and bolted from every side. The inside of this vault has been very nicely arranged for Mr. Scott's use. The wooden door is made to lift out, and the back of it is dressed with velvet, containing hooks for hanging watches on. The centre is fitted up with draw shelves at proper distances, for the purpose of holding plate and jewelry, in addition to which there are large drawers for various articles, besides pigeon holes for books and papers. Both doors are beautifully and artistically painted, the scenes and the lettering on each being executed in the best possible manner. R. J. E. is very proud of his handsome piece of furniture, and well he might be. It reflects much credit, not only on the genial agent of the Bell Telephone Co., but also on the firm who manufactured so handsome an article."

HE IS OF AGE.—In the case of Ellis *v.* Sapery, tried at the last County Court, in which Messrs. P. W. Ellis & Co. sued Louis Sapery for payment of notes overdue amounting to about $1,300, a verdict was given for the plaintiffs. The whole case hinged on the question of whether Sapery was of age when these promissory notes were given by him. There was no evidence offered by the Messrs. Ellis, and the defendants had that part of the case all their own way, but the opinion of both judge and jury was that they not only failed to prove he was under age when he made the notes, but that they actually proved beyond a peradventure that the defendant was of age at least a couple of years before that time. A good deal of interest has centered around this case in jewelry circles, and the plaintiffs are to be congratulated on the plucky and determined way in which they have fought the thing through. The plaintiffs boldly claimed in court that the whole thing was a premeditated swindle and that they proposed to keep at him until they got their lawful dues. Young Sapery has been in jail now for over three months and it looks as though he will stay there for some months longer unless he is willing to do the square thing with his creditors.

EXCELSIOR'S ARTICLES.

In regard to "Excelsior's" articles on Watchmaking we had hoped to be in a position to announce definitely to the trade in this number our intention to commence their publication at a very early date. Not wishing to do anything that would appear arbitrary or ungenerous to the author, we wrote to the former publishers, asking their permission to re-print these articles in THE TRADER, and are now awaiting their final reply. We hope to have this matter definitely settled one way or the other in a few days, and trust that in the meantime our readers will bear with the delay.

WORKSHOP NOTES.

BUTTING.—The tendency of pinion leaves to butt the wheel teeth when coming into contact is caused either by the bad shape of the teeth or the leaves, or by using a pinion of an improper size, or by the wheel and pinion being placed at an incorrect distance from each other.

CLEANING SOAP FOR METALS.—A German technical paper publishes the following recipe for the preparation of a cleaning soap for bronze, brass and silverware: 50 grams finely cut cocoa soap is by heating mixed with a sufficient quantity of water that it will form a thick paste; again, 5 grams crocus are stirred up with a little water, and 1½ grams carbonate of ammonium are mixed with it, and then stirred into a soap paste, after cooling. The obtained paste is preserved in stone jars, well tied up with bladder or parchment paper.

BLUEING SPRINGS.—There is no advantage, says Mr. Glascow, gained by blueing a spring; it is not thereby kept free from rust. Indeed it is said that steel, when blued, is in a state of incipient oxidation, and it is known that the blue spring is more frequently found rusted in ship's chronometers than the bright portions of the escapement; but as it is customary to blue springs, I will explain how it is done. The best way to blue a cylindrical spring is upon a block kept for the purpose, and not used for hardening. The block should be solid, so as to heat slowly, and the grooves be cut very shallow, and not fitting the spring too closely, in order that the air may have access to all parts of it. The spring should be fixed with screws, as if for hardening, and

GUARANTEE NOTICE.

All Spoons and Forks bearing the stamp

G. RODGERS, A 1

are made of the finest nickel silver and are plated and hand-burnished under my personal supervision, and standard of quality—each article is guaranteed perfect in finish and durability.

All Knives bearing the stamp

G. RODGERS

12 DWT.

are plated on the best English cast steel with pure silver, and are hand-burnished and warranted to give perfect satisfaction. The well known reputation that the name RODGERS has attained all over the world have induced other makers to adopt a similar name, calcuiated to mislead the public. See that the trade mark reads and is spelled G. RODGERS, A1, on Spoons and Forks, or G. RODGERS, 12 Dwt., on Knives.

SOLD ONLY BY

THE ACME SILVER COMPANY,

to whom all orders should be addressed. Send for quotations.

G. RODGERS,

Known to the trade in Sheffield, England, and on this continent since 1846.

the block be placed on end upon a blueing pan over a spirit lamp. If the parts of the spring nearest the pan are coloring more than the upper part, the block must be turned upon the opposite end. Every part of the appartus must be dry and hot before commencing to blue, and above all things it must be clean, for the least particle of oil or dust will prevent the spring from blueing evenly. Covering the block with a short length of glass tube will prevent external air currents from affecting the spring, and will keep the temperature uniform within the tube. When the spring is the required color, set the block down to cool, and if the spring has been well polished, it should be a very bright blue.

CONCERNING THE RATE OF A WATCH.—To the question: "Where can I discover the disturbance in a watch which has been wound up but goes lame and finally stops?" in the *Schweizer Uhrm. Ztg.*, a correspondent replies: When the watch is wound up, and has a lame motion and at last comes to a stop, either the male stop has wedged itself under the female stop in the last winding, or, if it should be a little smaller, then the former applied to a shoulder of the latter, or, the spring is too broad by one number, and, when the barrel cover is pressed in a little, a friction will occur, or, finally, the hole is not located in the centre of the spring. The first coil of the spring in this case comes to a stand above the spring core, in consequence of which the inner end of the spring rubs on the cover or bottom of the barrel, whereby the spring is pinched in, and thus contrasts its elasticity, which has happened to me several times. I took out the spring, filed the two inner sides of the spring a little smaller, rounded their edges with the graver, and with a round file filed the hole in the centre. It also happens sometimes that the spring hook is not located exactly in the centre of the spring core; there are also springs of an inferior quality, that lose their elasticity after several weeks or months, whereby the watch makes a lame motion, and stops after from 10 to 12 hours. It may also occur that the balance spring works lose, which defect also produces a slow motion and finally stoppage; this will occur only, however, when the watch has been wound too quickly, whereby the balance is transported into unduly large vibrations.

OTHER NOTES.

AN Italian invention is a compass, in which the needle floats upon a pool of water tinctured with spirits of wine to prevent freezing. The whole is enclosed in a sealed case. The advantage claimed for the compass is that, while ordinary movements of the needle are free enough, those occasioned by sudden shocks are modified and softened. The effects of the pitching of the vessel are thus guarded against.

AT a happy spot where a number of darkies reside, an old negro was heard calling to his wife, "Manda, is you got dem chickens shut up in de smoke-house, like I tole yer?" "No; an' I'd like to know what's de matter with you, dat you're so tickler 'bout dem chickens all at once," she replied. "Nebber you mind; I know what's de matter, an dat's nuff till dem chickens is housed. When I hear dat dem niggers ober dar in de next yard is gwine to hab a party to-morrow night, I wants to be sure my chickens doesn't tend to it."

AN open-faced gold watch, with the inscription, "John Andre, 1774," engraved on the inner case, was sold at auction the other day in New York. The watch is a curious piece of workmanship. After Major Andre's execution it was sold for the benefit of his captors, Paulding, Van Wart and Williams. It was purchased by Col. William S. Smith, of the Continental Army, for thirty guineas, and by him was committed to General Robertson, of the British Army, to be sent to Andre's family in England. For some reason it never left the United States, but found its way into a pawnshop.

MOST people will be surprised to learn that there has ever been any mystery as to the origin of penny postage and the adhesive postage stamp. Sir Rowland Hill, who put the principle of cheap postage into practical working shape, is said to have claimed, and he certainly has received the popular credit for the origination of both. As a matter of fact, however he was the originator of neither. Careful investigation shows that Rev. Samuel Roberts, of Conway, proposed and petitioned for penny postage ten years before Sir Howland came to the assistance of the Post-office Department, and James Chalmers, bookseller, of Dundee, invented the adhesive postage stamp.

WISE AND OTHERWISE.

WHEN is a young lady "very like a whale?" When she's pouting.

TIME is money: of course it is, or how could you "spend an evening?"

Two twin brothers are said to be so much alike that they frequently borrow money of each other without knowing it.

AN old Grecian philosopher advises all men to know themselves. That's suggesting to a good many to form disreputable acquaintances.

"DURING his ministry he made six hundred hearts beat as three hundred," is the way a Maine paper neatly puts it concerning a local pastor.

WHY have the funny men of America been so dull this winter? Answer First—They haven't! Answer Second—Because it's been such an no-pun Winter.

A GENTLEMAN just returned to this country from a tour in Europe was asked how he liked the ruins of Pompeii. "Not very well," he replied; "they were in such shocking bad repair."

OUR boy says:

Those melancholy days have come,
The saddest of the year,
When the good house-wife, mop in hand,
Gets up upon her ear.

HE appeared to be almost gone. Rolling his eyes toward the partner of his bosom, he gasped: "Bury me 'neath the weeping-willow, and plant a single white rose above my head." "O, it's no use!" she snapped out. "Your nose would scorch the roots." He got well.

OUR HELP COLUMN.

THE TRADER aims to be of practical value to the Retail Jewelry Trade.

NO CHARGE is therefore made for advertising in this column, but the subject-matter should not exceed five type lines, or about 60 words.

When requested, these advertisements will be published in successive numbers of the paper.

If you have a Store, Stock, or any Special Article to sell; if you wish to buy an Established Business, or enter into Partnership; if you want a Journeyman, Clerk, Salesman, or Foreman; if you want a situation yourself—communicate the fact to THE TRADER PUBLISHING CO., 57 ADELAIDE ST. WEST, TORONTO, and it will be inserted in this column free of charge. This is the only way by which you can reach the entire Trade, and we shall be glad to help you.

WATCHMAKER in need of situation. Best of references. WM. SCOTT, care of A. Attwood & Son, Hamilton, Ont.

WANTED.—A SITUATION AS A WATCHMAKER.—By a young man about three months through his apprenticeship. Address, S. MATHERS, care of W. Watson, Jeweler, STAYNER, ONT.

SITUATION WANTED.—AS WATCHMAKER. Five years' experience. Can give best of references. Address, O. R. SUMNER, Oakville.

WANTED.—A SITUATION AS IMPROVER IN WATCH-making. Two years' experience. Address, Box 277, Barrie, Simcoe Co.

WANTED A SITUATION to learn the watchmaking and jewelry business, by a careful and steady young man. Apply to FRANK PURVIS, Lyn, (Leeds Co) Ont.

SITUATION WANTED by a first-class practical watch maker, fourteen years' experience, best of references furnished. Address stating salary. P. O. Box 174, Simcoe, Ont.

WANTED.—A FIRST-CLASS WORKING JEWELER for a pushing eastern town. Plenty work. Apply to THAYER & Co., 3 Wellington east, Toronto.

ATTENTION WATCHMAKERS and jewellers; an old and well-established business for sale in one of Ontario's flourishing towns on the G. T. R.; about 40 miles from Buffalo; 2,000, population; house and stock connected and centrally located; has been a watch and jewelry store for 28 years; will sell house and lot, with stock and fixtures complete, at a bargain; reason for selling, eyesight failing. For further particulars address E. J. LASALLE, Lock Box 11, Dunnville, Ont.

THE TRADER is printed by R. G. McLEAN, 13 Adelaide St. E. Toronto, who makes a specialty of Jewelers' Work. Samples and estimates on application.

The Only Absolute Guarantee of Quality

IS THE INTEGRITY OF THE MANUFACTURER.

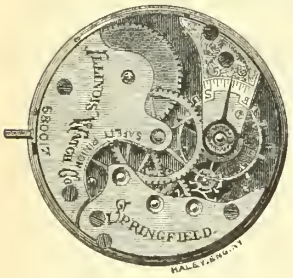
The AMERICAN WATCH CASE COMPANY, of Toronto, guarantee every case bearing their trade mark, no matter by whom sold.

CANADIAN PATENT

JANUARY 15TH, 1886.

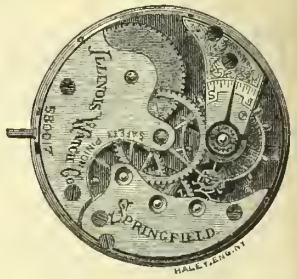
THE PERFECTION

Dust Proof Watch Case, although placed by the American Watch Case Co., of Toronto, upon the Market two months ago, has already been pronounced by expert Watch Dealers to be



THE BEST AND CHEAPEST WATCH CASE EVER MADE.

The Perfection has been specially designed with a view to make a Watch Case which would at once be cheap in price, and at the same time afford sufficient protection to the movement. This idea has been admirably carried out by taking the excess of Silver from the centre and placing it in the backs, which will be found extra firm and heavy. Although the cheapest Watch Case ever made, it is warranted to give satisfactory wear. Ask your Jobber to show them to you; it is money in your pocket to handle them, therefore take no others instead. Every "Perfection" Case we manufacture bears our stamp and registered Trade Mark as above, and is fully guaranteed as to quality, no matter by whom sold.



OUR NEW PATENT UNBREAKABLE PENDANT SET.

☞ Dealers will please notice that we are now fitting all of our *regular* Open-Face Stem-Wind Cases with our new Patent Unbreakable Pendant Set, the simplest, strongest and best device for the purpose ever invented. They are made so as to take any regular American Full-Plate Movement with Female Winding Pinion.

HELLO! HELLO! HELLO!

WELL, WHAT IS IT?

Why, we want to place our order for some of the new and popular

FOUR SIZE MOVEMENTS

MADE BY THE

ILLINOIS WATCH COMPANY.

They are the SMALLEST watch made by any Company engaged in the manufacture of watch movements in America. The

FOUR SIZE MOVEMENTS

are constructed upon a new and distinct model having no resemblance to the Celebrated Eight Size Movements manufactured by the ILLINOIS WATCH COMPANY. The Top Plate is composed of two pieces only, hence THE BARREL CAN BE REMOVED WITHOUT DISTURBING THE TRAIN. They are provided with Safety Pinions, thus securing a protection to the Train in case of the breakage of the Main Spring. They also have CONVENIENT LET DOWNS, and all the steel work is finely finished with especial care.

There is NO LADIES' WATCH TO COMPARE with them in size, style, beauty, durability and price, and we want to place our order early, for the ILLINOIS WATCH COMPANY has already sold its entire production of FOUR SIZE MOVEMENTS, months ahead, and is daily receiving large and numerous orders for the various grades of Four Size Watches. The

ILLINOIS WATCH COMPANY

WARRANTS EVERY MOVEMENT OF EVERY SIZE MANUFACTURED BY IT.

DON'T SKIP THIS PAGE IN MAY, FOR IT WILL PROFIT YOU TO READ WHAT WE SHALL SAY THEN.

EDITORIAL.

EXCELSIOR'S ARTICLES.

We had no idea when we made the offer to the readers of THE TRADER in our March issue, to publish "Excelsior's" articles on Watchmaking, that the response would be so quickly and so unanimously made. From every part of Canada—from Halifax to Vancouver, we have received replies to our offer, and in every instance the pith of the letter has been "publish them by all means." Now that the trade have expressed an almost unanimous wish that we should republish these articles, we have decided to carry out our proposition, and commence their publication in next month's issue. We understand that "Excelsior" intends at some future time to complete the series of articles on this subject and publish them in book form, and while we shall advise every Canadian jeweler to purchase one of these books when they come out, we shall advise them at present to preserve very carefully every number of THE TRADER containing them, and have them bound up for future use and reference. If our space would allow us we would like to print in this issue the opinions of some of our leading Canadian watchmakers, who have read these articles carefully and preserved the numbers of the *Jewelers' Circular* in which they originally appeared. They are all unanimous in the opinion that they constitute the best work on practical watchmaking ever published, and that unless they were sure of being able to get another copy, they would not part with them for their weight in gold. This being the case, we trust that every jeweler who has not read them will do so carefully, and if they do, and try to attain to the standard of workmanship which "Excelsior" sets before them, we feel confident that they will be of lasting benefit to the trade in general. We cannot close without expressing our sincere thanks to our many friends throughout Canada for the very kind and flattering things they have said about us in the letters we have above referred to. We have been toiling and plodding along for the past seven years, scarcely knowing whether our work was being appreciated or not, and sometimes feeling as if we didn't care. The kind words contained in these letters have convinced us of the fact that THE TRADER is appreciated, and that it has got a very much stronger hold upon its readers than we had ever imagined it possessed. We don't care for taffy, but a few words of appreciation once in a while does us good, and if we know ourselves we shall work all the better for them in the future.

Our thanks are also due to Mr. M. C. Ellis, of the firm of P. W. Ellis & Co., the well-known wholesale jewelers of this city, through whose kindness we are enabled to secure the complete set of "Excelsior's" articles, from which to republish them as promised.

SHORTER PARLIAMENTARY SPEECHES.

We imagine the great mass of thinking electors in this country will agree with the principle laid down by Mr. Charlton in his bill for the curtailment of parliamentary speeches. While it may be a very nice thing for members to read these long orations in the *Hansard*, they must remember that as a rule, speeches are read by the public in proportion to their length. It may be safely asserted that where one person reads a newspaper report of a speech six columns long, a thousand will read one which is only half a column long. For the present state of affairs, we think the publication of the *Hansard* is in a great measure responsible, because it has a tendency to keep members with the gift of the gab on their legs long after they are through with anything new or original, bearing upon the subject under discussion.

This thing has got to be a public nuisance, and the M. P. who fails to grasp the situation, is certainly a poor discerner of the signs of the times. No man, no matter who he is, can speak six hours on any subject that can possibly come before our Canadian Parliament, and talk facts and common sense bearing on the subject in hand. Such speeches remind us a good deal of picnic lemonade, a single lemon to a barrel of water. If these wordy gentlemen would just take half the trouble to boil their speeches down instead of diluting them all that they can, they would carry a great deal more weight in Parliament, and be a great deal better received by the country at large.

Artemus Ward referring to this subject once said, that, "if a preacher can't strike ile in half an hour, he is either boring in the wrong spot or he's got a bad gimlet." There is more truth than poetry in this saying of Ward's, and what is true of pulpit preaching is equally true of parliamentary speaking.

These interminable speeches of three, four, five and even six hours, are not only insipid in themselves, distasteful to the listeners and laughed at by the general public, but they are a source of expense to the people that should not be tolerated. It costs about one hundred dollars an hour to run the Dominion Parliament, so that the country has to pay for the simple delivery of these pedantic orations from three to six hundred dollars each. In one case in a hundred the country may get value for the money spent, in the other ninety-and-nine the money is worse than wasted.

The remedy lies with the people and they should either make a law prohibiting speeches of more than one hour duration on any subject, or do away entirely with the sessional indemnity now paid to members of Parliament. Either remedy would have the effect of cutting off a great deal of windy and irrelevant verbiage which at the present time makes our sessions of Parliament both ridiculous and costly.

THE EIGHT-HOUR MOVEMENT.

The recent conflicts that have occurred between Capital and Labor, in the United States and Canada, have suddenly awakened the public that the great army of mechanics is fast and deservedly becoming a power in the land. Taught by the experience of former years, that labor had no earthly chance of success when pitted against capital under ordinary conditions, the leaders of the working men have with considerable difficulty and commendable foresight organized them into one solid compact body, commonly known as the Knights of Labor. The master workman or head centre of this organization, Mr. T. V. Powderley, appears to be a level-headed gentleman, admirably fitted for the position. He fully recognizes the fact that Capital and Labor should never be antagonized, but that their proper sphere is to walk hand in hand, each being absolutely necessary for the other's welfare. If the organization over which he presides, will listen to Mr. Powderley's advice, we think that they may effect much in the way of improving the condition of many of the worst paid and most precarious trades. Appearances at present seem to indicate, however, that the local organizations of the Knights of Labor are inclined to take the bit in their teeth and act on their own responsibility. In order to check this feeling, Mr. Powderley has recently issued a manifesto, pointing out the danger and folly of strikes, and asking the members to refrain from striking in all cases except as a last resort. He also points out that the proposed eight hour movement is premature and likely to be productive of more harm than good to the working classes. With both of these contentions we thoroughly agree, and trust that he may be able to impress them upon his followers so thoroughly that they may act as he requests.

The eight-hour a day platform in the eyes of a great many working men seems to have a charm which makes it appear more practical than it really is. Of course if the hours of labor were reduced to eight, instead of ten as they are at present, it would no doubt give employment to more men than are now employed. This would however of necessity be at the expense of those at present having steady employment, a thing which we hardly think the workmen of our acquaintance are quixotic enough to accede to. While it might benefit the workman who is disposed to utilize the time thus gained for the improvement of his mind or the benefit of his health, there is a large number to whom shorter hours of labor would simply mean more hours for loafing and spending money in idle amusement, and who would be damaged instead of being improved thereby.

A workman's labor, like the capitalist's money or the merchant's goods, is his capital, and every unbiased person must admit that he is fairly entitled to get the highest price for it that he possibly can, provided that he does so lawfully. If workmen are scarce and work plentiful its value is enhanced ; if on the contrary work is scarce and workmen plentiful its value is depreciated. The inevitable law of supply and demand governs the price of labor exactly the same as it does the price of groceries, wearing apparel or any of the thousand and one articles of daily consumption.

Subordinate to the law of supply and demand, the true test of the value of any workman is the amount of work he can turn out in a given time. If all kinds of manufacturing could be conducted on the piece-work system, it would be very much to the advantage of the manufacturer and the skilled workman. A man would thus get paid exactly what he earned, and the harder he worked the more he would have to show for it. By the day or week system where trades unions force employers to pay the same rate of wages to all, an injustice is often perpetrated upon the honest and capable mechanic, who receives no more pay than the man next him who perhaps does twenty five per cent. less work. If the piece-work system were generally employed the pay rolls would very quickly show the relative value of the different workmen.

If it be admitted that the true way to pay any mechanic is to do so in proportion to the work he accomplishes, then he can easily see that if the hours of daily labor are shortened from ten to eight hours, that their wages will show a similar shrinkage. If as they propose, they shorten the day's work two hours or one-fifth, then one-fifth of their pay must be deducted to correspond. If the total amount of their wages were not reduced but continued on at the old figure, it would practically mean that they were receiving twenty per cent. advance on old prices, a thing that they would hardly venture to propose in these times of keen competition.

The leaders of the Knights of Labor are wide enough awake to see that such a proposition is absurd when applied to day and week workmen, and they therefore argue, "of course if the day's work was shortened two hours we would expect and be willing to take less pay for awhile, but would trust by agitation and strike eventually to get it up to the former ten hours a day rate." At the first blush from the workman's standpoint there seems to be some reason in this argument, but a little thought will reveal the fact that it is the veriest nonsense. If the eight-hour system were to prevail amongst all branches of manufactures and if they even succeeded in getting the wages back to ten hour a day rates, the effect would simply be to raise the value of all kinds of manufactured goods twenty per cent. on former prices. The workingmen would then find that although they were getting the old rate of wages, the purchasing power of their wages had declined exactly in proportion to the rise, and that they were no better off than before they made the change. In other words they would be simply taking two hours play every day and paying for it themselves out of their own pockets.

There are natural and commercial laws which may be said to be immutable, and either workingmen or capitalists might as well expect the sun to stand still at their bidding, as to be able to overthrow them by any effort of their own however well directed. Thus by applying the law of supply and demand and the principle of piece-work prices to labor, any person can quickly see that the result of such efforts as discussed above must be very disappointing. We think that the correct solution of the labor question is, where practicable to do everything by piece-work and let a man work just as fast or as slow, or as many or as few hours a day as he pleases and pay him in proportion to what he does. Every man would then be practically his own master and could suit himself as to how many hours a day he was willing to work. If this system were to come in vogue we think we would hear little or nothing about ten hours' pay for eight hours' work, which is the true way the principle of the eight-hour labor movement ought to be stated.

EVEN the clocks must have their little joke. On April Fool's Day the old reliable clock in the spire of Trinity Church, New York, stopped suddenly at half-past six in the morning, and later in the day many unwary passers-by who forgot the occasion really congratulated themselves at reaching business at an hour so unusually early.—*Jewelers' Weekly.*

WRITTEN SPECIALLY FOR THE TRADER.

PAPER NO. IV.—CONCLUSION.

Long Sight. The healthy eye can distinguish near and distant objects with equal facility. By this we mean any object not nearer to the eye than eight inches; but at a certain period of life long sightedness occurs, which shows itself by a difficulty of distinguishing any object closer to the eye than fourteen, sixteen or eighteen inches, although objects at a distance are as easily seen as in youth.

When this occurs the rays of light from a near object after being refracted by the eye, fail to form a sharp image on the retina, hence instead of accurate vision, imperfect haze is the result, and clearness can only be obtained by removing the object to a greater distance, or increasing the light, so as to cause an undue contraction of the pupil.

Short Sight. In short sight, distant objects cannot be distinctly seen and even near ones must be brought very close to the eye to see them distinctly. This arises from too great a convexity of the crystalline lens and cornea, and is in many cases congenital.

As long sight and short sight are the only two cases that an ordinary dealer in spectacles has to fit, we shall confine ourselves to these two conditions.

Long Sight. The natural decay of vision occurs usually from thirty to fifty years of age, varying according to the habits and employment of the individual. Sometimes during this interval the refractive power of the crystalline humors of the eye slightly alters its condition, whilst the crystalline lens and cornea change their form so that a difficulty of distinct vision is felt. The eye loses a portion of its power of seeing at varying distances, or its power of adjustment and near objects are no longer seen as easily as in youth. Reading small print by lamplight is difficult, as the book requires to be held at a greater distance from the eye than formerly, and a more powerful light is needed, and even then the letters appear misty and run one into the other or seem double. And still further, in order to see more easily, the light is often placed between the book and the eye and fatigue is soon felt even with moderate reading.

These symptoms indicate an alteration in the primitive form of the eye and spectacles are absolutely needed. Nature is calling for aid and must have assistance; and if such is longer withheld the eye is needlessly taxed and the change, which at first was slight, proceeds more rapidly, until a permanent injury is produced.

There is a common notion that the use of spectacles should be put off as long as possible, but such is a great mistake, leading often to an impaired vision for life, and is even more injurious than a too early employment. Timely assistance relieves the eye and diminishes the tendency to flattening, whereas should the use of spectacles be longer postponed the eye changes rapidly, and when the optician is at last consulted, it is found that a stronger focus spectacle must be used than usual for the first pair, and even these suit but a short time and have to be again exchanged for those of a still stronger power; and these frequent changes become a matter of necessity, which unless judiciously checked, continue during life.

It must not be forgotten that when first using spectacles they are not required during daylight, but only for reading, etc. by artificial light, and it may be from six months to five years from the time of first adopting them ere they will be required for day use.

The spectacles used for correcting long sight are called convex. (Cx.)

A great many machines have been invented for testing sight but they are all more or less useless, and it seems that the more expensive an optometer is, the worse it is. We recommend a test type that is a series of different sized type, or even a newspaper.

After having judged what focus the patient requires, get them to read the small print; if they hold it away off they require a stronger spectacle, if they hold it too near their eyes give them a weaker one.

In trying the first pair you will find it as well to go by the following table of ages:

Age in years.	40	42	45	48	49	50	53	55	56	58	60	62	63	64
Convex glass required.	60	54	48	42	36	30	26	24	22	20	18	16	14	12
	65	66	67	68	70	72	76							
	11	10	9	8	7	6	5							

The weakest power of glass with which a person can read distinctly at a distance of fourteen inches is the glass required.

Short Sight. Short sight is often present at birth, but is little noticed nor its inconvenience felt until study becomes imperative. When this occurs the power employed should be always slightly under that needed to remedy the defect, otherwise the eye will gradually accommodate itself to the lenses and require constantly an increase of power. In all cases leave some little for the adjustment of the eye to do, then you may, after a time diminish the power of the lenses needed.

The spectacles used for correcting short sight are called concave. (cve.)

For fitting find the farthest point at which small print can be read without spectacles, measure the distance from the eye to the print in inches, and add half this distance to itself and the result will be the number of concave lense required for distant vision.

For example, if the patient holds the print six inches from the eye, give number nine concave lense. If any glass is required for reading it will generally be about one-half the power of that required for seeing at a distance. If number ten concave glass is required for seeing at a distance, number twenty will be required for reading.

Give the weakest possible power of lense to near sighted persons that will give satisfactory vision. Lenses that make the object appear smaller or very bright are too strong.

Persons using a number twelve or weaker generally use the same glass for all purposes.

H. G. LEVETUS.

Editor TRADER,—

SIR,—There is a report current that a gentleman of the boot making persuasion has lately taken strongly to the jewelry business, having made several sales of watches, supplied to him by a wholesale jeweler—on the list. You will put both feet, armed with boots, down on this, Mr. Editor.

I am sure if such is the case, the merchant who supplied them, if he becomes known, will be likely to have a very *stern* experience of boots, before he is much older.

Yours respectfully,

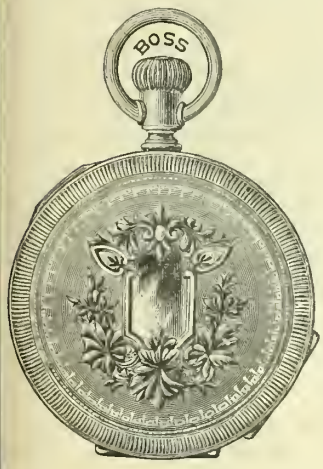
JNO. W. CAMPBELL.

[Although we publish this letter we think that the proper course for the jewelers in any town to pursue who have to meet this kind of competition, is to find out the name of the wholesale firm thus violating their contract and get them cut off from the Association as they assuredly would be could such a charge be substantiated.—*Ed.* TRADER.]

SPRING TRADE, 1886.

Jas. Boss 6 Size Gold Watch Cases

FOR LADIES' WEAR.



These celebrated Cases especially adapted to Ladies' use, have every improved feature that has given the larger sized Boss Cases their wide and rapidly extending fame.

Close fitting, finely finished, exquisitely engraved, and of unequalled durability, the Ladies 6 Size Boss Cases are undoubtedly the finest and most durable ever handled. New designs of engraving for these watch cases are now ready.

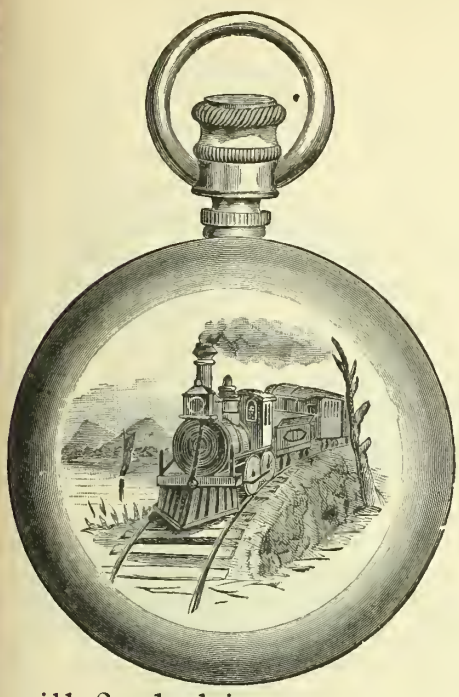
New York. Philadelphia. Chicago.

SELECTED MATTER.



DEAD STOCK.

The end and aim of mercantile business is to gain money, and when men invest capital in a stock of merchandise it is with the expectation of reconverting it into cash at prices sufficiently in excess of the original cost to yield a larger return than it would if loaned at rates established by the various State laws. All this goes without saying : but when by either indiscriminate and injudicious buying or by circumstances unforeseen and uncontrollable a quantity of unsalable goods accumulate upon the hands of the merchant, there arises a problem incident in a greater or lesser degree, to every business, and which involved may lead to loss and possibly to disaster. Unsalable, or, in the vernacular of trade, "dead" stock, is one of the most serious cares of a merchant's business life, requiring in its avoidance the exercise of all his taste in selecting and his talent and acumen in the sales room. In spite, however, of the best management, some of the goods in every store will be found to be of this character, receiving accessions constantly as other pieces fail to win the favor of customers, and locking up capital that should be actively employed. What disposition should be made of this incumbus is the perplexing question which is not rendered more easy of answer by the reluctance of merchants generally to make prompt reductions in prices. And yet we know of no other method of transferring capital that is tied up in goods that do not sell into capital that will pay profits because invested in goods that are in demand. It may be true that when these goods were new they were worth the price asked for them; but when it also becomes a fact that an unappreciating public has, by letting them alone, taken a considerable per centage from their value, this latter unpalatable truth must be realized if the goods are to be moved at all. As to the wisdom of converting "dead" stock into money as quickly and easily as possible there can be no question. The point turns entirely upon the methods to be employed in accomplishing this result. Some have favored auction sales, as we do when ever circumstance is favorable, two of which are important—a first-class reputation and being able to get a good auctioneer on the part of the dealer; but this plan is open to several objections. There are few auctioneers who can and do obtain in this way even moderately fair prices, and when commissions are deducted it is often found that there has been a needless sacrifice. The old method still in use by many large houses appears to be the most wise of any yet devised for the trade at large. The "bargain" counter has usually its own class of customers, some of whom will buy anything if assured of its cheapness. Such a counter should not belie its name. Make it a counter where bargains are truly given. Let the goods placed upon it bear cost prices, or, if need be, in special cases considerably below cost, and they will soon disappear at prices far in excess of most auction sales, while the legitimate trade receives no interruption and suffers very little, if any, injury. If the merchant resolves in some cases to abandon all ideas of profit on unsalable goods, and even submits to a loss on special articles, he is doing a wise thing. It is said of that merchant prince, the late Mr. A. T. Stewart, that one day walking through his immense establishment he stopped before a clerk, and said in that peculiar high-keyed voice of his, "That dress doesn't seem to go very well, young man. What's the matter?" "Customers complain of the price, sir," was the reply. "Ah," said Mr. Stewart, "cut it down twenty per cent." The next week the dress was still there. "Not sold yet?" was asked. "No, sir." "Cut it down twenty-five per cent. more." The third week the dress had disappeared. "Ah," said the merchant, "we can make more out of the money, young man, than we ever could out of the dress." "That's a business man's sermon in plain English that the reader may well remember.—*Jewelers' Journal.*

CHAINS OF INTEGRITY.

The fabric of human society is so woven in and out that no individual can claim for himself a condition of perfect independence. The farmer is dependent upon the merchant, the merchant upon the manufacturer, the manufacturer upon the producer, and each upon the other, forming a vast system of mutual dependence quite like the wheels and pinions of a watch. Each performs his part in the ever moving train of civilization. This applies not only to the food we eat, the clothes we wear and all other necessities of existence, but also affects the very foundations of business integrity. Man's confidence in his fellow-man cannot be more easily overthrown than by detected irregularities and frauds in business transactions. A misstatement or an unreliable guarantee will often create more injury to the offender than weeks of energetic endeavor can repair; yet the offender may be entirely innocent of any intention to act otherwise than fairly and honestly, being himself deceived by those upon whom he is dependent. Thus the jeweler may purchase of the manufacturer an article of 14k. gold which is represented to be 18k. He relies implicitly upon the statement of the maker that the latter is the true quality of his purchase, and he, the retailer, in turn guarantees to his customer that the goods are of the high quality named. In such a case the jeweler, innocent of intentional wrong, finds unfortunately for himself, that the indignant customer upon learning the true quality of his purchase does not look beyond the dealer for redress. Both are defrauded, but the consumer does not as a rule recognize this fact; for he has purchased his article, confiding fully upon the statement of the jeweler, and with complete faith in the merchant's supposed knowledge of his business. By such transactions, and they are frequent, confidence receives a rude shock, and may be forever destroyed, while the jeweler suffers in reputation and consequent loss of trade.

The same chain of connection applies to silver and silver-plated ware, for if loose manufacturers stamp wares of only 814-1000 fine with the "sterling" mark, or the lightest plate "quadruple" or "12 oz." it needs but few cases of detection to blast the future business of any jeweler who sells them for what they are not. That such goods are manufactured and sold is an established fact, and it is no less apparent that the remedy lies largely in the hands of the jewelers themselves. The predominant desire of every merchant to purchase his stock at an advantage over his neighbor, together with the effort of the manufacturer to produce goods cheaper than his competitors, are primal causes of all the adulteration and deterioration of American products. If it could be remembered that there is always sufficient competition among reputable producers to keep prices within reasonable limits, and that houses of capital and standing cannot afford to produce aught but re-

WATCHES!

Everybody knows that Watch Movements and Cases are as much the staples of the jewelry trade as tea and sugar are of the grocery business. The Jobbers' Association of Canada having laid down prices and terms on which such goods have to be sold, the only advantage that a large jobber can offer over a small one is the larger and better assorted stock from which to select such goods.

In this connection I beg to inform the trade that I am to-day carrying the largest stock of American Movements (all makes), and Canadian and American Gold, Silver, Filled and Nickel Cases, of any house in Canada. I can fill any order, no matter how large or small it may be, the day it is received. Retail Jewelers will find this a great advantage. When you visit Toronto, call and examine my immense stock of Watches, Chains, Optical Goods, and general Jewelry.

If you can't come and see my goods, send an order by mail or wire, and it shall have my prompt personal attention. Remember the address :

liable wares, perhaps the temptations offered by less honorable manufacturers would more often fail. At least it may be certain that if the dealer refuses to purchase anything but the best, and of firms whose integrity is unimpeachable, other than honest manufacturers cannot live; the nuisance would cease for reasons plainly apparent, and the condition of the retail jewelry trade would be greatly improved.—*Jewelers' Journal.*

JOSH BILLINGS' PHILOSOPHY.

The following selection from the dead humorist's writings will give a fair idea of his style of thinking and saying :—

To make light bread—do as bakers do—call 9 ounces a pound.

To make a hoe kake, take a hoe and bile it to a thin jelly, and then—let her kake.

To learn yure offspring to steal—make them beg hard for all that you give them.

Tew remove grease from a man's karakter, let him strike sum sudden ile.

Angels handle the dice when doublets are thrown into the cradle.

Flattery is like Colone water, tew be smelt ov, not swaliered.

If a man haint got a well-balanced head I like tew see him part his hair in the middle.

There is only one good substitute for the endearments ov a sister, and that is the endearments ov sum other phellow's sister.

Piety iz like beans; it seems to do the best on poor sile.

Going to law iz like skinning a new milk cow for her hide and giving the beef tew the lawyers.

About the hardest thing a phellow kan do is tew spark tew girls at onst and preserve a good average.

I had rather undertaik tew be two good doves than one decent sarpent.

A good wife is a sweet smile from heaven.

A lie iz like a kat—it never comes tew yeu in a straight line.

It is better to no less than to kno so mutch that ain't so.

A broken reputashun is like a broken vase; it must be mended, but allways shows where the krak was.

If you kant trust a man for the full amount let him skip. This trying to get an average on honesty has allways been a failure.

There is no treachery in silence—silence is a hard argument to beat.

Don't mistake habits for karacter. The men ov the most karacter hav the fewest habits.

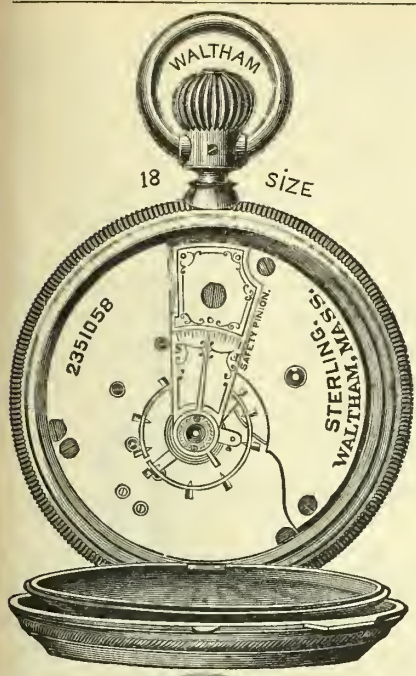
There iz cheats in all things—even pizon iz adulterated.

The man who is thoroughly polite, is 2 thirds of a Christian enny how.

Kindness iz an instinkt, politeness only an art.

Thare iz a great deal of learning in this world, which iz nothing more than trieing to prove what we don't understand.

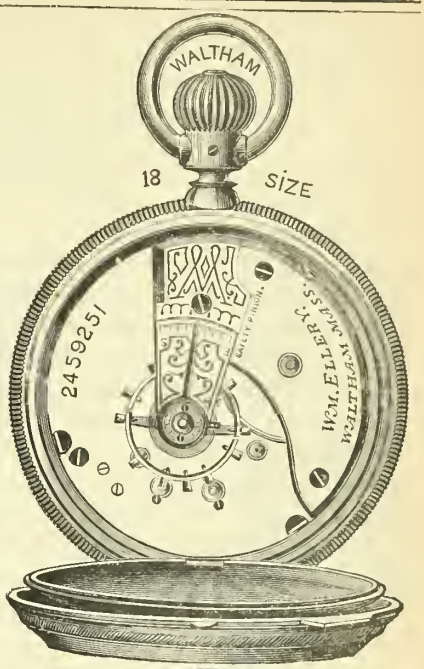
Mi dear boy, there are but few who kan commence at the middle ov the ladder and reach the top—and probably you and I don't belong to that number.



One ov the biggest mistakes made yet iz made by the man who thinks he iz temperate, just because he puts more water in his whiskey than his neighbour does.

SILVER PLATE MANUFACTURING.

The student of Canada's commercial history, must feel surprised at the rapid and gigantic strides she has made as a manufacturing country. Scarcely more than a decade since, fully nine-tenths of our manufactures were imported. For a few years manufacturers may be said to have had a hard time of it, but the experience gained during the trying years of 1876-7-8, enabled them to perfect their knowledge and to secure their home market—till now, our manufacturers are looking round for foreign markets. The Indian and Colonial Exhibition to be held this ensuing summer in London, will give them the opportunity of showing to their fellow-colonists and the world, what they can produce, and the price and quality of the production. While all branches of manufacture have made such worthy progress, there is one, that of the manufacturer of silver plated ware, that deserves, perhaps, more than a passing notice. Previous to the year 1877 we had not one factory in existence, and consequently not one dollar's worth of goods made in Canada. Now there are two at least that produce spoons and forks, and what is known as hollow-ware, from the raw material, and two more factories that import the goods in an unfinished state from parent factories in the United States, and plate them in this country. Among the former is the Acme Silver Company of Toronto. This company bought out the factory, tools and machinery of the Toronto branch of the Meriden Silver Plate Company of Connecticut. The managers of this Canadian branch now control and operate the Acme Silver Company. The writer had the pleasure of witnessing the manufacturing of some of the goods, and to his inexperienced mind, the results were wonderful. The machinery was of the most powerful description; ponderous rollers for rolling out the metal into sheets, and huge-power presses for cutting out the blanks, and stamping in that delicate chasing that adds so much to the appearance of silver plate goods. The company report a good demand for their spoons and forks, which are stamped G. Rodgers, A 1, and are guaranteed equal to the best produced, and certainly if demand for goods is any criterion of appreciation, then indeed must the people of Canada be well pleased with the artistic designs and splendid finish of their goods. We were also shown a portion of the goods that the firm intends exhibiting at the London Exhibition, and we are sure that with such representatives as the above, Canada will add at least one more leaf to her chaplet, and give evidence to the world that in the march of industrial progress she is in the van.—*The Canadian Exhibitor.*



A STRANGE CLOCK.

The Judge's house, says a correspondent of the San Francisco *Call*, was over in the French quarter of New Orleans, unattractive outside, but as soon as you got into the broad hall a cool breeze struck you, laden, without exaggeration, with the balm of a thousand flowers. The hall led right through the house and opened into a regular fairy land of flowers, a garden the like of which I had never dreamed of. It was surrounded by a high wall, and had plants in it from every country under the sun. The white haired old gentleman and the group of grandchildren hanging about him took us about, and the first

thing we stopped at was a large oval plot set out with small plants around the edge.

"This," said the judge, "is my clock. What time is it Clara?" he asked of one of the children. The girl ran around the plot and said it was four o'clock, and so it was. The four-o'-clock was in bloom. "In fact," said the story-teller, "the clock was made up of flowers." In the centre was a pair of hands, of wood, covered with some beautiful vine, but they had nothing, however, to do with the time-telling.

The plan was this: The judge had noticed that at almost every hour in the day some plant bloomed, and working on this principle he has selected plants of different hours and placed them in a circle, twenty-four in number, one for every hour.

For example, at the top of the earthen clock, at 12 o'clock, was planted the portulacca, and he told me it would bloom within ten minutes of 12 and rarely miss. At the hours of 1, 2 and 3 he had different varieties of the same plant, all of which bloomed opposite the hour to which it was planted. At four o'clock he had our common plant of that name, and you all know how you can depend on that.

At 5 the garden niotago come out, at 6 the geranium triste, and at 7 the evening primrose. Opposite 8 o'clock he had the bona nox, and at 9 the silent noctiflors—all these blooming at or near the time given. At 10 o'clock, if I remember rightly, he had a cactus, at 11 another kind, and at 12 the night-blooming cereus.

Half the year some of the plants don't bloom at all. The plants opposite 1 and 2 in the morning were cacti that bloomed about that time; and at 3 was planted the common salsify, and at 4 the common chicory, and at 5 the snow thistle, and at 5 the dandelion.

THE GREAT PYRAMID.

Mr. J. Bailey writes to the *St. James Gazette* as follows, with reference to the desirability of exploring the great pyramid: "Now that Great Britain is dominant at Cairo, would it not be a good plan to clear away the sand and rubbish from the base of the great pyramid right down to its rocky foundation, and try to discover those vast corridors, halls, and temples, containing priceless curiosities and treasures with which tradition of all ages has credited the great pyramid? The wonderful building, of such exquisite workmanship, was erected many years before any of the other pyramids, which are only humble imitations, built by another nation, and also for other purposes; for neither King Cheops nor anybody else was ever interred beneath this mighty mass of stone. The smaller pyramids also exhibit neither the nicety of proportion nor the exactness of measurement, both of which characterize the first pyramid From internal evidence it seems to have been built about the year 2170 B.C.; a short time before the birth of Abraham, more than four thousand years ago.

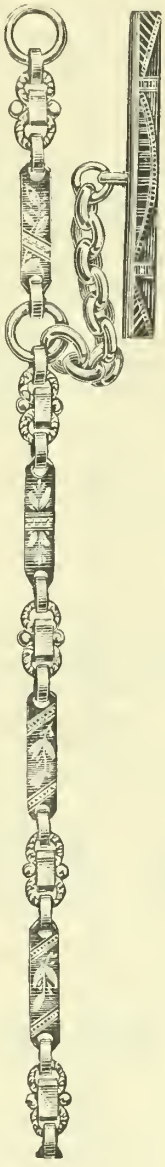
This—one of the seven wonders of the world in the days of ancient Greece—is the only one of them all still in existence. The base of this building covers more than thirteen square acres of ground. Its four sides face exactly north, south, east, and west. It is situated in the geographical centre of the land surface of the globe. It was originally 485 feet high, and each of its sides measures 762 feet. It is computed to contain 5,000,000 tons of hewn stone, beautifully fitted together with a mere film of cement. And these immense blocks of stone must have been brought from quarries five hundred miles distant from the site of the building. The present well known king and queen chambers, with the various passages, might also be thoroughly examined by means of the electric or lime-lights. The astronomer royal of Scotland some years since closely and laboriously examined all that is at present known of the interior of this enormous building. He states that measurements in the chambers, etc., show the exact length of the cubit of the Bible—namely, 25 inches. This cubit was used in the building of Noah's Ark, Solomon's Temple, etc. He also maintains that the pyramid shows the distance of the sun from the earth to be 91,840,000 miles.

BAD BOOK-KEEPING.

"My boy kept the books. I never looked at them. If I wanted to know anything I just asked him." "Was he a competent book-keeper?" "No, he was not. He kept the accounts in his head, and on little slips of paper in his pocket. Half the time and more he didn't get my liabilities down on the accounts at all. I spoke to him about it several times, and he said he would fix up the books some time, but he never did. I now find that I owe several thousand dollars more than I supposed I did."

Such is the substance of a statement made recently by a machinery manufacturer. The statement was made to a meeting of his creditors. There is nothing new in it. Hardly a failure occurs in the manufacturing business that does not disclose a wellnigh inextricable confusion in the books of the insolvent.

This suggests an inquiry. Do the failures occur because of careless book-keeping, or is careless booking used as a cloak to cover insolvency? In other words, is it a cause or an effect? We are inclined to think it is both. A business firm without true and clear accounts is like a ship without charts. It is only by good luck that it can escape the rocks. A prudent seller will therefore be very inquisitive about the book-keeping of his customers. No doubt bad book-keeping is frequently in itself a sufficient cause of insolvency.



It is also a frequent effect. The dealer who through dishonesty or incompetence has brought himself to the verge of failure, is usually quite willing that his affairs should be kept from the prying eyes of a too ardent investigating committee. The absence of books of account, involves in darkness the causes of his failure, and spares him from specific charges or itemized blame. Even where, as in the case of a recent failure, no such thought can be supposed to exist in form, in the mind of the debtor the essence of it often does exist there in the form of self-deception. It is a curious metaphysical fact that men are prone to deceive themselves. The man who would scorn to cheat his neighbor will not scruple to cheat himself. Don't cheat yourself.—*Trade Bureau.*

"ARE you a customs officer?" "Yes, sir." "Well, I had a little package sent over to me by the steamer *Oregon*—just a little valueless package, not worth more than $10. Has it come in yet?" "Why, man, haven't you heard that the *Oregon* was sunk?" "No; was she? By George! I must go right up and put in a bill for that package There were $12,000 worth of diamonds in it."—*Chicago News.*

EDITORIAL NOTES.

SPECIAL NOTICE.

Jewelers throughout Canada will oblige the Editor by sending into this office for insertion in these notes any items of news pertaining to the Jewelry business that they think would be of interest to the Trade generally.

REGARDING OUR HELP COLUMN.—Retail jewelers desirous of having advertisements inserted in our "Help Column," will please take notice that as we issue on the first of each month, any matter for insertion in this column must reach us not later than the 20th of the preceding month. Any advertisement arriving after that date will be too late and must be held over until the next issue. We have already received a considerable number of letters from retail jewelers thanking us for the help afforded them by this column, and stating that when the whole trade realizes the fact that they can avail themselves of its service free of charge, it will become one of the greatest helps they have ever enjoyed. The more that use our "Help Column" the more valuable does it become to every one else.

BON VOYAGE.—Mr. John H. Jones of the firm of John H. Jones & Co., of Montreal, sailed for Europe last week. We wish him *bon voyage*.

MR. SMITH, the manager of the Boston office of the American Waltham Watch Co., was in the city last week looking after the interests of his Company. He gave us a call and reports their Canadian business as being very satisfactory.

SELLING OUT.—Mr. J. F. Berringer, of Picton, Ont., is offering his jewelry business for sale. Any person having a practical knowledge of the business and some capital will find this a very good chance to get hold of a going business in good running order.

BACK AGAIN.—Mr. H. Smith, of the firm of Smith & Fudger, has just returned from a business trip to British Columbia. He reports trade quiet out there, probably on account of the completion of the C.P.R. Mr. Smith looks the better for his trip.

DEATH OF WM. DEARDEN.—Mr. Wm. Dearden, the wholesale jeweler of Montreal whose frauds against the Customs authorities were exposed only a few weeks ago has since died. It is said that after the seizure, Dearden, who is well advanced in years, became partially deranged, and that the loss of his money practically killed him.

SHOW CASES.—The Dominion Show Case Manufacturing Co. have issued a new and very handsome Catalogue of the goods they manufacture. Their cases will be found first-class in every particular and their prices are lower than any other house in Canada. When you want cases give them a show.

A GOOD CHANCE for an enterprising jeweler with money can be found in London, Ont. The business of A. S. Murray & Co., which everybody knows is one of the best in Canada, is now being offered for sale at a very low price, and any competent man with Grit and Greenbacks can make a fortune in short order by investing in this estate.

JOHN A. PARKER.—We were pleased to receive a visit last month rom Mr. John A. Parker, the general manager of the Meriden Britannia Company's Canadian business and manufactory. Mr. Parker expresses himself as highly pleased with the trade his Company has done so far this year, and with the prospects ahead.

DAMAGED BY THE FLOOD.—We are sorry to learn that Mr. R. Hemsley, one of the leading jewelers of Montreal, had his store badly flooded during the recent inundation. It is thought that his loss will amount to several thousand dollars. These floods are worse than fires, for while you can insure against loss by fire you can't get any compensation for damage by water.

FOR EUROPE, HO!—Mr. Harris H. Fudger, of the firm of Smith & Fudger, sailed for Europe by the Cunard steamer last month. He will visit the principal markets of England, France, Switzerland, Austria and Germany before his return, and the firm's customers may make up their minds to look out for good styles and big values before the fall trade commences. We wish him a successful trip and safe return.

A BIG PURCHASE.—We learn from the *Manitoba Sun* that "seven thousand four hundred and eighty-eight pieces of silverware passed the customs yesterday for W. F. Doll, wholesale jeweler, of that city." From the above it is evident that Mr. Doll is going to push trade in the North-West for all it is worth and give the retail jewelers of that part of Canada a chance to purchase stock very near home.

SALE OF CARRIER & CO.'S STOCK.—The entire stock of the estate of W. F. Carrier & Co., wholesale jewelers, amounting to $18,000, was sold *en bloc* by public auction on Tuesday, the 27th April, and was the occasion of a good deal of spirited bidding. It was finally knocked down to Mr. Fred Thayer, wholesale jeweler of this city, at fifty-one cents on the dollar of the inventory price.

A NEW ENTERPRISE.—Mr. R. H. Jupp, of Orillia has opened out his new premises, which for completeness and elegance will compare favorably with anything outside of Toronto. The show cases and fittings were manufactured specially for him by the Dominion Show Case Manufacturing Co., of Toronto, and are very handsome. Mr. Jupp intends to push business for all it is worth, and his well-known energy and business ability should ensure him success.

PALACES ON WHEELS.—We are creditably informed that the Canadian Pacific Railway Company have in course of construction nine elegant new dining cars. These cars are to be the handsomest and best appointed in any railroad service. The Meriden Britannia Co., of Hamilton, have received the contract for manufacturing the Silver Ware for them, which is sufficient guarantee that this feature of the equipment will be in keeping with the rest of the palaces on wheels.

A GOOD REPORT.—The Goldsmiths' Company report that their Jewelers' Record of Work and Repairs, referred to in last month's TRADER, has pleased their customers exceedingly. Ever since the book has been sent out, job and repair work of all kinds has been constantly coming in. The trade speak in highly complimentary terms as to its usefulness. If any regular jeweler who has not yet received a copy will write for one they will find it is just the thing they want.

FIRE.—We regret very much to learn that Mr. Fred. Chinnock, the well-known jeweler, of Napanee, was burned out during the recent fire in that town. We are glad to know, however, that he was level headed enough to be well insured, so that beyond a temporary inconvenience from the stoppage of business, his loss will not be very serious. This is another example of the beauty of every merchant carrying adequate insurance on his stock and buildings.

JOHN C. DUEBER, of the Dueber Watch Case Co., was in Toronto last week, and the Editor of the TRADER had the pleasure of a few hours in his society. While the Editor does not always see eye to eye with Mr. Dueber on matters pertaining to the Case Manufacturers' Association, and we have a fashion of calling a spade a spade, still we are free to confess that personally we think Mr. Dueber a very estimable gentleman, who as a practical case manufacturer stands second to none in America.

PROGRESS.—It is with some, and we think pardonable pride, that we call the attention of our readers to the size and general get up of the present issue of THE TRADER. We are not egotistical enough to credit the progress of our paper entirely to our own efforts, for we feel that without the kind assistance and co-operation of the trade, both wholesale and retail, the paper would not be what it is to-day. We propose to make THE TRADER a live jewelers' paper and a correct guide to the best markets in which to purchase goods.

PEACE.—We are glad to be able to announce in this issue the fact that the Dueber Watch Case Manufacturing Company are back again in the fold of the Manufacturers' Association, and that once more peace and quietness reigns in the watch trade. This is the result that would naturally have been expected from shrewd business men such as all the members of the Manufacturers' Association undoubtedly are, and it is only a pity that any misunderstanding and disagreement should have kept them apart and disturbed trade for ever so short a time.

IMPORTANT TO RETAILERS.—The American Waltham Watch Co., have had quite a number of their new illustrated material catalogues returned to them with comments, "dead," "moved away," "address not known," "out of business," etc., so that it is quite possible every jeweler in Canada may not have received one. Any jeweler who will send his business card to Robbins & Appleton, General Agents, 403 Washington St., Boston, Mass., U. S., will receive one of the valuable lists post free.

C. T. PICARD & CO.—The case against this estate has at last been

BANKRUPT STOCK.

RARE CHANCE.

We desire to inform the trade that we have bought the entire stock belonging to the Estate of W. F. CARRIER & Co., Wholesale Jewelers, of Toronto, at fifty-one cents on the dollar of the original cost price, and will in a few days offer it in lots to suit purchasers, at prices never before heard of in Canada. This stock consists of

WATCHES, JEWELRY,

Musical Instruments and Fancy Goods.

It is fresh, well-bought, and we propose to give the Retail Jewelers of Canada the full benefit of our

IMMENSE BARGAIN.

Our travellers will call on you in a few days, and we think it will pay you to wait for them, as our prices cannot be repeated.

THAYER & CO.,

3 WELLINGTON STREET EAST, TORONTO.

- CLOCKS -

TO THE TRADE

OUR attention has been called to the letter written by the Ansonia Clock Co. to a local firm, and published as an advertisement in the "Globe" of the 20th inst. We have not the slightest fault to find with the letter, and we do not dispute the facts contained therein; on the contrary, we are exceedingly obliged for the free advertisement, and beg to return our sincere thanks for same.

ALL WE DESIRE IS THIS, THAT THE TRADE OF CANADA WILL UNDERSTAND

WE ARE STILL IMPORTING OUR USUAL LINES OF ANSONIA CLOCKS

And so long as our prices are right we presume it is a matter of supreme indifference to the trade whether we buy the goods from Factory direct or not. We claim to be the

OLDEST AND LARGEST CLOCK HOUSE IN CANADA

And the trade can rely on obtaining the most desirable goods from us. In not confining ourselves to any one Factory we are enabled to supply our Customers with the most desirable lines of each, an advantage readily appreciated by Dealers. We handle clocks manufactured by the following reliable and well-known Companies:

NEW HAVEN, SETH THOMAS, WELCH, TERRY, INGRAM AND ANSONIA.

H. A. NELSON & SONS,

MONTREAL HOUSE:
59 TO 63 ST. PETER STREET.

TORONTO HOUSE:
56 TO 58 FRONT ST. WEST.

P. S.—Illustrated Catalogue of Clocks will shortly be ready for distribution.

EDMUND SCHEUER,

OF THE LATE FIRM OF

LEVY BROS. & SCHEUER,

begs to announce to his numerous friends and the trade generally, that he has leased the premises,

MATERIALS,

JEWELLERY

AND

OPTICAL GOODS.

"The Only Absolute Guarantee of Quality is the Integrity of the Manufacturer."

Quality. Workmanship. Price.

TRADE  MARKS.

GUARANTEE OF THE AMERICAN WATCH CASE CO. OF TORONTO.

The American Watch Case Co. of Toronto Guarantees every Gold Case manufactured by them and bearing any of their Trade Marks as above, to be of the quality stamped upon it according to the United States standard.

TO THE RETAIL JEWELERS OF CANADA.

GENTLEMEN,—We take pleasure in placing before you a few of our newest and most desirable designs of SOLID GOLD CASES, and of calling your attention to some of the advantages of selling them in preference to those of any other make:

QUALITY.—The guarantee we give in regard to the quality of the gold in all Cases bearing our stamp, is an absolute assurance that in handling goods of our manufacture you are getting the quality exactly as represented, and no other—an advantage that, in these days of "stamped-up" goods, we think you will not be slow to appreciate.

WORKMANSHIP.—In regard to the excellence of our Cases, we think that we can to-day say without egotism, that our goods have passed beyond the stage of experiment and are now as perfect as any Cases made in any part of the world. We have fitted up our factory with all the latest and most improved American machinery, and we employ only the most skilled workmen that can be had in the best American factories. The trade may therefore rest assured that we shall take no steps backward; on the contrary, we shall strive by every means in our power to improve our product until it becomes absolutely perfect, and recognized the world over as 'the best Cases made.'

PRICE.—The greatest advantage, however, to be obtained from handling our Cases is the saving in price. No dealer who sells imported Cases can begin to compete with a competitor who handles our goods. Every jeweler of ten years' standing or more must recognize the fact that a complete revolution has recently taken place in the Gold Watch trade. A few years ago Gold Cases were sold at retail in Canada at from thirty to fifty per cent. higher than the same goods were priced at in the United States. The result was that a great many fine watches were purchased by Canadian consumers visiting that country, to the loss of the Canadian retail jewelry trade. To-day, thanks to the presence of our factory in the country, the Canadian retail jeweler can buy Gold Cases of our make from any member of the Canadian Jobbers' Association as cheaply as the American retail jeweler can purchase the same quality of goods from the New York or Chicago jobbers. What does this mean? It means that we have practically put a stop to the general public buying Gold Watches in the United States, because if our retailers are wide enough awake, they can easily show their customers that if they are honest they can save the duty by buying at home, and that even if they are reckless enough to try and evade it, they can make nothing by handling goods which can be bought as low in Canada as in New York.

We sell no goods direct to the Retail trade but dealers will find a full assortment of our Cases with the leading Canadian jobbers. All that we ask of you is to examine the goods, compare the prices and weigh the facts we have stated above. If you do, we are satisfied you will find it greatly to your advantage to handle them.

Don't be misled by any one telling you other goods are better, they are not; they may be, and no doubt are dearer, but they are not any better, if as good. Insist on getting our Cases, and no others.

Soliciting your patronage, through the legitimate jobbing trade,

We are, yours very truly,

JOBBING REPAIRS.

WE desire to notify the trade that we have added to our business a department for Jewelry and Watch Repairing in all its branches. We employ only the most skilful workmen and warrant every job we do. Jewelers at a distance will save time and money by sending us their repairs, as we guarantee prompt service and low prices.

Our travellers are now on the roads mentioned below and we ask for them a liberal share of your esteemed patronage.

Our MR. WILL PARKER, G. T. R., East.
Our MR. FRED ADDISON, N. R. R. and C. P. R., West.
Our MR. FRED THAYER, G. T. R., West.

settled by the Customs' Department agreeing to accept a fine from the trustees of $6,000 and release the stock amounting to about $42,000 to the creditors. It is said that goods to the value of $52,000 had been smuggled in by Picard & Co. The outside creditors will likely get a dividend of twenty cents on the dollar from the estate. The stock has been purchased from the trustees by Mr. John Inglis, a former partner in the business, who will conduct the business in the future. It is said that Picard is now in Chicago running a billiard saloon.

A SENSIBLE CUSTOM.—It is now said to be the custom in England for a gentleman who is engaged to present his betrothed with three rings. The engagement rings given by Earl Cairns to Miss Adele Grant included a half hoop of diamonds, a ring set with a diamond and a ruby, and another mounted with a fine single sapphire. It's said to be an ill wind that blows nobody any good, and although this new innovation may come heavy on the bridegroom's pocket, it's a good thing for the jewelry trade. Most of our readers will hold up both hands to have it become the custom in Canada as well as in England.

THEY DO US PROUD.—We were surprised to receive another visit last month from Mr. Sherry, accompanied by Mr. Fahys, jr., of the firm of Jos. Fahys & Co., the well-known watch case manufacturers of New York. Mr. Sherry who has drummed up the Canadian trade for some years past, will in future devote his energies entirely to the U.S. and young Mr. Fahys will take the Canadian trip. Our Canadian jobbers will miss Mr. Sherry's genial smile and hearty hand shake, but it cannot be helped, and we trust his successor may be as well treated by them in the future as Mr. Sherry has been in the past.

A GOOD THING.—The new Association Price List of watch movements and cases of all kinds, has just been sent out by the Secretary of the Jobbers' Association, Mr. George Chillas. It is the best printed and most complete watch list we have ever seen in Canada, and reflects much credit on Messrs. H. H. Fudger, M. C. Ellis and Geo. Chillas, the committee appointed by the Association to compile it. As only one list is sent to each jeweler, they should take good care of them, as only enough to go round once has been printed. This list being official is a big step in the right direction.

DEATH OF DENNIS C. WILCOX.—We regret to chronicle the death of Mr. Dennis C. Wilcox, Secretary of the Meriden Britannia Co., of Meriden, Conn., U. S., and brother of Mr. Horace Wilcox, its President. The deceased was one of the most prominent business men in the United States and leaves behind him a brilliant record of successful and honorable labor. He was energetic and clear-headed in business, generous though unostentatious in his charities, genial and whole-souled in the privacy of his own family, and the inner circle of his friends. He will be much missed by those who knew him.

HOW ARE YOU, MR. ROGERS ?—We had a visit last month from the Rogers Bros., of New York. Although they were not the genuine 1847, being minted in the neighborhood of '65, they are genuine sterling quality, 925 fine all the way through. We thought at first that not being in the spoon and fork business these gentlemen had mistaken their calling, but on finding that the elder brother was representing the Howard & Son button (a soft thing for a pushing fellow), and the younger one, a rising rolled-plate chain house, we changed our mind—after we had seen their order books. Glad to see you gentlemen, come again.

A CHANGE.—Few jewelry travellers are more widely known or more thoroughly liked than Mr. Richard Russell, commonly known as "the lightning traveller." For several years past he has been connected with the firm of A. C. Anderson & Co., and on the amalgamation of the two businesses, with the firm of Lowe & Anderson. His many friends will, however, be surprised to learn that for the future he will travel for the firm of Levy Bros., of Hamilton, and will take the road for them in about a month's time. Mr. Russell has won success by honest persistent effort, and we trust he may long be spared to handle his genial grip and book good fat orders.

OUT OF JAIL.—After being about four months in jail the friends of Mr. Sapery came to a settlement with Messrs. P. W. Ellis & Co., by buying their account against him for the sum of one thousand dollars in hard cash. Taking it altogether we think that this is but another illustration of the truth of the old saying that, "honesty is the best policy." Young Sapery's adventures have not added anything to his reputation or credit, and by the time his lawyers' bills are paid we think he might about as well have attempted to pay one hundred cents on the dollar to his creditors. We trust the lesson will not be thrown away on either wholesalers or retailers. Credit is altogether too cheap at the present time in Canada.

REVISING OUR LIST.—We have been at considerable pains during he past month to revise the list of names to whom we send THE TRADER. In accordance with the promise made to the trade some time ago, we have struck off all but *bona fide* dealers in jewelry and kindred goods. This is we consider a step in the right direction. We propose for the future to make THE TRADER strictly a jewelers' journal, and as there are many questions that will arise for discussion that are better kept from outsiders, we propose to confine our circulation as strictly as we can to the legitimate jewelry trade. If we have inadvertently omitted any jeweler, all that he has to do to get put on the list, is to send us a note to that effect and enclose his business card.

ACCIDENT.—What might easily have been a fatal accident occurred at the factory of the American Watch Case Co., of Toronto, a few days ago. It appears that one of the Company's machinists was fitting a new die into the large steam drop-hammer and while turning around his foot accidentally touched the lever which sets it in motion. The hammer, which weighs one hundred pounds, struck him on the head cutting it to the bone and rendering him insensible. Fortunately he was standing almost upright at the time which made him receive the blow almost at the start of the hammer. Had he been stooping down it would have crushed his head to a jelly. A doctor was at once called in who dressed the wound, and the plucky fellow was able to resume work in a couple of days.

ASTONISHING.—Rice Sharpley & Sons, of Montreal, were recently prosecuted for exhibiting in their window two figures in marble of the real decotelle style, copied from Michael Angelo's statues in the Pitti Palace at Florence. Five witnesses testified that there was no indecency in the exhibition, as the figures are purely works of art, and valued as such. Surely the fools are not all dead yet. It is really astonishing how much fuss a few ignorant people will make about such exhibitions at home, while they will spend thousands of dollars to travel to Europe and cheerfully disgorge of their wealth to see the originals of all such works of art. Of course the originals are simply superb in Florence, Rome and Paris, but immodest and disgusting when exhibited nearer home. Verily consistency, thou art a jewel !

A DECIDED CHANGE.—Mr. Edmund Scheuer, late of Levy Bros. & Scheuer, of Hamilton, having retired from that firm, has removed to Toronto and opened out a new business at No. 1 Wellington St. West, where he proposes to keep one of the largest and best assorted stocks of jewelry, clocks, etc., to be found in any warehouse in Canada. Mr. Scheuer has been connected with the wholesale jewelry trade in Canada for the past fifteen years, and has the credit of being one of the ablest and most popular men in the business. On the formation of the Canadian Jobbers'Association, Mr. Scheuer was chosen Vice-President and this year was elected President. We welcome him to Toronto and trust he may have a long and successful career here. Mr. Scheuer is able and energetic and the kind of man our city wants, and what is Hamilton's loss will be Toronto's gain.

DISSOLUTION.—Amongst the retail jewelry trade of Canada, the name of Levy Bros. & Scheuer had become almost a household word, and it will be a genuine surprise to many of their more distant customers to learn that they have dissolved partnership, Mr. Edmund Scheuer retiring. The business of the old firm will be carried on at the old stand by the Messrs. Levy Brothers, and we need scarcely say that the honorable trade policy of the past will be continued by them as heretofore. Mr. A. Levy the senior partner of the firm has been identified with the jewelry business of Canada for nearly a quarter of a century, and is, we believe, the oldest jewelry jobber in Canada. Under his guidance the firm has made an honorable record and had a very prosperous career, and we wish the remaining partners a long continuation of both.

A MAGNIFICENT CATALOGUE.—The new illustrated catalogue of gold watch cases just issued by Messrs. P. W. Ellis & Co., of this city is the best thing of its kind that we have ever seen, and will we think prove to be one of the most useful auxiliaries to the retail jewelry trade that any firm has yet produced. The paper, artistic and typographical

work are as fine as anything we have ever seen published in the U.S., and reflects the highest credit on every person concerned in its publication. A good feature of this catalogue is that every case is distinguished by number and listed at the price the retailer can afford to sell to his customer. For this reason it will be found very convenient for securing special orders for goods not usually kept in stock, as well as a help to the jeweler in making up his stock orders for staple goods. Every live jeweler should secure a copy, and order from it after he has it.

THAT WONDERFUL CASE AGAIN.—Our friend John Sheppard of the Boss Case Co., was in Toronto last week trying to hunt up the Editor in order to club him with that wonderful watch case. He says that since the last issue of THE TRADER his office has literally been beseiged by people to see his patent life saving Boss Case. We heard by accident as it were, that while in Boston the other day John had occasion to use a hack, which got upset during the journey. John was precipitated out but landed on his watch case, which again acted the good Samaritan. John says as this case has saved his life twice he won't sell it under any consideration. We notice that the Boss Co. have reduced the price of their 6 and 8 size cases which are now lower than they ever were before. Although the price has gone down, the quality still remains away up at par. The Boss Co. still stick to the old fashioned way of giving people full value for their money.

ENTERPRISE.—As our readers will have noticed before they read this, the American Watch Case Company of Toronto, are occupying much more than their usual space this issue and have filled it in a very artistic manner. This Company is now producing gold watch cases which for quality, style and finish are unexcelled by any other makers. Some of these new designs as illustrated in this issue are exceedingly artistic and cannot fail to attract attention. Their guaranteed goods can now be bought by the trade from members of the Canadian Jobbers' Association as cheap as American retailers can buy the same class of goods in Maiden Lane, New York. The effect of this will be to do away with the unfair competition that the honest retail jeweler has so long experienced from competitors who were less scrupulous and willing to smuggle. So far as gold cases in Canada are concerned, the smugglers' occupation is gone and he will have to turn his attention to some other, and more profitable line of goods. The best way to stop smuggling is to make the price in Canada as low as in the U.S.; this truth was recognized by the A. W. C. Co., hence their action. In doing this they have ignored the question of dividends, but we trust that any reduction in profit may be counterbalanced by their more extensive sales.

GIVING THE CANUCKS A LESSON.—We heard a good thing the other day of an American safe manufacturer, who, finding trade rather slack at home, concluded that he would ship one of his unrivalled safes over to Canada, and put in his time and make a good thing financially, by instructing the aborigines of this wooden country how to make safes under his improved patents. Arriving at Toronto he very soon found himself in Messrs. J. & J. Taylor's factory where he discussed to a very patient audience on the merits and values of the unrivalled patents he had for sale. After he got through, the proprietor quietly took him through their works, where he found that not only were the firm using a very superior invention to his in their ordinary goods, but a contrivance exactly the same as the American patent he was trying to sell had been tested by this firm some six years ago but discarded as being worthless. If Brother Jonathan was surprised at this, he was completely paralyzed when his Canadian competitor suggested that they should try his safe by a practical fire test. No, siree, not by a jugful, his safe wasn't got up for any such purpose, and he didn't think any safe would stand the test proposed. When the Messrs. Taylor showed him a safe almost uninjured inside that had come through this very test and offered to put one of their own along side of his during the operation, he collapsed entirely. He said that without doubt there was no safe made to-day in the United States that would stand such a test, and so far as fire-proof safes were concerned, why the United States would have to take a back seat for some time to come. His sample patent safe went home by the next freight train, while its owner after swallowing half a dozen cocktails, took the fastest express he could find to get him out of a country where safe makers were fools enough to test a safe by fire before they guaranteed it to their customers. Canada is poor —but honest.

WORKSHOP NOTES.

To clean filigree silver work that has become tarnished by exposure, you can dip it for a moment in a solution of cyanide of potassium. If not very badly tarnished, probably a solution of hyposulphite of soda will clean it. If there is no base metal about the ornament, you might clean it by boiling it in sulphuric acid.

ALL jobbers should know that gold and silver plate may always be kept clean and bright by a simple process: Mix one part of sal-amoniac with sixteen parts of vinegar. Rub stains and spots with this mixture. They will soon disappear. The plate should then be well washed in soap and water and rubbed till thoroughly dry.

ONE of the most ingenious processes which has lately come into vogue in the treatment of iron—an Austrian invention—is that of giving to the metal a silver surface, this being effected by first covering the iron with mercury and then silver by the galvanic process. By heating to 300°, C., the mercury evaporates and the silver layer is fixed.

THE Moniteur Industrielle gives the composition of an artificial gutta-percha as follows: Fifty parts by weight of copal and 7 5 to 15 of sulphur, with 15 to 30 of turpentine, or 55 to 60 of petroleum; mix well; heat to 100° C., until completely dissolved; let it cool to 35°; add a solution of 3 parts of caseine in weak ammonia and a little methylene; re-heat to 120° until of a weak consistency; then boil with a 15 to 20 per cent. solution of tannin and about 15 parts of ammonia. After several hours boiling wash and cool.

To etch on metals cover the surface of the metal on which you desire to etch, with white melted wax; when cold, trace the design or character upon it with a sharp point, which penetrates through the wax layer. Into these lines pour either very strong vinegar, or pure acetic acid, and spread upon it a powder made of 100 grains rock alum, and the same weight of sulphate of copper, previously calcined in a crucible in the fire. To have the engraving deeper, soon as thee ffect of the first mordant is spent, wash the wax in cold water, without rubbing, however; let it lay, and repeat the operation. By renewing it as often as necessary, the workman has it in his power to regulate the depth of the engraving to his liking.

IT is found that a superior brown tone may be produced upon brass by the following simple process: The article having been thoroughly cleaned and freed from all traces of grease, then polished, is dipped for about half a minute in a cold solution of 18 grms. of hypomanganate of potash, 50 grms. green vitriol, 5 grms. muriatic acid, and one litre of water; thorough rinsing and drying in fine soft sawdust follow. If a reddish cast is desired, the article is to be dipped into a second bath, heated to 60° C., of 10 grms. each of chromic acid, and chloric acid, and hypomanganate of potash, with 50 grms. blue vitriol or sulphate of copper, dissolved in 1 litre of water—this latter mixture alone producing a light bronze. The subsequent operation of heating in an oven produces, it is said, a very rich tone.

OTHER NOTES.

THE mouth of the Mississippi River is again filling up with sand and debris despite the Eads system of clearage.

COLOMBO, the capital of Ceylon, is the chief centre of the jewel trade of the East. Almost any jewel can be bought there by an experienced purchaser for from one-fifth to one-tenth the amount for which it would sell in America.

ISAAC RAYIXN, of Flint, Mich., has a bust of Lincoln, the material of which was originally worth $3,500. The bust is of redeemed greenbacks which were macerated by the Government, after which the pulp was pressed and moulded to form the likeness.

AMONG the French Crown jewels which it is proposed to sell are the "Regent" diamond, valued in the official inventory at 12,000,000f, the seven "Mazarin" diamonds, a small reliquary, made as a brooch, set with 93 brilliants, and dating from 1496, and the watch of the Dey of Algiers.

A COPY of Dickens' "Strange Gentleman," one of the rarest of his productions, was recently bought by a small bookseller for threepence.

By him it was sold for 15 shillings to a young man in the trade, he in his turn disposing of the book to another person for £1. This last knew the value of his prize, and, in spite of its being imperfect, re-sold the volume for £5 to a well-known firm of booksellers, who now want somewhere about £12 for it. A perfect copy is worth £20. It is quite a small pamphlet, and has been reprinted—without the frontispiece.

WILLIAM L. SILVERY, the young mechanic who invented the induction telegraph by which messages may be sent from flying trains, is only 19 years of age. This unknown boy perfected the induction telegraph while working on his mother's farm, near Castleton, Ind. He had wires strung through the apple orchard, and on these, with encouragement from no one but his mother, developed the principle of induction until he was able to transmit messages from one wire to another forty feet distant. Those to whom he confided his discovery laughed at his ideas, and he was forced to abandon his efforts to bring his work before the world. Thus it lay unheard of until Mr. Edison got a clue to it and applied the principle to telegraphing from moving trains. Young Silvery has not been discouraged for a moment, but has worked away with tireless industry, and his genius has produced other devices equally marvellous.

WISE AND OTHERWISE.

WHY have the funny men of America been so dull this Winter? Answer First—They haven't! Answer Second—Because it's been such an no-pun Winter.

A GENTLEMAN just returned to this country from a tour in Europe was asked how he liked the ruins of Pompeii. "Not very well," he replied; "they were in such shocking bad repair."

AT dinner the host introduces to the favorable notice of the company a splendid truffled pheasant, amid murmurs of admiration. "Isn't it a beauty?" he says. "Dr. So-and-So gave it to me—killed it himself." "Aw, what was he treating it for?" asked one of the guests.

"Do you think, William," said Mrs. Brown to her husband the other night, "that the telephone will ever be as generally used as the telegraph?" "Why, yes," replied Brown; "the time is coming when it will be as common to telephone as it seems now to tell—a fib."

HE appeared to be almost gone. Rolling his eyes toward the partner of his bosom, he gasped: "Bury me 'neath the weeping-willow, and plant a single white rose above my head." "O, it's no use!" she snapped out. "Your nose would scorch the roots." He got well.

CASTE—Young lady (in carriage): "Her name is Smith,—I think her husband is in the artillery. I wish you would tell her I wish to speak with her." Soldier's wife: "I don't know the lady, mum, which we're in the 'orse artillery, mum, and we don't visit with the field batteries."

"CURIOUS thing about that statue of Washington," said old Smash-pipes, in a musing sort of tone, as he sauntered past with Starlight—"curious thing: always shrinks when it rains, you know." "Don't say so!" said Starlight. "Fact!" muttered the old man; "every time it rains it becomes a mere statue-wet;" and the old man's left thumb went under Starlight's fifth rib with tremendous violence.

ALEXANDER DUMAS wrote his autograph for a successful quack who lavishly entertained him:

Since my good friend here, Gallipots,
Has fixed his dwelling in this town,
The hospital has been torn down—

"Good, good," murmured the doctor, who was looking over the writer's shoulder. The poet concluded his epigram;—

And the site sold for burial lots.

We hear of an "exploding dish of chowder,"
A blown up doughnut and a busted cup,
'Most everything is dangerous but powder—
But could Guy Fawkes have Bologna sausage up?

OUR HELP COLUMN.

THE TRADER aims to be of practical value to the Retail Jewelry Trade.

NO CHARGE is therefore made for advertising in this column, but the subject-matter should not exceed five type lines, or about 60 words.

When requested, these advertisements will be published in successive numbers of the paper.

If you have a Store, Stock, or any Special Article to sell; if you wish to buy an Established Business, or enter into Partnership; if you want a Journeyman, Clerk, Salesman, or Foreman; if you want a situation yourself—communicate the fact to THE TRADER PUBLISHING CO., 57 ADELAIDE ST. WEST, TORONTO, and it will be inserted in this column free of charge. This is the only way by which you can reach the entire Trade, and we shall be glad to help you.

A WATCHMAKER wanted. A practical man, temperate, of good moral habits, with good references, can get a situation with me at once. Address, LEONARD MORRIS, Summerside, P.E.I.

FOR SALE. Mosley lathe with partial set of chucks, will be sold. A bargain for cash. Apply to J. D. PARKINSON, 253 Parliament Street, Toronto.

FOR SALE. A new Buffalo forge, cheap for cash. L. B. BLASDELL, 23 Adelaide Street East, Toronto.

JEWELRY BUSINESS for sale, on a leading thoroughfare in the City of Toronto. Large double fronted store (could be partitioned and made into two separate stores if necessary). Stock and fixtures about $500. Established 13 years. For particulars, apply to P. W. ELLIS & Co., Wholesale Jewelers, Toronto.

SITUATION WANTED by a first-class practical watch maker, fourteen years' experience, best of references furnished. Address stating salary. P. O. Box 174, Simcoe, Ont.

TOOLS. Wanted to purchase a pair of flat rolls, ½ round ring ditto, and "Little Giant" ring rounder. All must be in good order, state price and conditions to E. ROBINSON, 192 Dundas St., London.

WATCHMAKER in need of situation. Best of references. WM. SCOTT, care of A. Attwood & Son, Hamilton, Ont.

WANTED A SITUATION to learn the watchmaking and jewelry business, by a careful and steady young man. Apply to FRANK PURVIS, Lyn, (Leeds Co.) Ont.

THE TRADER is printed by R. G. McLEAN, 13 Adelaide St. E. Toronto, who makes a specialty of Jewelers' Work. Samples and estimates on application.

GUARANTEE NOTICE.

All Spoons and Forks bearing the stamp

G. RODGERS, A 1

are made of the finest nickel silver and are plated and hand-burnished under my personal supervision, and standard of quality—each article is guaranteed perfect in finish and durability.

All Knives bearing the stamp

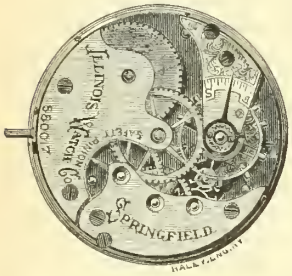
G. RODGERS

12 DWT.

are plated on the best English cast steel with pure silver, and are hand-burnished and warranted to give perfect satisfaction. The well known reputation that the name RODGERS has attained all over the world have induced other makers to adopt a similar name, calculated to mislead the public. See that the trade mark reads and is spelled G. RODGERS, A1, on Spoons and Forks, or G. RODGERS, 12 Dwt, on Knives.

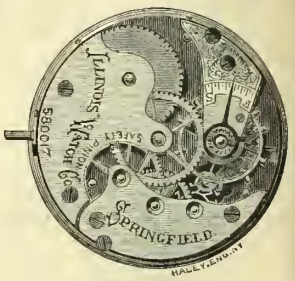
SOLD ONLY BY

THE ACME SILVER COMPANY,



TORONTO,

to whom all orders should be addressed. Send for quotations.



G. RODGERS,

Known to the trade in Sheffield, England, and on this continent since 1846.

HELLO ! HELLO ! HELLO !

WELL, WHAT IS IT?

Why, we want to place our order for some of the new and popular

FOUR SIZE MOVEMENTS

MADE BY THE

ILLINOIS WATCH COMPANY.

They are the SMALLEST watch made by any Company engaged in the manufacture of watch movements in America. The

FOUR SIZE MOVEMENTS

are constructed upon a new and distinct model having no resemblance to the Celebrated Eight Size Movements manufactured by the ILLINOIS WATCH COMPANY. The Top Plate is composed of two pieces only, hence THE BARREL CAN BE REMOVED WITHOUT DISTURBING THE TRAIN. They are provided with Safety Pinions, thus securing a protection to the Train in case of the breakage of the Main Spring. They also have CONVENIENT LET DOWNS, and all the steel work is finely finished with especial care.

There is NO LADIES' WATCH TO COMPARE with them in size, style, beauty, durability and price, and we want to place our order early, for the ILLINOIS WATCH COMPANY has already sold its entire production of FOUR SIZE MOVEMENTS, months ahead, and is daily receiving large and numerous orders for the various grades of Four Size Watches. The

ILLINOIS WATCH COMPANY

WARRANTS EVERY MOVEMENT OF EVERY SIZE MANUFACTURED BY IT.

DON'T SKIP THIS PAGE IN JUNE, FOR IT WILL PROFIT YOU TO READ WHAT WE SHALL SAY THEN.

MARK.

OBSERVE

this Trade Mark is stamped on all Hollow Ware of our manufacture.

TRADE

1847, Rogers Bros., A 1,

OR

1847, Rogers Bros., XII

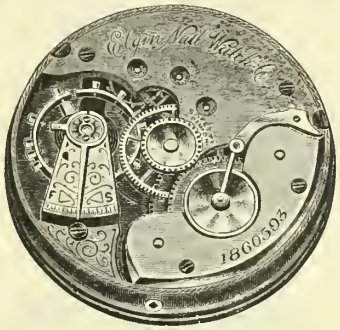
MARK

OBSERVE

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and names as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.



THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

ELGIN NATIONAL

57 ADELAIDE ST. W., TORONTO, ONT.

SPECIAL NOTICE.

To ensure insertion, changes or new advertisements must reach this office not later than the 20th of each month.

EDITORIAL.

EXCELSIOR'S ARTICLES.

Agreeable to our promise, we commence in this issue, Excelsior's articles on Watchmaking, and will continue them regularly from month to month until they are completed. We need hardly say that we trust our readers will study them carefully, for we are satisfied that they possess so much inherent merit, that no practical watchmaker that ever commences them, will leave them off until they are completed. In order that our readers may have them complete, we have started at the very foundation, his Treatise on the Balance Spring, and will continue them on in the same order in which they were originally published.

In another part of this issue, will be found a few, from amongst the hundreds of letters we have received from all parts of Canada, endorsing our remarks regarding the merit of Excelsior's articles, and it will be noticed, that those most enthusiastic are the ones that have read and studied them attentively. All of these gentlemen are unanimous in their opinion that these papers are invaluable to any watchmaker who desires to make his mark in the craft.

Many of these correspondents are good enough to say some kind and flattering things about THE TRADER, and how they regard it. For these we thank them sincerely, and shall do our best in the future to deserve their confidence and goodwill. We have now ceased sending our paper to anyone not a *bona-fide* jeweler, and now that we have made it purely a jewelers' paper we trust that the craft will make it more than ever their own, and help to make it a success by sending in contributions on trade topics and any item of news that they think would be of interest to the trade in general.

As we only print enough papers to send *one* to every jeweler in Canada, we trust that our readers will preserve them carefully. Although we are often written to for them, we cannot furnish back numbers. Our readers will please take note of this, and govern themselves accordingly.

Our advertising pages are now so varied and interesting, as to be fully as good reading as the rest of the paper. They are the monthly messages from our leading manufacturers and jobbers to the trade generally, and we ask for them your careful perusal and consideration. We would take it as a favor, if, when ordering goods from houses to which you have been directed by their advertisements, that you would mention having seen them in this journal. It is but little trouble, and will be of benefit to us.

HOW ABOUT INSURANCE?

The disastrous fire in Hull last month, involving a loss of nearly a quarter of a million of dollars' worth of property, is but another instance of the danger to which most of our country villages are exposed. Had Hull, like half-a-dozen other places in the Dominion which have been reduced to smoke and ashes during the past ten years, not been built principally of wood, and allowed to remain without adequate water and fire protection, its two hundred buildings might have been standing today, and it is scarcely probable that we would have been called upon to commisserate its citizens upon the awful calamity which has reduced many of them to poverty, and rendered most of them homeless.

The era of wooden buildings has gone by, and if people who ought to know better would look a short way ahead, and estimate the risk they are running by living in wooden towns and villages, inadequately protected against the ravages of fire, we are satisfied that in most cases brick or stone would be used in preference.

Of course there are lots of places that are now in existence whose people are not wealthy enough and who probably would not care to pull down their wooden buildings and replace them with brick ones, and to any jeweler who may happen to be carrying on business in such a place, we take this opportunity of saying that they cannot be too careful in looking after their fire insurance, and having both their building (if they are fortunate enough to own it) and stock adequately insured. A man who owns his own store, has his stock paid for, and owes no man anything, if he is foolish enough to do so, can afford to go without insurance, because he takes all the risk himself. But the merchant who buys his goods on credit, has no right to expose his creditors to a chance of loss that can be so easily guarded against as loss by fire.

As a rule, most people insure, but many of them, when they put on a few hundred dollars, fancy that they have done all that they ought to do in the matter. There never was a greater mistake. Total loss by fire is an ever present risk, and it should be as intelligently looked after and provided against, as rent or taxes, or any other necessary expense that it is impossible to do without. It is true that a man may go on for a lifetime and never have a fire, but he *may* have one the day after he insures, or, as has happened, the day after he has allowed his policy to lapse, thinking that the risk was not worth the expense.

Anything that is worth doing at all is worth doing well. Therefore, if you insure against fire at all, do so intelligently. Take stock, and find out how much your loss would amount to in case you were burned out without a chance to save anything. Then go to some first-class company and insure for as near that amount as they will allow you to do. If insurance, no matter how small the amount is good, adequate insurance, so as to reduce your loss in case of fire, to a minimum is far better. Hundreds of wealthy merchants in Canada have been reduced from affluence to poverty simply because they neglected to insure their stock and property in proportion to the amount of risk involved, whilst others, who have been equally unfortunate

in having been burned out, are to-day in a good position and doing a prosperous business, simply because they had prudence and business foresight enough to know the risk of loss they ran by fire and guard against it by adequate insurance.

Cheap insurance is usually dear insurance. No good reliable company ever goes in for low, cut-throat rates, and if any company offers them, you may depend upon it that their responsibility is about on a par with their rates. Always remember that in insurance, low rates should not be so much an object as getting it placed with some first-class and thoroughly reliable company, who not only are able to pay their losses, but to pay them without higgling, or being forced to do so by law.

If possible, put all your insurance in *one* company, and don't break it up if you can help it. If you do insure in more than one company, however, be sure and see that all your policies are concurrent; that is, that as to description and proportion of property they all read alike. Such an arrangement will be found of the very greatest service in case of loss by fire.

In conclusion, we cannot urge upon our readers too strongly the importance of being fully insured against loss by fire, and we think that most of them will agree with us that it should not be neglected. If this be conceded—How do you stand yourself?

CORRESPONDENCE.

NORWICH, March 11, 1886.

TRADER *Publishing Co.:*

GENTS,—By all means publish "Excelsior's" articles. I would like to give them to my apprentice and wish to keep my own numbers for the other matter.

Yours etc.,

J. HOLTON ROBINSON.

BOTHWELL, March 16, 1886.

TRADER *Publishing Co.:*

DEAR SIRS,—THE TRADER is a welcomed visitor every month and your offer in editorial of last issue would make it a valuable work to every practical watchmaker. I hope it will be appreciated.

Yours respectfully,

D. H. CUNNINGHAM.

PORT HOPE, March 6, 1886.

Editor TRADER:

DEAR SIR,—I for one desire the republication of "Excelsior on Watchmaking." I have read "Excelsior's" treatise on Watchmaking with a great deal of interest and am sure the trade will be profited by it.

Very respectfully,

J. S. SMITH.

QUEBEC, March 15, 1886.

THE TRADER *Publishing Co., Toronto:*

GENTLEMEN,—Have read just this day of your *splendid* offer to we retailers and do at once write you to say that I for one would be delighted to see "Excelsior on Watchmaking" in your splendid trade paper.

Yours respectfully,

C. ROUTIER, *Horloger et Bijoutier.*

50 et 52, Cote Lamontagne.

TORONTO, March 8, 1886.

Editor TRADER:

DEAR SIR,—I have read with much interest some of "Excelsior's" articles and should very much like to see all of those on Watchmaking published in the TRADER.

I believe it would increase the already deserved popularity of the TRADER.

Yours respectfully,

N. W. SPELLER.

PALMERSTON, March 4, 1886.

Editor TRADER:

DEAR SIR,—I for one of the many readers of THE TRADER would like very much to see a reprint of "Excelsior on Watchmaking." I find THE TRADER of great benefit to me in keeping me posted on changes in style of goods and other things pertaining to the jewelry trade.

Yours respectfully,

R. CROSKERY.

FOREST, March 8, 1886.

Editor TRADER:

SIR,—If "Excelsior's" article on Watchmaking is an article on watch repairing I should very much like to have you reproduce it in the TRADER; if on watchmaking I think your space is much better filled as you are doing now. THE TRADER is always welcome with me.

Yours etc.,

G. M. VANVALKENBURG.

72 Sparks St., OTTAWA, March 12, 1886.

Editor TRADER:

DEAR SIR,—I would be greatly obliged to you if you would send me THE TRADER. I look forward to seeing it every month and find it boss reading. I don't know the price of subscription, but would gladly pay whatever it is. I would like to see "Excelsior's" work published.

Yours etc.,

W. G. YOUNG.

CHARLOTTETOWN, P.E.I., March 10, 1886.

TRADER *Publishing Co., Toronto*:

GENTLEMEN,—I am of opinion that the publication of the articles referred to would be of benefit to the trade generally, and also would like to see them in THE TRADER on the ground that although we cannot drive the botch out of the trade, we may assist to make him a better workman.

Yours respectfully,

E. W. TAYLOR.

RODNEY, March 8, 1886.

THE TRADER *Publishing Co., Toronto:*

GENTS,—I received THE TRADER for March. In regard to the articles of "Excelsior on Watchmaking," I would very much appreciate the republication of same. I have been read-

THE HOWARD WATCH

Second to none in the world for accurate time, beauty and durability, which essential qualities have gained for them a wide reputation and the general favor of the American trade.

18 SIZE.
For Open Face or Hunting Cases

16 SIZE.
For Hunting Cases.

6 SIZE.
For Hunting Cases.

These Movements are made of the finest materials and in the most faithful manner, with fine ruby jewels, chronometer balances, and with thorough adjustments to heat, cold and position.

The 16 and 18 sizes are all made ***Pendant Hand Setting,*** as well as Stem Winding. The winding and setting arrangement an easy and uniform action, superior to all others in point of durability.

Every dealer who has a sale for fine Watches should use the Howard.

132 St. James Street, MONTREAL.

ing THE TRADER for nearly seven years and look to its arrival each month as that of an esteemed friend. I remain

Yours respectfully,

E. J. SCHMID.

OSHAWA, March 5, 1886.

Editor TRADER :

SIR,—In compliance with your request, I wish to state that it would be a great pleasure to me as a retail jeweler to re-read "Excelsior on Watchmaking." The papers are of great benefit to the trade. It will be a matter of surprise if you do not receive replies from *all* watchmakers who receive THE TRADER.

Sincerely yours,

GEORGE W. WYATT.

TEESWATER, March 29, 1886.

Editor TRADER :

DEAR SIR,—I would be very much pleased to see published in your columns a reprint of "Excelsior on Watchmaking," although I have the most of his treatise as published in *Jewelers' Circular*. I think you would be making a move in the right direction and publishing something that would be of great value to the trade at large. I remain

Very truly yours,

GEO. H. COO.

HAMILTON, March 5, 1886.

Editor TRADER :

DEAR SIR,—I for one should be much pleased to see "Excelsior's" excellent articles on Watchmaking published in THE TRADER. I have, I think, all the Nos. of the *Jewelers' Circular* in which these notes appear, but for the benefit of those who have not I say publish them. I am very much pleased with your paper and wish you continued prosperity.

FRED. CLARINGBOWL, *Jeweler*,
158 King St. East.

TORONTO, May 18, 1886.

Editor TRADER :

DEAR SIR,—"Excelsior's" articles are undoubtedly the best written and most easily understood of any in the English language and should be *studied* by every watchmaker in Canada. Should you decide to publish them, the trade generally will be under greater obligations to you than it probably is aware of. I would not take $100 for mine if I could not replace them.

Yours truly,

ED. BEETON.
Head Workman with Kent Bros.

TORONTO, March 6, 1886.

THE TRADER *Publishing Co.:*

GENTLEMEN,—In response to your request for watchmakers to say if they would like you to publish Excelsior's "Practical Hints on Watch Repairing," I for one heartily endorse the idea. I have read them all and am of the same opinion as that generally expressed: that they surpass anything that has ever been printed on the subject. If you publish them, which I hope you will conclude to do, I believe you will be the means of doing a great amount of good to all concerned.

I remain, etc.,

C W. COLEMAN.

TORONTO, March 8, 1886.

Editor TRADER :

DEAR SIR,—I noticed your editorial re "Excelsior on Watchmaking," and knowing by experience the value of the articles referred to (having them myself bound in the *Circular* vols.), I have great pleasure in voting for a republication of them by you. I trust you will receive all the encouragement you deserve in making such an offer, and feel sure that the careful study of them will certainly improve that workman whose aim is to *know* his business thoroughly.

Yours very truly,

T. H. ROBINSON, 510 Yonge St.

WINDSOR, May 10, 1886.

THE TRADER *Publishing Co., Toronto:*

DEAR SIRS,—You deserve at least the hearty thanks of all Canadian jewelers for the free distribution of your excellent monthly, THE TRADER. It has become a credit to its publishers and worthy of the Canadian trade, and, judging by the push exhibited in its management and by its literary merit, I believe it will continue to improve with age.

I heartily wish THE TRADER success, particularly in its support of reform movements now on foot to correct certain abuses in the trade.

Yours sincerely,

G. A. HUESTIS.

TRURO, NOVA SCOTIA, March 20, 1886.

THE TRADER *Publishing Co.:*

GENTLEMEN,—Please accept my thanks for the March No. of your very interesting and useful journal, THE TRADER, which I have gone carefully through and with which I am very much pleased.

I notice particularly your remarks on "A New Metallic Standard of Value," and it strikes me that the idea set forth therein is the very best that could be suggested.

I notice also your proposal to publish the articles of "Excelsior on Watchmaking," which I cordially endorse, as I think it would make your journal more than ever a public benefactor.

Yours faithfully,

CALEB MCCULLY, *Watch and Chronometer Repairer.*

PORT ELGIN, March 8th, 1886.

THE TRADER *Publishing Co.:*

SIRS,—It is with pleasure that I find you disposed to publish that most valuable work of "Excelsior on Watchmaking," and trust that you will have every encouragement from the trade in the matter.

Your valuable journal is of interest enough to make it al-

EXTRA QUALITY STAMPED * H. & H. H.

ways welcome, even without such a work; but it will surely be of much more interest when you have in it "Excelsior's" work.

Trusting that you will at once begin the "good work" and wishing THE TRADER and its promoters every prosperity,

I am yours sincerely,

A. MOFFAT, *Jeweler, etc.*

P.S.—Having most of the *Circulars* containing work spoken of, I feel sure it will be a "boon" to the trade to have a reading of it. A. M.

To the Editor of THE TRADER:

DEAR SIR,—Your generous offer in last month's TRADER is one that every watchmaker will fully appreciate or I am greatly mistaken.

I have Grossman's prize essay, a work that no watchmaker should be without, and from what I have heard the one by "Excelsior" is far superior to it.

And then to have it reprinted in THE TRADER, at no expense to the retail trade, is something I don't understand as I consider THE TRADER one of the most spicy trade publications I know of. The *Watchmaker and Metal Worker* costs $2 per year and the *Jewelers' Circular* the same, whilst we have THE TRADER free. Hoping the rest of the craft will show their appreciation of your kind offer, I subscribe myself

Yours truly,

B. RICHARDSON.

MAIN STREET, MITCHELL, March 10, 1886.

THE TRADER *Publishing Co.:*

GENTLEMEN,—Your most generous offer to publish "Excelsior on Watchmaking" in the columns of THE TRADER is one I think every watchmaker should appreciate. I have read some of "Excelsior's" articles and was much pleased with them. I think there is no mechanic but can learn a great deal by interchange of ideas. In fact, I see THE TRADER has been for some time endeavoring to draw the craft nearer to each other through the use of its columns, but not with much success I regret. It would appear as if you were really taking more interest in our welfare than we do ourselves. Such should not be the case. I always look on THE TRADER as a welcome friend and would not like to be without it. Perhaps, if you did not send it out for a few months, we would learn to appreciate your efforts and counsel better. In the meantime, let me thank you for your generous offer.

Yours truly,

ALEX. CAMERON.

LONDON, May 5th, 1886.

Editor TRADER:

SIR,—I have mailed you the *Times*, containing a complete account of the opening of the Colonial and Indian Exhibition here yesterday.

It is impossible for me, at this time, to give you more than a few brief notes regarding the event which has brought so many Canadians over to this side of the Atlantic. However, brief as they are, I hope that they may not be uninteresting to the readers of THE TRADER.

In the first place I would state that the Exhibition, although opened, is far from being ready to open. There is but one department that has received ALL of its goods and has everything in shape, and that is India. The others are more or less incomplete. The one most behind, I am sorry to say, is Canada. Only about ONE-THIRD of the Canadian exhibits have as yet arrived. The balance are *somewhere*, the Lord only knows, for Sir Charles Tupper and the balance of the Commissioners here say *they* do not know. There has been a great amount of bad management either on this or the other side of the water. In fact, there seems to have been considerable on *both* sides. The papers here give Canada some very hard knocks. No one seems to be responsible for the delay. Sir Charles says it is the parties at Ottawa. However, when I tell you that there are *over one-thousand* packages of goods from Canada that have not arrived yet, you will see about where the "Canadian Exhibit" stands. No doubt but that when our goods arrive we shall have the *largest and finest* exhibit here. So everyone seems to think. But at present poor Canada is left out in the cold, and all on account of the negligence or bad management of whoever had the charge of shipping the goods. To tell you that there is a crowd of growling, complaining and kicking exhibitors here does not begin to express it. Such swearing and threats you never heard. If the present "force" at Ottawa were dependent upon the votes or support of the Canadians here now for another term of office, I am afraid they would be badly "left." The Exhibition, as a whole, will be a grand success. It is said to by far surpass *anything* ever produced on this side of the Atlantic. There has been nothing spared in fitting up the grounds and buildings. In fact, there is *everything* that money and brains could produce. The opening yesterday was probably the grandest affair of the kind that ever took place. Imagine, if you can, over 40,000 people in one vast assemblage made up of representatives from *every nationality* in the known world. *Hundreds of thousands* of people lined the streets and, in fact, the *whole world* seemed to be "let loose" into the streets of London.

As there are but few of our exhibits up (and most of those are incomplete), I cannot give you a detailed account of them. Hope to be able to do so later. I saw John Hallam here yesterday. I understand John tried to get up unto the platform upon which were Her Most Gracious Majesty, the Royal Family and the Colonial Commissioners, but was refused because he had neither "dress suit" nor "uniform" on. I was a little surprised at John attending such a gathering in his "little brown coat" (I think the same one he wore at Philadelphia in '76) and "same old hat."

I forgot to mention that the greatest trouble that we shall have to contend with will be the lack of space for our goods. What few goods that are here have *nearly* filled the space given to Canada. Those whose goods are here have not been allowed to open hardly more than *one-half*. The rest of their goods have been sent away and stored. To say that the exhibitors are dissatisfied does not express it. No doubt their grievances will find space in Toronto papers before long.

With kind regards, I remain

Yours truly,

EXHIBITOR.

REDUCTION IN THE PRICE

—OF—

LADIES' SIZES JAS. BOSS WATCH CASES.

NO Reduction in Quality, Method of Construction, or Beauty of Finish.

MORE HANDSOME, DURABLE, AND RELIABLE THAN EVER.

NO GILDING.

JAS. BOSS gold cases, whether of ladies' or gents' sizes are not gilded, but always present the natural color of the 14 2-10 carats gold of which their outer and inner plates of precious metal are composed.

The new styles of engraving for these surpassingly beautiful cases are now ready.

Bear in mind that, in the respects of quality and efficiency, Jas. Boss ladies' sizes of watch cases are the best and cheapest ever made.

Every Jas. Boss case is a gem, giving the full measure of satisfaction.

KEYSTONE WATCH CASE COMPANY,

NINETEENTH AND BROWN STS.,

PHILADELPHIA, PA.

A PRACTICAL TREATISE ON

THE BALANCE SPRING.

Including Making, Fitting, Adjusting to Isochronism and Positions, and Rating, also Adjustment for Heat and Cold.

BY EXCELSIOR.

PART I.

(1). Every watchmaker thinks he can "put in a hair-spring," and he does it,—after a sort. Probably there is no other one thing so generally done, in the whole range of the trade, about which there is such complete ignorance. Not one workman in a hundred can put in a hair-spring in all respects as it should be done; and when done, not one in fifty can tell whether it is properly fitted or not, if the general *appearance* is unobjectionable. Men will claim to be able to "fit a hair-spring the first time trying" who do not really know the object of a terminal curve, and who suppose the supplemental coil of the Breguet spring is designed to make the balance vibrate more freely!

(2). Nor is this ignorance confined to any particular class of workmen. It is found even among professional "springers," when they are induced to break their sapient silence and give some *reasons* for their routine manipulations. Theories are often put forth by persons undoubtedly well informed, which are not only absurd and without foundation in fact, but which it would seem that a single moment's reflection should have convinced their authors were untenable. But others, misled by the eminence of the authority, take them up, and defend and propagate them, until they almost become accepted as axioms, which no ordinary man dares dispute, least he should be considered an ignoramus. I propose to take that risk, and show up the most prominent of these bug-bears, and sweep away some portion of the mist and humbug that hang around this subject—not by any assumption of superior knowledge, but by applying the plain test of mechanical laws, practical experience and common sense.

(3). Before proceeding to the more usual operations, it will be useful to consider the mode of making springs. The material employed is the very best quality of cast steel, specially prepared and drawn into wire. Steel has the objection of liability to rust, and to be affected by magnetism, but thus far no substitute has been found which would perserve all of its valuable qualities and be free from these defects. The only rival worthy of being mentioned, is wire made of 18 karat gold, alloyed with pure copper, and worked into springs in accordance with the nature of the material. This is free from the two objections named, but long experience has shown that it is not as reliable as steel, besides that it is more difficult to work properly, and, its expansibility in heat being greater than that of steel, it requires heavier adjusting screws in the balance, thus introducing a train of evils which more than offset all its advantages over steel. It is to be hoped, however, that our inventors may yet succeed in discovering a material having all the advantages, with none of the disadvantages of steel. Until then, owners must take proper care of their time-pieces or suffer the penalty of ruined springs.

(4). Steel may be made elastic either by hardening and tempering, or by compression, and springs are made in both ways. Springs for marine chronometers are now almost always hardened and tempered, as are those for the finer classes of pocket watches—while cheap springs are wire-drawn and rolled to all degrees of hardness, then wound into shape, and blued by heat, which causes them to "set" in the proper form. The former are more expensive, but are in every way preferable when properly made. Their temper is more uniform, both in the body of the spring and throughout its length; their qualities, whatever they may be, are more permanent, and they are more certainly made of any desired temper. Where the elasticity is given by drawing through wire plates and by rolling, there is the danger of minute cracks being produced in the edges at the final rollings, when the wire is already hard, which, although imperceptible to the sight, will disturb the action of the spring. But if the spring is to be hardened by fire, it can be annealed and kept in safe workable condition till the moment of hardening.

(5). In drawing (or rolling) the wire it is important, 1st: To draw always from the same direction, and, if it is rolled upon a spool after each drawing, it must be unwound and re-rolled before drawing again, so as to commence with the same end each time; 2nd: To draw at a regular rate of speed—not fast at one time, then slow, etc., for such irregularity of speed will produce irregularity of texture in the wire; 3rd: To have as few stops as possible, for there will be a difference of texture at that point of the wire that is in and behind the plate at the time of the stoppage, no matter how short the stop may be. The best way is to draw the whole length of the wire through at a regular speed without stopping at all; 4th: Wind the wire upon *large* spools or bobbins, if at all, and do not cramp or bend it any more than is unavoidable, until it is made up into springs; 5th: Instead of oil use bees wax as a lubricant; that will adhere to the wire under any pressure, while oil will not; 6th: Before heating the wire, either to harden or "set' it, clean it thoroughly by rubbing it lengthways with a rag dipped in pure (or 98 *per cent.*) alcohol, and then do not handle it with the bare fingers, but with clean tools, or by interposing clean paper or cloth between the skin and the steel.

(6). *Different forms of springs.* There are two principal forms for hair-springs; the flat spiral, either plain or with the Breguet curve, and the cylindrical or helical. The latter is adopted for chronometers, and the former for most pocket watches. There are many other forms, not often employed, as the spherical, which is largest in the middle and tapering down toward each end, making it globular in form. These are very roublesome to make and set true, and have no practical advantages over the helical form with proper terminal curves. Another method is to make half of the wire in the helical form and the rest is coiled up in the flat form at the end of the helix. The objections to this are that the flat portion of the wire is subjected to violent twistings, being first straightened out from the helix, then wound up again in the spiral form, which would be sufficiently objectionable if the wire was soft, but in this case it is done after the wire is hardened and ready for use. And, even if this objection could be avoided, there is another, that the coiling and uncoiling of the helix would inevitably throw the flat portion out of its plane at each vibration, and greatly disturb the isochronal properties of the spring, to improve which is the only object of the helico-spiral form. Then there is the reversed helix, being, in effect, a helix broken in two in the middle, and the two ends pinned into a stud in such a way that the upper half of the spring coils up while the lower half is uncoiling, and *vice versa*. This is difficult and

unreliable. The same object is accomplished with flat springs, by using two of them, so attached that one coils up while the other uncoils, as above stated. But no form of spring has yet been tested which produces any better effects than can be obtained from the helix or the spiral, by proper manipulation.

(7). There are good workmen who claim that a flat spring cannot be made isochronal—which, in view of innumerable instances to the contrary, is as ridiculous as the claim that the spring-detent or chronometer escapement is, *per se*, superior for keeping time to a detached lever escapement equally well made –a point which I shall touch upon hereafter. Theoretically, the helix, with its coils of equal diameters, is superior to the spiral; but practically, the average of the effects of the numerous coils of different diameters is equal to that of a spring with equal coils of an intermediate diameter. And a spiral spring with its outer end returned by a properly formed terminal curve is fully equal to a helical spring, for pocket watches; but for marine chronometers it is better to make the spring in the helical form, on account of the large size of the wire required for their heavy balances. As both forms are good, I will describe the mode of making each.

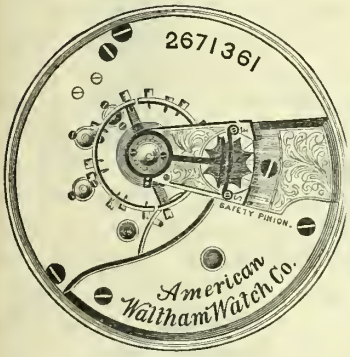
(8). *Making helical springs.* For the helical spring a cylindrical brass block is made, and shallow grooves cut in its exterior surface, by a small screw-cutting lathe or otherwise, having the exact shape the spring is desired to take, the wire is then coiled tightly in these grooves, and each end is fastened by screws or pins. But as brass expands more than steel, when heat is applied, the block will expand more than the wire wound upon it, and injure it more or less by straining it while heated and soft. We avoid this as follows: At each end the spring if pinned, is drawn through holes drilled in the block, pulled tight and fastened with the pins. This produces a right-angled bend at the edge of the hole. The pins are then loosened, and the wire drawn out of the holes so that, when again pinned fast, these bends or elbows, instead of lying on the surface of the block, are about the breadth of the spring above it. These short upright portions will yield sufficiently to avoid straining the wire when heated, yet are stiff enough to hold it properly to its place. When the ends are fastened by screws instead of pins, the screws should be put on the ends of the block, not on its sides, and each end of the wire being drawn over the sharp edge, produces the elbow as before, which can be loosened up and refastened at the proper height by the screws. The elbows may serve the same purpose of safety when bluing the spring. The object of using brass blocks is two-fold: If of steel, they would be liable to warp more or less by hardening, and communicate an irregular form to the spring, which is, of all things, to be avoided; and a steel block will scale to some extent by the hardening process, and lose the perfect accuracy of its grooves—whereas a good brass block can with care be used many times. The block on which the cylindrical springs are hardened should be hollow, so that it will cool quickly. Its thickness should be no greater than will give sufficient rigidity and strength. The thickness is generally from one-eighth to one-sixth of the total diameter of the block.

(9). If the spring is to be simply blued and "set," hold the block with the spring upon it in the frame of the alcohol lamp, turning it constantly, and heating slowly and evenly, till it acquires the proper color, then let cool. One bluing is sufficient for a rolled spring, but coloring a hardened and tempered spring is a very different matter.

(10). *Hardening springs.* If the spring is to be hardened by fire, it is sometimes wrapped in thin sheet copper or platina foil fastened with binding wire or folded over the ends, having been previously well daubed over with common soap, softened by warmth, not moisture, which largely protects it from scaling and coloring by the heat, by keeping it from the air. When so wrapped up it must be hardened in water. But most workmen simply slip the block and its spring into a brass, copper, or iron tube, or even a common clay pipe bowl, and fill it around and over the block with fine wood-charcoal dust, well shaken down to fill all the interstices, and entirely exclude the air while the wire is being heated. A small piece of steel wire must be so placed that it can be occasionally taken out to judge of the heat, as charcoal packing is a very poor conductor of heat, and very deceptive to the inexperienced. Very fine silver filings have been proposed, being a good conductor, but I do not know that this has been tried. Animal charcoal is also used, but it makes the spring very hard and difficult to form the terminal curves. For a plain spiral spring, requiring no after manipulation, it would be excellent.

(11). The whole must be carefully heated in a charcoal fire to a cherry red, but no higher, and, as soon as it reaches that, the block with its spring is emptied into oil or water—the preference being for oil, unless the block is wrapped up as stated above, when it should be quenched in soft water. The proper temperature for the quenching bath is about 60° Fahr., as that is found to give sufficient hardness without danger of causing the steel to crack. But if the wrapping is at all thick, a greater degree of cold will be safe, and in fact necessary—but that is to be avoided.

(12). *Tempering springs.* If the spring has been hardened in oil, it is now drawn down to a straw color—if in water, to a purple—then removed from the block and polished inside and out, edges and all, with a stick and fine oil stone dust or "sharpe," again fastened tightly on the block as before, and the color brought down to a rich dark blue. This, however, is a matter which depends somewhat on the quality of the wire used, and can only be fixed by testing your sample. Some steel will be as hard and elastic at a dark blue as another sample will be at a straw color. The aim should be to stop just short of brittleness, so that a piece of the tempered wire may, *with care*, be bent cold to a right angle around your screw-driver, or a round broach, but would snap off if it was bent carelessly or over the square edge of your pliers. If the spring is to be used white, it should be brought to the proper temper before polishing. In forming the terminal curves the hardened spring must always be bent by heated tools, a subject I shall treat on hereafter under the head of isochronism.



(13). In coloring a spring, it is not always necessary or even advisable to go by the color of the spring itself, as any piece of steel on the block or plates will do just as well. But there are certain precautions to be observed which are not necessary with larger articles of steel, because here even the slightest variation of the temper affects the action of the spring. Supposing the color should be a dark blue, if the mass (spring and block, or plates), has been heated rapidly, the coloring must be stopped sooner, or at a lighter shade, say a purple or a reddish brown; while if it has been heated very slowly, it may be carried to the exact shade desired.

(TO BE CONTINUED.)

AMERICAN WALTHAM WATCH CO.

NEW NAMELESS 18 SIZE STEM WIND MOVEMENTS

HUNTING OR OPEN FACE.

No. 5.

GILDED MOVEMENT; thirteen jewels in settings; expansion balance; patent regulator. Eighteen size, Stem Winding, Huntiug or Open Face.

No. 15.

GILDED MOVEMENT; fifteen jewels in settings; expansion balance; patent regulator; patent Breguet hair spring, hardened and tempered in form. Eighteen size, Stem Winding, Hunting or Open Face.

No. 25.

NICKEL MOVEMENT; adjusted; fifteen jewels in settings; expansion balance; patent regulator; patent Breguet hair spring, hardened and tempered in form; adjusted to heat and cold and in three positions, viz.: pendant, cock and dial. Eighteen size, Stem Winding, Hunting or Open Face.

No. 35.

NICKEL MOVEMENT; adjusted; fifteen ruby jewels in gold settings: expansion balance; patent regulator; patent Breguet hair spring, hardened and tempered in form; double sunk dial; adjusted to heat and cold and in all six positions. Eighteen size, Stem Winding, Hunting or Open Face.

ALL OPEN FACE MOVEMENTS ARE MADE PENDANT SETTING

THESE goods are regular full plate eighteen size, fitting any standard make of eighteen size cases, are of the newest models, and have all the latest improvements, numbers 15, 25 and 35 having the celebrated **Logan Breguet hair spring, hardened and tempered in form,** which is made only at Waltham and is **not to be found upon watches of any other makers in the world.**

They possess all the qualities of high grade movements and are offered at the usual prices of grades known to be much lower in quality.

They bear the name **American Waltham Watch Co.** only, and can be sold upon **their merits,** which, we believe will be more evident and acceptable to dealers and to the public than the fictitious value often claimed for goods of less established repute than Waltham.

We believe the market offers nothing of any other make to at all compare with these goods in such a rare combination of quality and price.

Dealers should **buy** them because they offer opportunity for profit.

Dealers should aim to **sell** them because they will give satisfaction to customers.

Prices will be found on Page 5 of Price-list issued by Canadian Association of Jobbers.

FOR SALE BY ALL JOBBERS.

ROBBINS & APPLETON,

GENERAL AGENTS,

SELECTED MATTER.

THE JEWELER WHO ALWAYS DOES A RUSHING BUSINESS WHEN TIMES ARE DULL.

When times are dull and trade is slow,
And commerce is depressed,
A jeweler sometimes is found
Who " sells more than the rest."
His store is found on some side street,
His stock is low and snide;
Perchance a chattel mortgage rests
On everything inside.
In Bradstreet's he is rated at
N. G. and No O;
His goods they must be paid at once
As soon as they are bought,
He lives in clover; has everything
Which mortal can desire,
And judging from his talk you'd think
Makes money like " wild fire."
He's smooth tongued and polite,
He watches for his prey,
And finds it in those men who like
Flattering (but they pay).
In problems, in arithmetic,
There's none so clever as he,
He has four watches monday morn;
However dull trade may be
He sells five of these in a week,
And has remaining three.
To his friends he says that at the bench
He earns five dollars a day.
When his customer comes to get his watch,
And has two dollars to pay,
And returns to say it's rather much;
This is what he'll say:
" It takes a good man all his time
A dollar a day to earn,
And if I could again start out
This trade I'd never learn."
"All other jewelers in town
Are botches at the best.—"
In fact he is the only one
Who can stand the test,
All watches by these botches ruined
To him are finally sent.
He gets in " regular six a week,"
" More than he likes to tend—"
If he would say one in six weeks
Instead of six in one,
It might then be one in three months,
Again it might be none.
And if it really were the case
That he'd get in his work,
The watch in question would soon be
A subject for the morgue.—
" This watch was found in a back street,"
The chief police would say,
" Foul murder here suspected is,"
" Inquest is held to-day.—"
The coroner's jury is sworn in,
The case explained to a letter—
" Killed by an assasin " the verdict is.
Unknown; (for that no better)—
The man who cast the watch aside
Is lost to him for ever,
And if he buys ten watches more
He'll patronize him never.
This stops the blower not—he blows,
He goes from worse to worst;
Some day he'll get up too much steam—
The end will be he'll burst.—G. K., Elmira, Ont.

A BOLD ROBBER.

Paris must have its weekly sensation. This time it is not a murder nor a duel, but—a robbery. Something new and ingenious in the way of robberies, you may be sure, to attract attention in this lively city. Cartouche could not have been more clever. For the distinction of this recent marauding expedition M. Trochard's store in the Boulevard Haussmann—one of the largest establishments in Paris—was selected.

One afternoon lately a carriage drove up, two men alighted and entered the store. They were well-dressed and had pleasing manners. Asking to see some plate, they were shown the choicest specimens by a salesman, and bought a large amount of it, to the value of 15,000 francs. Going to the diamond counter, one of them inquired the price of a magnificent necklace in diamonds and opals, and was told that the jewels were valued at 95,000 francs. The visitor then ordered it to be packed with the plate, and asked if his cheque would be taken in payment. He seemed to expect this would be refused, and produced from his pockets bank notes for the full amount, lacking 3,000 francs, which deficiency was at once supplied by his companion. The precious pair then drove off with their purchases.

Half an hour later a cab dashed up to M. Trochard's store, two men, dressed as police agents, sprang out, and, entering, hurriedly asked whether two persons answering the description of the plate buyers had been there, and, if so, what they had bought. When told of the purchase of the diamonds and plate, they demanded, in the name of the law, to see the money which had been paid. This money they pronounced counterfeit, and insisted that the clerk, with these spurious notes, must accompany them to the police station. They all three got into the cab.

The clerk was found several hours later, half stupefied in one of the suburbs. He was arrested as drunk and disorderly and taken to the station, where the whole story came out. The so-called police officers were confederates of the purchasers. The notes were perfectly good. The clerk had been drugged, and after the money had been taken from him, he had been thrown into the street. The police are piqued at the success of the crime, and are making extraordinary efforts to detect the thieves but up to now without avail—Cor. *Jewellers' Weekly.*

THE WESTMINSTER CLOCK.

Mr. S. Fawcett some time ago delivered an interesting discourse on the largest steeple clock in the word, the Westminster clock, which was constructed by Sir Edmund Denison in 1854. Admirers of this gentleman tried last year to hold a thirty years' celebration, or something of the kind, but we believe the proposal did not meet with favor in horological circles. The following are the most interesting data from his lecture: The clock, the frame of which is 16 feet long, and 4½ feet broad, and whose flies rotate more than 20 feet above the head of the visitor, is wound and kept going at the cost of £100 per year. The striking train is also wound by hand—an operation, which, for the two trains, is performed twice a week and lasts two hours each time. The first hour stroke resounds when the large hand has reached the sixtieth division line, and each stroke lasts about five seconds. The clockwork moves almost noiselessly. A very large arc (2¾ degrees on each side of O) was taken for

the pendulum, whereby it is regulated, not by the difference of temperature, but by that of barometric pressure. The clock has four dials, each 21½ feet in diameter. In each half minute the large hand moves nearly seven inches forward. The going train runs eight and a half days. The hour gong, introduced in 1857, measures 9 feet in diameter, is 8¾ inches thick, weighs 13 tons and 11cwts., and sounds in E. Its hammer weighs 7 cwts. Besides this there are four other gongs (bells) in the tower connected with the clock, weighing from one to four tons, which are struck by hammers weighing from 56 to 175 pounds, and sound in B, E, F, G. The large hand is 14 feet long, and its weight and counter poise are about 200 pounds. The hands are of copper, and of tubular shape. Dials and hands cost £5,334, or about one quarter more than the cost of the entire clock with striking train. The figures upon the dials are two feet long. The pendulum is perhaps the largest in the world.

EDITORIAL NOTES.

SPECIAL NOTICE.

Jewelers throughout Canada will oblige the Editor by sending into this office for insertion in these notes any items of news pertaining to the Jewelry business that they think would be of interest to the Trade generally.

J. A. GIROUX, jeweler of Granby, Que., has assigned with about $2,000 liabilities.

TRADE, although dull, has improved somewhat during the past month. Collections, however, are dull, and money reported scarce.

MR. A. S. CUTHBERTSON, one of the head pushers in the establishment of Messrs. John H. Jones & Co., of Montreal, was in the city last month.

MR. SHERRY, representing the Brooklyn Gold Case Company, and Mr. Fahys, representing Jos. Fahys & Co., of New York, paid Toronto a business visit last month.

MR. WM. EAVES, of Montreal, in correction of a paragraph in last month's issue, writes us that he is the oldest jewelry jobber in Canada, having commenced business in Montreal in 1859.

S. SYDENBURG, jeweler, of Yonge St., Toronto, was committed for trial by the police magistrate last month, on the charge of knowingly purchasing stolen goods.

MOSELEY LATHES.—We direct the attention of our readers to the advertisement in another part of this issue of the celebrated Moseley Lathes for watchmakers' use. They are away up at the top.

THE PREMISES OF L. N. DORION, jeweler of Hull, Que., was destroyed by fire last month. We understand that he was partially covered by insurance.

MR. DAVID THOMPSON, the well-known jeweler of Hamilton, has been recently admitted as a partner in the wholesale firm of E. J. Thompson and Co. of that city.

A. E. EDWARDS, jeweler, of Montreal, has assigned with liabilities of about $3,000, due principally in England. The probability from present appearances is that the estate will pan out very poorly.

WE CONGRATULATE THEM.—At a late meeting of the directors of the American Waltham Watch Company, Mr. E. C. Fitch was elected president pro tem., and Mr. Irving Smith, of Boston, was elected a director.

WE ARE EXTREMELY SORRY to learn that Mr. Charlie Ellis, of the firm of P.W. Ellis & Co., lost his eldest son last week from diphtheretic croup. We are sure he will have the sympathy of the entire trade in his bereavement.

FAHYS INLAID CASES.—We direct the attention of the trade to the price list of the Fahy gold inlaid cases sent with this issue as a supplement. By some oversight it was omitted when the association list was published, but as it has been made exactly the same size, it can be pasted into the book without impairing its symmetry.

OUR ESTEEMED FRIEND Mr. W. J. Porte, Picton's oldest jeweler, called at this office about a week ago, to say "how do you do" to THE TRADER. It is needless to say that we were very much pleased to see Mr. Porte looking so well and to assure him that we were always glad to have him call.

GONE TO EUROPE.—Mr. Herman Levy, of the firm of Levy Brothers, of Hamilton, sailed for Europe last month for the purpose of purchasing goods for his firm. He expects to be absent about three months, and the trade may look for a fine assortment of goods when his firm gets ready for the fall trade.

HENRY W. JAEHNE, the New York alderman, recently convicted of bribery, and sentenced to nine years in Sing Sing, was formerly a jeweler. It may be that the jewelry business was not a very profitable one, but it was at least honest, and would not have landed him in prison had he properly conducted it.

E. SCHEUER, wholesale jeweler of Toronto, has just returned from New York, where he has been laying in an immense stock of jewelry and clocks. He proposes making clocks one of his specialties, and intends to keep an assortment so complete that his customers can have their orders filled from stock without any delay.

SNATCH THIEVES have been going through Montreal jewelers pretty thoroughly lately, and can count amongst their victims R. W. Stoddard and L. O. Paradis, from both of which gentlemen they made a haul of watches and rings. We trust that the police may get these scoundrels into their clutches and make an example of them.

NEW HUNTING PERFECTION CASE.—The new 3 oz. Hunting Perfection Case manufactured by the American Watch Case Company of Toronto, seems to us to be just about all that its name indicates, and we should think that it will very shortly become the leading cheap case of the trade. In our opinion it is the best cheap case we have ever seen for the money.

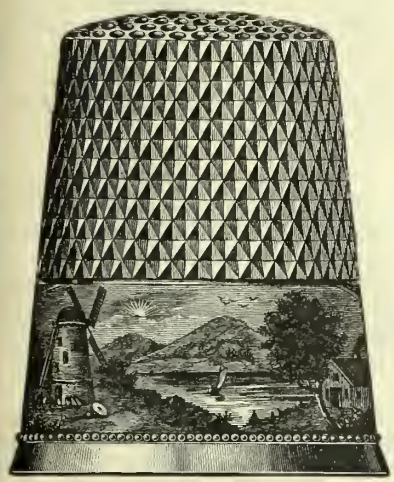
HYMENIAL.—Mr. W. G. A. Hemming, senior partner of the firm of Hemming Bros., the well-known case manufacturers of this city, was married last month to Miss Smithers of Montreal. THE TRADER, in conjunction with Mr. Hemming's myriad friends in the jewelry business throughout Canada, sincerely wishes himself and bride, long life, health, and prosperity.

MR. 4 SINGER, the late genial missionary of the Waltham Watch Company in Canada, writes us from Chicago, Ill., U. S., to say that he still lives. His many friends amongst the craft in Canada will be pleased to hear this, and the further news that he prospers. Not wanting to lose sight of his Canadian friends he wanted to have the TRADER sent to him regularly.

THANKS.—Regarding the publication of "Excelsior's Articles" our best thanks are due to Mr. A. Moffatt, jeweler, of Port Elgin, for his kindness in furnishing some of the missing journals containing them. Mr. Moffatt has an almost complete file of these articles, and thoroughly endorses our opinion that they are invaluable to any one who desires to become a first-class workman.

COMPLIMENTARY.—John C. Dueber, the well-known watch case manufacturer of Newport, Ky., was banquetted by his fellow citizens last week. Mr. Dueber has been talking for some time about moving his factory, but from the complimentary remarks of the speakers at this banquet we should say that if his townsmen have their way, the Dueber Manufacturing Company won't leave Newport.

MR. CHAS. E. HAYWARD, of the firm of C. E. Hayward & Co., died last month at the ripe age of 62, of congestion of the lungs. He was one of the Pioneers of the jewelry manufacturing business in America, having started in 1851. He was upright and honorable, and one of Attleboro's foremost citizens, and his loss will be keenly felt by that city. The business will be carried on by the remaining partners.



A CHANCE TO VISIT TORONTO.—Jewelers who want an excuse to visit Toronto will wait a long while before they find a better one than that afforded by Hanlan's Regatta, on Friday and Saturday, the 4th and 5th June. In addition to the fact, that with the exception of Teemer, all the first-class oarsmen of America will compete in the single and double scull races, the railroads have made special excursion rates which are very favorable.

THE complete and elegant catalogue of watch materials recently issued by the *American Waltham Watch Company*, is intended for

SIMONS, BRO. & CO.

Address all Orders to Factory

: CLOCKS :

TO THE TRADE

OUR attention has been called to the letter written by the Ansonia Clock Co. to a local firm, and published as an advertisement in the "Globe" of the 20th inst. We have not the slightest fault to find with the letter, and we do not dispute the facts contained therein; on the contrary, we are exceedingly obliged for the free advertisement, and beg to return our sincere thanks for same.

ALL WE DESIRE IS THIS, THAT THE TRADE OF CANADA WILL UNDERSTAND

WE ARE STILL IMPORTING OUR USUAL LINES OF ANSONIA CLOCKS

And so long as our prices are right we presume it is a matter of supreme indifference to the trade whether we buy the goods from Factory direct or not. We claim to be the

OLDEST AND LARGEST CLOCK HOUSE IN CANADA

And the trade can rely on obtaining the most desirable goods from us. In not confining ourselves to any one Factory we are enabled to supply our Customers with the most desirable lines of each, an advantage readily appreciated by Dealers. We handle clocks manufactured by the following reliable and well-known Companies:

NEW HAVEN, SETH THOMAS, WELCH, TERRY, INGRAM AND ANSONIA.

H. A. NELSON & SONS,

MONTREAL HOUSE:
59 TO 63 ST. PETER STREET.

TORONTO HOUSE:
56 TO 58 FRONT ST. WEST.

P. S.—Illustrated Catalogue of Clocks will shortly be ready for distribution.

gratuitous distribution to all watchmakers. The company have had copies of it mailed to all dealers in watches, but many have been returned on account of misdirection. Those dealers who have not received the book should apply for it to the general agents of the company in New York, who will forward it free of charge.

WATCH BUTCHERS.—Speaking of the trade rivalry between two opposition jewelers in Lowell, Mass., which will apparently last until one of them fails in business, the daily paper of that place says: "In the meantime, anybody who wants a watch spoiled can have it done for a dollar by either men." There is more truth than poetry in this sentence, and there are towns in Canada whose jewelers might without any impropriety think over it and lay it to heart.

A RESTITUTION BILL.—Representative Hemphill's restitution bill proposes to give back all the rebel jewelry confiscated during the late rebellion in the United States. This is all well enough as far as it goes, but as much of this jewelry has become old fashioned and depreciated in value, who is going to recoup the owners for this shrinkage? If the claimants are anything like the U. S. jobbing jewelers, Mr. Hemphill will have to add a rider in the shape of a rebate bill.

ELLIS' WATCH CASE CATALOGUE, to which we referred in our last issue has evoked golden opinions from the trade throughout the country. Besides being an excellent help in ordering stylish goods, it is, on account of its printed retail prices exceedingly helpful in making a sale where the jeweler has no goods in stock exactly suited to the wants of his customers. It is a credit to the Canadian trade, and we trust that its energetic publishers may reap a large return for their enterprise.

O. G. MARTIN the jeweler of Blyth, Ont., who was tried at the Guelph assizes last month for passing counterfeit money, was found guilty and sentenced to two years' imprisonment in the penitentiary. Mr. Martin is said to be a smart capable mechanic who could have done well at his business had he stuck to it properly, and it is a pity therefore, that he should have allowed a desire to get wealth without honestly working for it get the better of his judgment and lead him into such a disastrous scrape.

MR. FRED. CHINNOCK, the well-known jeweler of Napanee, called on us last month when in the city. We were glad to hear that having been level headed enough to carry plenty of insurance, his loss by the late fire in that town has not affected him beyond a temporary disarrangement of his business. If anything were wanted to enforce the lesson of "adequate insurance" it is the contrast between such business foresight as Mr. Chinnock has exhibited and the case of some of the other sufferers by the same fire who have been practically ruined by it.

HOWARD WATCHES.—The Howard Watch Company of Boston Mass., U. S., have determined to make a strong bid for Canada trade, and to accomplish that object have given the general agency of their goods to Messrs. Smith & Patterson, wholesale jewelers of Boston and Montreal. The merit of the Howard Watch is too well known to need any commendation on our part, and the trade may therefore rest assured that although they do not pretend to take the place of the ordinary American movements, nothing can be found superior to them for the finest class of trade.

MR. GEORGE CHILLAS, the indefatigable secretary of the Canadian Association of Jobbers in American Watches, has just issued to the wholesale trade a very neat and complete list of Canadian retail jewelers. As this list has been revised and corrected by half a dozen of the best posted jobbers in Toronto and Montreal, THE TRADER proposes to use it as a mailing list in future. We propose to make this a journal exclusively for the use of jewelers and to send it to jewelers only, and any *bona fide* jeweler engaged in business can get it free of charge by dropping us a line to that effect and enclosing his business card at the same time.

A HEAVY SUIT.—Mr. Charles Stark, jeweler, of Toronto, has issued a writ against the American Watch Case Co., of this city, claiming from them $25,000, on account of their assisting to boycott him from purchasing watch cases and movements. This case involving as it does the right of manufacturers to sell to whom they please, is the most important jewelry suit that has ever come before the Canadian courts, and its result will be carefully looked for by the retailers throughout the country, who claim that their trade has heretofore been much damaged by the very low prices Mr. Stark's direct purchases from the manufacturers enabled him to sell at. As the case is now before the courts we shall in justice to both parties reserve any comments until after it has been decided.

THE *Globe* ON THE LABOR QUESTION.—The *Toronto Globe* has for some time been endeavoring to trim its sails so as to get the support of both Capital and Labor. Its symposiums on the Labor Question has brought out so many and such irreconcilable views that any other journal would hesitate to tackle the contract of reconciling them. The *Globe*, however, is apparently equal to the task, and at the present time it assumes that it has them both well in hand although they are like steeds that are galloping in different directions. This trying to run with the hare and hunt with the hounds is about played out in Canada, and if the *Globe* don't get its backbone stiffened up somewhat before the elections come on, it will be the laughing-stock of both parties. Political jelly-fish are a luxury this country can't afford.

LORNE ON CANADIAN POLITICIANS.—A good deal of bombastic nonsense has lately been shot off by the partizan press of this country, in reference to the observation of the Marquis of Lorne that the strong endorsation of Canada regarding Home Rule for Ireland should not all be taken for Gospel, but should be appraised by England at its real value. He pointed out that as both the political parties in Canada were fishing for the Irish vote, neither of them dare refuse to vote for such a resolution as Mr. Blake lately brought before the House of Commons.

For this manly, common sense view he has been soundly taken to task by all, and sundry of the regular political hacks in the country, and told very plainly that although he had lived in Canada so many years his knowledge and experience of its politicians was of no value whatever.

As a matter of fact, we strongly concur with the Marquis of Lorne's view on this, as on many other questions, and were Canadian journalists as honestly outspoken about this subject as about dunning up delinquent subscribers, they would tell a very different story. At the present time of writing it looks as if common honesty were a missing plank in both the political platforms of our Canadian politicians.

THE DEATH OF HORATIO MOORE.—*Waltham, Mass.*, April 29th.—Horatio Moore, president of the Waltham Watch Company, and for many years an honored and useful citizen of Waltham, died here yesterday evening in the seventy-sixth year of his age. Mr. Moore was born in Bolton, Mass., in 1810, and from early youth till the present, his life has been one of great activity. At an early age he was appointed agent of the Newton Chemical Company, which position he held for thirty years, and when the corporation gave up business, seventeen years ago, he was entrusted with settling up its affairs, which involved the marketing of a large quantity of land.

He was president of the Waltham Savings Bank from the time of its incorporation in 1853 until about two years ago. In 1847 he was elected a member of the Board of Directors of the National Bank, then a State Corporation, and held the office continuously up to 1879, a period of thirty-two years. He also ably represented the town in the Legislature in 1851-52-53-56-59. In 1876 he was elected president of the American Watch Company, a position which he has since held, being re-elected at the last annual meeting held only a few weeks since. In addition to his official position he was also a heavy stockholder in the concern. Mr. Moore had been in feeble health for some time, but his death was unexpected. On the 24th of this month would have occurred the golden wedding of Mr. and Mrs. Moore, and great preparations were being made by children and grandchildren to celebrate that event. —*Jewelers' Weekly.*

FISH.—When Brother Jonathan found that he had to pay Canada three-and-a-half millions for the privilege of fishing in Canadian waters, the down-east portion of him at once set up a howl that the award was a gigantic fraud, and that the privilege was not worth that amount for all eternity. In fact, an outsider not knowing who was doing the howling, would have imagined that it was an insult to insinuate that Brother Jonathan wanted any of our fish at all, much less to pay for the privilege of catching them. Now, however, that the treaty has expired by effluxion of time, and this same Brother Jonathan has been refused the chance o-

GOLD AND PLATED JEWELRY.

catching our fish unless he pays for it, he is madder than ever. He has cleaned up the "Sword of Bunker Hill" and "the Cannon of 1812," and scorning all assistance from the rotten monitaurs and ironclad war-vessels of the regular navy, has fitted up a fishing schooner with them and will very soon blow the Royal Canadian navy out of the water.

The whole affair is simply a big piece of blow and bluster of which any great country, such as the United States of America undoubtedly is, should be thoroughly ashamed. We hope, however, that the usual good sense of its people in general will sit on the aspiring senator from Maine, and the greed of the small section of "down Easters" who want not only to steal their neighbor's fish, but to make the price higher to to their own countrymen by keeping out all opposition.

Although the people of the United States are now beginning to realize the fact that the Canadian fisheries are of considerable value, they may as well make up their minds that they are not going to get a share in them without paying a fair price for it, whether the equivalent be in reciprocity or in coin. All that Canada wants is fair play, and that she is determined to have, and no amount of bluster from Senators Blain or Fry, or others of that ilk, will put the jug-handled Yankee policy in force. Canada is now old enough and strong enough to look after her own interests and she proposes to do this, no matter whose corns she treads on.

WORKSHOP NOTES.

ARTIFICIAL CORAL.—An artificial coral mass can be made from four parts yellow rosin, and one part vermilion, melted very fine.

TO DRILL PEARLS.—The easiest way to hold pearls, in order to drill and otherwise work on them, is to fit them loosely into holes bored into a piece of wood. A few drops of water sprinkled about the holes causes the wood fibres to swell and hold the pearls firmly. When the wood dries they fall out.

WASHING SILVERWARE.—Tell your customers never to use a particle of soap on their silverware; it dulls the lustre, giving the article more the appearance of pewter than of silver. When it wants cleaning, rub it with a piece of soft leather and prepared chalk, the latter stirred into a kind of paste with pure water, for the reason that unclean water might contain gritty articles.

POLISH YOUR PINIONS.—Although it does not affect the running of the watch, or may have nothing to do with its rate as a timekeeper, there is nothing that hurts the critical eye more than a badly faced pinion, more especially if it be a fine watch and the other pinions beautifully polished. An ill-faced, rough pinion, is not only an eye-sore, but it is evidence of a slovenly botch of a workman. A new pinion in this age of lathes can be so easily finished and faced that there can be no excuse for leaving it undone. Another evidence of botch work is leaving the shoulders rough and unfinished.

TO RECOVER THE PRECIOUS METALS.—The gold solutions (generally the cyanides) are poured into a porcelain recipient, and heated up to ebullition; stannite of soda is next added and boiling continued until the gold combined with tin forms a black precipitate, which is to be washed and dissolved in hydrochloric acid. This solution of the annic and stannic chlorides must be carefully evaporated, diluted with distilled water, to which a proportionate quantity of tartrate of soda and potash (Rochelle salt) then added, and heated, whereupon the gold contained therein will precipitate in form of a brownish-yellow powder. When working with a silver solution, it is only necessary to boil it with stannite of sodium.

WORN CYLINDERS —Many reasons have been given to explain the rapid wear of a glass-hard cylinder, which is largely due, perhaps, to the hardness of the scape wheel, and the gold or brass scape wheels, formerly used, have lately been replaced by those made of steel. A soft wheel, strange though it may sound, will wear the hardest cylinder, because the soft metal will soon lose its polish on the points, become rough, and dust and oil will act as a grinding agent, while the soft, roughened wheel tooth answers in place of a permanent grinding file. A soft cylinder and a hard scape wheel will produce the reverse; we here have the tooth points that suffer, while the cylinder remains unharmed—an occurrence which is not half as injurious. Both parts must unconditionally be glass hard, and at the rubbing parts have a high fine polish.

OTHER NOTES.

ANOTHER MONSTER CLOCK.—The largest clock in Switzerland is that situated in the St. Peter's steeple, Zurich. Its dial has a diameter of 28½ feet, and the large hand advances 17¾ inches every minute.

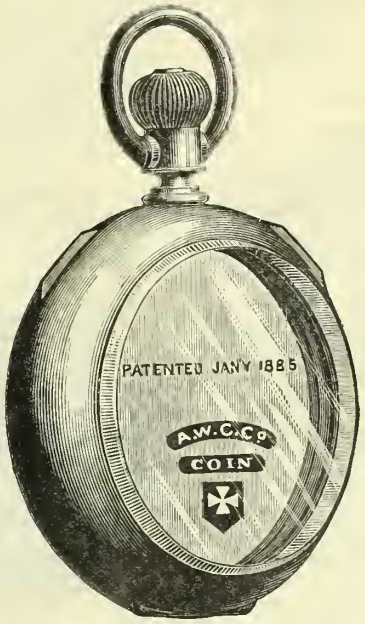
TARDY RECOGNITION.—In an assembly held at Chaux-de-Fonds, Switzerland, the question was debated whether it be profitable to advertise judiciously, and it finally concluded that the American watch industry owes all its success to extensive advertising. "Jes' so," gentlemen, together with a reliable first-class article to advertise. "First catch your hare, then cook it."

SOMETHING NEW.—A clock maker of Beziers has devised a means of giving the time simultaneously in every room in a house by an application of the electric bell system, in common use in Paris and elsewhere. The negative wire of the system is connected by a smaller wire with the pendulum portion of the clock train—any clock will answer the purpose, provided it strikes while the positive wire is made to pass just above the hammer of the clock, when the hammer rises to strike, it touches the wire, the circuit is closed, the current passes, and proceeds to act simultaneously on all the bells, alarms, etc., in the circuit.

MATERIALISM.—Samuel Pepys, a distinguished officer of the English navy under Charles II. and James II., and one of the shrewdest and most erudite scholars England ever possessed, once received the present of a pair of splendid flagons, costing £100. His vanity was pleased with the display before his friends, but note the sequel: "Weighed my two silver flagons at Stevens'; they weigh 12 ounces, which is about £5 at 5s. per ounce, and they judge the fashion to be worth about 5s. per ounce more, nay, some say 10s. an ounce for the fashion, sorry to see that the fashion is worth so much, and the silver come to no more."

EVERYBODY'S TIME.—To suit the whims of everybody in these times of universal time, Mr. Th. Bringolf, of St. Imier, has constructed a watch, the dial of which is divided into four kinds of time: We first have the ordinary division, 2 revolutions, each of 12 hours; the second divides the day into 24 hours, from midnight to midnight; the third conforms to the decimal system: the day into 10 hours, the hour into 100 minutes, the minute into 100 seconds. Finally, the last divides the day into 20 hours, the hour into 50 minutes. Not content with this, the dial contains two small hands, one of which marks the seconds according to the duo decimal system, the other conforms to the decimal. All hands are actuated by the same barrel. Take your choice gentlemen.

OPTICAL Telegraphy is sometimes like a sort of advanced guard to the electric system, which it completes by penetrating into regions where lines would not be safe. This is the case for instance, in Algeria, where Capt. Chilly and some military officers have been recently engaged on a mission of optic telegraphy. Each point of the extreme south is now connected with an electric telegraph station, so that a message sent in the evening from Negrine reaches Constantine next morning. Previously it took three days to convey a message to the nearest telegraph office. Between Negrine and El-Oued is about 93 miles, and the apparatus set up at Negrine throws the light (solar or electric) this great distance. The Arabs are astonished at the light, and are, of course, powerless to intercept it. *L'Electricite* expresses a hope that ere long the Niger will be reached with the system in question, and St. Louis connected with Algiers.



A POPE AND A KING EXCHANGE GIFTS.—In 1537 Charles V. paid a visit to Rome, and the Pope thought to make him some extraordinary present. Cellini suggested a gold crucifix in which he could utilize the statuettes and ornaments of his beloved chalice, but Paul decided to give a superbly illuminated missal, and Cellini was to make the cover, which was to be of gold, adorned with jewels worth about six thousand crowns, and he was also deputed to be the bearer of the present to the Emperor, who reciprocated the Pope's gift by a diamond which had cost him twelve thousand crowns, which Cellini afterwards set as a ring for Pope Paul. But he complained that he was not paid commensurately for his labor, either in the ring or the book cover, so he determined to go to France, and finally accomplished the journey, wonderful to relate, without any marvelous adventures, but only the ordinary incidents of travel.

The Only Absolute Guarantee of Quality

IS THE INTEGRITY OF THE MANUFACTURER.

THE AMERICAN WATCH CASE COMPANY, of Toronto, guarantee every case bearing their trade mark, no matter by whom sold.

OUR CANADIAN PATENT FOR THE PERFECTION CASE WAS ISSUED JANUARY 15th, — 1886. —

OUR NEW 30z. PERFECTION O. F. OR HUNTING CASE NOW READY. ASK YOUR JOBBER FOR THEM.

THE PERFECTION

Dust Proof Watch Case, although placed by the American Watch Case Co., of Toronto, upon the Market two months ago, has already been pronounced by expert Watch Dealers to be

THE BEST AND CHEAPEST WATCH CASE EVER MADE.

The Perfection has been specially designed with a view to make a Watch Case which would at once be cheap in price, and at the same time afford sufficient protection to the movement. This idea has been admirably carried out by taking the excess of Silver from the centre and placing it in the backs, which will be found extra firm and heavy. Although the cheapest Watch Case ever made, it is warranted to give satisfactory wear. Ask your Jobber to show them to you; it is money in your pocket to handle them, therefore take no others instead. Every "Perfection" Case we manufacture bears our stamp and registered Trade Mark as above, and is fully guaranteed as to quality, no matter by whom sold.

OUR NEW PATENT UNBREAKABLE PENDANT SET.

☞ Dealers will please notice that we are now fitting all of our *regular* Open-Face Stem-Wind Cases with our new Patent Unbreakable Pendant Set, the simplest, strongest and best device for the purpose ever invented. They are made so as to take any regular American Full-Plate Movement with Female Winding Pinion. Our 3 oz. S.W. Perfection cases are also fitted with it.

WISE AND OTHERWISE.

WHEN may a man be said to be a book?—When he is a tome.

THE first thing is to make your sermon plain. Mr. Bloomfield preached on the text, "The fool hath said in his heart, There is no God." Wishing to find out how it pleased his people, he called a poor foolish man to the pulpit and asked him how he liked the sermon. The reply, which made Bloomfield a sadder and a wiser man was: "Well, sir, I must say I can't agree with you. In spite of all you've said, I think there must be a God."

A COUPLE stood before a jewelers' the other evening, when the young lady remarked—

Gawgie, don't you think there is something perfectly lovely about those clocks?"

"What do you admire so much about them?" he asked.

"Why don't you see, they—they name the day?"

The future will tell if Gawgie tumbled.

OUTWITTED.—"No darling," George was saying to her as they walked along the brilliantly lighted street. "I have never loved as I love now. You are the only girl for whom I felt that deep longing that is born of true love. And in saying that I am not guilty of—"

"Chestnuts," yelled a street-vendor.

George hurried away; but before he could gain full possession of his senses, she had pulled him across the street and said "Vanilla" to the waiter.—*Tid-Bits.*

"Prof." Dale of Binghampton, N. Y., recently "broke the world's record," by swinging Indian clubs four hours and fifty minutes. A young man in this town swung Indian clubs in his mother's parlor a few days ago, and, although he didn't break the world's record, he broke nearly everything else in the room, including the chandelier, mantel ornaments, two plaques, a statue of Minerva, his own head and one of the commandments. If the world's record had been within reach of his clubs he would have broken that too.—*Norristown Herald.*

OUR HELP COLUMN.

THE TRADER aims to be of practical value to the Retail Jewelry Trade.

NO CHARGE is therefore made for advertising in this column, but the subject-matter should not exceed five type lines, or about 60 words.

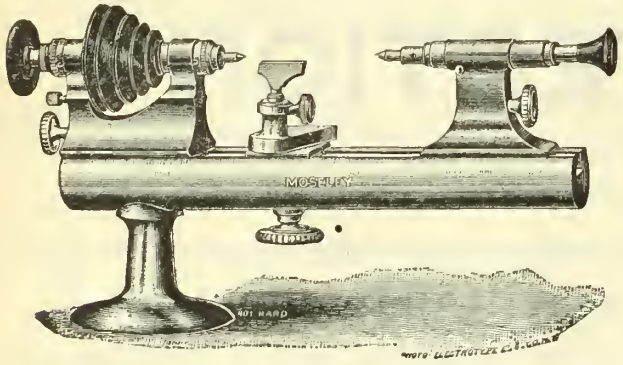
When requested, these advertisements will be published in successive numbers of the paper.

If you have a Store, Stock, or any Special Article to sell; if you wish to buy an Established Business, or enter into Partnership; if you want a Journeyman, Clerk, Salesman, or Foreman; if you want a situation yourself—communicate the fact to THE TRADER PUBLISHING CO., 57 ADELAIDE ST. WEST, TORONTO, and it will be inserted in this column free of charge. This is the only way by which you can reach the entire Trade, and we shall be glad to help you.

A WATCHMAKER wanted. A practical man, temperate, of good moral habits, with good references, can get a situation with me at once. Address, LEONARD MORRIS, Summerside, P.E.I.

JEWELRY BUSINESS for sale, on a leading thoroughfare in the City of Toronto. Large double fronted store (could be partitioned and made into two separate stores if necessary). Stock and fixtures about $500. Established 13 years. For particulars, apply to P. W. ELLIS & Co., Wholesale Jewelers, Toronto.

WATCHMAKER in need of situation. Best of references. WM. SCOTT, care of A. Attwood & Son, Hamilton, Ont.



7 FINE GLASS SHOW CASES FOR SALE VERY CHEAP; ALSO ONE WALL SHOW CASE. Must be cleared out. THAYER & Co., 3 Wellington Street, Toronto.

NEW STYLES FOR 1886.

The above illustration is a sample of my New Goods for this Spring's Trade. I am making a large variety of Silver brooches, and retail dealers throughout Canada will find it greatly to their advantage to send for samples and prices. I make and guarantee all the goods I sell, and you will find my prices lower than any other House in Canada. Call and see me when in the city..

GUARANTEE NOTICE.

All Spoons and Forks bearing the stamp

G. RODGERS, A 1

are made of the finest nickel silver and are plated and hand-burnished under my personal supervision, and standard of quality—each article is guaranteed perfect in finish and durability.

All Knives bearing the stamp

G. RODGERS

12 DWT.

are plated on the best English cast steel with pure silver, and are hand-burnished and warranted to give perfect satisfaction. The well known reputation that the name RODGERS has attained all over the world have induced other makers to adopt a similar name, calculated to mislead the public. See that the trade mark reads and is spelled G. RODGERS, A1, on Spoons and Forks, or G. RODGERS, 12 Dwt, on Knives.

SOLD ONLY BY

THE ACME SILVER COMPANY,

EDITORIAL.

POLITICAL MUDDLERS.

As a rule, our first-class business men don't bother their brains much about politics, and it is only when one or other of the political parties lays down some plank in its platform that is inimical to their interests that they take an active part in elections. The dyed in the wool Tory or Grit, that can always be depended upon to vote straight for the party ticket, is of very little account in an election, and politicians as a rule don't squander much ammunition on such game. The people who turn elections, and therefore those to whom both parties pay the greatest attention, are the men of independent mind, who, being without party ties, vote according to their own ideas of right and wrong. These men occupy the same position as a boy on the middle of the teeter, their weight on either side gives it a preponderance, and they are virtually the masters of the situation.

Some of our readers may wonder why a paper like THE TRADER, which is a purely commercial one, should at times apparently go out of its way to discuss political questions, and we may at once say that although we do not profess to dabble in politics, yet there are continually cropping up political questions which are also commercial questions, inasmuch as upon their correct solution depends in a great measure the future of the country. The question of a National Commercial Policy is the best example that we know of, for while it was made the real political issue in the federal campaign of 1878, it was also a commercial question that personally interested each voter in the Dominion.

We have more than once pointed out that the danger to the future of our country arises more from the feeling of unrest in our present political parties, than from any real trouble with the country itself. Both parties are looking round for an "election cry," and in our humble opinion neither of them care one-half as much for the welfare of the country as of their own party. It is not "What will be best for the country?" but "What will be best for our party?" and it is on this account, and from this direction, that independent and patriotic Canadians will have to look for the threatened danger.

As showing to what lengths party feeling will lead politicians, we have only to instance the insane and disloyal course of the *Globe* on the "Riel" question, or the defence of the iniquitous "Beaty scandal" by the *Mail*. Only the other day, the young Liberals of Toronto had a convention, and decided on a platform which they instructed their delegates to support at the National Convention of Young Liberals to be held at Montreal early this month. The platform of these young lads who are amusing themselves by playing at politics would scarcely be worthy of more than a passing squib, were it not for the fact that it has been written up by the *Globe* in such a way as to draw the fire of the other side in particular, and the country in general, in order to let the party see how public opinion is swaying. As usual, on all debatable questions, the *Globe* is strictly non-commital. Its editorial chair is securely perched upon the tip-top of the fence and is ready to execute its journalistic flop with grace, if not with dignity, whenever the exigencies of party shall demand it. In their present attitude they remind us very much of Biles, Artemus Ward's partner in the show business. Artemus said his partner had a well-balanced mind, for it balanced in any direction the public required. In a nutshell, this is the *Globe's* attitude on all debatable questions such as Independence, Commercial Union, &c.

Amongst the planks in the Toronto Young Liberals' platform which the *Globe* discusses and tacitly endorses because it does not repudiate them, are the following: "Canada's destiny is Independence," "Tariff for Revenue only," and "Commercial Union with the United States." A worse muddle than these three things we never heard of, and if the *Globe* or any one else can, outside of a lunatic asylum, show how Canada can have Commercial Union with the United States and keep up a revenue or any other tariff without becoming part and parcel of that "glorious Union" they are considerably smarter than we give them credit for. We could not possibly bring about Commercial Union with the United States until after we had secured Independence, and if Independence is only for the purpose of making Canada a tail of the United States' kite, we are afraid it will be a long time before it will have a majority of our people in its favor. Were the country to get all this, and as the *Globe* apparently desires, become a part and parcel of the United States, we think it would be a jump from the frying-pan of the *Globe's* bug-a-boo, the Canadian National Policy, into the fire of the protective policy of the United States, which is far more extreme than ours is at present.

Looked at from any standpoint, this political jumble is one which no one but a desperate and needy political party would ever sanction, and we trust that even if the *Globe* and its imitators do take it up, that the rank and file of the great Liberal party will repudiate its former organ, and fight for position from a sensible and patriotic platform. The day has gone past we trust, when a few *Globe* editorials can whip the party into line, and the course of Independent Liberals in supporting the Dominion Government on the National Policy, and the Ontario Government on Local questions, is one that not only reflects credit upon their backbone and common sense, but one which adds to the stability and good government of the country. Let our politicians once thoroughly understand that in order to carry the country, they have got to put forward good and patriotic measures, which independent thinkers can support, and the country will be safe from the political heelers and tricksters that have for so many years infested it and made public life a scandal and disgrace.

A BABY in a basket was found in the corner of a rail-fence in Pennsylvania the other evening. It is supposed to have been left there by Miss Stake.

ACCOMMODATION PAPER.

The danger which any merchant runs in giving accommodation paper is so great, and has been so often pointed out by THE TRADER, that we were in hopes no retail jeweler in Canada could be found weak enough in the back to countenance such a proposition from any jobbing house with which he dealt. We learn however, on good authority, that there is undoubtedly a good deal of such paper afloat amongst the jewelry trade, and that in consequence of a recent failure in the jobbing business, some of the easy going makers of such notes will have to pay pretty dearly for their good nature. We may not get the thanks of some of our readers for what we have to say on this subject, but it is of so much importance to the trade in general, that we think the justice of our remarks will be a sufficient reason for ventilating the subject at this juncture.

As we said before, it is unfortunately too true, that there are still jobbing firms in existence in Canada, who are in the habit of getting notes from their customers, for which no value has ever been received by the maker, and by this plausible but dishonest means bolstering up a rotten business long after it has become practically insolvent. When the after clap comes, and the firm is publicly declared insolvent, (which as a matter of fact they may have been for months or years previous), people read the list of victims of this vicious kite-flying system, and say they feel sorry for them. If they were bluntly told that they had been a parcel of fools and that the result was but a certain consequence of their own folly, it would be but the truth, and probably do these victims of misplaced confidence more real benefit than the pleasant but misdirected sympathy of which they are usually the recipients. But says one of the victims, "Although we knew well enough that it might be dangerous, we couldn't very well help it. The wholesale house we were dealing with asked us to give them our note as a favor, and as we sometimes require favors ourselves from them, we could not very well refuse, although we knew well enough we had never received value for it. Besides, they assured us that we would never hear any more about it, as they would take it up when due." A more absurd argument than this, when you come to analyze it in cold blood, could hardly be imagined, for in the first place, none but a weak house would ever ask or require to use accommodation paper. The very fact of a house being compelled to ask their customers to lend them their names on which to raise money, ought to be proof positive of its financial weakness, and in itself, the very strongest reason for refusing to grant it. It is quite true that they may intend when they ask it, and in many cases actually do take up such notes at maturity, so that their customers are never troubled about them at all, but this apparent security and freedom from risk only makes the danger greater by inducing recklessness on the part of the dealer, who naturally argues, that if he can put the jobber he deals with under an obligation to himself by so "cheap" a favor, it cannot be a very bad investment. When the assignee is in possession of the insolvent jobber's estate, and his victims are officially notified by the bank that they will be expected to pony up one hundred cents on the dollar for their accommodation notes, they begin to realize that they will have to pay pretty dear for their whistle. Unfortunately for all such, however, this knowledge comes too late to be of any service.

The ease with which wholesale dealers in fair credit can discount even inferior paper is often a great incentive for unfortunate or unprincipled men to resort to the use of notes obtained in this way. The danger, however, would be greatly lessened, if all retail dealers could be brought to understand and believe that with the aid of a good financier and a judicious use of accommodation paper, a business utterly rotten to all intents and purposes, can be floated on for years. In the end it must go down in the maelstrom of commercial bankruptcy, around which it has been so long circling, but, until the crash comes, it presents to the ignorant or unthinking outsider, a fair but deceitful appearance.

Our best advice on this subject to all dealers, whether wholesale or retail, and we cannot too strongly emphasize it, is to have a watchful care with whom you deal, especially in this matter of accommodation paper. Rest assured that a house that has to ask for it is a weak house and ought to be shunned. *Never give your paper to any firm, unless you owe them the money, and have received value for it.* If a merchant pays one hundred cents on the dollar for all the goods he actually buys, he does well, but he should never place himself in the position of being compelled to pay money for which he has nothing to show.

CORRESPONDENCE.

LINES ON THE CITADEL OF QUEBEC.

It rears its stately head athwart the arched blue skies
By kingly Nature grandly wrought, but man devised
The angry look to threaten foes with shot and shell like hail,
Who dared its own St. Lawrence, rushing seaward, waters sail.
But now it seems 'twould blush its angry look to own,
Its brow sweet smiles of peace long years have played upon,
As, when vain, angry ocean's waves grow weary of their roar,
Heaven's genial sun bedecks with dazzling radiance o'er,
Since Heaven's rich gift, blest Freedom's isle, spanned ocean to unfurl
Her conquering flag upon its heights. O, Flag, that sways the world!

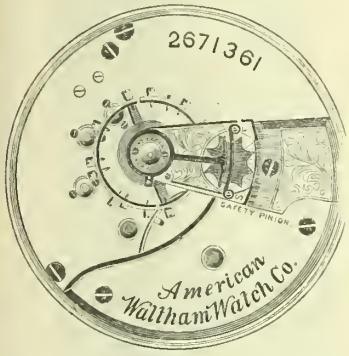
JOHN W. CAMPBELL

Editor TRADER.

DEAR SIR,—I have just received the May number of THE TRADER, which contains so much valuable information. I get a great deal of matter on Horology out of it. I have quite a library, but I must confess that THE TRADER surpasses them all and is destined to keep the lead. I have been receiving it ever since the start, and that free. I will gladly pay for such valuable information, as I am not too old to learn.

Yours very truly,
JAMES FRASER,
Watchmaker,
Vale, B. C.

PORTAGE LA PRAIRIE.



THE TRADER, *Toronto, Ont.:*

DEAR SIR,—I would rise to remark that I am getting proud of THE TRADER. It was my intention to rise some time ago, and while conveying this startling intelligence, to present an humble petition that you print "Excelsior's" articles. Of these I can with a great cloud of witnesses, bear testimony to their advantage to the body politic, as it were. Blacksmith and botchism, ignorance and prejudice flee away before the light of this Grossman's of American knowledge. I have his

AMERICAN WALTHAM WATCH CO

NEW NAMELESS 18 SIZE STEM WIND MOVEMENTS

HUNTING OR OPEN FACE.

No. 5.

GILDED MOVEMENT; thirteen jewels in settings; expansion balance; patent regulator. Eighteen size, Stem Winding, Hunting or Open Face.

No. 15.

GILDED MOVEMENT; fifteen jewels in settings; expansion balance; patent regulator; patent Breguet hair spring, hardened and tempered in form. Eighteen size, Stem Winding, Hunting or Open Face.

No. 25.

NICKEL MOVEMENT; adjusted; fifteen jewels in settings; expansion balance; patent regulator; patent Breguet hair spring, hardened and tempered in form; adjusted to heat and cold and in three positions, viz.: pendant, cock and dial. Eighteen size, Stem Winding, Hunting or Open Face.

No. 35.

NICKEL MOVEMENT; adjusted; fifteen ruby jewels in gold settings: expansion balance; patent regulator; patent Breguet hair spring, hardened and tempered in form; double sunk dial; adjusted to heat and cold and in all six positions. Eighteen size, Stem Winding, Hunting or Open Face.

ALL OPEN FACE MOVEMENTS ARE MADE PENDANT SETTING

THESE goods are regular full plate eighteen size, fitting any standard make of eighteen size cases, are of the newest models, and have all the latest improvements, numbers 15, 25 and 35 having the celebrated **Logan Breguet hair spring, hardened and tempered in form,** which is made only at Waltham and is **not to be found upon watches of any other makers in the world.**

They possess all the qualities of high grade movements and are offered at the usual prices of grades known to be much lower in quality.

They bear the name **American Waltham Watch Co.** only, and can be sold upon **their merits,** which, we believe will be more evident and acceptable to dealers and to the public than the fictitious value often claimed for goods of less established repute than Waltham.

We believe the market offers nothing of any other make to at all compare with these goods in such a rare combination of quality and price.

Dealers should **buy** them because they offer opportunity for profit.

Dealers should aim to **sell** them because they will give satisfaction to customers.

Prices will be found on Page 5 of Price-list issued by Canadian Association of Jobbers.

articles in back numbers of the *Circular*, but believe it would be for the best interests of the Canadian trade, who require the services of skilled workmen, to educate them by such articles. I am proud, too, of THE TRADER's new form and neat get up, able editorials and newsy columns, and though it may not be as large as the *Jewelers' Circular, Watchmaker and Metal Worker* and *Jewelers' Journal*, all of which I take, nor as prolific as the *Jewelers' Weekly*, or *Manufacturing Jeweler*, it is to me now just as interesting. Formerly, I looked upon it as the organ of hardware and kindred trades, now as a full-fledged watch doctor and perambulating jeweler. You have my blessing. Take as your motto "Faugh a Ballagh," and press on to victory. Our greeting shall be "*Ceade Mille Fealthe*," "*Erin go Bragh*," "*Ne Plus Utram Excelss*," "*E Pluribus Unum*" and much good will result to the trade from your bold step.

Respectfully yours,

H. WOODSIDE.

A PRACTICAL TREATISE ON

THE BALANCE SPRING.

Including Making, Fitting, Adjusting to Isochronism and Positions, and Rating, also Adjustment for Heat and Cold.

BY EXCELSIOR.

PART I.

(14.) The screw or piece by whose color we are guided should be hardened, as hard steel colors more rapidly, or with less heat, than a soft piece would do, and consequently there is less danger of reducing the temper too low. Some makers color or heat their springs once only; others clean the bluing off the color piece and blue again; some even heat their springs five or six times. My own opinion is that if the spring has been properly made, hardened and polished, one bluing is sufficient. But if it has scaled in hardening, or minute imperfections, roughness or cracks are feared, it will be safer to heat twice, but never more than three times. If the spring, after that, breaks under the test named in (12), it may be considered imperfect, unless it was packed in animal charcoal, when it will break even after the sixth bluing if bent cold. Such a spring, if smooth and perfect, may be blued three times, and will be sufficiently soft. It is understood, of course, that the color-piece requires a greater heat to bring it to a blue the second time than when it was hard, and still greater the third time, so that in reality it will be reduced to a lower temper or made a little softer at each bluing, although the color is exactly the same each time. This is also the case with the spring; but this need not be whitened after each heating, nor even loosened (if on a block) till done.

(15.) Another point is to avoid what are known as false colors. The color-piece, or some part of it near the middle of the whole mass, if practicable, is first ground off with the oil stone, or even Scotch gray. This bright spot must then be slightly dimmed again, by rubbing the finger over it once or twice before coloring, for the degree of temper cannot be closely judged from the color of a very bright piece, as will be found by trial. In coloring flat springs, as hereafter directed, the color-piece may be screwed in the center of the plates, holding them together, or in the centre of the spring-cover of the bluing-pan, and the heating should be very slowly and evenly done, the center of the hair-spring resting just in the center of the pan, and the cover also being central.

(16.) Before leaving the subject of coloring springs, I may add that it furnishes us a ready means of discovering whether they are equally hardened or not. For instance, if the wrapping (10) touches the spring in some places and does not in others, the former will be harder when quenched. So if the wrapping is lapped on one side and thicker than on the other, the spring will not be so hard in the former places as in the latter. This we may test after cleaning the block, but before loosening the spring, by arranging the block to revolve freely between the centers of the "turns," then suspending a trough or half cylinder of sheet copper under it, reaching up on each side, protecting it from the blaze, but leaving the upper half exposed to view. Now apply the heat to this copper trough, which in turn will communicate it to the block, and the latter will be heated more evenly than could be done by applying the blaze directly to it. The block must be constantly turned by a piece of peg wood, and the lathe centers loosened up when it expands. When the spring reaches a purple in its darkest part, take away the lamp and trough, still turning the block till it has cooled somewhat, when an examination will reveal any inequality of temper. Any soft places will be indicated by a lighter color, in spots or streaks, according to its cause. Even the course of a carelessly applied binding wire may be traced. Should any such appearance be found, it must not be passed over as a slight matter, for it is proof positive that the spring is incapable of fine performance, and it must either be re-hardened, or, if it has been scaled in the first hardening, it must be rejected entirely and a new one made.

(17.) *Making flat spiral springs.* Spiral hair-springs are made on a tool which slightly resembles a winding-arbor, one end being held firmly in the sliding tongs. Instead of a ratchet wheel there is a round piece of flat brass or platinum, one-half inch in diameter, fast on the arbor, and another similar plate which can slide on the arbor as its center, with a nut outside to screw it up towards the first one. Between these two flat pieces a space is left equal to the breadth of the proposed springs to be made. The arbor has a shoulder between these pieces, and two or three slits are sawed down into this shoulder in the direction of its length, with a fine saw. Two, three or more springs are wound up at once, the number depending on the space to be left between the coils of the spring when finished. The fewer springs wound up at a time the closer the coils of each will be. In making Breguet springs, only two are wound up at once, so that the coils shall be very close together.

(18.) The wire being cut into lengths of six or eight inches, or enough for a spring, the ends are fitted snugly in the slits in the shoulder, singly or together, the loose plate slipped on the arbor, which keeps the ends of the wire in their places, and the nut screwed up so as barely to leave the wire free between the plates. The pieces are then laid straight, and a pair of hand tongs or other weight clasped on the outside wire, which, hanging down from the winder, presses on the coils as the arbor is turned—the different wires being prevented from twisting, and occasionally pulled a little to insure close coiling. When the wire is all wound up, take hold of each piece in turn with the pliers, commencing with the one at the center, and pull gently on it to be sure that all is tightly coiled up, and fasten the end by twisting it sideways over a notch in the edge of the plate fast on the arbor, something as thread is fastened on a spool.

TRADE MARKS.

HOW TO BUY, WHAT TO BUY, FROM WHOM TO BUY.

That is the question, and it is easily answered. You should buy closely those things which sell best, and from the parties in whose integrity you have implicit confidence.

Watches are the staples of the jewelry trade, and no retailer can do a healthy, paying business unless he deals only in reliable goods and sells them at honest prices. No matter what movements you prefer, you can make more money by handling the Gold and Silver Cases made by the American Watch Case Co. of Toronto, than any others, because they are so much lower in price that you cannot hold your trade without them. Every Case bearing any of their trade marks is fully guaranteed to be of the quality stamped upon it, and they excel all others in finish and excellence of workmanship. Ask your jobber for them, and take no others.

If there is any doubt about the close coiling, pull the pieces again. Then screw the nut up tightly, to insure the coils being in a true plane, and heat the whole slowly and evenly, to blue the springs, and cause them to "set" in that form. When cool the springs are finished, if they are to be left soft.

(19.) But if they are to be hardened and tempered, they are placed either singly, or in a mass as made, between two flat pieces of brass, provided with steady-pins to prevent shifting or sliding, and tightly screwed together, then made red hot and treated as before described for helical springs, except that the polishing is done by passing a wire through the center of each to hold it while rolling it on a polishing block of bell metal with red-stuff or "sharpe." Some use a stick with a conical end to hold the spring upon, and scour it with a tooth brush. The stick is held in the left hand, its point in the center of the spring, which is stretched down over it into a shape similar to that of a hoop skirt, and kept in that position by the thumb resting upon it. The insides of the coils are polished by sharpening a piece of peg wood and forcing the spring into the same shape, while resting it on a flat piece of cork, rubbing it by moving the stick in both an oscillating and lateral direction, very carefully, to avoid bending the coils. The edges are polished by rubbing the spring around on a piece of smooth paper, by means of a cork pressed gently upon it. In all cases the polishing powder should be plentifully supplied. Springs should not be polished any more than necessary to obtain a clean smooth surface, lest some parts should be reduced more than others and cause irregular action. It is then blued in the bluing-pan, which is simply a flat brass disc on which the spring is laid and held down in close contract with it by a piece resembling a three-arm watch balance, on the end of a lever pivoted so that it is pressed down by a spring, but can be instantly raised by the finger on the other end of the lever. In Fig. 1, *a* is the cover, attached to the lever which is pivoted at *b* to the upright standard rising from the bottom piece, and held down by the spring *c*. When the desired color is reached the finished spring is thrown off to cool. See coloring, (12 to 16). In making the very finest quality of flat springs, a flat plate is sometimes taken and a spiral groove cut in its surface having the exact shape the spring is desired to take, in which it is placed and set by heat. But few watchmakers have the tools for cutting such a groove truly, or are capable of using them.

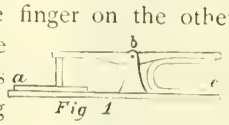

Fig 1

(20.) *Making the terminal curve.* Some workmen make the elbow of the Breguet spring before hardening and tempering, in which case a thin strip of brass must be placed between the main body of the spring and the supplemental coil above, and the whole then screwed together for hardening. But I do not advise to make any terminal curves till the last thing, but simply make the plain cylindrical or spiral spring, and ascertain its adaptability to the balance and proper place for the elbow or the commencement of the curve, before expending any labor on that part of the spring, which will be treated of under the head of isochronism. When, however, the springs are heated in animal charcoal, (10), if the required size and number of coils, place for elbow, and shape of curves are known, it would be well enough to form the spring before hardening.

(21.) These directions are not designed as a complete guide for making springs—although I have told enough, I think, to enable any who wish to experiment successfully, and some things not before published—but to give a clear idea of the process of making them as a basis for better understanding of subsequent operations. Furthermore, the workman who proposes to fit a helical spring in a chronometer will generally find it necessary to make one to suit. Hence instructions upon that operation must include the making of the spring, as already described. But flat or spiral springs can be bought ready-made, of almost every strength and quality, so that a suitable one can be readily selected from a fair stock of them, and thus save time and labor.

(22.) *Diameter of springs.* The proper diameter for a hair-spring is a matter of calculation in new chronometers and watches,—helical springs being generally one-third and spiral springs one-half the diameter of the balance. But a certain length in proportion to its thickness is indispensable to its free action, and if it is found that there is not room for that length of a helical spring, the coils being of the above-named diameter, then a spring with large coils must be made, to secure the necessary length of wire. But the repairer should generally be guided by the old spring, if it yet remains, remembering that the new spring, when finished, will have expanded a little larger than the grooves in the block, or its first size when hardened. If your wire is not of the same stiffness as that of the old spring, more or less coils than the old one had must be used, to get the same strength of spring. But generally the old spring should be copied in all respects, unless there is good reason to believe that it was never satisfactory.

(23.) *Number of coils.* Helical springs have usually from nine to eleven coils, but it is well to make thirteen, to allow for testing the temper at the ends, etc., after which the superfluous length can be broken off. A rather long spring is better than a short one, especially if it is somewhat soft, as the angle of flexion, and the consequent danger of setting by use, are less. A spring should be thin and hard, rather than thicker and lower tempered, both being of the same strength. For the former will maintain the motion of the balance longer (without additional impulse from the hand or the movement), and consequently a watch with such a spring will be less affected by difference in the motive power, or friction, poor oil, jarrings, etc. The less the number of coils the harder the temper should be, and, conversely, the softer the spring the longer it must be. Hardened springs, are less liable to be affected by magnetism than soft ones, and are to a great extent, but not entirely, free from the deterioration or loss of force to which all springs are more or less subject by constant action, even when the flexion does not approach the limits of their elasticity. The well-known phenomenon of hardened springs slightly accelerating on their rates, for a few months after being fitted, is an example of this change of condition. In this case the springs lose a portion of their excessive initial hardness, and gain in pliability and elasticity. After attaining their greatest degree of elasticity they remain nearly constant, while the deterioration of soft springs is comparatively rapid.

(24.) As for the proper number of coils for spiral springs, the custom is to use from nine to twelve in English lever watches, generally about ten; in the Swiss, eleven. For a duplex, eight or nine suffice. The Swiss, in their cheap watches, often use fifteen to eighteen coils—as the springs, being of a soft wire, must necessarily be long to prevent bending by use. But this only preserves them for a time, and in a few years they frequently need re-springing in order to do even decent service.

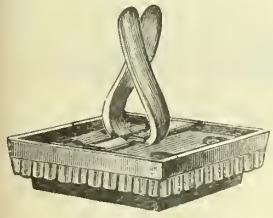
A. H. WELCH,

Fine Jewelry Manufacturer,

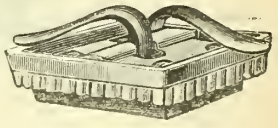
AND DEALER IN PRECIOUS STONES.

Five First Prizes, Diploma and Medal Awarded to Him at the Toronto Indl Exhibition.



I take pleasure in advising the retail trade that I have opened one of the finest Jewelry Factories in Canada, which I have thoroughly fitted up with the latest and most improved steam machinery. I intend making **Specialties of Gold, Signet, Gem, Band and Wedding Rings of all kinds; Gold Lockets, plain gold and set with stones; Gold Chains, in Vests, Guards, Chatalines and Necks.**

My experience of nearly twenty years in the manufacture of jewelry leads me to believe that I am now in a position to supply the retail trade with the specialties I manufacture cheaper and better than they can be bought elsewhere. I propose to do only first-class work. Trade repairs and plating of all kinds promptly attended to and satisfaction guaranteed.



Remember the address and call and see me when in the city.

LOWE & ANDERSON

16 WELLINGTON ST. EAST, TORONTO.

American watches have from thirteen to sixteen coils,—the higher number generally in the finer grades, and even with hardened and tempered springs. For the advantage of long springs, see (168).

(25.) *Breadth of springs.* The breadth of hair-spring wire should be about twice its thickness, or rather more, for marine chronometer springs, but for pocket watches there is no regular rule. Round wire has been proposed for springs, as being more easily and perfectly made; but there can be no doubt that unnecessary thickness in the direction of flexion should be avoided, and greater stiffness secured by increasing the breadth rather than the thickness. Experience indicates that a breadth of from three to four times the thickness is a good proportion for flat spiral springs for watches.

(TO BE CONTINUED.)

EDITORIAL NOTES.

SPECIAL NOTICE.

Jewelers throughout Canada will oblige the Editor by sending into this office for insertion in these notes any items of news pertaining to the Jewelry business that they think would be of interest to the Trade generally.

MR. J. BUNN, JR., of the Illinois Watch Co., was in the city a couple of weeks ago, and reports a big demand for their new four size movement. He says they can sell almost double what they can make.

ACQUITTED.—Mr. S. Sydenburg, jeweler, of Toronto, who was tried at the assize court last month for purchasing goods knowing them to have been stolen, was honorably acquitted of the charge by the jury.

FIRE.—D. T. Ferguson, jeweler, of Rat Portage, Ont., had his store and stock burned by the disastrous fire which occurred at that place last month. He was only partly insured.

JOSEPH TANNER, jeweler, of Prescott, failed last month. This failure may be fairly set down to his close proximity to the American border and the demoralized state of the jewelry trade consequent thereon.

FOR EUROPE HO!—Mr. John Segsworth, wholesale jeweler of this city, sailed for Europe by the Cunard line last month. We wish him a prosperous trip and safe return.

HOME AGAIN.—Mr. John H. Jones of Montreal, who has been to Europe on business for his firm, arrived safely home again on the 21st of June.

MR. DAVID THOMPSON, of E. J. Thompson & Co., wholesale jewelers of Hamilton, Ont., sails for Europe on July 3rd, in the interests of his firm. We wish him *bon-voyage*.

THANKS.—We have to thank Mr. James Fraser, jeweler, of Yale, British Columbia, for a business directory of that province and a list of the bona fide jewelers doing business out there.

R. GIVEN DOHERTY, jeweler, of Toronto, finding business very bad, has assigned for the benefit of his creditors. His liabilities are very small and his stock is about equal to his liabilities.

KEPT BUSY.—We took a run through the new factory of A. H. Welsh the other day and were pleased to find everything in such apple pie order. Mr. Welsh reports that he is "kept very busy," and mostly on very fine work.

REMOVAL.—The trade will be interested in knowing that on account of the large increase in his business, Mr H. Ellis, wholesale jeweler, has removed his warehouse to 14 Wellington Street west, where he will be glad to see his friends and the trade in general.

ATTENTION! WANTED!—In consequence of the many errors in delivering THE TRADER in the cities of Toronto, Montreal and Quebec, we would take it as a favor if every jeweler in the above cities would send us on a post card, their street number and proper address.

HAMILTON ENTERPRISE.—We ask the attention of our readers to the advertisement of Messrs. George H. Lee & Co., of Hamilton, Ont. Hamilton has long been known as the "ambitious city" and Messrs. Lee & Co. apparently don't propose to let it go back on its reputation

SELLING OUT.—Mr. Chas. Davis, the well-known jeweler of King St. Toronto, is thinking of retiring from business and offers his business for sale. This is a good chance for some capable and enterprising man with money.

THE LIGHTNING TRAVELLER AGAIN.—Mr. R. Russell, representing Levy Bros., was in the city last month on business for his firm. He appeared well pleased with his success, and thought the prospects for a large fall trade were excellent.

WEDDING BELLS.—Mr. J. Porte, jr., of Picton, Ont., was married last month, and visited Toronto on his wedding tour. THE TRADER wishes him and his bride all the happiness incident to the married state and long life and prosperity.

THEIR THREE MILLIONTH WATCH.—The 3,000,000th watch made by the American Waltham Watch Company was drawn for at the annual banquet of that Watch Company's Foremen's Association. Mr. H. M. Hayes was the lucky man who won it.

AS FRESH AND SPICY AS EVER.—The New York *Jewelers' Weekly* keeps as fresh and sparkling as ever. We look for its weekly visit with a great deal of pleasure and trust that like good wine it will improve with age.

CLOSED DOWN.—The American Watch Company closed down on the 1st July for holidays and repairs. They will resume work about the middle of the month. In the meantime their employees are amusing themselves and going in for the base ball championship.

AMERICAN LEVER BUTTONS.—Mr. Rogers, the genial representative of the American Lever Button, was in the city a few days ago, pushing business for his firm, who have something to say to our readers through our advertising columns this month.

MEDALS.—We are right in the middle of the medal season and those jewelers who want to have their orders in that line filled with promptness and satisfaction cannot, we think, do better than entrust them to Messrs. P. W. Ellis & Co., who are making a specialty of this line of goods.

A FAILURE.—The Williamstown Watch Company, Williamstown, Mass., which was organized under the laws of the State of New York, in February, 1885, with a capital of about $300,000, and which has been with difficulty struggling along since, has suspended operations for an indefinite period.

A SIGN OF THE TIMES.—At a meeting of the directors of the Hampden Watch Company held last month, Mr. John C. Dueber, of Newport, Ky., was unanimously elected a member of the board. Mr. Dueber is now largely interested in the Hampden Company, and will no doubt render valuable assistance in the prosecution of its business.

BOUND TO BE AT THE TOP.—The employees of the American Watch Case Co., of Toronto, have organized a base ball club and entered the Canadian Manufacturers' League. In addition to making the best watch case in America, they think they can down any other "nine" on the list, and are going to do their best to capture the pennant.

CHANGED HANDS.—We notice by the last number of the *Watchmaker, Jeweler and Silversmith* that that journal has changed hands and in future will be run on different lines. That journal has always tried its utmost to advance the interests of the jewelers in Great Britain, and we wish it a prosperous future.

STIENHOFF & SEABROOK, jewelers, of London, Ont., have assigned with some $11,000 of liabilities and assets to about the same amount. Like the most of the failures in the jewelry line, this one appears to have been caused by an attempt to run a large and expensive business upon little or no capital.

Mr. H. H. Fudger, of the Goldsmiths' Company, arrived home from Europe on the 7th of June. Although he made a very quick trip, he says that he has picked up enough bargains and novelties in jewelry to make the trade in this country open their eyes. Their customers may therefore look out for bargains this fall.

A UNIQUE ADVERTISEMENT.—We direct the attention of our readers to the unique advertisement of the S. E. F. & Co. bracelets on the inside back cover page of this issue. We think every retailer who has

SIMPSON, HALL, MILLER & CO.,

tried the S. E. F. bracelets can endorse the encomium of the writer of the letter which has been turned into an advertisement.

BACK AT HIS OLD QUARTERS.—The many friends of Mr. W. F. Ross, formerly of Toronto, will be glad to learn that he is back again at his old quarters in the store of Messrs. Kent Bros., of this city. Mr. Ross is one of the most courteous and painstaking salesmen we know of and we trust that he has made up his mind to stay right here in Toronto.

GOOD WORK.—Detective Rogers, of the Ontario detective service, has again earned the approval of law abiding citizens by the clever manner in which he caused the arrest of the gang of burglars who robbed the store of W. P. McLaren, of Watford, Ont. They proved to be two local desperadoes and at their trial got twelve and fourteen years respectively in the penitentiary as the reward of the crime.

TESTIMONIAL.—Mr. S. H. Hale's testimonial to the American National game took the shape of an elegant silver cup which he presented to the baseball club belonging to the Waltham Watch Company employees. This challenge cup is to be competed for only by "nines" in the trade. If New York were not so far away we have in Canada several trade "nines" that would be after that cup hot-footed.

FROM CALIFORNIA.—We are in receipt of a very interesting note from friend A. S. Wormood, of the Illinois Watch Co., dated at Blue Lake Park, California, in which he says he is enjoying himself immensely and wishes the Editor of THE TRADER were there to give him a hand with his game bag. Our friend evidently knows how to enjoy himself, as well as sell watch movements.

AN AMERICAN PREDICTION.—Says an exchange: "A Providence manufacturer, who is an acute observer of the course of events, says: 'This is not going to be a very good year; 1887 will be considerably better, and 1888 will be the best year the jewelry business ever had in this country. Now mark my words, and see if it doesn't come true. Business prosperity comes in cycles, and the jewelry business will reach its zenith in the year of the next presidential election.'"

THE REWARD OF GALLANTRY.—Amongst the volunteers who received the imperial medals for the campaign last year in the North-West, were Wm. Smith, of the Q. O. R., son of H. Smith, of Smith & Fudger, Max Stern, of the Governor General's Body Guard, and John Marshall, of the 10th Royal Grenadiers, an employee of the American Watch Case Co. This speaks well for the patriotism of the Toronto jewelry trade.

ENLARGING.—The advertisement in this issue of W. B. Hill, (formerly Hill & Houghton), manufacturing jeweler, of this city is worthy of more than a passing notice. The business of this firm has heretofore been principally confined to Toronto, but now that they are enlarging their facilities they propose to extend their trade to the Dominion generally. They are a thoroughly reliable firm and will do exactly as they agree.

HEAR! HEAR!—*The Keystone*, Philadelphia's sparkling and newsy jewelry journal, says in its last issue: "One of the best jewelers' publications that comes to our office is the Toronto TRADER. Its well filled columns, both advertising and news, fully entitle it to the marked consideration Canadian jewelers accord it. Typographically it ranks with the handsomest publications on the continent." In spite of the bald spot on the top of our editorial cranium we take off our hat to *The Keystone* and say, Thanks!

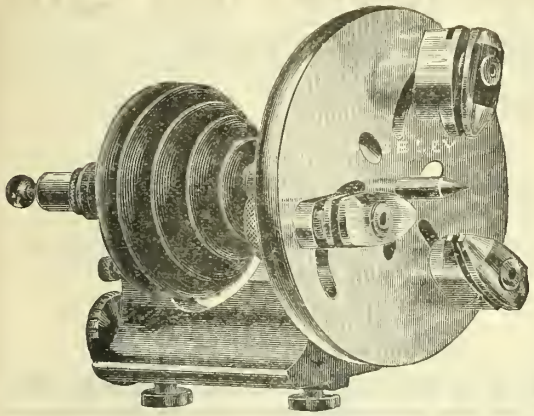
A TREACHEROUS EMPLOYEE.—It is said that Jules de St. Agnan, a scion of French nobility and an employee and prospective partner of C. T. Picard, the absconding jeweler, of Montreal, is the person who put the Customs authorities on the scent of the frauds against the revenue, committed by that firm. He was paid $1900 by the Collector of Customs for his share in the seizure and this money has been attached by his creditors. It is said that De St. Agnan has shaken the dust of Montreal from off his feet and returned to *la belle France*.

GROWING.—Mr. H. G. Levetus informs us that the Montreal Optical and Jewelry Company are busily engaged in enlarging their factory. They have imported a lot of the finest optical machinery to be had in Europe, and expect with the help of the skilled European artizans, whose services they succeeded in securing, to be able to turn out as good work in Montreal as can be found in the world. We trust to be able to furnish our readers with full particulars of the latest addition to Canada's industries in our next issue.

A T FAILURE.—The failure of James Laut, the proprietor of a gift tea business, is one of the latest things in Toronto. Jewelers used to wonder how Mr. Laut could give away a hundred dollar gold watch with every five dollars worth of tea, but this failure probably offers a correct solution of the conundrum. Without wishing these philanthropic tea merchants any harm we can only say that if they were all exported to Hong Kong or some other city of the Celestial Empire the jewelry trade would be no loser by their departure.

CLUTCH DONOHUE.—Quite a number of Canadian retail jewelers are watching with a good deal of interest the effort of the American Express Company to collect from him the money of which he robbed them some years ago. If they are successful in so doing, several of our jewelers, who have been victimized by him or his gang, intend to sail in and see if they can't make him disgorge also. Donohue has lived respectably for several years in Fort Erie, Ont., and is said to be worth some $40,000.

EARLY CLOSING.—The early closing movement has apparently taken a firm hold in Toronto, the latest addition to its adherents being the retail jewelers, most of whom have already agreed to close at two o'clock on Saturday afternoon during the summer season. The leading wholesale houses have always made this a practice, and have found that they gained rather than lost anything by it. THE TRADER is a great believer in the Saturday afternoon half holiday in the summer months, especially when the weather is so fine that it is a shame to stay in the house.



THE CREDITORS of W. S. Smith, jeweler, of Guelph, closed him up last month and the stock was sold en bloc by tender. It was bought by Mr. T. H. Lee of Toronto, for 60 cents on the dollar, a pretty good price. From present appearances it looks as if the secured creditors will get paid in full, while the others will get nothing. Mr. Smith had a good chance and every prospect of success, and his failure can only be attributed to his neglect of business. Had he kept his grip on it as well as when he first started he should have been away up near the top by this time.

WE HAD A VISIT from Mr. W. H. Hopper, the well known jeweler of Cobourg, last month. He was on the lookout for a high priced Jurgensen gold watch and wanted the Editor of THE TRADER to show him his. As a seven jeweled key wind American watch had always faithfully pointed out to us the hour for putting up our sanctum shutters, we were unable to gratify him in that particular; but as advice is cheap, we did not allow him to depart without a little friendly counsel. Mr. Hopper reports trade as being fairly good in his town and talks of making things hum there in the sweet pretty soon.

MR. DONALD MANSON, formely of Toronto, but for the past eight years a resident of Sydney, Australia, was in the city a few days ago to see his family and to say how do you do to his old friends. We understand that having secured some first-class agencies for leading American manufacturers he sails again for Australia on the 3rd of the present month and will permanently take up his residence there. Mr. Manson's many friends in Toronto and throughout Canada, are not only gratified at his success, but proud that he should practically be the pioneer in introducing the inimitable manufacturers of this continent to our brothers under the "Southern Cross." THE TRADER wishes him a long and successful career in his new business venture.

FISH.—The present aspect of the fish question is scarcely so threatening as it was a few weeks ago. Finding that bluster don't answer, our American cousins down in Maine are beginning to talk "treaty" and the possibility is that ere the year is out we shall have a fair and permanent solution of the difficulty. Canada has demanded her rights in a manly and dignified way, and her rights she is bound to have, and it is only we think a question of time when the press of the United States, which as a rule, is fair and level-headed, will demand that Canada's rights be conceded and the Maine fishermen sat on for the benefit of the country at large. If the Main fishermen can get the right to steal Canadian fish and also keep up the present rule of taxing Canadian fish caught by Canadian fishermen, they will have a soft thing; but it looks as if the country in general will prefer fair play and cheap fish to the individual interests of the down east fishermen.

THE GOWLAND FAILURE.—The failure of Geo. Gowland, jeweler of King St. East, Toronto, has proved quite a surprise to the trade, as it was generally thought that he was at least holding his own, if not

gradually improving his position. His liabilities appear to be about $7,000, with assets of about $8,000. The cause of the trouble seems to be an overstock of goods and scarcity of business. Owing to the depression he could not realize on his goods fast enough to meet his liabilities as they matured, and having got some $400 behind with his rent, his landlord closed him up. At a meeting of his creditors held last week, it was decided to refuse Mr. Gowland's offer of 50 cents on the dollar and close his business out. While we are sorry for the losses sustained by the creditors, we must confess to a strong feeling of sympathy with Mr. Gowland, whom we have always regarded as an honest and hard working man. Cheap credit seems to have been the rock upon which he wrecked himself, and it was probably owing as much to the pressure from the wholesale trade as from his own desire to carry a large stock, that he overbought himself and thus put a stop to his mercantile career. As we have more than once remarked, there are cases in which it is better to have too little credit, than too much and Mr. Gowland's seems to be one of them.

AN UNCALLED FOR STRIKE.—We are informed by an exchange that among the numerous labor complications of last month, was a strike of all the clocks of the Howard Clock Company. An indignation meeting was first called at which a venerable old town clock presided, while the dial acted as Secretary and recorded the minutes of the proceedings. The dial announced the object of the meeting to be a protest against their treatment by the company. They were required to work twenty-four hours a day, and, instead of being paid in cash, they were "on tick" all the time. Not only were their days full of labor, but theirs were Knights of Labor also. They did not object so much to long hours as they did to the introduction of machinery into their insides, and there was danger of their being ruined by machine work. The dial added that he thought all the hands should be compelled to join the union and not swing around the circle, wasting their quarters and halves so much, obeying every motion of that promoter of discord, the pendulum. The dial grew white with eloquence and indignation, and the hour hand complained that the minute hand was altogether too fast and not a fit associate for him, but the dial exclaimed that "that had nothing to do with the case." Other members chimed in, and after a long discussion, at precisely twelve o'clock P.M., it was resolved to strike. Every clock joined with the movement and the strike was unanimous, and they continue to strike every hour with great regularity some of the more impetuous ones striking every fifteen minutes. Mr. Pierson, the New York manager, says that this strike will not interfere with his filling orders promptly, for the company always has a large stock of clocks on hand that can be depended upon to do their duty with accuracy and promptness."

SECESSION.—The politicians down in Nova Scotia seem to have worked up quite an excitement about the injustice their Province is laboring under by being in the Canadian Confederation. The elections just held show a return of 30 Secessionists and 8 Unionists, which would look as if that Province meant business when they talk about leaving the Union. However, their bark may be worse than their bite, and we have no doubt but that a "little better terms" will keep them quiet for some time. If anything were wanted to give point to our editorial on political muddlers, this election would amply furnish it. This Secession cry was got up by the Liberals of that Province simply as a catch cry and by loud talk they persuaded the people that if they get out of the Canadian Union and had Commercial Union with the United States (in plain English become annexed to the U S.) that they would at once become prosperous and happy and the goose would hang so high that the poor mechanic and the farmer would scarcely have to work at all in order to live in affluence Well the "cry" took with the result above noticed, and now the winners are in a fix what to do. They know that going from Canada to the United States (even if they were allowed to go) would be like going from the frying pan into the fire. but having raised the devil they will have to do something to keep him quiet. We shall watch the developments of the Secession party with a great deal of interest. In the meantime the *Globe*, which professes to be loyal to Canada, even although it is disloyal to the land of its birth and the party that brought it into existence, is shouting itself hoarse at this Secession victory as a veritable liberal triumph. If this is a sample of the fruits the *Globe's* liberalism, then we say "God save Canada from any more of it," for a very little of it goes a long way.

WORKSHOP NOTES.

TO RESTORE DISCOLORED PEARLS.—Set pearls which have become discolored by wear may often be improved by placing in a covered vessel, with a mixture of whiting, ammonia and water, and permitting them to remain a few hours.

TO WHITEN IVORY THAT HAS BECOME YELLOW.—Slack some lime in water. After pouring off the water from the deposit, boil the ivory in this water until it has become white. To polish, put the article in the lathe, if it is a piece that can be turned, and if not, first rub it by hand with powdered pumice stone and water, and then polish with a rag or soft leather dipped in olive oil mixed with whiting.

THE *Scientific American* replying to J. M. M., who inquires how to make or mix the acid used for etching on steel plates for printing, says: Iodine, 1 oz., iron filings ½ dr., water 4 ozs. Digest till the iron is dissolved. Or pyroligneous acid 4 parts, alcohol 1 part, mix and add 1 part double nitric acid (sp. grav. 1.28.) Apply from 1½ to 15 minutes. Dilute nitric acid is frequently used alone with satisfactory results.

HECTOGRAPH OUTFIT.—For the pad 100 parts of good, ordinary glue, 500 parts of glycerine, 25 parts of finely powdered baric sulphate, or the same amount of kaolin, and 375 parts of water. For the copying ink a concentrated solution of Paris violet aniline is recommended. To remove the old copy from the pad, a little muriatic acid is added to the water, washing it gently with this liquid by means of a soft rag, afterward using blotting paper for removing superfluous moisture.

PAPER FOR WRAPPING UP SILVER.—The following formula is given for making paper for wrapping up silver. Six parts of caustic soda are dissolved in water until the hydrometer marks 20° Baume. To the solution add four parts of oxide of zinc, and boil until it is dissolved. Add sufficient water to bring the solution down to 10° Baume. Paper or calico soaked in this solution and dried will effectually preserve the most highly polished silver articles from the tarnishing action of the sulphuretted hydrogen which is contained in such notable quantities in the atmosphere of all large towns.

THE following is Stolba's process for nickel plating without a battery: Into the plating vessel—which may be of porcelain, but preferably of copper—is placed a concentrated solution of zinc chloride, which is then diluted with from one to two volumes of water, and heated to boiling. If any precipitate separates, it is to be redissolved by adding a few drops of hydrochloric acid. As much powdered zinc as can be taken on the point of a knife is thrown in, by which the vessel becomes covered internally with a coating of zinc. The nickel salt, either the chloride or the sulphate is then added until the liquid is distinctly green; and the articles to be plated, previously thoroughly cleaned, are introduced, together with some zinc fragments. The boiling is continued for fifteen minutes, when the coating of nickel is completed, and the process is finished. The articles are well washed with water and cleaned with chalk.

THE ELECTRO-CHEMICAL EQUIVALENT OF SILVER.—In the *Journal de Physique*, M. Mascart has an article in which he gives an account of recent experiments undertaken by him to determine the weight of silver deposited or dissolved during one second by a unit of currents. Some few months ago he arrived at the conclusion that the quantity was 11.24 m. g. Kohlrausch gives 11.36, and Lord Rayleigh 11.19. Since these determinations F. and W. Kohlrausch, by a fresh series of experiments, have found it to be 11.183, and Lord Rayleigh has recently, March, 1884, made it 11.18. Accordingly, M. Mascart thought it necessary to re-verify his calculations, and acknowledge that he was deceived. Without going into his calculations, we may say that he now gives his result as 11.156 m. g. The chemical action of one ampere per second, or of one coulomb will, therefore be, says M. Mascart: According to Kohlrausch, 1.1183 m. g. of silver dissolved. According Rayleigh 1.118 m. g. of silver dissolved. According to Mascart 1.1156 m. g. of silver dissolved.

FICTITIOUS GOLD.—Eight ounces of cream of tartar are gradually heated to redness in a crucible, and a little clay; pulverized saltpetre is then thrown upon it; both will fuse into a yellow substance, which is left to cool. On the other hand, eight ounces of pure copper are

FOR SALE BY ALL CANADIAN JOBBERS IN AMERICAN WATCHES.

melted in a crucible, and when in a thoroughly fluid state above mentioned composition is stirred in. The crucible is returned to the reverberating furnace, and melted, after which one-half ounce of the best zinc, one-half ounce of tutty, (impure oxide of zinc, to be had in any drug store), and the same quantity of borax are added. A noise will be perceptible when adding the ingredients, and smoke intermixed with a yellow flame will arise. The mass is stirred with an iron rod until the flame ceases. The mixture is then left quiet, and without fnrther stirring poured into an ingot rubbed in with wax. An alloy is prepared according to this receipt, which in color and other properties is strikingly similar to gold; it can be polished, drawn into wire, and is very supple.

OTHER NOTES.

AN ingenious process for giving silver surface to iron is a recent Austrian invention. It consists in first covering the iron with mercury and then depositing the silver by the galvanic process. By heating to 300° C. the mercury evaporates, and the silver layer is deposited.

A TEXAS jeweler hung a watch in his window and labelled it, "Look at this watch for $10," and the unsophisticated gentleman from Africa who stared at the article and then went in and wanted the $10, had to get down on the floor with the jeweler and roll over and under him a number of times before he could be made to understand that he couldn't have any $10.

AN interesting feature of the Colonial and Indian Exhibition to be held in London this summer, will be an exposition of the finding and preparation of diamonds, arranged in the African section by the Cape Government. A facsimile of a diamond mine and the whole of the operation through which diamonds pass, from the washing of the earth to the setting of the brilliants will be exhibited.

THE total number of watches produced annually in the entire world is estimated to be about 3,000,000. The annual production in the United States is now 1,000,000. The total number of key-winding watches made in the United States is now 1,000,000. The total number of key-winding watches made in this country since the introduction of machinery in the manufacture, or since about 1850, 3,250,000. Probably over 2,000,000 of these were made during the last ten years.

THE main wheel of a watch makes 4 revolutions in 24 hours, 1,460 in one year; the second or center, 24 revolutions in 24 hours, or 7,760 in a year; the third wheel, 192 in 24 hours, or 69,080 in a year; the fourth wheel—which carries the second hand—1,440 in 24 hours, or 525,600 in a year; the fifth or escape wheel, 12,964 in 24 hours, or 4,728,400 revolutions in a year; while the beats or vibrations made in 24 hours are 388,800, or 141,812,900 in a year.—*Ex.*

A CLOCKMAKER of Beziers has devised a means of giving the time simultaneously in every room in a house by an application of the electric bell system, in common use in Paris and elsewhere. The negative wire of the system is connected by a smaller wire with the pendulum portion of the clock train—any clock will answer the purpose, provided it strikes while the positive wire is made to pass just above the hammer of the clock; when the hammer rises to strike, it touches the wire, the circuit is closed, the current passes, and proceeds to act simultaneously on all the bells and alarms in the circuit.

ONE of the most enterprising jewelers in Paris, is Phillippe, of the Boulevard Poissonnière. Phillippe believes in handbill advertising, and has several men about in the streets whose duty it is to thrust his illustrated handbills into your hand, pocket or even down your throat, if you won't take them quietly. One of these bills is cleverly illustrated with six scenes representing the utility of investing in one of Phillippe's timepieces. One of the illustrations represents the interior of a wine shop with two workmen at the counter. "Governor," says one, "another glass round. The pawnshop stands treat. They lent me eighty francs on a gold keyless watch which I bought for seventy-five francs at Phillippe's." Another shows a parson at a wedding saying to the happy couple, "And now, dear friends, may your hearts always beat in unison and perfect harmony, like the watches sold by Phillippe, 29 Boulevard Poissonnièe (at the corner of the Rue Montmartre.)"

WISE AND OTHERWISE.

ONE swallow doesn't make a summer, but one robin makes a spring. Watch him, and see if he doesn't.

EDWIN ALONZO sends us a poem on "A Broken Link." Too late. Sausage season went out with the cold weather.

The moonlight summer nights will soon be here. You can't plant cats too early, nor is it possible to get too many in a hill.

THE cold world little realizes the sense of desolation that shuts down on a man who thinks he has been handed too much change by his grocer, when he dodges round the corner and finds it right to a penny.

A FEW evenings since, a father and daughter at Wellesley, Mass., were mutually recalling incidents of the latter's childhood. "I shall never forget," said the young lady, "how you took me out of church one Sabbath, when I was about three years old, and punished me for playing in meeting. I can remember the tingling of that peach tree switch to this day. "How strange, very strange," said the father, "I don't recollect the circumstance at all." "Ah, well, papa, you were at the other end of the switch."

HENRY VIII., so runs the story, having quarrelled with Francis I., resolved to send an ambassador to deliver a message to that monarch in the most menacing terms, and appointed Bishop Bonner to execute the commission. The bishop told the king that the embassy would cost him his life. Henry replied that if any harm befel his representative he would instantly cut off the heads of all the Frenchmen in his dominions. "So you may, sire," objected the bishop, "but I fear there is not one of them that will fit my shoulders."

OUR HELP COLUMN.

THE TRADER aims to be of practical value to the Retail Jewelry Trade.

NO CHARGE is therefore made for advertising in this column, but the subject-matter should not exceed five type lines, or about 60 words.

When requested, these advertisements will be published in successive numbers of the paper.

If you have a Store, Stock, or any Special Article to sell; if you wish to buy an Established Business, or enter into Partnership; if you want a Journeyman, Clerk, Salesman, or Foreman; if you want a situation yourself—communicate the fact to THE TRADER PUBLISHING CO., 57 ADELAIDE ST. WEST, TORONTO, and it will be inserted in this column free of charge. This is the only way by which you can reach the entire Trade, and we shall be glad to help you.

A GENTLEMAN of eight years' experience wishes position as traveler or bookkeeper in a first-class house. Best of references. Address, B. H., Box 55, Oakville, Ont.

4-SIZE

Jas. Boss Gold Watch Cases

—FOR—

NEW 4-SIZE MOVEMENT OF THE ILLINOIS WATCH CO.

The new 4-size Jas. Boss Cases are nicely proportioned, and are very small, close-fitting and compact. They possess all the characteristics that have given the larger-size Boss Cases their great fame, and are admirably adapted to take the place of foreign-made watches which have had a large sale because there was no watch of American make sufficiently small to compete with them.

As usual with Jas. Boss gold cases, the 4-size are engraved in a manner at once original, luxurious and captivating.

It may be safely said that handsomer small-size watch cases are not conceivable.

The jobbing trade is prepared to fill all orders for this new and beautiful line of goods.

KEYSTONE WATCH CASE COMPANY,

SPECIAL NOTICE.

To ensure insertion, changes or new advertisements must reach this office not later than the 20th of each month.

EDITORIAL.

THE OUTLOOK.

From present indications we should say that the prospects for a good fall trade were decidedly encouraging. The crop reports from all parts of the Dominion are favorable; labor seems to have got fairly settled down and our mechanics have all the work they can do at paying prices. From the United States word comes that everything there betokens a great expansion of trade in the near future, and this must in itself help on a revival of trade on this side of the line.

For our own part we never have been amongst those who for the past eight or ten years have been crying out with all their might that the wolf of hard times had its fangs deep into the commerce of the country. We have always held and hold still, that taking one thing with another, Canada has come through a long period of universally acknowledged business depression with very little injury to her commerce. It is true we have had a slight taste of hard times, but they have been caused more from the fact that we have too many people in business than any other cause. It is not the country that is at fault—the country is all right, but it is the fault of our people, too many of whom are bound to be middlemen instead of being producers. We venture the assertion that never before has the trade of this country been so large as it will be this year, and still we have no doubt but that there will be individual merchants who will feel and complain of hard times. Times are principally what people make them. Just as an individual makes money by working hard and living within his income, so a country becomes wealthy and enjoys prosperous times by following the same plan.

As far as we can see, it looks as if Canada is going to have a prosperous year before it. Competition is very keen in every branch of trade, and to make money, therefore, requires not only a thorough knowledge of the business in which one is engaged, but adequate capital with which to run it. Profits are cut down very much from what they formerly were, but if merchants have capital and business ability and are willing to make money by practicing economy, we see no reason why they should not find this fall one of the best they ever experienced.

The business outlook is fair, and those merchants who have faith in their country, faith in themselves, and the necessary ability and capital behind them both, should not hesitate to lay in a good stock of suitable goods in order to adequately supply the demand that a bountiful harvest will certainly produce.

GOODS ON APPROVAL.

No merchant whether he be wholesaler or retailer ever cares to send out his goods on approbation amongst his customers. No matter how careful these customers may be, it is seldom, if ever, that goods come back again into stock in as good condition as when they were sent out. If it is not generally so recognized, it is nevertheless a fact that the merchant who lets a customer have goods on approval does him a favor, and this being the case, the recipient should see that the person doing the favor suffers nothing by his good nature. Such however, we are sorry to say, is not always the case, for occasionally goods got as a favor on approval, are returned in most wretched condition and thereby occasion no small loss to the merchant whose disposition to oblige a customer has caused him to break his ordinary rule of business. Who that has ever been in a Canadian jobbing-house but can call to mind numerous instances in which fine jewelry has been returned wrapped up promiscuously in coarse brown paper, gold and silver watch cases come back dirty and scratched, and looking as if they had been worn for a month, delicate watch movements returned, perhaps with dial cracked, or dumped into the original box without paper of any kind? These, and a hundred other annoying occurrences of a similar kind, at once come before the mind's eye when this subject presents itself.

Now, in the name of fair play, we ask those who have a habit, whether from ignorance or carelessness of doing such things, to consider the matter and make up their minds to turn over a new leaf regarding it. No merchant of his own accord desires to send out his goods on approbation; it is one of the abuses of the trade that has grown from time to time until it has assumed its present disagreeable proportions. Every merchant desires to accommodate his customers, and if customers are benefited in this way, they should at least see that the person obliging them is not out of pocket by the operation.

We think that the least a person that gets goods on approval can do is to take good care of them while in his possession, keep them as short time as he possibly can, pack them carefully when through with them, and finally, be sure and pay the express charges when he sends them back.

In short, do as you would be done by, and if you follow this rule we think that you will have no difficulty in getting goods on approval when you need them, without any grudging on the part of the house sending them.

GIVE US A REST!

For the past eight years the *Globe* has been daily holding forth to the faithful the doctrine that the country was going to the dogs as fast as a corrupt government and a protective policy could send it. Entirely unmindful and unconvinced by the stern logic of events, that the people of Canada, farmers as well as mechanics wanted a protective tariff as the one best suited to the necessities of the country, the *Globe* has presistently harped upon the string that the farmer was being

S. FRENKEL,

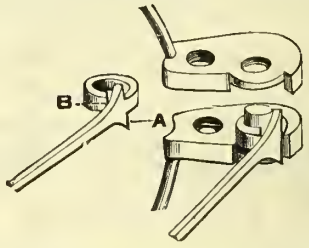
Wholesale Jeweler, Importer of American and Swiss Watches, Optical Goods, Etc.,

55 & 57 YONGE STREET, TORONTO.

WHOLESALE AGENTS FOR

T. A. WILLSON & CO.'S Optical Goods.

Would invite attention to the following new grades of Steel Spectacles lately introduced in the market.



No. 155.

They are Steel, Full Tempered. Parts Interchangeable. Joints so constructed that wear is compensated for. Temple will not work loose and fall down as in old style joints. Nose-piece reinforced where it joins eye, giving extra strength with neatness. PRIZE MEDALS AT ALL EXHIBITIONS WHERE EXHIBITED. PATENTED JULY 31, 1877.

A SPECTACLE TEMPLE

THAT WILL

NOT WEAR LOOSE.

PATENTED MAY 13, 1879. RE-ISSUED JUNE 8, 1880.

A.—Stop for Temple, preventing Strain on Joint.

B.—Compensating eye, for taking up wear of joint. The eye of Temple is smaller than Stubb Steel Joint Pin on which it works, and is left open at B, exerting a Spring Tension on Pin.

All my better grades of Spectacles are made interchangeable, and when necessary I SELL EITHER FRAMES OR LENSES SEPARATELY. Dealers are thus enabled to carry a large assortment with very little outlay.

I carry the largest stock of Spectacles and Optical goods in Canada. My prices are lower than any other house, and any dealer can save money by inspecting my stock before he purchases.

=NEW=

Solid Gold. JEWELRY. Rolled Plate.

We are prepared to show our Customers this autumn a full assortment of all the latest designs in **ENGLISH** *and* **AMERICAN** *Jewelry.*

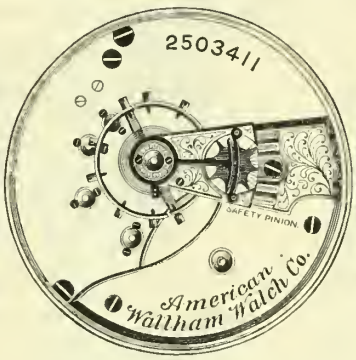
Our Stock is also Complete in

WATCH MOVEMENTS AND CASES, MATERIALS AND TOOLS

E. J. THOMPSON & CO.,

55 KING ST. EAST, HAMILTON, ONT.,

AMERICAN WALTHAM WATCH CO



NEW NAMELESS 18 SIZE STEM WIND MOVEMENTS

HUNTING OR OPEN FACE.

No. 5.

GILDED MOVEMENT; thirteen jewels in settings; expansion balance; patent regulator. Eighteen size, Stem Winding, Hunting or Open Face.

No. 15.

GILDED MOVEMENT; fifteen jewels in settings, expansion balance; patent regulator; patent Breguet hair spring, hardened and tempered in form. Eighteen size, Stem Winding, Hunting or Open Face.

No. 25.

NICKEL MOVEMENT; adjusted; fifteen jewles in settings; expansion balance; patent regulator; patent Breguet hair spring, hardened and tempered in form; adjusted to heat and cold and in three positions, viz.: pendant, cock and dial. Eighteen size, Stem Winding, Hunting or Open Face

No. 35.

NICKEL MOVEMENT; adjusted, fifteen ruby jewels in gold settings: expansion balance; patent regulator; patent Breguet hair spring, hardened and tempered in form; double sunk dial; adjusted to heat and cold and in all six positions. Eighteen size Stem Winding, Hunting or Open Face.

ALL OPEN FACE MOVEMENTS ARE MADE PENDANT SETTING

THESE goods are regular full plate eighteen size, fitting any standard make of eighteen size cases, are of the newest models, and have all the latest improvements, numbers 15, 25 and 35 having the celebrated **Logan Breguet hair spring, hardened and tempered in form,** which is made only at Waltham and is **not to be found upon watches of any other makers in the world.**

They possess all the qualities of high grade movements and are offered at the usual prices of grades known to be much lower in quality.

They bear the name **American Waltham Watch Co.** only, and can be sold upon **their merits,** which, we believe will be more evident and acceptable to dealers and to the public than the fictitious value often claimed for goods of less established repute than Waltham.

We believe the market offers nothing of any other make to at all compare with these goods in such a rare combination of quality and price.

Dealers should **buy** them because they offer opportunity for profit.

Dealers should aim to **sell** them because they will give satisfaction to customers.

Prices will be found on Page 5 of Price-list issued by Canadian Association of Jobbers.

FOR SALE BY ALL JOBBERS.

ruined by the high prices he was being compelled to pay for all manufactured goods, at the same time that the produce which he had to sell was continually being depreciated in value. It did not matter that this statement was diametrically opposed to the facts of the case, it was a good political cry with which to catch the farmers' vote and therefore it did not matter to the grit organ whether it was true or false, so long as it served its purpose. We have more than once asserted in these columns, that no matter if wheat or other farm produce were depreciating in value all the world over, it was not going down nearly so rapidly in value as were the products of the world's factories, and that therefore, by comparison the farmer was relatively a gainer. There never was a time, we think, in the history of the world (except perhaps that of the Russian war) when a bushel of wheat would buy as many goods as it will to-day. This is denied by the opponents of the National Policy, but they never attempt to prove their assertions by facts.

Now in reference to this very plausible falsehood that has done service until it has become almost threadbare, that the working of the N. P. is diametrically opposed to the interests of the farming community: we have just come across a set of tables compiled for the *Milling World*, from which it will be readily seen that while farm produce of all kinds has actually increased very largely in value during the past seventy years, the products of the world's manufactories have decreased in an almost equal ratio. Here it is:

"Grain growers and other tillers of the soil, who feel like complaining at the low prices of farm produce now prevailing, should remember that agricultural interests are not alone in the matter of depreciation of prices. The fact is that during the past seventy years, farm products have increased largely in price, while manufactured articles have decreased. An interesting comparison of prices for farm produce is shown in the following table, compiled for the *Milling World*:

	1816.	1886.
Wheat, per bushel	$0 44	$0 99
Oats, per bushel	15	41
Corn, per bushel	20	46
Barley, per bushel	2	80
Butter, per pound	12	32
Cheese, per pound	6	10
Eggs, per dozen	5	12
Cows, per head	15 00	50 00
Hay, per ton	5 00	17 00
Straw, per ton	4 00	15 50
Sheep, per head	75	2 00
Farm labor, per month	8 00	18 50

Certainly in "the good old times," so often regretfully referred to, farmers were not overpaid, and these figures show that farm labor has during seventy years increased over 100 per cent., and the selling prices of farm produce have increased from 100 to 400 per cent. On the other hand, the comparison of manufactured articles shows large decreases, as may be seen in the appended figures:

	1816.	1886.
Steel, per pound	$0 17	$0 12
Nails, per pound	12	4
Broadcloth, per yard	16 00	4 00
Wool blankets, per pair	15 00	7 00
Cotton cloth, per yard	30	12
Calico, per yard	25	6
Salt, per bushel	$1 00 to 4 00	15 to 25

Here are enormous differences against the manufacturers and in favor of the farmer. It would appear that agriculture has really been favored at the expense of mechanical industry, and the grain growers and general farmers should cease to consider themselves the only class of victims of the present depressed business conditions."

Although but few of the many articles produced by our manufacturers are embraced in the above list, we think that if the whole catalogue were gone over the result would vary but little from the sample given. This being the case, all we have to say to the *Globe* and its imitators is this, if they can't bring incontrovertible proof that these figures are false, then the thing they are in honor-bound to do is to drop the charge and give the long suffering public—a rest.

A PRACTICAL TREATISE ON

THE BALANCE SPRING.

Including Making, Fitting, Adjusting to Isochronism and Positions, and Rating, also Adjustment for Heat and Cold.

BY EXCELSIOR.

PART II.

FITTING HAIR SPRINGS.

(26.) *Fitting the flat spiral spring.* I will first give the ordinary method of fitting a plain spiral spring, followed by good workmen, and then describe my own method and tool for facilitating the work. It is not to be expected, of course, that pains will be taken to make the hair-spring perfectly isochronal, when the workman gets only $1, (which is the price in many places,) for fitting and regulating it. Nevertheless he should have some regard for his own reputation, inasmuch as it will be but little more trouble to approximate very closely to correctness, if he knows how, than to fit the spring in such a manner as to render its good performance impossible. He will therefore understand that the directions to be given in these articles are essential to success, although I omit any discussion or explanation of the reasons therefor till we reach that part of the subject relating to isochronism.

(27.) All tools used in working around hair-springs must be kept perfectly clean and dry, not allowed to become magnetized, nor touched with soldering fluid or other corrosive substances, nor should any such things be allowed on the watch bench at all. Their place is upon the clock and jobbing bench. A pair of fine tweezers must be kept solely for this use. The points should be very slim and thin, flat and rough on the inside, hard tempered, the jaws broad and firmly connected so that they cannot yield sideways and let the points pass each other, and made to come easily together without giving any more spring or stiffness at the points than is just necessary to hold the spring, or a pin. *Too much strength* is the cause of pins snapping away and other "accidents" that bother the beginner, who imagines that the tweezers should not only carry the pin to its place, but hold it firmly enough to force it in. They must not be heated and softened, nor used as a pin punch, for picking teeth, cleaning finger nails, prying off watch dials, or corks out of oil bottles, or picking the saw dust out of keys, nor for anything whatever except working upon hair-springs. But if the points do accidentally get injured, it will be a saving of time to put them in perfect condition again before you undertake to work with them. The same remark applies equally to all other tools. There is no surer sign of a

WHOLESALE ONLY.

good workman than that his tools are always in perfect working order.

(28.) A spiral spring should be perfectly flat, evenly coiled, the coils becoming more distant from each other as they proceed from the centre, being about twice as far apart at the outside as at the centre; the wire should be of an equal temper, breadth and thickness, throughout its whole length, well polished and free from rust. It should also be long and closely coiled.

(29.) *Enlarging a spring.* The diameter, as already stated, (22) should be one-half that of the balance. If a spring cannot be found of just the right size, or larger, one of smaller diameter but having a suitable number of coils may be enlarged by the following process, which is also useful for spreading the coils apart when they are so close as to be liable to interfere with each other. Put the spring on a flat plate of either steel or brass, and over it another thin plate of bright steel, or if of brass, with a hardened steel screw in the centre Heat the whole very slowly and evenly till the top plate or the color piece becomes blue, then let it cool and it will be found equally expanded, unless the top plate has been too heavy to allow of free motion. If not sufficient it can be treated in the same way again—as the temper will not be reduced any lower, provided that the heat is not at any time greater than will blue the *hardened* bright plate or color piece (14).

(30.) *Flattening a spring.* If a spring has been warped or bent out of flat, it may be flattened in a similar way, by fastening it *tightly* between two steel plates as as to *prevent* expansion, and blue the upper plate, which will cause the spring to "set" perfectly flat. But in all these cases great care must be taken not to exceed the bluing heat or, if the spring is of any other color, not to carry the color of the hardened color-piece beyond the shade of the spring.

(31.) *Bulged springs.* If the centre of the spring has been merely sprung up, the best way is to take the collet off the balance and slip it on your pin punch till it fits snugly, then take hold of the outer coil, or of the coil where the "bulge" commences, with a stiff pair of tweezers so that it can be firmly held horizontally, then push the centre with the pin punch, in in a position exactly vertical to that in which you hold the outer coil, and the spring can generally be sprung back so truly as to be about as perfect as ever, and with very little trouble.

(32.) *Ruined springs.* If a spring has been very much distorted, it probably cannot be made perfectly true in the coils, although it may be true in the flat, and if it belongs in a fine watch, another spring should be fitted. Even if a distorted spring should be worked on with the tweezers till it was restored to exactly its former shape, it would not act the same as before. Every place where it has been bent and restored will be of a different stiffness from the original, and every such place exerts a disturbing influence, rendering a uniform action of the spring impossible. An inexperienced workman will often render a spring worthless for fine time keeping simply by numerous changes and corrections of shape. A spring should not be bent or altered any more than it is absolutely necessary, and any changes of shape should be made by littles, rather than by bending too much and then having to bend part way back again. The injury caused by bending is greater in soft than in hardened springs. Hence Breguet springs should always be hardened, because they necessarily have to be bent more or less in perfecting the terminal curves.

(33.) *Number of vibrations.* In fitting a new spring, the first thing is to ascertain the number of vibrations the balance should make per minute, either by counting the vibrations of that watch, or of one like it for exactly one minute. Or it may be done by calculation. As the centre wheel revolves once per hour, we multiply the numbers of teeth in all the wheels from the centre to the escape wheels, inclusive of both, into each other, and divide that result by the product of the numbers of the leaves in the pinions of all those wheels (except that of the centre wheel), then double the quotient, as there are two vibrations to each tooth of the escape wheel. This gives the number of vibrations the watch makes in an hour, and dividing that by 60 gives the vibrations in one minute. Generally Swiss watches have 300 beats per minute, American watches 300 to 270, and English levers 240. Whenever there is a doubt, or the watch is of an unusual make, it is well to count up. If you have a movement which makes exactly the desired number of vibrations, you need only try your spring along side of that, as described in (36), and any divergence between them will be seen at once, without counting.

(34.) *Selecting a spring.* You next lay the balance bridge on the bench before you, bottom upwards, and with the regulator pretty well back towards the "slow," and selecting a hair-spring which you deem suitable, you place it on the bridge so that the centre will come exactly at the pivot hole. Furthermore, the elbow or bend at the *point of attachment* of the spring to the collet must lie nearly in an imaginary straight line drawn from the pivot hole to the hair-spring stud, for it is customary to avoid fractional parts of coils in flat spiral springs, as much as possible. In doing this allowance must be made or any cutting out of the coils at the centre, to make the spring fit the collet, and for any bending at the stud, as spoken of in (46), if either will be necessary, calculating as closely as convenient the point where the elbow of the inner coil will come after that shall have been done, and that point must be placed in line with the stud—the centre of the spring remaining over the pivot-hole, as before described. Then note the particular coil which lies naturally between the regulator-pins when the spring is so placed.

(35.) Having now attached a small piece of beeswax to the balance-staff, just below the shoulder of the upper pivot, you stick the inner end of the spring to this wax, making a temporary but firm connection between the spring and the staff. Adjust the spring so that it will stand centrally and truly on the staff, then grasp it with the tweezers about one-eighth of an inch back of the point that lay in the regulator-pins, and, while the lower pivot rests on some hard, polished surface, you hold the balance upright by means of the spring, and cause it to vibrate. Care must be taken not to get so large a motion as to loosen the spring in the wax. By holding the coil in the tweezers pretty high, the spring can vibrate without coming in contact with the coils outside of the one held in the tweezers. The hand is rested on some convenient support. Instead of using wax as above, if the centre of the spring is very small, and will have to be broken out, any way, the central coil may be bent so as to hug the staff tightly and dispense with the wax. But this should not be done when that coil will have to be bent back into shape again and used.

(36.) Everything being in readiness, you set the balance in motion, and count the vibrations it makes in exactly one minute. It will be much easier if they are counted only in

Manufacturing and Repairing a Specialty.

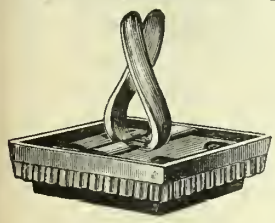
14 King Street West, UP STAIRS, TORONTO.

A. H. WELCH,

Fine Jewelry Manufacturer,

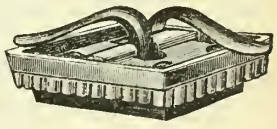
AND DEALER IN PRECIOUS STONES.

Five First Prizes, Diploma and Medal Awarded to Him at the Toronto Indl Exhibition.



I take pleasure in advising the retail trade that I have opened one of the finest Jewelry Factories in Canada, which I have thoroughly fitted up with the latest and most improved steam machinery. I intend making **Specialties of Gold, Signet, Cem, Band and Wedding Rings of all kinds; Gold Lockets, plain gold and set with stones; Gold Chains, in Vests, Guards, Chatalines and Necks.**

My experience of nearly twenty years in the manufacture of jewelry leads me to believe that I am now in a position to supply the retail trade with the specialties I manufacture cheaper and better than they can be bought elsewhere. I propose to do only first-class work. Trade repairs and plating of all kinds promptly attended to and satisfaction guaranteed.



Remember the address and call and see me when in the city.

one direction, as from left to right; then double the number. As already stated, if you have a movement making the proper number of vibrations, you can try your spring beside that, causing the two balances to vibrate together at first, and notice whether your spring lags behind or goes ahead. In either case, count the vibrations from the start till they come together again. If your spring loses a beat or gains one in fifteen seconds or less, it is certainly not suitable. It should not gain or lose *more* than a couple of beats in a minute. In the case of an American movement, you can rest the balance pivot on the glass cover of the movement box, directly over the balance going underneath, and readily compare the two.

(37.) *Pinning to the collet.* If the spring does not give very nearly the desired number of vibrations it is removed and another tried, and so on till one is found which meets the above requirements, when in the case of a flat spiral spring, it may be pinned to the collet for a final trial. Aside from the convenience of using wax as described, for preliminary trials, there is a grave objection to pinning the spring to the collet at first. Collets differ much in size, and if a spring was cut out at the centre to fit properly on a large collet, it would be greatly injured for any watch with a smaller one, if it did not happen to fit the one first tried. But with the temporary wax fastening no injury is done to the spring if it proves unsuitable. If it will be necessary, when pinning it to the collet, to cut out considerable of the inner end, additional length must be allowed at the outer coil to compensate for this shortening at the centre —otherwise the watch will of course gain time. Springs are generally made small enough to fit the smallest collets, and often require considerable cutting to go on a large one. And if this additional length outside, when allowed for, would make the spring too large to lie freely in the regulator-pins, it must be rejected. This can be ascertained before cutting it.

(38.) The manner of pinning it to the collet is important. There should not be a large vacant space at the centre of the spring, but the inner coil should be only far enough from the collet to avoid any danger of touching it, even in the longest vibrations—but it must not be too close. We often find springs with the inner coil actually hugging the collet—a certain proof that the watch has been in the hands of a botch. Either end of the pin sticking out so that the coil can hit it, is another evidence of botchwork. The inner end of the spring should be put into the hole in the collet entirely up to the elbow, where the straight joins on the curved portion. From the elbow the curve should diverge from the collet in such a manner that it will meet the regular spiral form in about one-eighth of a coil from the elbow. This is better than running the spiral itself up to the collet, except when the coils are very wide apart in which case the spiral should reach and be pinned directly to the collet. If the spring diverges too boldly from the collet, its action will not be good. On the other hand, if it diverges too slowly, it will lie so near the collet as to be likely to touch it when closely coiled up, or a minute speck of dirt wedged in between them would produce the same effect. No portion of the spring, however small, should rest on the collet, or on any dirt upon the collet, or on any pin, nor should any coil touch another, even at the extreme end of the longest vibration the spring will make in use. The repairer should examine every doubtful hair-spring that passes through his hands, turning the balance with the finger in each direction, and holding it still while looking over the spring. Although a little out of its order here, I would also say that the spring must not touch anything above, below, or around it, except the collet, stud and regulator, and them only at one point. All workmen know that this should be so, but they cannot know whether it *is* so, unless they move the balance to each extreme and hold it while they look, as above. It is very common for *two* coils to hit the regulator or the stud.

(TO BE CONTINUED.)

SELECTED MATTER.

DEAD STOCK.

The end and aim of all mercantile business is to gain money, and when men invest capital in a stock of merchandise it is with the expectation of reconverting it into cash at prices sufficiently in excess of the original cost to yield a larger return than it would if loaned at rates established by the various State laws. All this goes without saying; but when by either indiscriminate and injudicious buying or by circumstances unforeseen and uncontrollable a quantity of unsalable goods accumulate upon the hands of the merchant, there arises a problem incident, in a greater or lesser degree, to every business, and which involved may lead to loss and possibly to disaster. Unsalable, or, in the vernacular of trade, "dead" stock, is one of the most serious cares of a merchant's business life, requiring in its avoidance the exercise of all his taste in selecting, and his talent and acumen in the salesroom. In spite, however, of the best management, some of the goods in every store will be found to be of this character, receiving accessions constantly as other pieces fail to win the favor of customers, and locking up capital that should be actively employed. What disposition should be made of this incumbus is the perplexing question which is not rendered more easy of answer by the reluctance of merchants generally to make prompt reductions in prices. And yet we know of no other method of transferring capital that is tied up in goods that do not sell into capital that will pay profits because invested in goods that are in demand. It may be true that when these goods were new they were worth the price asked for them; but when it also becomes a fact that an unappreciating public has, by letting them alone, taken a considerable per centage from their value, this latter unpalatable truth must be realized if the goods are to be moved at all. As to the wisdom of converting "dead" stock into money as quickly and easily as possible there can be no question. The point turns entirely upon the methods to be employed in accomplishing this result. Some have favored auction sales, as we do when every circumstance is favorable, two of which are important—a first-class reputation and being able to get a good auctioneer on the part of the dealer; but this plan is open to several objections. There are few auctioneers who can and do obtain in this way even moderately fair prices, and when commissions are deducted it is often found that there has been a needless sacrifice. The old method still in use by many large houses appears to be the most wise of any yet devised for the trade at large. The "bargain" counter has usually its own class of customers, some of whom will buy anything if assured of its cheapness. Such a counter should not belie its name. Make it a counter where bargains are truly given. Let the goods placed upon it bear cost prices, or, if need be, in special cases considerably below cost, and they will soon dis-

appear at prices far in excess of most auction sales, while the legitimate trade receives no interruption and suffers very little, if any injury. If the merchant resolves in some cases to abandon all ideas of profit on unsalable goods, and even submits to a loss on special articles, he is doing a wise thing. It is said of that merchant prince, the late Mr. A. T. Stewart, that one day walking through his immense establishment he stopped before a clerk, and said in that peculiar high-keyed voice of his, "That dress doesn't seem to go very well, young man. What's the matter?" "Customers complain of the price; sir," was the reply. "Ah," said Mr. Stewart, "cut it down twenty per cent." The next week the dress was still there. "Not sold yet," was asked. "No, sir." "Cut it down twenty-five per cent. more." The third week the dress had disappeared. "Ah," said the merchant, "we can make more out of the money, young man, than we ever could out of the dress." That's a business man's sermon in plain English that the reader may well remember.—*Jewelers' Journal.*

A STRANGE CLOCK.

The judge's house, says a correspondent of the San Francisco *Call*, was over in the French quarter of New Orleans, unattractive outside, but as soon as you got into the broad hall a cool breeze struck you, laden, without exaggeration, with the balm of a thousand flowers. The hall led right through the house and opened into a regular fairy land of flowers, a garden the like of which I had never dreamed of. It was surrounded by a high wall, and had plants in it from every country under the sun. The white-haired old gentleman and the group of grandchildren hanging about him took us about, and the first thing we stopped at was a large oval plot set out with small plants around the edge.

"This," said the judge, "is my clock. What time is it, Clara?" he asked of one of the children. The girl ran around the plot and said it was four o'clock, and so it was. The four-o'clock was in bloom. "In fact," said the story-teller, "the clock was made up of flowers." In the centre was a pair of hands, of wood, covered with some beautiful vine, but they had nothing, however, to do with the time-telling.

The plan was this: The judge had noticed that at almost every hour in the day some plant bloomed, and working on this principle he has selected plants of different hours and placed them in a circle, twenty-four in number, one for every hour.

For example, at the top of the earthen clock, at 12 o'clock, was planted the portulacca, and he told me it would bloom within 10 minutes of 12 and rarely miss. At the hours of 1, 2, and 3 he had different varieties of the same plant, all of which bloomed opposite the hour to which it was planted. At 4 o'clock he had our common plant of that name, and you all know how you can depend on that.

At 5 the garden niotago came out, at 6 the geranium triste, and at 7 the evening primrose. Opposite 8 o'clock he had the bona nox, and 9 the silent noctiflors—all these blooming at or near the time given. At 10 o'clock, if I remember rightly, he had a cactus, at 11 another kind, and at 12 the night blooming cereus.

Half the year some of the plants don't bloom at all. The plants opposite 1 and 2 in the morning were cacti that bloomed about that time; and at three was planted the common salsify, and at 4 the chicory, and at 5 the snow thistle, and at 6 the dandelion.

CAUTION ABOUT BREGUET SPRINGS.—A Breguet spring should never be applied to a watch with an index. It is perhaps the best form of spring for a pocket watch, having all the properties in action of the cylindrical spring, and the great advantage of flatness in form, but any attempts at producing a good timekeeper with this spring and curb pins will end in failure. And any attempt at getting time in positions by pressing the outer coil of the flat spring against the outer or inner pin is mere jobbing, and, even if successful, would require to be repeated every time the balance had to be taken out. For flat springs with regulators it would be highly advisable to pin a spring into the collet, in order to get the stud hole and curb pins to correspond. The end of the over coil of a Breguet spring should run into the hole in the stud before being pinned in, and if the stud is screwed into the cock without the balance it will easily be seen if the jewel hole is in the centre of the hole in the spring collet, as it should be. This spring should also be pinned at equal turns.

BUSINESS NOTES.

SOLD OUT.—W. A. Whitford, jeweler, of Montreal, who failed a few weeks, has been sold out by the assignee.

THE GOWLAND JEWELRY STOCK was last month sold by tender to Messrs. E. & A. Gunther at 50½c. on the dollar.

R. MUNRO, jeweler, of Cannington, Ont., has assigned with small liabilities, and assets in proportion. As he has been slow for years this failure does not take the trade by surprise.

BRANCHING OUT.—Our old friends, McIntyre & Davidson, the well-known jewelers, of Portage la Prairie, Man., have started a branch of their business out at Edmonton. They are a pushing firm and deserve success.

T. B. STEACY, jeweler, of Brockville, Ont., is at present in Europe purchasing goods for his busin ss. He is enlarging his premises and expects when his new fall stock is in to have a display equal to anything in Canada.

THE MERIDEN BRITANNIA CO.—We had a visit from Mr. J. A. Parker, the general manager of the Meriden Britannia Co., Hamilton. He reports the business of his company beyond the average and expects a big trade this fall.

A NEW WATCH OILER.—The new watch oiler manufactured by S. P. Kleiser is one of the neatest and best things that we have yet seen for the purpose. They are cheap and every well regulated household ought to have one.

MR. BEVERLEY HEATH, the well-known representative of Simpson, Hall, Miller & Co., was in the city last month making things hum. He says they are well satisfied with their business this year and expect a boom in the near future.

A BIG PURCHASE.—Messrs. Kent Bros, the well known Yonge street jewelers, of this city, with their usual enterprise, have purchased the magnificent exhibit of the Toronto Silver Plate Co., which took the gold medal last year at the Toronto Industrial Exhibition.

SELLING OUT.—Mr. C. Davies, one of the oldest and best known retail jewelers on King Street, Toronto, is advertising his business for sale. As this is one of the best stands in the city for the jewelry business he should not have long to wait for a purchaser.

OFF FOR EUROPE.—Mr. James Venn, jeweler, of Toronto, sailed for Europe last week on business connected with some patents in which he is interested. That he will combine pleasure with business and take in all the fun there is going goes without saying. We wish him a prosperous journey.

GUARANTEE NOTICE.

All Spoons and Forks bearing the stamp

G. RODGERS, A 1

are made of the finest nickel silver and are plated and hand-burnished under my personal supervision, and standard of quality—each article is guaranteed perfect in finish and durability.

All Knives bearing the stamp

G. RODGERS

12 DWT.

are plated on the best English cast steel with pure silver, and are hand-burnished and warranted to give perfect satisfaction. The well-known reputation of my goods has induced other makers to adopt a similar name, calculated to mislead the public. See that the trade mark reads and is spelled G. RODGERS, A1, on Spoons and Forks, or G. RODGERS, 12 Dwt., on Knives.

SOLD ONLY BY

THE ACME SILVER COMPANY,

TORONTO,

to whom all orders should be addressed.

N.B.—AXIS CUT PEBBLES A SPECIALTY.

Montreal Optical and Jewellery Company, L'd. P. O. BOX 1054, MONTREAL.

THE NEW VICE-CONSUL.—M. Schwob, Esq., of the firm of Schwob Bros, Montreal, has been appointed Vice-Consul of France in that city. As Mr. Schwob is one of the most successful of Montreal's business men, as well as a thorough gentleman, the French republic is to be congratulated upon its choice.

THE STOCK OF H. C. FLACH, jeweler, of St. Thomas, who assigned last month will be offered for sale at public auction by the assignee. The stock and fixtures amount to $4 042 and is unusually well assorted. St. Thomas is a good town, but it is evident that it can only support a limited number of jewelers.

D. A. REESOR, jeweler, of Brandon, has gone to British Columbia on a prospecting tour. Now that the C. P. R. is an accomplished fact our Pacific brethren may look out for an influx of settlers and an increased volume of business and keener competition in all lines. The iron horse is a great leveler of prices.

HYMENIAL.—Mr. W. F. Doll, wholesale jeweler, of Winnipeg, Man., was married a few days ago to Miss Higginbotham of Bowmanville. The happy couple left for Washington and New York on their bridal tour and expect to reach their home at Winnipeg early in August. We wish them every happiness incident to the married state.

A WHOLESALE REMOVAL.—The Dueber Watch Case Mfg. Co., of Newport, Ky., have decided to remove their entire factory to Canton, Ohio, as that city offered them greater inducements than any other place. Unless some equally large company buys up the Dueber buildings we should say that real estate will soon be a drop in that market.

A SUCCESSFUL MERCHANT.—One of the finest retail jewelry stores in the Dominion is that of James Trotter, of Galt, Ont. His stock of fine goods is large enough for any first-class city store and is kept fully abreast of the times by constant additions of the latest novelties. His store is lighted at night by electricity and is a credit to the town.

MR. JOHN W. CAMPBELL, who has been American buyer and traveller for Rothschild & Co. for the past two years, has severed his connection with that firm and made an engagement to travel for Lowe & Anderson. Mr. Campbell is one of the most courteous and obliging travellers on the road, and we trust that he may meet with increased success in the future.

HOW ARE YOU GEORGE.—A few days ago we were surprised to receive a visit from Mr. George Thompson, the well-known jeweler of Port Arthur, Ont. The silver mining metropolis is getting too small for George, and he is looking around for other worlds to conquer. He will probably experiment on either Toronto or Winnipeg, the latter preferred.

THE VISIT OF THE KNIGHTS OF PYTHIAS to Toronto gave quite a stimulus to the jewelry business in this city. Most of our jewelers sold large quantities of Canadian jewelry, and the visitors expressed themselves as very much pleased with the styles which were entirely new to them. Our jewelers would be glad to have the Knights come every year.

THE STOCK OF R. J. DOHERTY, jeweler, of Queen Street, Toronto, was sold last month at fifty-one cents on the dollar, being bought in by some friends interested in his business. In this connection we might give Mr. Doherty a pointer to the effect that it does not pay any jeweler to do repairing and watch-work at or about cost. Cheap work means poor work, or loss of money.

TWENTY-FOUR O'CLOCK.—With its next change of time tables the Canadian Pacific will adopt the twenty four o'clock enumeration for all its system west of Lake Superior. This method of counting the hours is so convenient that within a few years there is no reason to doubt it will be in universal use. It will seem strange at first, but it will cause even less of disturbance than did the adoption of standard time.

A CLOSE SHAVE.—The factory of P. W. Ellis & Co., Toronto, came near being burned down a few days ago owing to a fire in a printing establishment next door. Fortunately the firemen were able to subdue the flames before much damage was done. Messrs. Ellis & Co. were so well pleased with the prompt service rendered by the fire brigade that they sent them a check for $20 in aid of their benevolent fund.

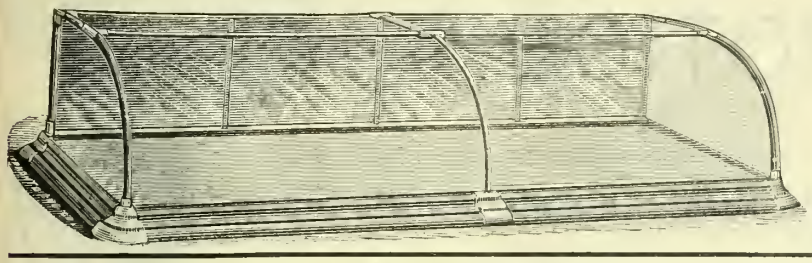
ON DECK ONCE MORE.—The latest turn in the Lancaster or Keystone Standard Watch Company's wheel of fortune, is that "three far-seeing citizens have stepped into the breach and by buying it up and running it to its fullest capacity have saved it from bankruptcy." This is all right for the employees of the Company, and of course we are glad for their sakes, but we trust that the "far-seeing" citizens whose public spirit has led them into the enterprise may see their money back again.

FOR SWITZERLAND HO!—Mr. John M. Inglis, wholesale jeweler, of Montreal, sailed for Europe last week, for the purpose of buying goods for his firm. As Mr. Inglis makes a specialty of Swiss watches and movements, he will spend the most of his time in Locle and Chaux du Fonds, the centres of the watch industry in Europe. We understand that Mr. Inglis has secured the agency of several new lines of American movements made in Switzerland, which are said to be first-class in quality and low in price.

PUSHING AHEAD.—As an evidence of Canadian enterprise we may mention that the American Watch Case Company of Toronto have just made contracts for the purchase of several thousand dollars' worth of new presses and machinery of the latest and most powerful pattern. They are bound to be fully abreast of the times and aim to make the very best case that is put upon the American market. Although the watch case trade of Canada is small of itself the Company think that by working up the foreign export trade which they now contemplate that they will be able to keep their machinery going at its full capacity and help to make the country what it is ultimately bound to be one of the manufacturing centres of the world.

THE U. S. INVADED.—The periodical invasion of the United States by Canadian wholesale jewelers has become so common that our cousins across the border don't seem to take much alarm at it. In fact, by the way they talk they seem rather to like it and wish it would continue. Amongst the prominent buyers who visited the States last month were Mr. Walter Barr, Manager of the Goldsmiths' Company, Mr. George Chillas, of Lee & Chillas, Mr. W. G. H. Lowe, of Lowe & Anderson, Mr. Thomas Marshall, Mr. W. A. Young, Mr. Harry Ellis, Mr. John H. Jones, of John H. Jones & Co., Mr. F. Chandler, of Liffiton & Chandler, Mr. Fred Thayer, of Thayer & Co., Mr A. Levy, of Levy Bros., Hamilton, and Mr. M. C. Ellis, of P. W. Ellis & Co.

SKIPPED.—Considerable talk has been occasioned by the disappearance of Mr. W. H. Jones of the firm of Bray & Jones jewelers, of this city. It has now been ascertained that Jones had for some time previously been making preparations to skip out, as he had been collecting in the accounts of the firm and pocketing the money. He took the Grand Trunk east and is probably in England by this time. This escapade was totally unexpected by those who knew him as he has always borne a good reputation and they are at a loss to account for his action. He is well connected both in England and this country, and his friends feel deeply his lapse from the path of honor. We are glad to learn that Jones' embezzlement will in no way whatever affect the standing of the firm, who are fully secured against loss.



ENTERPRISE.—Amongst the many Knights of Pythias who visited Toronto last month were about a dozen American retail Jewelers from different parts of the States. They were nearly all struck with the beautiful designs of the silver and gold Canadian jewelry, manufactured by Messrs. P. W. Ellis & Co., of this city, and complimented the firm highly on the quality and finish of their products. One of the largest retail dealers in the Eastern States bought a large bill for his business and expressed himself very highly pleased with his purchases. As an evidence of the superior workmanship of this firm we may state that the K. of P. division from one of the largest cities in the U. S., when here, gave them an order for their gold and silver medals in preference to getting them made at home. This is the kind of enterprise that builds up a country.

THE ACME SILVER CO. IN ENGLAND.—Mr. John Blackburn, manager of the Acme Silver Co., of Toronto, has just returned from England, where he has been spending about three months in the interest of his company. He says that their display of silverware rather astonished the natives over there, who couldn't believe that such beautiful goods could come from such a wooden colony as Canada "you know." However, seeing was believing, and the styles being better and the prices being lower than similar goods of English manufacture, Mr. Blackburn took quite a few orders for the goods. If this kind of thing is to continue and grow, the Canadian N. P. will indeed prove a bad thing for England. A few such eye openers as this will make an impression on thinking Englishmen whether it will do our hide bound free traders in Canada any good or not.

Steel Knives and Flat Ware a Specialty.

NOTICE.

We Deposit on our Extra Plate Ware as follows:

On	Tea	Spoons,	2½	ounces,	50	pennyweights,	pure silver.
"	Dessert	"	3¾	"	75	"	"
"	Table	"	5	"	100	"	"
"	Medium	Forks,	5	"	100	"	"
"	Dessert	"	3¾	"	75	"	"
"	Medium	Solid Steel Knives,	12			"	"

which is twenty-five per cent. more than the regular Standard plate. All other Extra Plate Goods in same proportion.

Every dozen of Spoons, Forks and Knives are weighed by our process, both before and after plating, and carefully recorded in a book kept for that purpose—and the full amount of silver is thereby deposited for Extra Double and Triple Plates, which is the highest standard for Electro Plate.

All our Flat Ware is "SET" or shaped by MACHINERY, whereby absolute uniformity is acquired.

These Goods are also HAND BURNISHED, which imparts a harder—consequently more durable—and a more even finish than is possible by any other process.

All wares bearing our trade mark are GUARANTEED TO STRIP FULLY UP TO OUR STANDARD, and we will replace all wares of our manufacture that do not strip full weight of silver.

We call our customers' attention to their being packed in Boxes containing One Dozen, making them more convenient for the Trade and Consumer.

TRADE

MARK.

OBSERVE

this Trade Mark is stamped on all Hollow Ware of our manufacture.

TRADE

1847, Rogers Bros., A 1,

OR

1847, Rogers Bros., XII

MARK

OBSERVE

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name is well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

THE EMPLOYEES OF THE GOLDSMITHS' Co. held their annual pic nic about the middle of July, and had a jolly time generally. Athletic competitions of all kinds were indulged in for the very handsome prizes offered by the firm, and not a little amusement was thereby afforded—to those who did not compete. As such pic-nics are becoming an annual institution why would it not do to have all the firms in the city unite and have a combined jewelers pic-nic? Such things go a long way to create a better feeling amongst the different members of the craft.

"NO PROTEST."—A few days ago we received a letter from an esteemed jeweler not a thousand miles from Toronto, protesting against our allowing the advertisement of an opposition firm appearing in our columns on account of his business methods. We take this opportunity of saying that so far as THE TRADER is concerned, we never have and if we know ourselves, never will insert the advertisement of any firm that does not bear an honest reputation. Our readers can, therefore, confidently look to our pages for the business messages of honest men seeking to place their wares before them with a view of doing an honest legitimate business. If opponents in business don't see eye to eye with each other as to the best methods of doing business we can't help it, and don't propose to take any side in the quarrel, provided neither party does anything dishonest or calculated to mislead the trade. Trade has always been a warfare and always will, and success in nine cases out of ten perches itself upon the banners of those who have the largest supply of brains, grit and greenbacks. Our advertising columns are free to any honest dealer who has money to pay for them, and we don't propose to be a party to any boycotting schemes that may be engendered through business rivalry.

THE COLONIAL EXHIBITION.—They say in England, that the Colonial Exhibition has been a great success and that the display of manufactured goods in the Canadian department has astonished the visitors more than anything else. An exhibitor who has just returned from there informs us that not one half of the goods sent from Canada are on exhibition at all. The space allotted to Canada although large in the first place, and almost doubled later on, was altogether inadequate to show the goods that our manufacturers sent there for display. While the other sections are not much more than three-quarters full, the Canadian section is so badly overcrowded that very few if any of the goods can be seen to advantage. We think it would be a good plan for Canada to start a world's fair of her own next year in the Sydenham Crystal Palace, and fill it up as she could undoubtedly do. A Canadian world's fair held in London, would do Canadian manufacturers more good than a dozen such exhibitions in Canada, because in London they would attract thousands of customers from foreign countries who could never be induced to visit Canada for the purpose of seeing an exhibition. A Canadian world's fair in the City of London would be a revelation to more than even the people of England, and if it became an accomplished fact, the people of that country might as well cable Macaulay's New Zealander to come on by first express (c o d) and carry out his part of the programme.

SAVED AGAIN.—We thought we had got through with the adventures of our esteemed friend John Sheppard, the genial manager of the Boss Watch Co.'s New York business, but it appears that we were mistaken John struck Toronto, during its invasion by the Knights of Pythias, and would have had to roost on a telephone wire only that Mr. George J. Bray acted the good Samaritan and took him home with him. John's striking Toronto would have been all right, however, if an attack of cholera hadn't struck him and doubled him up in less than no time. Samaritan Bray dosed him with burned brandy and John rubbed the part affected with his patent Boss case, and between the outward and inward applications his life was saved. The good Samaritan ascribes the cure to the brandy. John says that the brandy didn't have anything to do with it—it was the Boss case that fetched it. When doctors disagree, who shall decide such a knotty question. We don't pretend to, but all the same we lean to John's theory of the case and put our money on the Boss case in preference to brandy every time. Mr. Sheppard says all the silver dollars in the U. S treasury couldn't buy that case now. He thinks the Company will apply for a patent for their Boss case as a specific against cholera, but is not certain. At any rate they will continue as heretofore to make their cases twenty pennyweights to the ounce, of fourteen, and two tenths quality of gold and throw in all its life saving properties free gratis, for nothing. Their new four-size is a daisy.

WORKSHOP NOTES.

FOR giving the final or black finish to lenses use the finest jeweler's rouge on a pitch lap. Vienna lime is used by some for the last finish, in the same manner as the rouge.

AN excellent cement for mending marble can be made by adding to ½ pint of skimmed milk ½ pint of vinegar. Mix with this the whites of 5 eggs well beaten; then sift in with constant stirring sufficient powdered quicklime to form a paste.

TO MAKE A LEFT-HANDED SCREW-PLATE.—Screw a piece of steel of the desired size in an ordinary right-handed screw-plate. Then file it away to a feather-edge and harden it. A good left-handed screw-plate may now be cut with the top thus made, if it is turned the reverse or left-handed way.

TO REMOVE STAINS FROM WATCH-DIALS.—To remove black or cloudy stains from porcelain watch-dials, which are generally caused by the tin boxes they are shipped in, wet a piece of tissue paper in nitric acid and wet the dial. This will instantly remove them. After applying the acid the dial should be immediately washed thoroughly in water and then be dried in boxwood saw dust.

VARNISH FOR GLASS INSTRUMENTS.—An excellent gold varnish for brass objects, surgical or optical instruments, etc., is prepared as follows: Gum lac, in grains, pulverized, 30 parts; dragon's blood, 1 part; red sandlewood, 1 part; pounded glass, 10 parts; strong alcohol, 600 parts; after sufficient maceration, filter. The powdered glass simply serves for accelerating the dissolving by interposing between the particles of gum lac and opal.

THE SCREW-DRIVER.—The watchmaker's screw-driver should be as light as possible, consistent with strength, properly proportioned to the work, with well-polished points of a width nearly equal to the diameter of the screw heads to be operated upon, and of a thickness to fit the slits, with only sufficient taper to secure it from breaking. A tool with a blunt taper will ruin the best of screws. Screw-drivers made from pinion wire collect dust in the ridges and are therefore objectionable. A better form is readily made from square steel while hot.

To make a cheap but vey good battery use flat carbon plates, about 8 inches by 4 inches by ½ inch, and zincs to match, but thinner. Amalgamate the zincs by rubbing with mercury, keeping the surface moist with dilute sulphuric acid. One zinc may be used as a rubber for the other. For exciting fluid, mix five fluid ounces of oil of vitriol with three pints of cold water, and after it has cooled add six ounces finely powdered bichromate of potash. A little nitric acid will improve the constancy. Each cup contains one plate of zinc and one of carbon; connect zinc of one to carbon of next; do not let the plates touch each other under the fluid.

TO EXTRACT BROKEN WATCH SPRINGS.—All mechanical appliances will sometimes be of no avail for extracting the piece of a screw broken off with its hole, if this has been drilled only partly through the plate. In such a case slightly warm the plate, and cover it well with beeswax. Be careful not to let this touch the broken screw; then make a solution of oil of vitriol—one part of oil of vitriol and four of water. Let it stand until quite cold, then put the plate in, and in a few hours the acid will dissolve the screw. The wax may be removed by warming it in olive oil, and washing in hot soap and water.

TO BRONZE POLISHED STEEL.—Methylated spirits, 1 pint; gum shellac, 4 ozs.; gum benzoin, ½ oz. Set the bottle in a warm place and shake it occasionally. When dissolved, decant the clear part for fine work, and strain the dregs through muslin. Now take 4 ounces powdered bronze green, varying the color with yellow ochre, red ochre and lamp black, as may be desired. Mix the bronze powder with the above varnishes in quantities to suit, and apply to the work, after previously cleansing and warming the articles, giving them a second coat, and touching off with gold powder, if required, previous to varnishing.

OTHER NOTES.

COSTLY CHURCH.—St. Peter's Cathedral, just finished at Moscow, has five cupolas, and 900 pounds of gold were used in overlaying them. The doors of the temple cost $310,000, and the marble floors $1,500,000.

AN INTERESTING EXPOSITION.—Madgeburg, Germany, intends to hold a grand exposition of horology in 1888, in honor of the 1,000th anniversary of horology. As nearly as can be ascertained, Pope Sylvester constructed the first wheel clock in 888.

THE EIGHT-HOUR LAW.—The eight-hour labor agitators in Washington might find a chunk of wisdom in the remark of the practical English farmer to his experimenting landlord, who said that he did not despair of the time when he could carry the fertilizer for an acre of ground in his waistcoat pocket, that "Your honor would be able to carry the crop in the other."

NEW WATCH FACTORY IN FRANCE.—A large watch factory, to employ one thousand workmen and to produce from three to five hundred watches per day, is proposed to be started at Morteau, France, near the frontier of Switzerland. It is said that a syndicate of Paris capitalists are backing the enterprise, and that the well-known watchmaker, H. Haas, is to be the manager.

WATCH PRODUCTION.—The total number of watches produced annually in the entire world is estimated to be about 3,000,000. The annual production in the United States is now 1,000,000. The total number of key winding watches made in this country since the introduction of machinery in their manufacture, or since about 1850, is 3,250,000. Probably over 2,000,000 of these were made during the last ten years.

AN ILLUSTRIOUS WATCHMAKER DEAD.—The last of the small body of illustrious watchmakers of France died recently. Winnerl, who was a contemporary and co-laborer of Berthoud, Janvier, Brequet, etc., and the names of these artistes will be renowned as long as watches and clocks are made. He was born in Steyermark in 1799, and while still a young man went to Paris, where he made very artistic watches and astronomical mechanisms for the observatory; he also rendered, for many years, valuable assistance to Francis Arago.

AN IMMENSE CLOCK.—The works of the immense clock which has been put up in the Board of Trade building in Chicago, are pronounced a most perfect reproduction of those of the great Westminster palace clock in London, but with some additions and improvements adapted to its commercial purposes. It is constructed of iron, bronze and steel, and weighs ten tons without the bell, the latter adding some 4,500 pounds more. The pendulum alone weighs 750 pounds. In its arrangements the works are divided into a time train, a hand train and a striking train; these separate trains comprise separate machines, resting side by side on separate frames. Each of the trains is operated by a separate weight, and the three weights together reach some 3,500 pounds. The hammer that strikes the bell weighs eighty pounds; the clockwork is below the dials, which are ten feet ten inches in diameter, and the bell is above them, or 250 feet above the ground. The pendulum swings one way in two seconds.

WISE AND OTHERWISE.

IN Wales a signboard reads: "Take notice that when this post is under water the road is impassable."

"WHAT is wisdom?" asked a teacher of a class of small girls. A bright-eyed little creature arose and answered: "Information of the brain."

EX-GOVERNOR MILLER, of Minnesota, is delivering a lecture in that State which is entitled "All Men are Liars." His tickets read: "All Men are Liars. Admit one."

"SEE, nurse," exclaimed papa, as a smile irradiated the face of his infant, "an angel is whispering to it." "No, sir," replied the nurse, "it is only the wind on its little stomach."

"YOUNG man," said a minister to a youth of his congregation, "do you know what relations you sustain in the world?" "Yes sir; two cousins and a grandmother, but I do not intend to sustain them much longer."

AN Irish lover remarks: "It's a great pleasure to be alone, especially when yer sweetheart is wid ye!"

THE STOCK OF HENRY ROSENBURGH, jeweler, of Watford, Ont., was sold by his creditors last month and brought 40c. on the dollar, just enough to pay the landlord and the secured creditors.

A LITTLE boy was sent to a store for some eggs. Before reaching home he dropped them. In answer to his mother, who asked: "Did you break any?" he replied: "No, I didn't break any, but the shells came off some of them."

A GREENFIELD child has said its prayers regularly every night since it was taught to lisp "Now I lay me down to sleep." Hearing that its parents were about to remove thither, it closed its last evening prayer thus: "Dood-bye, Dod, we's goin' to live in Turner's falls."

SUNSTROKE.—Mr. W. G. H. Lowe, senior partner of the firm of Lowe & Anderson, Toronto, received a partial sunstroke during the heated term last month. Although he was confined to the house a few days from it, he is around again as well as ever, and is to be congratulated on his escape.

QUEEN VICTORIA, like other marms, has her trouble with the servants. "I am Queen of Great Britain and Empress of India," she is said to have said, the other morning; "but I have not power enough to make one of my servants put coal on the fire, if she has been hired to look after the bed chambers."

AT an exhibition of pictures, a baker and a facetious friend were examining a picture with a number of rocks in the foreground. Quoth Batchy: "Thae rocks are like lumps o' dough." "Weel," said his friend, "you shouldna find fault wi' that, when the puir chiel o' a painter makes his bread out o' them!"

THE superintendent approached a youth of color, who was present for the first time in Sunday School, and inquired his name, for the purpose of placing it on the roll. The good man tried in vain to preserve his gravity when the answer was returned: "Well, massa calls me Cap'n; but my *maiden name* is Moses."

OUR HELP COLUMN.

THE TRADER aims to be of practical value to the Retail Jewelry Trade.

NO CHARGE is therefore made for advertising in this column, but the subject-matter should not exceed five type lines, or about 60 words.

When requested, these advertisements will be published in successive numbers of the paper.

If you have a Store, Stock, or any Special Article to sell; if you wish to buy an Established Business, or enter into Partnership; if you want a Journeyman, Clerk, Salesman, or Foreman; if you want a situation yourself—communicate the fact to THE TRADER PUBLISHING CO., 57 ADELAIDE ST. WEST, TORONTO, and it will be inserted in this column free of charge. This is the only way by which you can reach the entire Trade, and we shall be glad to help you.

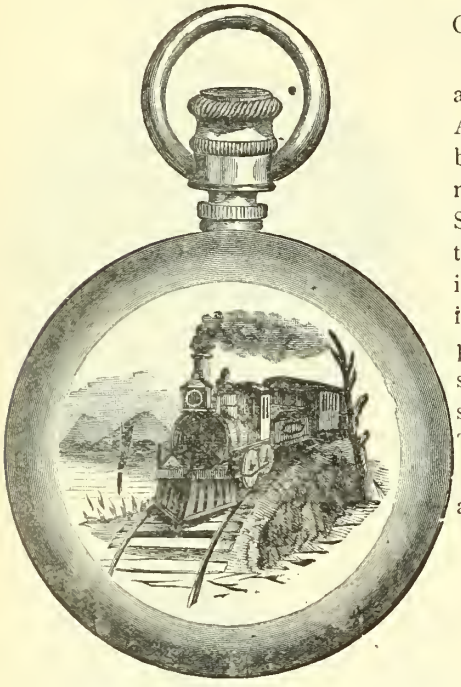
ON JAS. BOSS' GOLD CASES.



JEWELERS, ATTENTION !

GENTLEMEN,

I take this method of informing you that I have just received my fall assortment of goods, consisting of the newest patterns and best values of the leading American, English, French, German and Swiss manufacturers. These goods have all been bought direct from the makers for spot cash and all commissions saved. I have now, without doubt, the largest stock of JEWELRY, WATCHES, WATCH CASES, SPECTACLES AND OPTICAL GOODS of any house in Canada, and offer them to the Trade only, at very low prices. I employ no travelers, but sell my goods entirely in my warehouse. By this means I am enabled to give my customers an advantage in price of from 10 to 15 per cent. over houses that employ travellers, and are compelled to put their expenses upon the selling price of their goods. I have a lot of staple goods that I am jobbing off at prices far below the manufacturers cost, and shrewd business men who can handle such goods can get some big bargains in them These goods can never be repeated.

When you visit Toronto, be sure and call on me, and if I don't open your eyes as to the prices of Jewelry then I don't want you to buy.

SPECIAL NOTICE.

To ensure insertion, changes or new advertisements must reach this office not later than the 20th of each month.

EDITORIAL.

OURSELVES.

With this number THE TRADER commences the eighth year of its existence, and it may not upon such an occasion be amiss to say a few words about ourselves. It is with pardonable pride that we point to the growth we have made since the publication of our initial number. Launched upon the sea of literature with but scant eight pages of matter, it has been gradually enlarged until to-day, when we send out a journal of forty pages. We have taken no step backwards nor do we intend to do so. On the contrary, every movement has been forward and upward. We aimed to make THE TRADER larger and better each year and we leave it to our readers whether we have succeeded or not.

Since the year commenced we have dropped all the outside trades and confined the circulation of THE TRADER strictly to jewelers. It is now the recognized organ of the jewelry trade in Canada, and we propose to make it more worthy of their appreciation and encouragement. We don't take much stock in promises and therefore don't intend to make any, but this we will say, that as far as in us lies we shall continue our past policy of publishing an independent journal, for the best interests of the jewelry trade in Canada. Our record in the past is the best guarantee for our future conduct, and we point with pardonable pride to a clean sheet that no publisher need be ashamed of.

We would be ungrateful, did we close without expressing our thanks for the kind and generous support and encouragement we have received from the entire jewelry trade of Canada, both wholesale and retail. We want our retail jewelers to feel that THE TRADER is particularly their own paper, that its columns are free as air to them to help in interchanging their ideas and making known their wants. In using our columns and publicly discussing trade topics they will find that they are not only benefitting their neighbors but doing good to themselves. There are few men who cannot learn something from their neighbors, and a free interchange of ideas cannot fail to be of service to the trade generally. We invite correspondence on trade topics and shall be glad to hear from as many of our readers as can spare the time to send us a few lines.

PROTECTION TO RETAILERS.

The letter of Retailer in another part of this issue is one that calls for more than a passing notice. There can be no doubt in the mind of any thinking jeweler that the trade is now, and has for years past, been suffering severely from ignorant and unscrupulous competition. While almost all are agreed that such evils exist in the trade, as to make it far more risky and unprofitable than it ought to be, it seems hard to get any number of jewelers who take interest enough in the thing to set to work in earnest to devise a remedy. Our jewelers some way seem half asleep regarding the drawbacks against which they are struggling, and if they ever expect to shake themselves free of it they must rouse themselves and get to work as if they meant business.

Some one has got to take the initiative, and we do not know of any one more competent or one who possesses the confidence of the trade to a greater extent than the gentleman named in Retailer's letter. Mr. Ryrie is a jeweler of nearly twenty years' standing, and of undoubted ability and integrity, and if he will undertake to start the organization of a Retailers' Association we can promise him beforehand our best assistance in any way that such an association can devise.

All that such a movement wants is a start; once started it will grow and very soon become a power in the trade. This being the case we trust that Mr. Ryrie, although having the superintendence of a very large retail business, will consent to convene a meeting and proceed to get such an association organized. In our opinion it only wants to be started by the right man to make it a success. Shall it be so started, or shall things be allowed to drift on as they have been doing for so many years past?

THE ASSESSMENT QUESTION.

The people of Toronto are at present, thanks to the late expose in the *Globe*, cudgelling their brains for some solution of the assessment problem. A very cursory glance at the assessments of either the income or personal property of most of our business or professional men, will reveal the fact that in the levying of taxes as at present performed on either of these classes a great injustice is committed against those scrupulously honest citizens who make a statement in exact accordance with facts. It has been suggested that every citizen should make out a written declaration of his taxable assets and confirm its truthfulness under oath, but if even this were done and it produced the effect intended, that is, to get at the true amount of a citizen's personal property or income, the injustice of the system would in our estimation be greatly magnified. We are of the opinion that the present law which compels a citizen to pay taxes upon either his personal property or income is a most unjust one and should be changed as speedily as possible. As the stocks of jewelers as a class are usually valued more highly than the stocks of other merchants, and as about one-tenth of all the jewelers in the Dominion of Canada are doing business in Toronto where the tax on such property is quite a burthen, we ask our readers to examine the merits of the question with us.

We may premise that municipal taxes are or ought to be levied simply for the purpose of defraying the expenses incident

JOHN SEGSWORTH & CO.,

JOHN SEGSWORTH & CO.

to all communities of people who dwell in towns and cities in preference to living in rural districts. These taxes may be divided into two classes, general and special. The special taxes, such as water and sewer rates and those for street and other local improvements, are both asked for and paid for directly by those exclusively interested in the construction or maintainance of such works, and may therefore be dismissed without further comment. The general taxes, however, are levied from the entire population for such expenses as fire and police protection, lighting streets and keeping them clean, education and all such other services as every citizen needs and which cannot be collected in the same way as special taxes. It is in the levying of the general tax if anywhere, therefore, that unfairness has to be looked for.

Now while we hold that every citizen should pay his just proportion of taxes, he should at the same time get value for what he pays and he should not be taxed for what he does not get. The present law we think is unjust as measured by this rule, because the merchant being taxed upon his stock and other personal property is compelled to pay a larger share proportionately than those who are not engaged in business.

For such expenses as street lighting and cleaning, and police protection, it is evident that each citizen should pay exactly the same amount, because they receive exactly the same service, be they rich or poor. For such services as fire protection, it is equally evident that the larger owners of property having the most risk should pay a proportionately larger amount. We cannot for the life of us see, however, why a merchant who has say one hundred thousand dollars' worth of stock should pay taxes on it amounting to say sixteen hundred dollars, while his next door neighbor in an equally large and valuable building with only ten thousand dollars' worth of stock gets off by paying one hundred and sixty dollars of taxes. These two men get exactly the same service from the city and they should pay the same amount of taxes for it, but as the law at present stands the one is compelled to pay ten times more than the other.

Our idea is that no taxes whatever should be levied on personal property or incomes. We think in order that the burthen of the city's expenses should be fairly distributed, a new system of taxation should be adopted having for its basis the value of the real estate owed by each citizen In addition to the tax on real estate there should be a personal or poll tax on every person residing in the city over say eighteen years of age.

The amount of this tax could be easily ascertained, and it should be sufficiently high to pay for those general services mentioned above which every citizen receives alike. There should be also an annual business license which every merchant or professional man of any kind should be obliged to pay before being allowed to do business in the city and take advantage of its facilities as a trade centre.

We think if municipal taxes were levied somewhat after this plan instead of as at present, that not only would the burthen be more equitably distributed, but that it would give our merchants a better chance than they now have and stimulate trade in no small degree. It is no business of any municipality how much personal property a merchant may have, the municipality is not put to any extra charge in protecting the large stock more than in protecting the small one, and we fail to see therefore why the energetic and far-seeing merchant who anticipates the wants of the community and provides ahead for them instead of from hand to mouth, should be punished for his energy and foresight. As far as we can see it is to the interest of every jeweler (who as a class pay more than their proper share of taxes at present) to do what lies in his power to bring about a reform in the assessment of citizens on the lines laid down by us in this article.

CORRESPONDENCE.

To the Editor of THE TRADER.

SIR—I think it would only be an act of dutiful consideration on the part of our wholesale jewelers to provide at least sleeping accommodation for our jewelers who will be visiting Toronto during the exhibition season. It always mars the pleasure of such a visit to have to sleep on floors or lounges in overcrowded places, and have to pay exhorbitant fees for even such mean accommodation. Contracts could be made with some of the very good houses in convenient localities at a comparatively small cost on the part of the wholesale merchants, if all would bear a proportion of the expense.

Yours respectively,

TRAVELLER.

CLINTON, Aug. 19th, '86.

AURORA, July 5th, 1886.

To the Editor of THE TRADER,

SIR—Allow me through the columns of THE TRADER to suggest that a meeting of the craft be called in Toronto to try and organize a Trade Union. There is no other trade in Canada at the present time without an organization to protect their interests, and if there is a need for protection for any trade, the watchmakers and jewelers trade needs it above all others. I would suggest the name of Mr. Ryrie as a likely person to call a meeting, or if he will not do it, let him name some one whom the trade will have confidence in, and let us try and form a united body to protect the interests of the trade. There has appeared in the advertisements of *The Globe* a specimen of some who offer to put in watch-glasses for five cents, &c., &c., and where has it ended?—just simply in the party becoming insolvent. I contend that the trade should put on a fair scale of prices for work, also a legitimate scale for clocks and American watches, and allow none to sell below, nor work below the prices laid down by the league. It would be the means of bettering our prospects. It is true that in selling watches we are forced to take an old watch in order to make a sale, and in doing so some will allow too much for the old one, but if they do, they will be the loosers in the end. I know of no business where capital is used to monopolize the trade so much as it is in the watch trade. Take some of the large dealers of Toronto as a sample. For a while they spoiled the business for themselves and others; more than one dealer on King Street had to go out of it.

Hoping some effort will be made,

I remain, yours truly,

JOHN BULL.

PORTAGE LA PRAIRIE, Aug. 14th, '86.

To the Editor of THE TRADER.

I was rather amused to see my squib of compliments inserted in your July number. It is now in order to atone for its levity by writing some solid sense if possible. THE TRADER

THAYER & CO.'S

SEPTEMBER MESSAGE.

It will pay you to read it.

We beg to advise the Trade that our Mr. Fred. Thayer has just returned from the United States, where he has succeeded in picking up for spot cash the greatest bargains in Jewelry ever secured by any Canadian House.

These goods we propose to offer to the Canadian Trade at prices unprecedented in the history of the Jewelry business. Every Jeweler visiting the Toronto Industrial Exhibition will therefore find it to his advantage to call and inspect our stock, and get quotations from us. No trouble to show goods.

REPAIRING JEWELRY A SPECIALTY. SEND IN YOUR JOBS.

THAYER & CO.,

3 Wellington St. East, Toronto.

☞ **PLEASE TAKE NOTE OF THE FOLLOWING STAPLES FOR WHICH WE ARE HEADQUARTERS:**

BATES & BACON Filled Cases in 4, 6 and 18 size. The cheapest Filled Case made.
GILBERT CLOCKS. (Sole Agents.) We have them in every variety.
INGRAHAM CLOCKS, all kinds.
SILVERWARE of all kinds.
ROLLED PLATE ALBERTS AND GUARDS. The largest stock in Canada.
WATCH AND CLOCK MATERIAL. A full line exceedingly low in price.

has become a very welcome visitor, but there is one way of making it more interesting still; *i.e*, by having practical workmen contribute articles on various branches of our craft, with the understanding that their theories or formulas are open to criticism by everyone who feels he knows better. I can remember wondering a few years ago when I began taking the *Watchmaker and Metalworker* of Chicago, why its communication columns were so full. and seemed so interesting. Criticism and corrections were fully indulged in, and its whole circle of readers seemed to take their turn at putting in an oar in the debate. On investigation, it would seem that the mainspring of the whole discussion was the advocacy by the fierce Arkansaw Demby, a literary free lance and watch repairer, of mending spectacles with soft solder. Now, whether Demby was in earnest or only wanted to stir the boys up a bit is hard to say. It stirred the boys up very largely, and Demby was corrected and complimented as a soft solder botch, but he wouldn't stay either corrected or complimented, but replied to his brother repairers in terse "United States," and defended himself with marked ability through a controversy, which widened out as expected, and embraced nearly all subjects of interest to our craft. The ball once rolling, the columns of the *W. and M.* have shown ever since a marked contrast to larger trade journals in the number and interest of correspondent's letters.

If it was likely to have the same effect on Canadian watch repairers, I would advocate putting in balance pivots with soft solder, or better still, a little job which came under my eye some years ago. It was done by one of the best watchmakers of Toronto, during a temporary sojourn in the wilds of North-Western Ontario or Eastern Keewatin. One of the top plate jewels and corresponding pivots were broken. Our friend had some kind of a lathe or turn I think, a graver, and, perhaps, screwdriver, and tweezers. He turned a fresh pivot and shoulder on the pinion or staff, and having no jewels beside which, the pinion being too short, he borrowed the seconds' hand, broke off the two extremities, drove out the fragment of jewel in the setting, inserted the tube of the seconds hand into the hole, until stopped by the circle of the hand, and fastened it in the centre with cement. In the end of this tube projecting as it did below the plate, and making up for the shortness of pinion, the newly-made pivot worked like a charm, "neat but not gaudy." I will reserve for a future letter my experience with the same watch in the same locality, if you wish it given. I would like some other brother to stand up and tell what sort of blacksmithing he has seen on watches which has come under his notice. I don't wish to give myself away unless in company.

In the issue before last, you plumed yourself on the loyalty of Toronto jewelers. Toronto is, in the matter of loyalty, behind. The following brethren of Winnipeg took part prominently in the unpleasantness of 1885, in "North West, Canada" as the medals say. 90th Batt. "L.B.D's," Major Forrest, Lieut. S. C. Vick, Pvtes. W. W. Matthews, W. Loughead, T. C. Thurman and Robt. Doyle; 92nd Batt. (now 91st, Lieut. Smith,) Pte. Amos Rogers; Winnipeg Troop of Cavalry, Trooper Winks. Capt. Forrest then commanding No. Co'y 90th, displayed great coolness and bravery at Fish Creek. The first man, or rather boy, killed, Allie Ferguson, fell at his side. His friends wonder yet how he escaped wounds, as when moving around, his great height and build (he is about 6ft. 3in.) made him a conspicuous object for the enemy's fire. His establishment in Winnipeg, out of its staff, contributed besides himself, Lieut. Vick and Pte. Loughead. The former was in British Columbia when he heard of the rebellion. Starting back at once, he passed our battalion at Qu'Appelle Station, (Troy, C.P.R.,) travelling post haste to the front to rejoin his command. Pte. Matthews was wounded at Fish Creek. "Billy" says when the half-breeds set fire to the prairie their company had to get out of that quick, to avoid the blinding smoke and flames rolling down on them. While executing this movement along with his fellows, stooping as they ran, suddenly his left hand flew up higher than his head. The shock caused him to drop the rifle out of his right hand. Once in safe quarters, an examination showed a round rifle ball had penetrated the joint of the wrist, bulging the skin out on the upper side and smashing the bones badly. The ball was cut out, and for weeks in the hospital he endured the daily agony of cleansing and dressing operations. He had a hard fight to save his hand from the surgeon's knife, and from students who wished to see how cutting off hands was done. He has now so far recovered its use as to be able to do all repairs except putting in case springs, his left hand being too weak to press the pliers enough. He left his store in charge of a competent workman and still has an assistant to accommodate his increased trade from the "boys" in dark green. The day after our battalion, the 91st (now 95th, nicknamed "Scott's Fighting Battalion," because they didn't do any fighting) arrived at Fort Qu'Appelle, after making one of the swiftest marches of the N.W. Field Force, I went over to visit the local watchmaker. "Gone with the Morse Mountain Scouts," was the reply to enquiries as to his whereabouts. The jewelers serve their country well was the decision I arrived at.

Yours respectfully,

H. J. WOODSIDE.

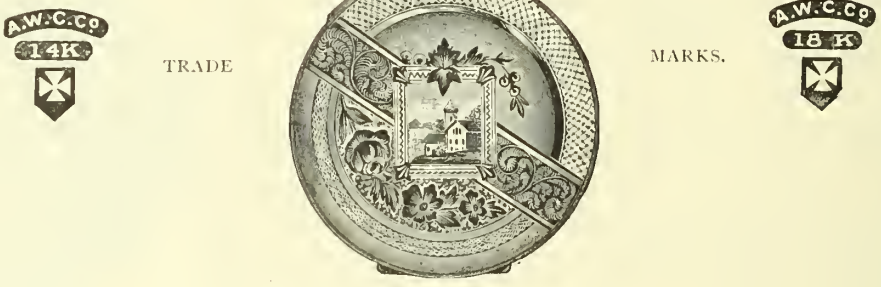
(We are proud to acknowledge the loyalty of the Craft in the North-West, and cheerfully "accord them the bun." Regarding the opening up of correspondence amongst our readers on trade topics, we may say that the columns of THE TRADER are now and always have been as free as air to any one in the Craft who has anything of interest to say, and can say it without taking up too much space. We thank brother Woodside for his kind offer, and say to him, sail right in, you will soon be in good company.)—Ed. TRADER.

A PRACTICAL TREATISE ON

THE BALANCE SPRING.

Including Making, Fitting, Adjusting to Isochronism and Positions, and Rating, also Adjustment for Heat and Cold.

BY EXCELSIOR.



PART II.

FITTING HAIR SPRINGS.

(39.) If, however, there is more space at the center than is supposed above, the curve should take more length to reach the regular spiral portion of the spring, but in no case more than 90° or one-fourth of a coil. If that is not enough to reach the spiral, with a moderate divergence, the space is too large. The object we have in view is to bring the entire length of the spring, from the regulator to the collet, into action as uniformly as possible. Any considerable variation from the spiral form at the center causes irregularity of action, *i. e.*, an action different from that of the rest of the spring, and the greater this variation the greater the resulting irregularity. In springs which diverge very boldly, or which have a large open space at the center, this sweep or curve becomes a veritable "terminal curve" modify-

"Men have a touchstone whereby to try gold,
But gold is a touchstone whereby to try men."
Shakespeare.

The American Watch Case Company, of Toronto, ask the attention of the trade generally to the following rules which, in the interest of honest dealing, theyhave laid down for the guidance of their business.

(1) To manufacture no goods without their own Trade Marks.

(2) To stamp no goods of higher quality than they really are.

(3) To guarantee every case bearing any of their trade marks to be of the quality stamped upon it.

These rules they have faithfully carried out, and dealers and the public can therefore buy goods of their manufacture with the full assurance that they are getting the quality represented and no other. They aim at making their Trade Mark a synonym of undeviating quality, and stand ready always to fully carry out the terms of their guarantee. They claim that their Cases are fully equal in quality, workmanship and finish, to any made elsewhere, while they are so much lower in price that the trade can save the duty by buying them. Although the Company sell no goods direct to the retail trade, they can be procured at catalogue prices from any of the leading jobbers in Canada.

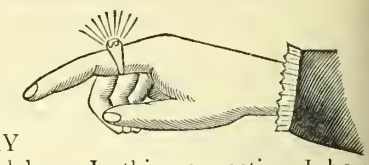
ing the action of the whole spring, always difficult to change or adjust, on account of its position, and frequently defying every effort to neutralize its injurious effects upon the isochronism. It is even necessary sometimes to make the collet larger, as hereafter noted.

(40.) In pinning the spring many workmen fasten the end "any way it happens," then *bend* the central coil up or down to make the spring stand truly, not knowing that as soon as it is flexed it will be thrown out of its true plane by reason of this central twist. The spring should always be leveled before the pin is tightened, so that when fast it will be true without any twisting. The pin should barely reach through the hole, not sticking out at either end, and particularly not at its large end next to the elbow. It should be made either of hard brass or steel, stiff and tapering but little. After filing it up, flatten one side so that it will go in nearly as far with the spring in the hole as out, and while both are in the hole mark where it projects from the collet on each side, cut it off at the end, file a notch around it at the other mark, then force it to its place and break it off while in the hole. The small end should not be pointed, but flat, so that it can readily be pushed back for altering, if necessary.

(41.) For this purpose you want a special pin-punch, made from a short needle, perfectly flat on the end, and firmly fixed in a stout handle. While pushing the pin in or out of the collet, you should hold the latter flatwise (the hole being outside of the end of the jaws), in a pair of pliers lined with soft iron or copper—by which you can hold it firmly without any need of marring it. The jaws also serve as guides in getting the spring flat. To try it, slip the collet on an arbor, and revolve it in the turns or calipers, either with a bow or with the fingers, noticing both the flat and also that the coils *rise evenly* from the center to the outside. But if, as your eye runs along the coil while it is turning, there seems to be any waving or "bobbing," the spring is not concentric with the collet, and must be made so by altering the central coil. Being true both in the flat and in the coil, you now put the collet on the balance-staff, and again try if the spring is flat and true, by whirling the balance in the turns, or even between the thumb and forefinger. The collet must be adjusted on the staff at such a height that the spring, when pinned in the stud, will be perfectly level. If the collet end of the spring is higher or lower than the hole in the stud, the center will be bulged up or down, and satisfactory action will be impossible. It is important, for this reason, that the balance-staff itself should have no more end-shake than necessary.

(42.) *Pinning to the stud.* Before pinning the spring in the stud, you now verify its proper length more closely, by again counting the vibrations while holding it with the tweezers, remembering that the point which is to go in the stud should be about one-eighth to one-fourth of an inch beyond the place where it gives the correct number of vibrations in the tweezers. This is to allow for the effect of the regulator. The exact distance will be about one-third less than the actual distance from the regulator to the stud, along the coil. Having placed that point over the hole in the stud, while the pivot is in its jewel hole, the outer coil should lie freely in the regulator, and the elbow at the collet should be about in the line between the pivot and stud, as already described.

(43.) If the elbow varies much from this position, the isochronism of the spring will be more or less defective. Although the time shown by the watch at the end of each 24 hours may become correct, by dint of regulating, it will not be correct at any previous period,—nor afterwards, in case the watch is allowed to run over 24 hours before rewinding. It will either gain in the first 12 hours and lose in the last 12, or the reverse, making a correct *average* for the entire 24 hours. Such watches must be wound regularly, at precisely the same hour each day, to secure even fair time. And in regulating them they must be timed at the end of each 24 hours, and at no other time during the day, as that would damage the regulation instead of improving it. But no watchmaker who cares for his reputation should let a job go out in this condition. The correction of this error will be fully treated hereafter.



(44.) But if the spring has been fitted as I have directed, you may proceed to pin it to the stud, with full confidence that it will perform satisfactorily. It should not have been done before, because at that point in the stud there is always produced a bend or crimp, by the pin forcing it to conform in shape to the hole, and if it should afterwards be necessary to let it out and bring the crimp into the acting portion of the spring, that stiff point would interfere with perfect performance. Even filing the pin flat on one side does not entirely prevent this. Hence it is advisable not to pin a spring unless it is reasonably certain that it will answer the purpose, and then it should be so pinned that it will surely be *long enough*, and that any necessary alteration will be made by taking it up, or drawing it further through the stud, not by letting it out. In the next article I shall show how a spring may be selected, fitted and partly regulated in the watch before pinning it in the stud at all. But as springs occasionally need to be shifted, even after they are fitted, it might be a good idea in fine watches to pin them with a flatted pin on each side—unless some inventor can furnish us a stud with a slot instead of a round hole for the hair-spring.

[Mr. S. F. Gordon proposes to make a square steel punch, and hammer the stud upon it till the stud becomes square. If this plan is followed, however, it would be sufficient to have the punch square on one side only, leaving the other side of the hole round, as usual, for the pin.]

(45.) The spring must be pinned perfectly solid, both in the stud and the collet, so that not the slightest change or yielding can occur. The larger end of the pin should be towards the body of the spring and should not project at all outside of the stud, so that under no circumstances can it affect the action of the spring, as it would do if it extended alongside of it even for a short distance. But the point of the pin may project from the other side of the stud, next the end of the spring, for convenience of pushing out and also turning it with the pliers, to level the spring perfectly before making it fast. Enough spare spring must be left, when broken off, to have at least one-eighth to one-quarter of an inch beyond the stud, after the watch is regulated, to provide for future contingences requiring it to be let out.

(46.) If the stud hole in the bridge is further from or nearer to the balance jewel-hole than the regulator pins are, as sometimes happens, the spring must be bent near the stud to bring the outer coil within the circle of the pins as soon as possible, as, throughout the sweep of the regulator, the spring must lie *freely* between the pins, not pressing against either one of them, when the balance is at rest. If there is a considerable space between the pins, the spring should stand in the center of it. The position of the spring should be tested by screwing down the balance-bridge in its place and moving the regulator each

JEWELRY REPAIRS.

Every Retail Jeweler in Canada has at some time or other felt the need of a JEWELRY REPAIR SHOP that could not only do such jobs in first-class style, but return them without delay. In this connection I beg to notify the Jewelry Trade throughout Canada that having fitted up my new factory with all the modern steam machinery requisite to the successful carrying on of a first-class jewelry manufacturing business, I have also opened a repairing department in connection therewith. I respectfully solicit your custom therefore for repair work of all kinds, and gold and silver plating in all its branches. Every job done by me will be executed in a first-class manner, and my prices will be found as low as consistent with good workmanship.

Special attention is also given by me to the execution of orders for special jewelry to be made up either from original or selected designs. For such things as Lockets, Diamond or other Earrings Brooches, Earrings or Chain work of any kind, I have special facilities and can guarantee satisfaction every time. When you have any new special work or jewelry repairs, give me a chance. Remember my address, **A. H. WELCH,** FINE JEWELRY MANUFACTURER, 31 ADELAIDE STREET WEST, TORONTO.

way. Sometimes the regulator cap or center-piece gets screwed on the wrong way and causes the pins to stand further in than they should. If this is the cause of the trouble, reversing the cap will throw the regulator further out and obviate the need of bending the spring. But if it must be done, the bend should not be too abrupt at the point where the outer coil is made to become concentric with the regulator, but should be made far enough from the stud so that the change of direction it produces in the spring at that point will not be more than about 15°—never over 25°.

(47.) When it is correct, take the balance-bridge off, and lay it bottom upwards; having taken the stud out of its hole, place the pivot of the balance in its jewel, and hold the staff nearly upright with the tweezers. Then the spring should lie naturally in the regulator-pins, while the stud must hang freely directly over its hole and must point straight down into it, which will show that the spring is properly pinned and correctly shaped. If it is not as described, it must be made so, for the spring must have exactly the same form when loose as when it is secured in the watch for running, so that it may stand perfectly free from any twist or constraint during its vibrations. This is indispensable to its good performance. When the stud is a heavy bar, the above test cannot be applied, and, instead of that, the collet should be removed from the staff, and the bar screwed into its place, when the collet should naturally come exactly concentric with the balance pivot-hole. If not, the spring should be bent to bring it so. We often see springs that are too large, with one side spread out, while the other is compressed within narrow limits. Also, springs twisted sideways at the stud, to go over or under a center wheel, and many similar makeshifts. Such jobs may be excusable when the owners will not pay a price for which the watchmaker can afford to do the work properly, but they should be given to understand that good service cannot be expected from them.

(48.) *Taking out the stud.* In taking out a stud we often see workmen use a knife to pry it up, and, if it should come up more easily than was expected, the knife-blade suddenly slips across the bridge, and off goes the pivot. Tweezers have been made for pushing out studs—also pliers for the same purpose. But as good a way as any is to rest the arm of the bridge on any convenient square-edged block of metal, say an inch thick, to allow the balance to hang down from the stud, or rest partially on the bench, while you push the stud out from above with a pin-punch of suitable size. As the end of the arm is supported

by the top of the block, close up to the stud, which is in contact with its side, it is very easy to hold the bridge level under any amount of force required for pushing out the stud, without the slightest risk to any part. In Fig. 2 *a* is the block; *b*, the arm of the balance-bridge, and *c*, the stud.

(49.) *Putting in beat.* Putting the watch in beat is an operation that frequently troubles beginners, and sometimes those who are very far from being beginners. I will therefore give directions for so much as relates to the hair-spring. Errors in the escapement, etc., will be treated in their proper places. When the power of the movement is cut off and the balance at rest, the position of the parts should be as follows:—In the chronometer the unlocking jewel should stand just on the outside of the unlocking spring, *i. e.*, not on the same side as the escape-wheel, or the unlocking side, but on the opposite side. In the duplex, the slot in the roller-jewel on the staff should be in a line from the center of the staff to the center of the escape-wheel. In the detached lever, the ruby pin should be in a line between the centers of the balance-staff and lever-staff, or "pallet arbor." When the hair-spring stud is fixed to the balance-bridge, turn the regulator so that it will point to the lever-staff, while the bridge is screwed in its place. Then the ruby pin is easily put in line with the regulator while the balance-bridge is lying bottom upwards on the bench and the balance-pivot in its hole, and got very close before the spring is put into the watch at all. Then it can be tested by "sighting," or by placing a blunt screw-driver against the fourth wheel, or the one which carries the seconds-hand, and moving it very slowly so that the balance will vibrate as far in each direction as the lever carries it, but no further. Notice the position of the arm, or a screw in the rim, at each extreme, then turn the collet so as to cause it to stand at a point midway between them when at rest, and it will be in beat.

(50.) In the horizontal or cylinder escapement, the stud should be in line with the two impulse lips of the cylinder. But if the mechanism is not in its normal condition, and the watch does not prove to be in beat, upon trial, take your oiling-wire or a stiff bristle and with it move the balance very slowly each way till the escape-wheel tooth drops, but no further, noticing the position of the banking pin on the rim, at each drop. Then place the pin halfway between these two drop-points, and hold the balance there while you "sight" a line through the center of the stud to the cylinder-pivot, and identify the point on the rim of the balance which is in that line, by means of some mark or stain, etc., or its distance from one of the arms or in any other way. Then take off the bridge, remove from it the balance and stud, and turn the collet so that the stud will hang naturally in that line from the mark on the rim to the cylinder pivot, when the balance is held horizontally, and the watch will be in beat, provided the spring is not forced out of its normal shape when the stud is fastened in its place.

(51.) *Turning the collet.* Most workmen use a screw-driver or a knife-blade to shove the collet around with, and unless they move it very carefully it will slip off and "jab" into the spring; or it will pry open the cut and loosen the collet, rendering the watch liable to be thrown out of beat by jars, or even by running, making it unreliable for time and likely to stop. A tool can be made in a few minutes which will turn the collet without trouble or danger. Take a thin piece of steel, say a piece of the main-spring of an English lever watch, one-eighth of an inch broad, and hollow out the end into two claws or prongs—a long one on one side, and a short one on the other, as shown in Fig. 3.

The latter should point towards the end of the former, and be so formed as to hook into the cut in the collet, while the former rests against the side of the collet. It is used by placing it flatwise on the spring, pressing it lightly against the collet, and *pulling*, not pushing, with the short claw in the cut. Mount it in a light handle, and keep the short claw in a good condition and a little under-cut.

TO BE CONTINUED.

A FIRM in New York wrote to a Western piano dealer who owed them money:—"Dear Sir—Will you be kind enough to send us the amount of your bill? Yours truly." To this the firm received the following reply:—"Gentlemen—Your request is granted with pleasure The amount of my bill is $575. Yours very truly."

SELECTED MATTER.

WHAT IS A WATCH?

How few among the many who own and carry watches ever stop to ask themselves this question, or to think that it is the smallest, most delicate piece of machinery—having anywhere near the same number of parts—ever constructed, and yet is expected to indicate the correct time at any and all times during the day or night, for a period of at least one year, without being cleaned or oiled. Is depended on for nearly every action of our lives. Is expected to be so perfectly regular in its habits, no matter how *irregular* we may be in ours—that it must indicate almost to the very second, the time for all our most important engagements, and must not vary even a *second a day* without calling down on its poor defenceless head our strongest disapprobation.

The E. Howard & Co.—better known, perhaps, as the "Howard" watch—is composed of some 175 different pieces, comprising upwards of 2400 separate and distinct operations, in its manufacture. The balance has 18,000 beats, or vibrations, per hour; 12,960,000 in thirty days; 157,680,000 in one year. It travels $1\frac{4}{10}\frac{3}{0}$ inches with each vibration, which is equal to 9¾ miles in twenty-four hours; 292½ miles in thirty days or 3558¾ miles in one year. The amount of oil used in oiling the entire watch is about $\frac{1}{10}$ of one drop, while the oil that can be put in the Balance Jewels with safety must not exceed $\frac{1}{100}$ of one drop, and on this minute quality the Balance must feed during its 3558¾ miles of travel in the course of one year.

Did you ever stop to think what one second a day, or thirty seconds a month means?

Should the vibrations of the balance be so accelerated or retarded—accelerated by means of running, jumping, horseback riding, etc., etc., or retarded by the changes or wearing out of the oil—so as to accelerate or retard the vibrations three one-millionths ($\frac{1}{1000000}$) of each excursion; the watch may gain or lose one second per day, thirty seconds per month, or six minutes per year. If by any means the little globules which form the lubricating substance become so changed—and changed they must be with this constant travel over them—from what they were when the watch was first started up and regulated—so as to allow a little more friction on any of the several bearings, the same result may follow. Is it any wonder, then, that variations take place in the running of a watch? On the contrary, is it not a *perfect marvel* that such a little piece of machinery can be constructed with such precision, that it will perform with such nicety, and prove such a faithful servant under such adverse circumstances.—*Exchange.*

REACHED AN UNDERSTANDING.—"If I should ask you to concoct a milk-punch for me could you do it?" he blandly inquired of a Michigan avenue saloonist. "Yes, sir." "And if I should consume the said punch and had no money to pay for it how would you treat me?" "Give you the bounce." "Gently?" "Not by a long shot!" "Do your best to injure me, eh?" "Of course." "Wouldn't care how much you degraded me in the estimation of the public?" "No, sir.' 'Very well, sir. I always like to have a previous understanding in regard to such matters. You can keep your milk-punch and I will keep my dignity.—*Detroit Free Press.*

BUSINESS NOTES.

C. L. PAPST, jeweler, of Seaforth, has assigned. His stock, amounting to about $5,000, is being offered for sale by tender by the Assignee.

MR. WILLIAM LEWIS, ring manufacturer, formerly of Birmingham, England, has commenced business in Toronto, where he intends to make a specialty of ladies and gentlemen's rings of all kinds.

JEWELERS PIC-NIC.—The working jewelers of Toronto, to the number of nearly 200, held their annual pic-nic on August 11th and had a very enjoyable time.

MESSRS. GREEN BROS., jewelers, of Plattsville, have bought out the business of W. G. Ryckman, of Parkhill. They are pushers and we wish them success in their new venture.

MR. HERWICH, of the firm of Rothchilds & Co., has just returned from Europe, where he has spent the past four months in the interests of his firm.

C. H. GILPIN, jeweler, of Uxbridge, Ont., has assigned. He offers forty cents on the dollar, and we understand some of his creditors object to any such settlement.

MR. A. C. ANDERSON, of the firm of Lowe & Anderson, has just returned from the North-West after a very successful trip. He reports the prospects up there as being brighter than at any time since the great land boom of '82.

HOW DO YOU DO?—During the month our sanctum has been enlivened by visits from the following well-known jewelers: T. Evans, Alliston; C. H. Hepinstall, St. Thomas; and A. W. Mitchell, Brampton.

A CREDITABLE JOB.—The new jewelry trunks and fittings, of Mr. A. W. Dixon, to replace those destroyed by the sinking of the "Passport," were made by Hemming Bros., of this city, and are the best specimens of this kind of work that we have ever seen in Canada.

SAYS AN EXCHANGE.—A bar of gold weighing about 200 ounces and valued at $4,000 arrived in Halifax last week from the Caledonian mines. It was the product of twenty tons of quartz, and is of the purest and most valuable kind.

SPECIAL TO FISHERMAN.—A prominent Toronto retail jeweler told us the other day that the reason he didn't go in for fishing was because he didn't want to get up a reputation for lying. He thought it might hurt his business. He was sound on the goose anyhow.

BURGLARS attempted to enter the jewelry store of Mr. E. C. Fortier, of Montreal, last month, but were frightened off by the Holmes Burglar Alarm which raised such a rumpus that they got demoralized and left without securing any booty.

DEAD.—Joseph Taylor, one of the oldest and best known jewelers in Hamilton, Ont., died last month. Mr. Taylor was very popular amongst the trade here, and did a large and paying business. We understand the business will be liquidated as speedily as possible.

MR. JOHN SEGSWORTH, wholesale jeweler of this city, has just returned from Europe and looks very much improved by his trip. He reports prices very low, and says his firm are prepared to give the trade some eye openers in the way of bargains this fall.

A CURIOSITY.—Messrs. C. & J. Allan, the well known King Street jewelers of this city, had a curiosity in their window a few days ago, in the shape of a gold harnessed beetle from Yucitan. It is needless to say that it attracted a great deal of attention, especially from the fair sex.

PROGRESS.—The *Watchmaker, Jeweler and Silversmith*, of London, England, has changed hands, and last month came out in an entirely new dress. It has become Americanized into a bright and newsy journal fully abreast of the times, and we wish it increased success under its new management.

DISSOLVED.—Benham & Grigor, wholesale jewelers, of Toronto, dissolved partnership last month, Mr. Grigor retiring. The business will be carried on in future by H. Benham, under the style of H. Benham & Co. Mr. Grigor remains with the firm until the end of the year when he will go to Kingston to take charge of his father's business.

A FRAUD.—We are informed that some unprincipled persons are travelling through Canada and selling spectacles and eye glasses said to be manufactured by Messrs. Lazerus & Morris, of England. We are

LOWE & ANDERSON

TORONTO.

CANADA'S

GREAT - INDUSTRIAL - FAIR

PURCHASERS to the amount of $100 and upwards will have THEIR RAILWAY FARE PAID.

COME AND SEE US.

LOWE & ANDERSON

16 WELLINGTON ST. EAST, - TORONTO.

☞ DO NOT FORGET THE ADDRESS.

advised by the representatives of this firm that their only authorized agents in Canada are the Montreal Optical & Jewelry Co., of Montreal. Dealers should make a note of this and govern themselves accordingly.

FLATTERING TO CANADA.—We clip the following from the last issue of our bright contemporary, the *Jewelers' Weekly*:—The new pendant stem for watches recently patented by Edward F. Hefferman. case maker, in the employ of the American Watch Case Company, of this city, which was illustrated in the *Weekly* of July 21st, is said to be meeting with favor among practical jewelers.

STOLEN.—We ask the attention of our readers to the advertisement in our Help Column of the watches stolen from customers of Messrs. Barker & Co., of Listowel, Ont. If any Canadian jeweler comes across any of them they will confer a favor by at once communicating with Barker & Co. regarding it. In all such cases every jeweler should do his utmost to help in the good work of restoring stolen property.

MR. Edmund Scheuer, wholesale jeweler, of this city, has just returned from a purchasing trip to the Eastern States, his business having increased so rapidly as to compel him to keep his stock permanently full in every department. He has purchased largely, and offers to the trade, besides an unusually elegant and choice variety of goods, many novel lines in Watches, Clocks and Jewelry. See his advertisement on another page.

MR. WM. ANDREWS, the well-known jeweler, of St. Marys, Ont., called on us the other day on his way home from a three weeks' holiday down east. He reports crops good in his section of the country and thinks that there are good prospects ahead for the jewelry trade. As one of the most successful retail jewelers in Canada, Mr. Andrews' opinion upon the business outlook is entitled to carry considerable weight.

A SLY THIEF.—John Beatty went into Mr. Mumford's jewelry store, King Street East, one evening last month, and asked the price of some gold chains. Beatty left the place without buying anything and shortly afterwards the jeweler missed one of the chains. The man was arrested. Detective Burrows, much to the gratification of the jeweler, subsequently recovered the chain which had been thrown in the doorway of a King Street store.

A CREDIT TO CANADA.—When in St. Catharines the other day we were attracted by an elegant gold watch case in the shop window of Mr. J. W. Jackson, the well known jeweler of that place. Attached to the case, which was manufactured by the American Watch Case Co. of Toronto, was a card bearing the inscription, "A specimen of home manufacture of which every Canadian ought to feel proud." The case was an exquisite piece of workmanship, and it is needless to say was greatly admired by the many sightseers who paused to examine it.

A NEW DEPARTURE.—Messrs P. W. Ellis & Co. have made a new departure as regard their city trade by opening a sample room at the Rossin House and showing their goods exactly the same as they would do in any other place. Their display of watches, cases, setts, rings and all varieties of gold and plated jewelry, was most complete and reflected the highest credit upon their enterprise. Messrs. Charley and Tom Ellis presided alternately as master of ceremonies, and we understand they succeeded in making a lot of very good sales.

LOOKING FOR A MAN.—We understand that Mr. John Sheppard, of the Keystone Co., was in the city about a week ago on business. From a post card received a few days before he came, we inferred that part of his business was to club the editor of this journal, so we quietly went off to the island on our holidays. After lying *pardue* for several days we finally ventured back to the city, only to find that John had been so busy taking orders for Boss Cases that he had entirely forgotten our existence. Thanks, John.

THE GOLDSMITHS' COMPANY have this season made arrangements for a most extensive fall trade. Mr. Walter Barr, their genial manager, personally visited theUnited States manufactories, and as he was well heeled with taste, grit and greenbacks, it is needless to say that he secured some wonderful bargains. Mr. Barr has long been recognized as one of the most enterprising and successful men in the trade, and he is bound to bring the Goldsmiths' Co. to the front if there is any go in the trade this year.

ENTERPRISE.—Messrs. R. F. Simmons, the well-known manufacturers of rolled plate goods are out with a new line of seal chains, which have taken the market by storm. The seals consist of sardonyx, bloodstones, cornelians, &c., plain and intaglio, and are mounted in solid gold settings. This novelty, which was introduced into the market by R. F. Simmons & Co., furnishes an attractive ornament. The chains are made for both gents and ladies' wear.

THE END OF THE WOLTZ BUSINESS.—The stock of watches and jewelry of the firm of Woltz Bros, over which there has been so much litigation, was last week handed over to J. S. Coolican, Auctioneer, to be disposed of and converted into cash without delay. Mr. Coolican will remove the goods from the store of Woltz Bros., and will sell it piecemeal to the public by auction at an early day. The inventory of stock and fixtures amounts to $56,820.

ATTEMPTED BURGLARY.—A daring attempt to burglarize the premises of Messrs. Kent Bros., the well-known Toronto jewelers, was made about the middle of last month. These midnight mechanics commenced operation by trying to force an entrance through the cellar wall but it proved too thick and solid for them and they were forced to give it up for a bad job. This is the second unsuccessful attempt that has been made to burglarize these premises during the past few years.

SAYS AN EXCHANGE:—Early in September the Elgin National Watch Company will place a new line of watches on the market and retire one or two grades which they ceased to manufacture several months since. The steady demand for Elgin watches has kept this factory running full time all summer, and about July 1st the business wave that swept over the West emptied their vaults to such a degree that extra steam was put on and everything done to give the public more and better watches.

SCORE ONE FOR THE HOLMES.—Mr. Narcisse Beaudry, jeweler, of Montreal, was very nearly becoming the victim of a couple of thieves last week, who asked him to show them some fine gold watches and chains. Becoming suspicious of them, Mr. Beaudry with the aid of his Holmes' Protection, quietly called up a couple of detectives who promptly arrested the thieves. Two valuable gold watches were found in their possession, for stealing which they were, next day, sentenced to six months in jail.

BURGLAR-PROOF SAFES.—Self-preservation is said to be the first law of nature, and it is equally true that the preservation of his stock from the ravages of burglars is the first consideration with any jeweler. Burglar-proof safes have heretofore been so high priced as to be beyond the reach of ordinary jewelers, and on this account we have more than ordinary pleasure in drawing our readers' attention to the new low-priced burglar-proof safe advertised by J. & J. Taylor, the well known safe manufacturers, in another column.

OUR HELP COLUMN.—We are frequently in receipt of letters from jewelers throughout Canada whose advertisements have appeared in our Help Column, saying that they have had their advertisements satisfactorily answered, and thanking us for our liberality. For these letters we are grateful, and we want the retail trade to feel that our Help Column is their's, and they can use it as freely as they please. It is the only way we know of by which they can communicate with the trade free of charge, and we trust that they will not hesitate to avail themselves of its benefits.

A COMMUNISTIC PAPER.—In a recent editorial the Toronto *Globe* advocates the idea of not allowing people to accumulate more than a certain amount of filthy lucre. Like all other communists, we notice that they fix the amount at a point there is no probability of themselves ever reaching until they walk the streets of the golden city. $1,000,000 is the modest sum they mention as being the maximum of any man's fortune in future. We will take exactly half that amount in cash and give the country a bond to go out of the money making business to-morrow.

A BIG ADVERTISEMENT.—The *Globe's* special correspondent at the Colonial Exhibition says: "The extensive display of safes made at the Indian and Colonial Exhibition by Messrs. J. & J. Taylor, of this city will never see Canada again. A Bombay dealer with an appreciative eye has purchased the entire consignment consisting of two car loads and will take them back to the land of jungles, elephants and tigers. Nor is this the whole story. The firm is at present working on a second order for the same purchaser. Some idea of the extent of the first sale may be gathered from the fact that the value of one safe alone is $2,000. Messrs. Taylor have, of course, no doubts as to the benefits arising from the London Exhibition, as already enquiries have been received from far Australia.

SIMPSON, HALL, MILLER & CO.,

OBITUARY.—We regret to have to chronicle the death of Mr. N. W. Speller, jeweler, of Yonge St., Toronto. Mr. Speller was one of the best known jewelers in Toronto, having been in the employ of the Sheffield House for over ten years before commencing business on his own account. He was highly respected by all who knew him, and will be much missed by a large circle of friends.

PARCEL POST TO ENGLAND.—The new Parcel Post system which has been extended to England, is a big step in the right direction, and the Government deserve credit for it. We desire to point out to the Postmaster-General, however, that he might extend its workings to the United States and Australia with great acceptance to the merchants of this country. Our trade relations with the United States are more intimate than with any other country, but although we have book post we have no parcel post arrangement with them. This should not so be. The United States have a splendid parcel post arrangement with Australia, while Canada has none; this gives our American competitors for that trade a big pull over Canadians. The Government should see that both of these evils are remedied as soon as possible.

TOO PREVIOUS.—As Mr. J. B. Williamson, the well-known jeweler, of Montreal, was landing from one of the Allan Steamships at Rimouski, he handed a valuable package of diamonds to the Customs Officer for inspection. This nineteenth century official did not understand the English language and Mr. Williamson did not understand the lingo he spoke, and therefore they were unable to come to terms concerning Mr. W's treasures. The upshot of the whole matter was that this "too previous" officer seized the diamonds, although they are on the free list, and thought he had a great snap until he was compelled from headquarters to disgorge them. It seems a pity that the Government should appoint a person to such a position who could not speak the language of the country, and that reputable gentlemen such as Mr. Williamson should be put to so much annoyance by such a combination of ignorance and zeal.

DOWN ON THE PASSPORT.—Mr. A. W. Dixon, traveller for Messrs. P. W. Ellis & Co., was one of the passengers on board of the ill-fated steamer "Passport" when she struck the pier at the entrance of the canal at Cornwall, and went down in less than half an hour. Mr. Dixon had his three jewelry trunks on board, and it is needless to say that when they were fished up and unpacked they presented a very sorry spectacle. The damage to the trunks and contents is estimated at from five to six thousand dollars, and it is probable that before the firm can recover from the Richelieu Navigation Co the matter will have to be fought out in the courts. Messrs. Ellis & Co. intend to fight it out to the bitter end, and the probability is that it will be a test case as to the liability of Steamship Companies in carrying valuable merchandise, such as jewelry stocks usually are. The result will be watched for with extreme interest by the trade in general, and by the firm and the Navigation Co. in particular. THE TRADER without wishing the Navigation Co. any harm, wishes the Messrs. Ellis the biggest kind of a success in the encounter.

OUR POET LAUREATE.—We shall have to dub our old friend, James Walton Jackson, of St. Catharines, the poet laureate of the Canadian jewelry trade. His latest effusion, a copy of which he has kindly sent us, is entitled, "Our Empress-Queen—Victoria," and is one of his best. We understand that Mr. Jackson has sent a copy printed in gold on white satin, to her Most Gracious Majesty. As the right of printing is reserved, we are afraid to steal more than the final verse, in order to give our readers a touch of its flavor :

"From morning light to set of sun,
Shall prayer, with time, co-equal run :
GREAT RULER! KEEP THE KINGDOM ONE—
Of Empress-Queen—Victoria!
High swell the strain :
God bless the reign
Of Empress-Queen—
Victoria!"

INTERESTING TO RETAIL JEWELERS.—A case of much interest to retail jewelers in Canada, came to our notice a few days ago. The regular jewelers of St. Marys, Ont., have for some time past complained of being undersold in the matter of watches and jewelry, by a shoemaker residing in the same town, and could not understand how it was done. They finally consulted with one of our leading jobbers about it, and the result was that the Customs authorities were informed of the facts and proceeded to work up the case. The latest case of underselling, it appears, was a gold watch which was purchased by a well known resident of the town. This the Customs officer seized, and the purchaser repudiating any fraud referred him to the shoemaker from whom he had purchased it. The shoemaker showed up an invoice from a Canadian jobbing house and thus cleared himself, and the officer then proceeded to investigate the record through the jobber's establishment. The jobber could show no Customs entry for it, and finally acknowledged that it had been smuggled, which result led to a seizure of his place and a thorough examination of his books. The final outcome of the case was the confiscation of the watch by the Customs authorities, and a fine upon the jobber who smuggled it. The case is of more than ordinary interest to retail jewelers throughout Canada, inasmuch as it shows that smuggled goods can be seized even after having been sold and in the possession of the purchaser. There is no doubt but that in some places a good deal of smuggling is done, much to the disadvantage of the honest dealer, but now that it has been shown that the Customs authorities are not disposed to let even small infringements pass with impunity, those who have been undersold by smuggled goods can see a remedy at once quick and effective. The above may be taken as a test case and it will be the jewelers' own fault if they find themselves as badly handicapped in the future by dishonest competitions. We have no sympathy with professional informers, but merchants who use such information as a protection to their own legitimate business are not only entitled to respect but commendation.

AS OTHERS SEE CANADIANS.—The following personal notices from the last issue of the *Philadelphia Keystone* may be of interest to our readers.

LOWE & ANDERSON.—Mr. Lowe, of Lowe & Anderson, Toronto, recently spent a week or more in New York in buying a large and varied line of watches, clocks and jewelry. He devotes a considerable portion of his time to the road, among the retail trade, and it is a pleasure to be able to say that his presence, goods, and representations concerning them are a source of gratification and confidence to his patrons. His social and business abilities make him a power, and his sales are necessarily such that at the conclusion of each trip he feels "at peace with the world and the rest of mankind." Mr. Anderson holds his end of the business up bravely, and, with Mr. Lowe, has been largely instrumental in imparting the spirit and substance of progress, in its best sense, to Canadian jewelry interests.

P. W. ELLIS & CO.—This Toronto house, it is a marked satisfaction to know, is doing a largely increased business this year. The manufacturing establishment which Messrs. Ellis & Co. own and control will compare favorably with the best-appointed industries of similar character in the States, and its products are not surpassed by any. Messrs. Ellis & Co. manufacture medals of all kinds, their catalogue including 150 designs. Their specialties also include presentation trowels, officers' badges, college rings, souvenirs, and all classes of dies and press tools for making the above articles. The firm also carries a large and diversified line of American watches. Their travelling men are on the road all the year round, and penetrate every portion of Canada, with the most substantial results.

LEE & CHILLAS.—Mr. Geo. Chillas, of the noted Toronto house of Lee & Chillas, was in New York and vicinity a short time ago, making a purchasing tour, during which he selected an unusually large and varied stock of the best staples and latest novelties in watches, a leading specialty of the firm he so ably represents. Promptly and satisfactorily filling all orders entrusted to them, it is quite natural that Messrs. Lee & Chillas rank among the foremost and most successful business men in the Dominion.

EDMUND SCHEUER.—Mr. Edmund Scheuer, formerly of Levy Bros. & Scheuer, Hamilton, Can., has, since the dissolution of the old firm, secured possession of a large four-storey building on Wellington Street Toronto, and opened it as a jobbing house. The first floor of the edifice is attractively fitted up as a salesroom, the second is devoted to clocks, and the third and fourth to the storage of a stock of watches, jewelry, and material whose selection is unmistakable evidence of good judgment and whose magnitude illustrates the courage and confidence with which Mr. Scheuer begins his new business venture. Combining integrity, experience, industry, and a disposition to please, it is but reasonable to assume that success will crown his efforts.

WORKSHOP NOTES.

DIAMOND FILES.—Shape your file of brass and charge with diamond dust ; grade the dust in accordance with the coarse or fine character of the file desired.

SILVER SOLDER.—A good silver solder for jewelers may be made by melting together 19 pennyweights of fine silver, 1 pennyweight of copper and 10 pennyweights of brass.

TO OXIDIZE GOLD, SILVER OR BRASS.—Paint over the parts to be oxidized with a solution of chloride of platinum, then let it dry. To make the chloride of platinum in solution, dissolve one drachm in two ounces of hot water.

REDUCING FLUXES.—In order to fuse hard smelting substances, such as stonings, bench sweepings, etc., employ a mixture of equal parts of potash, saltpeter and salt ; or, three parts of sandiver, one part of potash and one part of saltpeter ; or, two parts of sandiver, and one part of saltpeter ; or, two parts of potash, one part of saltpeter and one part of cream of tartar.

TO WRITE ON STEEL.—Steel can be written upon or engraved by first cleaning it with oil then spreading a coating of melted beeswax upon it. The writing can be done on the beeswax with any sharp instrument, and the lines and marks thus made should be painted with a fine brush dipped in a liquid made of one ounce of nitric acid and one-sixth of an ounce of muriatic acid. When the written lines are filled with this liquid it should be allowed to remain five minutes, after which the article should be dipped in water and afterwards cleaned.

TO PREVENT TARNISHING OF SILVER PLATE.—An excellent protective wrapper to prevent the tarnishing of silver plate goods may easily be prepared as follows : Caustic soda is dissolved in water until the hydrometer—a very simple instrument—shows 20° Beaumè. To this mixture is added oxide of zinc, until the amount reaches about two thirds the quantity of caustic soda, and the mixture is boiled until perfect solution is effected. Water is then added gradually to reduce the solution ot 10° Beaumè. Into this solution summer calico, muslin or paper is dipped, and when dry it is ready for use.

POLISHING RAGS.—Nothing is better for cleaning silver than the following : Boil one ounce of finely pulverized hartshorn in one quart of water. Leave the vessel on the fire and put all the silverware into it—as much as the water will accommodate ; boil for a time, take it out, drip it over the vessel and let it dry at the fire. Continue until every article has been treated in this manner. Next place clean linen cloths in the water and let them become saturated. When taken out and dried, use them for polishing the silver. Rub the ware with the cloth and finish with soft leather. These rags are at the same time excellent for cleaning articles of brass — signs, door knobs, etc.

TO PUT IN A FUSEE TOP HOLE.—Put the pillar plate in the lathe and peg the bottom hole true ; then turn out the top hole to the required size for bushing. The bouchon (a hollow one) should be small and no longer than just sufficient to form the rivet. If there be danger of bending the plate, the bouchon should be softened slighty (the hammering will re-harden it), and the ends turned hollow to facilitate the riveting. The top hole is now to be turned to nearly right size for the pivot, testing it frequently for truth with the peg, as much broaching is especially to be avoided. In finishing the bouchon use polished cutters, take off the corners of the hole and polish the cup. The same procedure is to be followed with three-quarter plate fusee, and it will be found best to finish the bouchon in fusee piece before screwing the steel on to the brass. Be careful to give the fusee but little end shake ; if it be at all excessive the stopwork and the maintaining work will become uncertain, and either or both may fail.

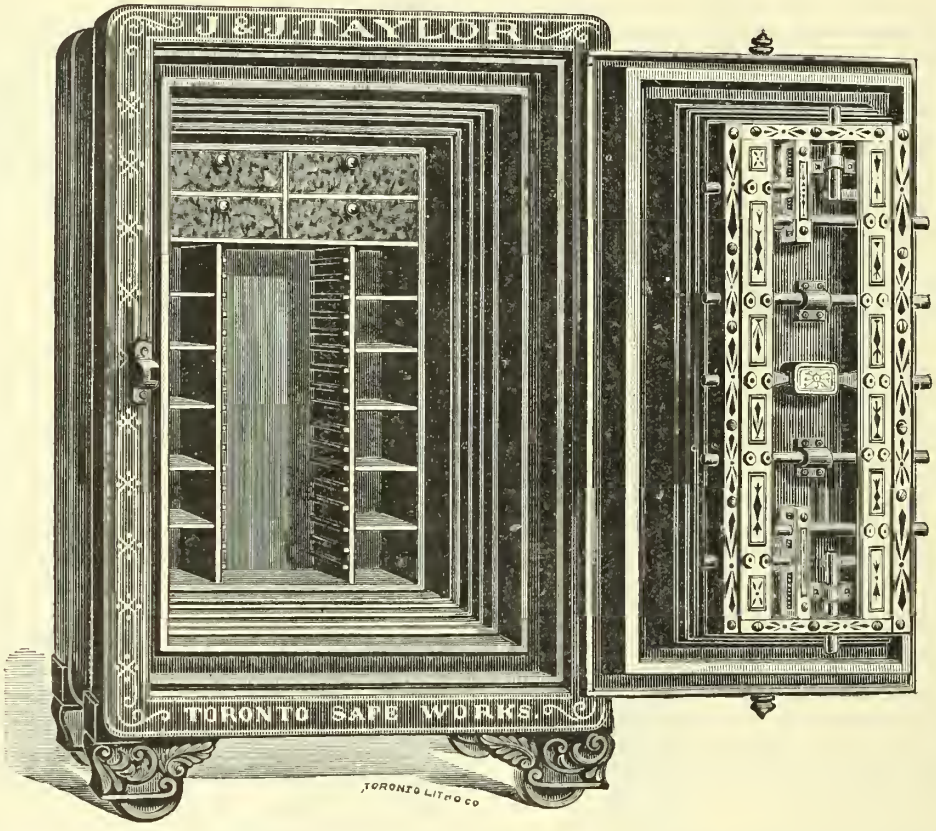
HOW TO POLISH A WHEEL.—The wheel to be polished is laid upon a flat cork, and at first ground with a bluestone until thoroughly free from scratches. Be careful neither to touch the pinion nor the riveting with the stone. The first grinding being finished, the wheel is finally ground a second time, again laying it on a cork and grinding it with a tin file, and finally powdered bluestone and oil. The wheel is then well cleaned with a soft brush and warm soap water and polished with a polishing file. Before polishing is commenced the cork upon which the wheel is laid must be well cleaned again and covered silk paper also be careful, when polishing with the sword file, to do it only by short strokes and without strong pressure.

A LOW TEMPERATURE SOFT SOLDER.—A soft alloy which attaches itself so firmly to the surface of metals, glass and porcelain, that it can be employed to solder articles that will not bear a high temperature, can be made as follows : Copper dust, obtained by precipitation from a solution of the sulphate by means of zinc, is put in a cast iron porcelain-lined mortar and mixed with strong sulphuric acid, specific gravity 1.85. From 20 to 36 parts of the dust is taken according to the hardness desired. To the cake formed of acid and copper there is added, under constant stirring, 70 parts of mercury. When well mixed, the amalgam is carefully rinsed with warm water to remove all acid, and then set aside to cool. In 10 or 12 hours it is hard enough to scratch tin. If it is to be used now, it must be heated so hot that when worked over and brayed in a mortar it becomes as soft as wax. In this ductile form it can be spread out on any surface, to which it adheres with great tenacity when it gets cold and hard.

DRAWING THE TEMPER FROM A PINION.—When taking the temper from a pinion for pivoting, be very careful to confine the heat as much as possible to the spot necessary to be softened. If the heat is carried so far that a scale will peal off the leaves, the pinion is practically ruined, as no amount of re-polishing can restore the original shape of the leaves. But a slight coloring is easily removed. Some workmen use a dilute solution of muriatic acid—two or three drops in a spoonful of water. Into this they dip for a short time the discolored part of the pinion, assisting the operation by rubbing with a piece of pegwood dipped in the same solution. Others use a similar solution of sulphuric acid in the same manner. But the use of acids on watch movements is hardly to be recommended, even in the most careful hands. A better way is to use a properly shaped piece of pegwood with fine oilstone dust, finishing with crocus. If the pinion has not been overheated the polish can easily be restored in this manner.

TO SELECT A BALANCE SPRING.—The usual way is to select a spring of as near the proper strength as we think it should be, after which it is attached to the balance staff, either with a small pellet of wax or by springing the central coil over the hub. Then put the pivot of the staff in its hole, so as to get the spring central, and grasp with the tweezers the coil that lays in the regulator pins. This gives the proper size of spring wanted ; it is next to be tested as to time, which is done by resting the lower pivot on some hard, smooth surface, holding the balance upright by means of the spring in the tweezers, and counting the number of vibrations it will make in exactly one minute, or even half a minute, by th regulator. If it gives very nearly the proper number, it is pinned int the watch and tried more ac curately. If correct the central coil is cu such a manner that when pinned in the collet it will be near to but not touch it, and the spring will be central or concentric on the staff. Then carefully pin it in the stud, with the collet end of the spring in a straight line running from the center of the balance to the stud or nearly so. This will, in most cases, make the vibrations of the spring isochronal.

OTHER NOTES.



THE representations of diamond washing and diamond cutting and polishing are among the most popular features of the Colonial and Indian Exhibition in London. When the Queen went to visit the Exhibition the other day she stayed longer in this department than in any other, and quitted her bath chair that she might thoroughly examine the various processes. A small diamond, worth about $50, was washed up while Her Majesty was present, and she purchased it on the spot.

THE flowers that bloom in the pot, tra la,
Have the bulge on the flowers of spring,
For whether it's cold or it's hot, tra la,
They're placed in a temperate spot, tra la,
And in fact have a very soft thing.
So they don't care a jot,
If it freezes or not,
As they feel pretty certain that they have the pot,
Tra la, la, la, la, tra la, la, la, la,
Oh theirs is a fortunate lot.

"WHY don't you trade with me ?" said a close-fisted warehouse-

SOMETHING NEW IN JEWELERS' SAFES

J. & J. TAYLOR'S NEW STYLE JEWELERS' SAFE,

WITH DOUBLE TONGUE AND GROOVE FIRE-PROOF DOORS.

J. & J. TAYLOR, TORONTO SAFE WORKS.

IN ORDER to meet the wishes of the jewelry trade, we have at last succeeded in perfecting a new style of safe for jewelers' use, combining the advantages of first-class

FIRE AND BURGLAR PROOF SECURITY WITH MODERATE COST.

THE above cut represents our new style of Fire and Burglar Proof Safe for Jewelers, which has an entire lining inside of best five ply welded Chrome steel and iron, with heavy Burglar Proof door, made any thickness required, and which is securely attached to the Fire-proof door. The Burglar Proof Door is fitted with rubber tube packing to prevent the use of explosives, and is locked with four wheel Combination Lock having our patent Enlarged Centre Lock Spindle and Bolt Handle.

To the above improvements is also added our new patent

DOUBLE TONGUE AND GROOVE FIRE-PROOF DOORS,

this being the latest improvement in Fire Proof Safes, and PATENTED BY US JANUARY 14TH, 1886. This door is fitted with a TONGUE made of wrought iron, corresponding with and locking into a GROOVE, made of same material, on the door frame. To both of these is connected a SECOND TONGUE and GROOVE made of thin galvanized steel, which is filled with non-conducting material thus making

TWO COMPLETE TONGUES AND TWO GROOVES IN EACH DOOR,

and which we maintain is the best fire-proof safe now made.

Visitors to the coming Industrial Exhibition can see samples of these safes at our exhibit in the Main Building. Do not fail to examine them.

J. & J. TAYLOR,

TORONTO SAFE WORKS,

117 and 119 Front St. East, Toronto.

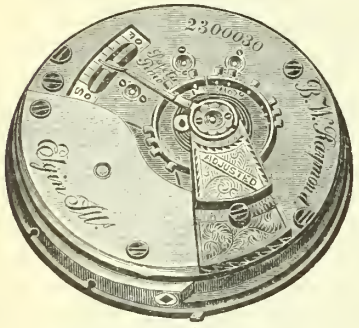
MARK

OBSERVE

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name is well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.



THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

WATCH COMPANY

man to an acquaintance the other day. "Because," was the reply, "you have never asked me, sir. I have looked all through the paper for an invitation, in the shape of an advertisement, but in vain. I never go where I am not wanted."

A slab-sided, mud-covered granger entered a Main street clock store about dusk the other evening, and, with a bewildered look, asked:

"Mister, is this where a man kin git a clock?"

"Yes, sir," said the clerk.

"Wall," said the granger, "what be that ticker worth?" pointing to an ornate and intricate piece of time-recording mechanism on the shelf.

"That sir," said the clerk, "is a wonderful time-piece. It is worth $200, and will run three years without winding."

"Great Scott!" gasped the granger, "three years without winding. Say, mister, how long would the blamed thing run if she was wound up?"

WISE AND OTHERWISE.

A CALIFORNIA man whose store had just burned was telegraphed by his family for "particulars of fire in store." He answered, "No particulars. No store."

AN optical delusion. Traveller: "Hi! Guard! Have you seen a man walking about with one eye, of the name of Walker?" Guard (musingly): "N-no, sir. I dun-no as I 'av. What was the name of the other eye, sir?"

A LITTLE girl suffering from the mumps declares that she "feels as though a headache had slipped down her neck."

"AH, yes," said a cabinet-maker to a crockery-dealer, to whom he was introduced—"ah, yes; you sell tea sets and I sell settees."

"I meant to have told you of that hole," said a gentleman to his friend, who, walking in his garden, stumbled into a pit of water. "No matter," said the friend, "I have found it."

"Do you know," remarked a rather fast Newark youth, the other day, to a stuttering friend to whom he was slightly indebted—"do you know that I intend to marry and settle down?" "I do-don't know anything about it," was the reply; "bu-but I think you had better stay single and set-settle up."

SNIPKINS refused to get his wife a new hat; and soon after his little girl came in and said: "Mamma, won't you buy me a monkey to play with, when you go down-town?" "No, darling. Wait till you are older, and then marry one, as I did," replied the grief-stricken wife, her tears bursting forth afresh.

A CLERGYMAN was preparing his sermon for Sunday, stopping occasionally to review what he had written and to erase that which he was disposed to disapprove, when he was accosted by his little son: "Father, does God tell you what to preach?" "Certainly, my child." "Then what makes you scratch it out?"

GENERAL M. A. Pleasonton, in an article on the battle of Gettysburg, in Philadelphia *Times*, says: "Had General Meade followed Lee on the Fourth of July, the surrender of Lee would have been unavoidable." Of course. And if that celebrated small boy's aunt had worn whiskers, she might have been his uncle.

OF the poet Whittier, this story is told: "During the rebellion he was riding in the cars, and met a friend who had just made a contract with the government for timber for war ships at a navy yard. He asked Mr. Whittier if he thought he had done wrong. The peace-loving Quaker characteristically replied: 'If thee has a contract with the government to supply timber for ships of war, thee must see to it that the timber is all sound.'"

FACTS are facts, even when pronounced by savage lips. It was a peculiar notion of the Mohawks that some great misfortune would happen if any one spoke while crossing Saratoga Lake. A white woman, who was ferried over by an Indian, talked all the way, and on arriving safely on the further shore rallied her boatman on his superstition. He simply grunted: "The Great Spirit is merciful and knows that the pale face woman cannot hold her tongue," and then re-crossed the lake in silence.

OUR HELP COLUMN.

THE TRADER aims to be of practical value to the Retail Jewelry Trade.

NO CHARGE is therefore made for advertising in this column, but the subject-matter should not exceed five type lines, or about 60 words.

When requested, these advertisements will be published in successive numbers of the paper.

If you have a Store, Stock, or any Special Article to sell; if you wish to buy an Established Business, or enter into Partnership; if you want a Journeyman, Clerk, Salesman, or Foreman; if you want a situation yourself—communicate the fact to THE TRADER PUBLISHING CO., 57 ADELAIDE ST. WEST, TORONTO, and it will be inserted in this column free of charge. This is the only way by which you can reach the entire Trade, and we shall be glad to help you.

A BOY of sixteen years of age wants to serve his time to the Watchmaking and Jewelry Business. Has a natural taste for same. Highest of references. Address, P. O. Box 61, Cowansville, P. Q.

A VERY fine Mosely Lathe, good as new, with a full set of chucks and good assortment of attachments, for sale. For particulars apply to P. W. Ellis & Co., Toronto.

A GENTLEMAN of eight years' experience wishes position as traveler or bookkeeper in a first-class house. Best of references. Address, B. H., Box 55, Oakville, Ont.

FOR SALE.—A First-class Jewelry business. A rare chance for a good man. Will sell lease of store and fixtures only if required. C. Davies, 59 King St., West Toronto.

JEWELRY, Stationery and Fancy Goods Business for Sale in a thriving village north of Toronto. Well established. No opposition. Stock and Fixtures about $1200. Good reasons for selling. For particulars, address, Box 30, Sunderland, Ont.

JEWELERY BUSINESS TO EXCHANGE FOR SAFE, GOOD Regulator, Nickel Counter or Show Cases. Established three years. H. ING, Watchmaker, 106 James Street North, Hamilton, Ont.

STOLEN—ON July 29th, during the Listowel Band Tournament, 2 watches as follows: 1. "Sterling," expansion balance, No. 1909763, in light weight, snap bezel, Waltham dust proof case, numbered inside case B 1290. 2. "Broadway," expansion balance, patent pinion, No. 2498214, in hunting, silver case, numbered inside back case B 2460. Any information leading to the recovery of these watches, or the detection of the thief will be rewarded by Barker & Co., Listowel, Ont.

WATCHMAKER, age 17, wants situation: good set of tools; can pivot, staff, etc., and do all general work. Best references. Would go as improver. Address W. S., 51 Richmond St. East, Toronto.

WANTED.—A SITUATION by an honest and sober young man, 20 years of age, with a good watchmaker to finish his trade. Can furnish best reference. P. Booth, care of A. M. Leger, Shediac, N. B.

WANTED A SITUATION to learn the watchmaking and jewelry business, by a careful and steady young man. Apply to FRANK PURVIS, Lyn, (Leeds Co.) Ont.

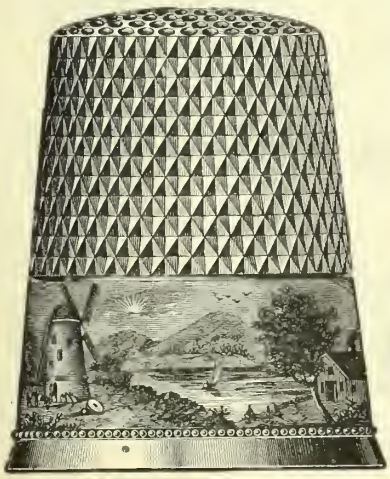
N. T. S.



NO travelling salesmen. That is what "N. T. S." means, but it also means much more. It means that my system of selling goods without travelling salesmen is enabling retail jewelers who handle my goods to buy them cheaper than their opponents in business possibly can who buy from houses that sell their goods on the road. If I employed travelling salesmen, I would be obliged, in figuring the cost of each new article, to add a proportion of the $10 per day paid the traveller for salary and expenses. As it is, I propose to reach the Trade through my advertisements, and at an almost nominal cost. In buying my goods you do not have to pay any TRAVELLING expenses whatever. I pay no travelling railway fares, no hotel bills, no extra baggage, and no incidentals. I have everything marked away down at rock bottom prices, and am not afraid to place them before you, for I know they are always bottom for first-class goods. I do not propose to start you with baits. You can inspect my entire stock and purchase just what you want, when you want, and in quantities to suit your trade. I guarantee to sell any goods in my line cheaper than any other jobbing house in the Dominion of Canada. If you do not believe this, give me a call and a sample order and you will be convinced. If you can pay me a visit, it will pay you, as I have always a lot of good stock that I can sell at less than manufacturer's cost. If you can't come to the city yourself, send me a trial order and I will guarantee you entire satisfaction. ☞ Mail orders promptly attended to, but always remember that **S. FRENKEL, 55 YONGE STREET, TORONTO,** keeps no travelling SALESMEN.

EDITORIAL.

CANADA'S GREAT FAIR.

The eighth annual fair of the Toronto Industrial Exhibition Association, which was held from the 6th to the 18th of September, was decidedly the most successful one they have ever had. The exhibits of all kinds were larger in number and higher in quality than at any previous exhibition, and to our mind, nothing could show in a clearer or more convincing manner the steady progress that this Canada of ours is making towards being in the not distant future one of the greatest countries in the world. In the products of the farm, Canadian Exhibitions have never had any occasion to take a back seat to any other country. In manufactures, however, she has until recently been behind and it did seem at one time as if her ultimate destiny was to be "a heaver of wood and a drawer of water" to Europe and the Republic to the south of us. The National Policy has proved, however, to have been just what was needed to revive and encourage our drooping industries, and to-day Canada can in the manufacturing line hold her own against all comers. We must confess that as we walked through the main building and beheld on either side of us manufactured goods of almost every variety, equal in quality and finish to anything made in the world, we felt proud of Canada. In our opinion such exhibitions are not only excellent competitive schools and advertising places, but they perform a higher and better work by disseminating information about our country, its products, capabilities and people; and also by engendering a feeling of national pride in it, whose further development in other directions is known as love of country. Without desiring credit for any superabundance of devotion to Canada, we have felt the same inspiration on surveying one of our great Expositions as Marmion's English squire did when from the hills overlooking the Tweed and Floddin's Field, he took in a "Pisgah" view of Scotland and exclaimed, "Where is the coward who would not dare to fight for such a land?" While the Toronto Industrial Exhibition has done much for this city, it has done more for Canada by educating its citizens about their own country in a very practical manner.

"WHEN shall I call you in the morning, sir?" asked an hotel waiter of an Aberdonian one night. He replied peskily, "I'll ring the bell when I wish to be called."

EXPRESS PARCELS.

In these days of telegraphs and telephones, it is in most cases an imperative necessity that valuable goods, such as jewelry, be shipped by express instead of by freight. While most merchants like to get their goods with all the despatch that the Express Companies can command, but few of them care to pay the often extortionate charges that these companies try to collect. It is a well-known fact that an Express Company like any one else, charges not only according to bulk but also according to value, and if two packages of equal size were shipped at the same time and one were say twice the value of the other, the charges for carriage would be much higher. Right here is where many jewelers kick. They think that the charges should be determined by the bulk, no matter what the value of the contents. And they are quite right in this, provided always that they are willing to run the risk of loss and relieve the company from any extra responsibility in that direction. The trouble is, however, that most people want the Express Companies to carry valuable parcels and charge for them by bulk only, but in case of loss they want and expect these companies to make good their loss, no matter how large it may have been. Now this is hardly fair and should not be expected from any person or company, and as a result there is trouble constantly arising between the wholesale shipper and his retail customer from this very cause. According to the conditions laid down in their contract, the Express Company "cannot be held responsible for any loss or damage to any box, package or thing for over $50.00 unless the just and true value thereof is stated by the shipper at the time of shipment." We believe as a matter of law, that if an Express Company accepts or ships any package without making the consignee declare its real value, it virtually by so doing accepts all risk and can be made to pay full value, no matter what it is, in case of loss. Such a thing, however, rarely happens, as once bit twice shy, the Express people having been caught napping once, get rid of any such risks in future by making every shipper declare value before they will accept a package.

This being the case, the retailer who is always kicking at his exorbitant express charges and holding the jobber from whom he buys responsible for it, should consider the facts fairly before taking such a position. Supposing that the jobber does exactly as he wishes and ships his package putting on only a nominal value of say $5 or $10. This is all right and everything goes lovely as long as no package goes astray. But there comes a time in the history of even the best regulated merchant, when his valuable package goes astray, then comes the question: Who is to stand the loss? The Express Company say: "We are only responsible for $5 or $10, as the case may be, for here is the consignee's own signature to the effect that such was all the package was worth." The retailer says to the jobber: "You shipped the package but you certainly can't hold me responsible for it until I get it, and as it was never delivered I decline to accept any responsibility." The jobber on the other hand says: "The goods were shipped entirely at your risk and value was declared low at your request so as to save you paying big express charges." Out of the three parties the Express Company is the only one that has a clear case and it therefore lets the buyer and the shipper fight it out amongst themselves, and the result is often a law suit to decide who is the owner of the goods.

We think it well that this matter should be thoroughly

understood by the trade as it may save both loss and misunderstanding in future to many a retailer who has been in the habit of getting a low value put upon his express packages by the jobber when shipping them. The duty of our wholesale men is clear. They should in all cases fix the responsibility of loss before shipping. If nothing is said they should in all cases declare the true value of every package they ship. If any of their customers, however, object to pay charges on the value, or in other words, pay the Express Company for the extra risk they assume, the jobbers should have an order in writing to that effect and an acceptance of all risk by the purchaser. In case a customer declines to give such an acceptance of risk the jobber would have a chance to consider whether he would assume the extra risk himself or pay the extra express charges incurred by declaring the proper value.

In asking increased charges on account of increased value, an Express Company is only carrying out an ordinary business principle, the neglect of which might easily prove fatal to their prosperity. If retailers expect to get valuable packages carried at the same rate as packages of small value, they must calculate on either the jobber or themselves accepting the risk, for Express Companies, like individuals, don't usually do something for nothing. The person who gets the benefit ought certainly to pay, and in our opinion that person is the retail merchant who buys and therefore owns the goods.

We are glad to learn that very many of the retailers throughout Canada now insist on having the proper value put upon all their packages. In this we think they are sensible, for if a loss were at any time to occur they could at once recover its value without any tedious law suit and all risk of ultimate loss from such a cause is thus avoided.

EXHIBITION NOTES.

It has apparently become the fashion for all newspapers of any account to erect a hut or tent upon the Exhibition Grounds and keep a committee of its best looking employees busy within it opening champagne and taking advertisements and writing up local puffs at so much per line. The objection the manager of THE TRADER saw to this style of thing was, that editorial notices written up at the diction of the exhibitor with the aid of a bottle of "Mumm's Extra Dry," was generally inclined to be too flowery and roseate, and after a while those gracefully rounded certificates of excellence began to pall upon the reading public, more especially those who had a chance to personally inspect the articles written about. THE TRADER, therefore, determined to send its best reporter disguised as a farmer to take notes of the exhibition and tell its readers what he saw. He presented himself before his chief for inspection, dressed in pants and coat of brownish gray tweed, relieved with a vest of bright blue, spotted with red, a fifty cent straw hat with a striped colored ribbon completed an outfit which the chief said was rural enough for any farmer in Canada. When our reporter first struck the exhibition he was astonished at the absence of farmers. Wednesday was advertised as Farmer's Day but never a farmer did he see except himself. There were some 35,000 people there, the bone and sinew of Canada, as he found out afterwards, but they were, all of them, dressed up in black broad-cloth or something akin to it, and looked about as unlike the commonly received ideal of the horny handed sons of toil as could well be imagined. When in the Agricultural Hall, our reporter found himself the centre of a crowd of enquirers thirsting for information about the agricultural resources of British Columbia. He knew he was unusually intelligent looking, but he had no idea that such a host of strangers could detect the possession of so gigantic an intellect in such a home-spun disguise. To say he felt flattered, would be a mild way of putting the elation he felt over this tribute to his genius. It was of short duration however, for as he strolled along, accompanied by the knowledge thirsty crowd, he came across a printed card, which not only put a damper on his spirits, but made the air of that building so oppressive that he had to excuse himself to these new found friends and seek the oblivion of the horse ring. The printed card bore the following legend:—"If you want to know anything about British Columbia, ask the men with the straw hats." The cat was out of the bag, our intelligent reporter being the only person in the building with a straw hat, had been taken by the crowd for one of the attendants of the B. C. exhibit, who were to be distinguished from visitors by their straw head-pieces. What our reporter saw of interest to our readers will be found below.

MESSRS. J. AND J. TAYLOR,

The old-established safe makers of Toronto, made one of the largest and most attractive exhibits we ever saw. Their assortment comprised almost every kind of safe from the small cheap fire-proof to the large and expensive one with electric time lock suitable for a banker's use. The safe that attracted most attention from the craft however, was a new, cheap burglar-proof safe designed especially for jewelers' use. This, to our mind, is exactly the thing that the trade has stood in need of for a long time—a safe strong enough to keep out any ordinary burglar, and yet low enough in price to be within the reach of regular jewelers. The interior of this safe is lined with heavy steel and iron composition plates and it has a first-class fire and burglar-proof door with all the latest improvements. Any jeweler in want of a safe should not hesitate a moment to purchase one of these safes as they are first-class in every particular and just what the trade has been waiting for these ten years past. No jeweler can afford to have his stock protected by a fire-proof safe only, which means simply that they are at the mercy of any burglar that comes along ; we are glad therefore, that the Messrs. Taylor have seen fit to meet the needs of the trade in this respect, and trust that their enterprise will meet with a liberal response from every jeweler wanting protection.

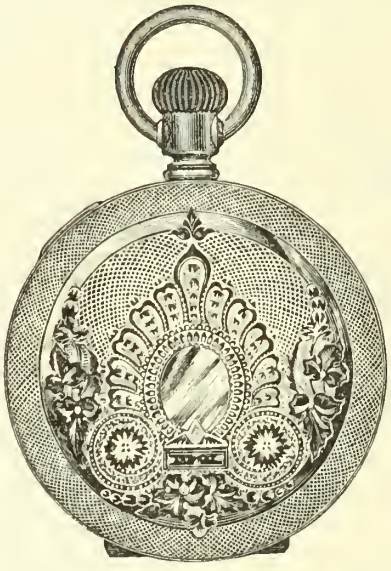
THE MONTREAL OPTICAL CO.

Had a very fine display of optical goods presided over by their genial western representative, Mr. Levetus. This company displayed a very choice assortment of spectacles and eye-glasses in their new patent cases, one of which every person who deals in optical goods ought to have. These cases are divided into compartments, each of which is large enough to hold a stock of glasses all properly numbered. By this means, a merchant can tell at a glance exactly how his stock stands at any moment without handling his goods. It also effects a great saving of time in fitting customers with glasses, as when the proper number is obtained the dealer can at once put his hand on the glass he wants. The arrangement is a very ingenious one and a great advance on anything of the kind we have ever seen.

THE TORONTO SILVER PLATE CO.

Had the only silverware exhibit shown, but it was to our mind

"Economy is in Itself a Source of Great Revenue."--Seneca.



TRADE MARKS.

HOW TO BUY, WHAT TO BUY, FROM WHOM TO BUY.

That is the question, and it is easily answered. You should buy closely those things which sell best, and from the parties in whose integrity you have implicit confidence.

Watches are the staples of the jewelry trade, and no retailer can do a healthy, paying business unless he deals only in reliable goods and sells them at honest prices. No matter what movements you prefer, you can make more money by handling the Gold and Silver Cases made by the American Watch Case Co. of Toronto, than any others, because they are so much lower in price that you cannot hold your trade without them. Every Case bearing any of their trade marks is fully guaranteed to be of the quality stamped upon it, and they excel all others in finish and excellence of workmanship. Ask your jobber for them, and take no others.

the best they ever got up and a long way in advance of any of their former efforts. Indeed while standing before their show-case, one could hardly realize the fact that such beautiful and artistic goods were the product of a Canadian factory. In this line, it is safe to say that at the present time, this country can hold its own with any other country in the world, and the importation of such goods has therefore become a thing of the past. The Toronto Silver Plate Co. are to be congratulated on the excellence of their exhibit, and we trust that their enterprise may have its reward in increased orders.

MESSRS. KENT BROS.

Of Yonge Street, Toronto, showed, under the superintendence of Mr. W. F. Ross, a very fine assortment of watches and jewelry, which was greatly admired. This enterprising firm were apparently endeavoring to educate the tastes of the numerous visitors, and if one could judge from the conversations which took place amongst those who stopped to admire their display, they must have met with abundant success. Unlike a lot of the Cheap John stands scattered throughout the building, this firm sold no goods from their exhibit, but referred intending purchasers to their palace warehouse on Yonge Street, where we understand they were kept very busy during the entire continuance of the exhibition.

THE DOMINION SHOW CASE CO.

Although not making a separate exhibit of their cases, attracted a great deal of attention to them by having them filled with the Messrs. Kent Bros'. exhibit. Their bevelled edge show-case was very much admired and was certainly a splendid piece of workmanship. This company are forging ahead very fast, and now claim to make not only the largest variety of show cases in Canada, but make them better at lower prices than can be had elsewhere. They deserve success.

MESSRS. HEMMING BROS.

Did not this year make a separate exhibit, but any person acquainted with the quality of their workmanship could have no difficulty in deciding that they had no small share in making the exhibits of Messrs. Kent Bros. and Thos. Russell & Son as attractive as they were. This firm is now making a specialty of fine jewelers' fittings, such as trays, etc., and any of our readers who want to give tone to their stock cannot accomplish their object better or cheaper than by calling in the aid of the Hemming Bros. They are A1 in their line.

MESSRS. J. E. ELLIS AND CO.,

Of Toronto, the well-known retailers of the corner of King and Yonge Streets, showed a large and handsome tower clock, manufactured by the Howard Clock Co., of Boston, Mass., for whom they are agents. The massive machinery of this time-piece was more suggestive of a steam engine than a chronometer, but so faultless were its proportions and so delicately was it regulated that it gave the time for the entire exhibition with the utmost nicety. We understand that this firm had a splendid run of trade during the exhibition at their warehouse down town, and are well pleased with the results.

MESSRS. THOMAS RUSSELL AND SON

Were represented as usual by a magnificent display of fine English and Swiss gold and silver watches, and fine jewelry of English manufacture. Their large, square show-case was always the centre of an admiring crowd, and the manager, Mr. Robert Cuthbert, deserves credit for the enterprise which has made his exhibit annually one of the features of the exhibition.

WHAT THEY SAY ABOUT US.

I appreciate THE TRADER very much, and am desirous of preserving a complete file.

K. BEZANSON, Jeweler,
Hillsborough, N.B.

THE TRADER is very useful and interesting, and I would not like to be without it.

WM. PEARSON, Jeweler,
Minnendosa, Man.

THE TRADER is a credit to Toronto, and must eventually improve and elevate the different grades of the trade throughout the Dominion.

JAMES WRIGHT, Chronometer and Watchmaker,
Montreal, Que.

Your excellent publication reaches us every month and is much appreciated, so much so, that I cannot refrain from sending you my thanks for it.

J. E. SANCTON, Jeweler,
Bridgetown, N.S.

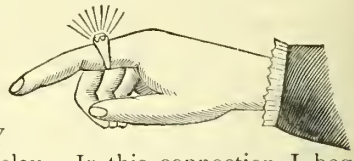
One would almost regret of its being free. Indeed it is well worth a subscription fee of $2 yearly, considering its manifold advantages to the watchmaker and jeweler.

G. H. GAZZWELL, Jeweler,
North Sydney, Cape Breton.

A PRACTICAL TREATISE ON

THE BALANCE SPRING.

Including Making, Fitting, Adjusting to Isochronism and Positions, and Rating, also Adjustment for Heat and Cold.



BY EXCELSIOR.

PART II.

FITTING HAIR SPRINGS.

(52) *Oiling the escapement.* When everything is done, so that you are sure you will not have to take the balance out again, a little oil should be put to the jewel holes—they and the pivots being, of course, perfectly clean. Put in barely enough oil to fill the *holes*, but not stand at all in the oil-cup or concavity of the jewels. If it seems to be soon drawn away by capillary attraction between the hole-jewel and the end-stone, put in a little more. But put no oil on the pallets of a verge; a very little only on the long impulse lip of a cylinder; a very little on the pallets of a lever watch, but none on the ruby pin nor in the notch of the lever; a little on the roller-jewel of a duplex staff, but none on the impulse pallet; none on either the unlocking or impulse-jewels of a chronometer, none on the detent-pallet, and but little on the balance-pivots. Use none but the very best watch-oil to be had at any price. Keep the bottle closed and in the dark; keep your oil-cup perfectly clean and covered; put but little oil in it at a time, and fill it often with fresh, wiping it perfectly dry and clean with paper every time you fill it. Make an oiling-wire by taking the temper out of a sewing-needle, file it tapering to a point as fine as a hair, then turn over the extreme end, and make the smallest possible loop or ring, so close that you can

JEWELRY REPAIRS.

Every Retail Jeweler in Canada has at some time or other felt the need of a JEWELRY REPAIR SHOP that could not only do such jobs in first-class style, but return them without delay. In this connection I beg to notify the Jewelry Trade throughout Canada that having fitted up my new factory with all the modern steam machinery requisite to the successful carrying on of a first-class jewelry manufacturing business, I have also opened a repairing department in connection therewith. I respectfully solicit your custom therefore for repair work of all kinds, and gold and silver plating in all its branches. Every job done by me will be executed in a first-class manner, and my prices will be found as low as consistent with good workmanship.

Special attention is also given by me to the execution of orders for special jewelry to be made up either from original or selected designs. For such things as Lockets, Diamond or other Earrings Brooches, Earrings or Chain work of any kind, I have special facilities and can guarantee satisfaction every time. When you have any new special work or jewelry repairs, give me a chance. Remember my address, **A. H. WELCH,** FINE JEWELRY MANUFACTURER, 31 ADELAIDE STREET WEST, TORONTO.

FOR SALE.

A Valuable Frame Store and House attached, with a garden in the rear of the building which contains the following valuable Fruit Trees and Plants: Cherries, Ruskins, Mulberry, Walnut, American Sweet Chestnut, Best English Downings, Gooseberries, Strawberries, Raspberries, also 126 Grape Vines. There is a good summer house in the centre of the garden, gravel walks around the house, a first-class well at the kitchen door, also a cistern. The building was built about four years ago. It is a frame structure, painted white with green shutters.

Fly screens on all the doors and windows. The shop doors are glass with patent spring attached. In the shop there are six show cases, namely, two ebonized bent glass, three walnut bent glass, and one nickel show case on castors; two of the show cases have a double story with trays. There are 104 drawers of all sizes behind the counters, also one of the latest style watch reach nickel-plated, marble watch bench, and enough tools and material to last five or ten years, a good safe, and $3,000 to $4,000 worth of stock. The house cost me $3,000. I have also a lot in the village which cost me $300, with 95 maples, 56 fruit trees and 40 pines around it, 70 grape vines inside. There is a good well and pump in it too.

There is no opposition here. I want $7,000 for all except my furniture, or $8,000 for all. My reason for selling out is ill health, and I wish to go to New Zealand. This is the finest business country in Western Ontario, and for a first-class business man, he will never have another such a chance in a life-time. Apply to

One 14 K. Open Face Case, No. M. 4209 with Am. Watch Co. Nickel Mv't, No. 2,643,060

One 18 K. Hunting Case, No. S. 8303 with Am. Watch Co. Nickel Mv't, No. 2,605,460

One 18 K. Open Face Case, No. U. 3019 Without Movement.

A reward in proportion to the amount of goods recovered will be paid by

J. A. D. VICKERS,

Supt. Vickers' Express Co., Toronto.

see no hole in the center, and mount it in a light handle. This loop will take up all the oil that any ordinary hole ought to have. Keep it away from soldering fluid, water or dirt, and keep it out of your mouth. Of course, if the balance, spring, etc., are at all greasy or dirty, they should have previously been hung on a wire hook and moved about in a bottle of benzine for a few seconds, then dried by exposure to the air.

(53.) *Timing the spring.* Having now put the movement together, with the hands on, set it to seconds and run it for exactly one minute, changing the regulator till it is correct. Then try it for fifteen minutes, and if it is about right it may be put into the case and hung up for the final regulation. Although I have dwelt upon a large number of details, the workmen should remember that it will take little more time to do his work rightly, if he understands how it ought to be—and it has been the object of these explanations to clearly show the proper method, so that when his work is done it will be correctly done. The isochronal adjustment of the spring will be treated hereafter; also, testing and correcting the poise of the balance. I am aware that there are plenty of blunderheads in the trade who will dispute this or that proposition, which may not agree with their theory or practice. I can assure the reader, however, that the directions given or to be given may be relied upon, and are approved by those best qualified to judge in these matters.

New Tool and Method for Fitting Hair Springs.

(54.) In my last article I gave the ordinary method of fitting hair-springs followed by good workmen, with such tools and appliances as every watchmaker has or ought to have in his shop. I shall now describe my own tool and method, by which we may test a spring in every way without injuring it in the least, and in a very short time, so that, if it should not be suitable for the watch on trial, it will still remain as perfect for the finest isochronal adjustment in another watch as when made—a point of considerable importance when fitting fine and costly springs.

(55.) The tool I use is not designed for fitting hair-springs only, but is applicable for measuring heights and distances in fitting staffs, cylinders, pinions, wheels, etc., also for setting and re-setting jewels, upright drilling of pivot holes, etc., chamfering and countersinking, fitting screws, and many other uses, as will be seen hereafter. It is substantially an Upright Holder, carrying arbors for different uses, and so constructed that the upright portion can be moved in any direction to bring the arbor over any hole in the watch, and there fastened. It consists of a clamp, to be fastened to the movement in any convenient place, carrying a round upright rod, movable up, down and on its own center, and having a head through which moves a horizontal slide carrying the vertical arbors.

(56.) The clamp is made from a thick piece of metal, (steel, cast iron or hard brass,) flat on its under surface, nearly rectangular in shape, 1½ inches long, by 1 inch wide, half an inch thick in the center and one-eighth inch at the edges, with one edge hollowed out to form two projections or claws, one at each corner, and about 1¼ inches apart. Under each of these claws there is a jaw, made something like the jaws on a universal lathe chuck, capable of being fastened parallel with the surface of the clamp, and at any desired distance from it—so as to be screwed to the potance plate alone, or, if necessary, they can take in the whole thickness of the watch movement. The claws are slipped in between the bridges, or upon the plates, wherever a good bearing can be got, and the jaws screwed up to hold the clamp firmly in place—its flat under surface being, of course, in the same plane with the plate of the watch. The jaws can be faced with thin leather or rubber, if thought best, to give them a good hold without much pressure. In that case, they could be clamped directly on the dial without danger. My own tool is made double, having two claws 1½ inches apart as above, and, on the opposite side of the clamp, two other claws or projections only ¾ inch apart, so that one side or the other will fit readily upon all sizes of movements. The jaws are also reversible, being turned at their center to point towards either pair of claws which are in use.

(57.) Through the center of this piece or clamp is drilled a vertical hole to take an upright steel rod $\frac{3}{16}$ inch in diameter, and about 1½ inches long, having a head at its top, and fastened at any desired height by a screw, like the centers in a bow lathe. In the head is a rectangular slot through which slides, horizontally, a steel strip 1½ inches long, ¼ inch wide, and $\frac{1}{16}$ thick, (a piece of an old pair of tweezers will do,) edge up, and fastened wherever desired by a screw. This strip also has an enlargement or head at its inner end, with a vertical hole to take in the different arbors to be used. These arbors may be the centers of your bow-lathe, or depthing tool, or any others you have already on hand, if you do not wish to make them specially for this tool. But I advise to use tolerably large ones, at least ⅛ inch in diameter, so that the head will take in arbors for setting jewels, etc, to be described hereafter. But the arbor we use for hair-spring fitting should be reduced to a diameter of about $\frac{1}{16}$ inch for half an inch from each end, so as to penetrate into the smallest places, and also to enable us to bring our false regulator pins near to the center when wanted. One end should be brought to a fine central point, the other tapered down a little, and the end truly and centrally countersunk. Or two sets of arbors can be made, one fine, the other larger, each having its own horizontal slide and head.

(58.) The use of this tool is obvious. Having first fastened the clamp firmly to some part of the movement, the upright rod is inserted with the head at any desired height, and the horizontal slide placed so that the point of its arbor will rest in the balance jewel-hole, when the sides are screwed fast. We reverse the arbor, and bring the other end, which has the female center, down upon the upper pivot of the balance (or any other piece you are fitting,) and hold it upright the same as would be done by the bridge itself. The angle of this female center should be rather acute, *i. e.*, it should be deeper than it is wide at its mouth, so that it can be raised sufficiently to give the pivot freedom and yet not allow it any play sideways. The surface should be well polished and hard, kept clean and free from rust, and it will form a very tolerable substitute for the balance bridge.

(59.) This arbor has two hubs, which slide freely upon it, and are each fastened by a set screw. In each of them is fixed a steel wire, $\frac{1}{16}$ inch in diameter, pointing horizontally outward from the center of its hub. Each of these wires has a smaller hub, which slides to and from the arbor, and is fastened by a screw. One of them has two pins, to represent the regulator; the other has a clamp to grasp the hair-spring instead of the tweezers, and therefore represents a stud. This clamp can be either self-acting and spring-tight, or be opened and closed by a screw. The points are made thin, so as not to touch the adjacent coils of the spring, and both they and the regulator pins point vertically downwards. The two hubs, carrying the clamp

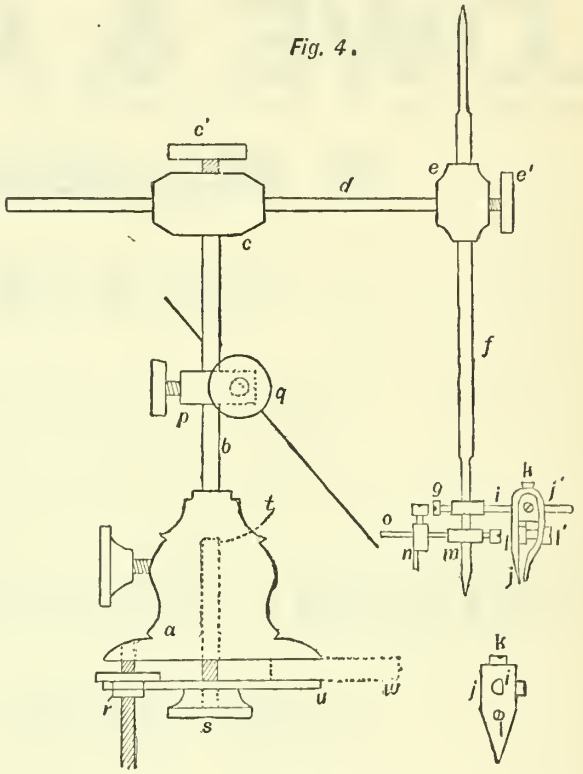
and the pins, are adjustable independently of each other, as to distance from the arbor, height, and distance from each other, to correspond with the relative positions of the stud and regulator in the watch. The wires which carry the two small hubs are filed flat on one side, so that the set screws can be loosened enough to allow the hubs to slide along, while they cannot turn over. If the spring on trial requires to be altered, we simply open the clamp to release it, and raise the arbor, when the balance can be taken out, and after altering can be as readily replaced and refastened, everything being in the same position as before.



(60.) In my own tool I also have holes in different places, in any one of which a small plug with a milled head will fit—the plug being sawed through the center so that the two halves spring outward and hold the plug in any position in which it is placed. This plug carries a stiff bristle, and I place it in any hole suitable to the watch, so that by turning the milled head with the fingers I can lower the end of the bristle upon the balance rim, or raise it in an instant, for the purpose of holding the balance still or liberating it. I also provide holes for causing a bristle to rest against the balance staff while it is running, should it be desired to make the vibrations small while isochronizing the spring, as hereafter specified.

(61.) Now, there may seem to be a good deal of this tool, but it is all perfectly simple and easy to construct, and any man fit to touch a watch ought to make one all complete in a day, at the utmost. If he has much work to do it will save him days and weeks of time, to say nothing of the satisfaction in its use, and the superiority of the work. Perfection is not required in any part for hair-spring fitting—the only point at all essential is that the arbor shall stand vertically or nearly so. There is nothing obligatory about any of the sizes or details given. The rectangular slot can be easily made by riveting together flat pieces, and leaving a space for the horizontal slide. But, whatever time may be required to make it, it is a tool for which every workman will find frequent and profitable use.

Figure 4 is a sketch of a lighter and cheaper tool that I have, adapted only for hair-spring fitting. The clamp, *a*, was made from a round piece of harness mounting, and the heads, *c* and *e*, from a piece of brass lightning-rod point,—showing how refuse scraps may be worked up into valuable tools and save cost. In this Holder, the horizontal slide is a round rod, and the vertical arbor, *f*, is simply got into line with the upright rod, *b*, by the eye, as exactness is not required in fitting hair-springs. But in the tool as previously described, the slide, *d*, should be flat, to maintain the vertical position of the arbor, *f*.

In this tool, *a*, is a round clamp, with a set screw in the center on the back side, while the front edge is filed out to make the two claws; *b*, is the vertical rod, with its head, *c*, and set screw, *c'*. This rod slides down between the two jaws, *u*, which are made from a broad flat piece of steel. The nut, *r*, runs on a screw fixed in a clamp, *a*, and its center passes through the jaws, to give more substance for the screw to hold in. The tightening screws, *s*, are near enough to the center of the clamp to be bedded in the metal up to *t*, before coming out. The dotted lines, *w*, represent a plate to which the Holder is fastened; *d*, is the horizontal rod, with its head, *e*, and set screw, *e'*; *f* is the vertical arbor, point upward. The holes are drilled entirely through the heads, *c*, and *e*, at right angles, one side of the center taking in the rods, which should be screwed in very tight and fast,—the other side taking in the set screws. *g* is the hair-spring hub with set screw and smaller hub, *h*, sliding on the wire, *i*, which is filed flat on one side, and fastened thereon by

Fig. 4.

the set screw seen in front; *j*, is a steel strip bent around the hub, *h*, to which it is fastened by the screw, *k*, and terminating in fine points at the lower ends, which grasp the hair-spring; *l* is a brass piece riveted in the back half, to give substance for holding the screw, *l'*, which draws the points together upon the spring. The small figure below is a transverse view of the same. *m* is the regulator slide, with hub, *n*, sliding on the wire, *o*, which is flatted on the top; *p* is a brass strip which slides along the rod, *b*, and turns in any direction, with plug, *q*, carrying a bristle. The set screw of this strip is long enough to fasten it upon the rod, *b*, *d*, or *f*,—wherever it will be best to have it. All the parts are drawn in the best position for showing their construction, not for use.

(62.) Our Upright Holder being fastened to the movement so that the point of the arbor rests in the lower balance jewel hole, we select a spring for trial and stick it to the staff according to previous directions, then put the balance into its place in the watch. Reversing the arbor, we bring the end with the female center down upon the upper pivot, holding it in position, but leaving it free to vibrate. The hubs having been previously slipped on the arbor and fastened by their set-screws, we place the hair-spring clamp at the proper distance from the center to grasp the spring at the point which, before, we held in the tweezers, and fasten the whole properly. We then place the false regulator pins about as the real ones stand in the watch, and fasten them also. Then we loosen the arbor and turn the whole—the arbor, with its hair-spring clamp, and the pins,—all together, and bring the balance in beat, or near enough for the watch to go freely, and fasten it again.

To be continued.

An old judge told a young lawyer that he would do well to pick some of the feathers from the wings of his imagination and stick them into the tail of his judgment.

SELECTED MATTER.

THE MEANING OF THE OPAL.

" See with what vivid and what varied flame
I love you, Aglae," said my love to me.
Always so tenderly he breathes my name,
The little name seems a caress to be.

Clasped in an endless circlet of fair gold,
An opal—less a jewel than a fire—
Burned with bright hues whose symbols sweetly told
Of deathless love, of truth and pure desire.

We studied this keen opal, he and I,
Cheek warm on cheek, hand safe in sheltering hand;
Here burned the blue of fair fidelity,
There shot the gold of wisdom and command;

Here vivid violet, in which red and blue
Blend cunningly to tell the truth of love;
And then all suddenly love's crimson hue
Triumphantly all colors spread above.

Next sprang to light the emerald's fairy sheen,
Whereat I looked to him; he, whisperingly:
" Of old, Hope's sacred symbol was this green;
Profaned it means, love's tender jealousy."

Then glowed an orange light where red and gold
Met in an *oriflamme*; and softly he
Spoke yet again: " This union, sweet, doth hold
Sign of eternal wedlock that shall be,

Fire-like, this trembling and most vivid light
Speaks deepest passion—hear you me, my life?
Yet purely above flame reigns virgin white.
So dares this opal speak of you, my wife!"

HENRI DANGE.

OVERBANKING AND ITS CAUSES.

Overbanking is a defect frequently met with in watches, and it is quite difficult sometimes to ascertain the causes, and to do the subject full justice, we would require more space than the editor would be likely to afford us.

There are several causes, each of which requires a different treatment. The most common cause is a short lever. The upright pin in the end of the lever fork nearest to the balance staff may be bent back, or its front filed away. In case of a sudden jar, that end of the fork may be jarred from its rest against the banking pin, and fall toward the balance staff. When this occurs the table rollers *should* prevent the pin passing until the ruby pin comes round into the notch in the lever and carries the lever over to the other banking pin in the normal way. But if the pin is bent or filed away, as mentioned, it will not be stopped by the edge of the table rollers, but will pass directly over the other banking. Then when the ruby pin comes around, it is of course on the outside of the lever fork, and the watch stops from overbanking. If this is caused by the brass pin being bent as described, it should be bent forward again until it stands vertical in all directions. Sometimes the table roller is not round, its edge being nearer the balance staff at one point than elsewhere, so that the brass pin can slip by it when the scant side comes opposite the pin, although it may not be able to pass at any other place. In this case the roller should be turned up, or a new one fitted in. The same thing may occur when the roller is not fitted truly on the balance staff, or even when the staff or its pivot is bent or eccentric. The roller itself may be too small, instead of the lever being too short. How to ascertain which part is at fault would require a long and detailed explanation of the principles of the detached lever escapement, which would not be practicable to give within the space allotted to us.

Another kind of banking is caused by the lever pallets being set too far from the scape wheel, making what is called a shallow depthing. In this case, when one tooth of the wheel escapes from its pallet, the next acting tooth does not fall properly upon its pallet, that is, it does not fall upon the locking face of the pallet, and draws the fork against the banking, but comes short of it and falls upon the driving face, or working surface of the pallet. This tends to force the lever back when it should be resting against the banking, and leaves the table roller free. This backward tendency brings the upright brass pin forcibly against the edge of the roller, and retards the motion of the balance When the latter stops and takes up its return motion, the friction between the pin and roller becomes more excessive, and assumes a sort of wedging nature, which reduces the balance vibrations to very small ones, stops it entirely, or may even bend or break off its pivots in the effort to pass by the roller and get to the other side.

If the depthing is very scant indeed, it may be detected by removing the balance, when the escape wheel will cause a continuous oscillation of the lever, and the movement will rapidly run down. This kind of banking may occur even when the escapement does not run down, but is close enough for the lever, when lightly pushed from one banking, to fly over and lock on the other banking. In this case, take a fine pin point, not half filling the notch in the lower fork, and carefully lift the lever off the banking pin, and hold it still. The lever flies forward, and the pin is no longer pushing it forward, but is now holding it back, by its presence in the notch. Then slowly let the lever pass over to the other side, till the acting tooth passes off the pallet it is forcing forward, and notice the action which follows. As it passes off, the next acting tooth will drop upon *the locking face* of the other pallet, if the depthing is correct, and the lever will go to the banking and rest against it. But if the depthing is scant, the lever will fly back, and the other side of the notch will rest on the pin point, tending to force it back instead of drawing it forward. When tested in this way, a very slight scantiness of the depthing may be detected, and when one or both pallets are wrongly placed. The remedy is to move the pallets upon the arbor until the depthing is correct, so that, when the lever is faced, as before described, it will draw the pin point along until it rests against the banking on the other side, and will there remain, securely locked.

As regards a rule for the position of the banking pins, it should be remembered that they are not acting parts of the escapement, but are merely barriers set up to keep the lever in proper bounds. The only possible rule is, first, to see that the escapement is correct, the parts all of proper proportionate sizes and shapes, that is, adapted for each other, and placed at the proper distances apart; then the banking pins should be so placed that they, at the same time, allow the escape-wheel teeth to rest far enough up the locking faces of the pallets to secure safe locking, and no further, and hold the lever fork in such position that the upright pin will be quite free from the table roller, and the notch will receive the ruby pin without striking on either corner—that means that the ruby will clear

SIMPSON, HALL, MILLER & CO.,

WALLINGFORD, CONN.

—MANUFACTURERS OF—

Artistic and Useful Hollow Ware,

ELECTRO-PLATED UPON FINE HARD WHITE METAL.

There is nothing in Designing, Ornamentation or Manufacturing which our artists and workmen cannot produce.

OUR FACILITIES FOR EXECUTING FINE WORK ARE UNEXCELLED.

OUR ASSORTMENT IS SUITABLE FOR THE BEST TRADE.

WE CARRY A STOCK OF MANUFACTURED GOODS SUFFICIENT TO MEET THE DEMANDS OF THE LARGEST TRADE.

SPOONS, FORKS, ETC., PLATED UPON THE FINEST NICKEL SILVER IN

EXTRA, DOUBLE, TRIPLE AND SECTIONAL PLATE.

Full lines of over FORTY STAPLE AND FANCY PIECES in each pattern in Geneva, St. James, Countess, Windsor, Oval Thread, etc. Made under the supervision, and quality guaranteed and controlled by WM. ROGERS, formerly of Hartford and Meriden. (Wm. Rogers, Sr., died 1883.)

WM. ROGERS, - - WALLINGFORD, CONN.

No connection with any concern in Waterbury, Meriden, or Hartford using name of Rogers in any form.

FACTORIES: WALLINGFORD, CONN., U.S., AND MONTREAL, CANADA.

the outer corner in passing, and will strike safely below the other corner, inside of the notch. In order to conduct his operations understandingly, the workman should have a clear comprehension of the principles of the entire escapement.—*Manufacturing Jeweler.*

THE TENACITY OF STANDARD GOLD.

In the annual report of the Mint just issued, it is stated that it is well known that standard gold is rendered very brittle and unfit for coinage by the addition of a minute quantity of certain metals, the action of lead being specially remarkable. It seemed desirable to obtain more accurate data than at present exist as to the effect of impurities on the mechanical properties of gold. With this object in view, bars five inches long, each weighing about five ounces, were prepared of pure gold alloyed with pure copper in the proportion of the legal standard, as well as bars of the same alloy to which small but varying amounts of lead had been added. These bars were then cut by a planing machine into the form usually employed for testing tenacity of metals, and submitted to traction in an ordinary testing machine. The result showed that pure standard gold has a tensile strength of 18 tons per square inch sectional area. The limit of elasticity appears to be reached with a stress of 1¾ tons, and the sample of metal fractures after elongating 24 per cent. The presence of one four-thousandth part of lead reduces the tenacity of 7.7 tons, the limit of elasticity practically coincides with the breaking load, and the elongation is hardly measurable. The further addition of one four-thousandth part of lead produces a diminution of tenacity to 5.4 tons. If, however, the total amount of lead be raised to 1 per cent., the breaking point remains about the same, so that 0.5 per cent. of lead would appear to be as deleterious as 1 per cent. The effect on mechanical properties of standard gold produced by minute quantities of impurity is very remarkable, and well deserves further examination.—*Exchange.*

EDITORIAL NOTES.

SPECIAL NOTICE.

Jewelers throughout Canada will oblige the Editor by sending into this office for insertion in these notes any items of news pertaining to the Jewelry business that they think would be of interest to the Trade generally.

CLEARED OUT.—G. H. Gordon, jeweler, Amherst, N. S., last month left suddenly owing about $3,500. His creditors think that another good man has gone wrong.

BACK AGAIN.—Mr. James Venn, the well-known retail jeweler of this city, arrived home safely from Europe last week. He had a big time and looks well.

ASSIGNED.—L. N. Paré, jeweler, of Montreal, assigned last month. His liabilities are said to be $3,500 and his assets about half that sum. There are evidently too many retailers in Montreal.

BURNED OUT.—We are sorry to learn that the store of H. C. Canneff, jeweler, of Petrolia, Ont., was destroyed by fire about a month ago, but trust he was fully insured against loss.

MR. C. E. REDFERN, jeweler, ofVictoria, B. C., and formerly Mayor of that metropolis of the Canadian Pacific slope, was in the city for a few days last month purchasing goods for his fall trade. He reports favorably of the state of trade in his province.

MR. G. SEIFERT, the well-known jeweler of the city of Quebec, called on us last month to present his compliments in person He had been West attending the Berlin Sangaerfest and on his way home dropped off to see his brother craftsmen in the Queen City of the West.

LOOK OUT FOR THEM.—We direct the special attention of our readers to the advertisement of goods stolen from the Vickers' Express Company. Any jeweler getting trace of them will be rewarded by applying to the Superintendent of the Company.

STOLEN.—Mr. B. Savage, the well-known jeweler, of Guelph, had some watches stolen from him a few weeks ago, as will be seen by our Help Column. Will the trade kindly keep a lookout for them and report to Mr. Savage if they get any trace of them.

MR. HUGH RYAN, formerly with E. & A. Gunther, of Toronto, and Levy Bros., of Hamilton, has made an engagement to take the road for Mr. Harry Ellis, wholesale jeweler, of Toronto. Mr. Ryan has a first-class reputation as a traveller, and we wish him continued success.

A GOOD TRADE.—The verdict of Toronto jewelers, both wholesale and retail, regarding the amount of business done during the Fair, is that it far surpassed in volume any previous Exhibition. The Toronto Exhibition is in time bound to become to Canada what the Leipsic Fair is to Germany.

THE MONTREAL BRIGADE, mustered in full force at the Rossin House (their usual headquarters) during the Exhibition. As a rule they looked cheerful, did a good business and left well pleased with the results. The only exception we saw was the patriarch of the brigade who complained that things are not what they once were.

SELLING OUT.—Mr. A. Brownley, jeweler, of Ailsa Craig, Ont., is, on account of ill health, trying to dispose of his business, as will be seen by his advertisement in another column. This presents a rare chance for some enterprising young man to step into a well established and good paying business.

CLOCK CATALOGUE.—The illustrated clock catalogue issued last month by H. A. Nelson & Sons, Toronto and Montreal, is one of the best of the kind ever issued in Canada. This firm is now making a specialty of clocks, and as our readers will see by our advertising columns, propose to keep in the front as regards prices and styles.

RETURNED FROM B. C.—Mr. E. G. Gooderham, Manager of the Toronto Silver Plate Co., has returned from a most successful business trip to British Columbia. Mr. Gooderham expresses himself as delighted with Canada's most Westerly Province, and expects that his company will do a large trade there in the near future. Although it was his initial trip it was a big success.

OUR CARD BASKET.—THE TRADER was not altogether forgotten by our jewelers who visited the Toronto Exhibition, and our sanctum was enlivened by some of the most genial souls in the craft during the week. Amongst them were the following: Mr. Geo. Smith, of Smith Bros., Kingston, Ont.; R. E. Bywater, Brighton, Ont.; W. J. Douglas, Pembroke, Ont.; W. Harkness, Meaford, Ont.; A. S. Murray, London,Ont.; C. E. Redfern, Victoria, B. C.

A LIE NAILED.—Interested parties have been circulating the report that the Montreal Optical Company sold goods at retail during the continuance of the Toronto Exhibition. Mr. Levetus, the western representative of the company, and the gentleman who had charge of the company's exhibit, requests us to state that the report is entirely untrue, as the Montreal Optical Company have never sold their goods at retail either at the Toronto fair or anywhere else. The company sell only to the legitimate trade and protect them in every way.

OUR ADVERTISEMENTS.—We need scarcely say to our readers that the advertisements that fill our columns each month are well worth perusing and studying carefully. The wide awake merchant who keeps fully abreast of the times is always the best advertiser, and our readers may rest assured that the monthly messages from these firms cannot fail to be of benefit to them. Our advertisements this month are of more than ordinary interest and we bespeak for them the careful attention of Canadian jewelers.

MR. ROBERT MCLEAN, one of the partners in the firm of J. & J. Taylor, the well-known Safe Manufacturers, sailed for Europe last month by the Cunard Steamship "Etruria." Mr. McLean has stuck very close to his business for a number of years, but as their rapidly increasing foreign business made it necessary for more complete arrangements he thought he could kill two birds with one stone, by taking a combination business and pleasure trip. We wish him a pleasant and successful journey and a safe return.

GUARANTEE NOTICE.

All Spoons and Forks bearing the stamp

G. RODGERS, A 1

are made of the finest nickel silver and are plated and hand-burnished under my personal supervision, and standard of quality—each article is guaranteed perfect in finish and durability.

All Knives bearing the stamp

G. RODGERS

12 DWT.

are plated on the best English cast steel with pure silver, and are hand-burnished and warranted to give perfect satisfaction. The well-known reputation of my goods has induced other makers to adopt a similar name, calculated to mislead the public. See that the trade mark reads and is spelled G. RODGERS, A1, on Spoons and Forks, or G. RODGERS, 12 Dwt., on Knives.

SOLD ONLY BY

THE ACME SILVER COMPANY,

TORONTO,

to whom all orders should be addressed.

G. RODGERS,

Known to the trade in Sheffield, England, and on this Continent since 1846.

No connection with Joseph Rodgers, Roger Bros., Wm. Rogers, or Rogers & Bro.

THE VALUE OF EXPERIENCE.—The *Keystone* speaking of the Boss says in its last issue: "An experience of thirty years in the construction of Jas. Boss filled cases enables the manufacturers to furnish the 20 years' guarantee with a perfect knowledge of the character of the goods they so confidently recommend. Other manufacturers of filled cases work, comparatively, in the dark, which is not to be wondered at when their inability to command such facilities as are obtained in the Keystone Factories, especially improved and *patented* machinery, is considered." Correct you are.

TAKE IT OUT PLEASE!—"Please take out the advertisement in your Help Column, signed ———. He has lots of answers to it, and is thankful for your space and trouble." So writes one of the advertisers in our Help Column, and it is but a specimen of the letters we are continually receiving. And jewelers are beginning to realize that in THE TRADER they have an organ that goes to every one of the craft in the Dominion and that its Help Column offers them for nothing an amount of publicity amongst the trade that money cannot purchase outside of it.

"OVERBANKING."—We received a letter from an esteemed jeweler in the West, last month asking us to publish the article on "Overbanking," which appears elsewhere in this issue. At the first glance it struck us from a monitary point of view and we were inclined to doubt that many of the craft were suffering from their exertions in banking too much money. When the horological aspect presented itself, however, we thought that prehaps it would do our readers no harm to peruse it and therefore inserted it.

MR. H. L. ROBERTS, the Secretary of the Keystone Watch Case Co. of Philadelphia was in the city during the Exhibition and paid us a visit. He says the Boss cases are in greater demand than ever and they can't begin to fill their orders. In spite of all competition from filled cases which are "as good as the Boss," their company is making all their filled cases up to the old standard of excellence and rather increasing than deteriorating their quality. In this we think their heads are level; the Boss case has a substantial foundation on which to rest its reputation and no matter at what price snide filled cases are put upon the market the old and reliable "Boss" is bound to sell.

FLATTERING.—The Toronto *Telegram*, in an editorial article in a recent issue, on the revival of trade in Canada, after stating that the importations of jewelry have been heavier than usual this fall, goes on to say, "A feature of the trade at present is the great and constantly increasing demand for Toronto made watch cases in gold and silver, which are reported to be equal to the best imported goods, and have almost completely captured the home market." Although the *Telegram* has been charged with being on the fence on most questions, it has evidently made up its mind in the right direction on the watch case question.

HOW WATCH CASES ARE MADE.—Quite a few of the retail jewelers from the country who attended the Toronto Exposition took advantage of the opportunity to pay a visit to the factory of the American Watch Case Company, where they were received with the utmost courtesy and shown through the works by the general manager. They were unanimous in their praise of its splendid equipment and the first-class manner in which its product was turned out, and left with the resolve that now we had a Canadian factory equal for its size to any in the world and turning out goods equal to any made, that they would henceforth support home manufacture especially as it was considerably less in price.

THE OUTLOOK.—From the indications we should say that a big business boom has struck Canada and that the coming year promises to be one of the most prosperous that this country has ever seen. Crops are good, prices above the average, and what is equally good, confidence in the country and its future seems to have been completely restored. The probability is that goods will be scarce before Christmas, especially 4 and 6 and low priced 18 size movements. Those who don't want to be left should put in their orders early. Retailers should remember that although a man should not buy goods unless he can pay for them, yet the merchant who has the stock is the one that is bound to do the selling. Don't starve your stock gentlemen!

THE BRANT MEMORIAL MEDAL.—We have just had sent to us a specimen of the memorial medal which has been struck by the committee in honor of the unveiling of the Brant memorial statue. This medal is executed by Messrs. P. W. Ellis & Co. of this city and is without doubt one of the finest productions of the medalists' art ever produced on this continent. We are proud to think that Canada can produce such a real work of art as this medal undoubtedly is, and it is strong evidence that in this branch of manufacture at least this country is fully abreast of the age. We are informed by the Messrs. Ellis that they have worked up an immense business in medals and now export them by the thousand to some of the principal dealers in such goods in the United States, who declare that their prices are not only lower but their work better than any they can get at home.

THE FREE TRADE WAY.—"A recent traveler in Germany has contributed to The Million some striking figures about the wages and living of German peasants and mechanics. One man, a hard-working old twig broom-maker, earned about 15 cents a day, and his total yearly income of ₹68.64 was thus divided: Clothing, $7.20; incidentals, $1.22; food and lodging, $60.22. His daily fare was: bread, 3 cents a day; coffee and sugar, 2 cents; beer, 2 cents; potatoes and sauerkraut, 3 cents; all other food, 3 cents" If the free traders of England and Canada had their way this is just about what our working men would come to. We fancy Canadian mechanics even with the N. P. are very much better off than this German laborer and free trade.

HOW LANGUAGE CAN BE MADE TO HIDE AN IDEA.—We clip the following from the last issue of the London *Jeweler and Silversmith*, and insert it as a good specimen of how English free traders can shoot all around a mark without hitting the bull's eye: "The present would be a good opportunity for the watch manufacturers, who are neither a sufficiently numerous or influential body to act by themselves, for uniting with some other bodies, such as, for example, the Sheffield cutlers, who find themselves in the same condition with regard to unfair foreign competition, when doubtlessly, a *modus vivendi* could be arranged which, avoiding the stumbling-block of "protection," would enable their parliamentary representatives to frame a short Act that would remedy the existing state of affairs."

THE CHARLESTON EARTHQUAKE.—Mr. E. Rosenthal, a Charleston jeweler, speaking to the reporter of the *Jewelers' Weekly* about the recent earthquake in that city said amongst other things: "My regulator stopped at nine and a-half minutes to ten, standard time, the fork being pushed out entirely from the pendulum. All the other pendulum clocks had stopped. I took up one watch which had stopped at ten minutes to ten and found the fourth wheel jewel pushed out of its setting and the lower cap jewel of the balance staff cracked. A great many clocks have been broken, and there will be plenty of work for repairers as soon as matters settle down to their former state. A curious effect of the shock was to cause the stones to fly from their settings in rings and brooches."

SCENE IN AN ENGLISH JEWELRY STORE.—In the last number of the London *Jeweler and Silversmith* we find the following: "A dock laborer came in bringing with him a watch he purchased the day before. (He was also accompanied by his mate or fellow laborer as a witness.) The man pulled the watch out of his pocket and handed it across the counter, saying, "Here, sir, I've brought this watch back; it won't go at all and it ain't an English watch." The shopkeeper held it up and looking the poor man sternly in the face, exclaimed, "Why, mein Got you can't expect a new vatch to go like an old von as is used to it—'t ain't likely—you must vind it and shake it and it will come all right.' I quickly made my exit from the scene, thinking the force of impudence could no further go." We have seen jewelers even in this Canada of ours who apparently knew as much about the running of a watch as this Tueton did, and they were not a thousand miles from the Queen City either.

MISSING PAPERS.—Although THE TRADER is mailed at the beginning of each month to *every* jeweler in the Dominion of Canada in business for himself, the publishers cannot guarantee that in every case the paper will be delivered. When the paper does not come to hand all we can do is, upon being notified, to send another copy. This we are always glad to do, and a post card to the effect that your paper is not to hand will always be promptly attended to. Some few of our readers of late have missed their papers and we are occasionally in receipt of eye openers from some of the more irate of them who seem to think that we are withholding their paper on purpose. All such may rest assured that such is not the case and we are as pleased to send it to them as they can be to get it. We are glad to find that we

The ILLINOIS WATCH COMPANY are now delivering their new FOUR and SIX size movements.

The SMALLEST, PRETTIEST and BEST Ladies' Watch is the new FOUR size made by the ILLINOIS WATCH COMPANY.

THE
ILLINOIS WATCH COMPANY

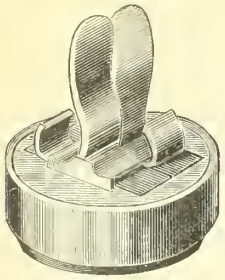
It will be MONEY in your pocket to place your order early for the new ILLINOIS WATCH COMPANY FOUR size movement.

Everyone who tries the present product of the ILLINOIS WATCH COMPANY orders again.

are missed and the fact that some of these letters are written in bad temper is proof positive that the writers miss our journal and are bound to get it if there is any get to it.

LOOK OUT.—About a week ago burglars tried unsuccessfully, we are glad to say, to burglarize the premises of Mr. Charles Stark, jeweler and gunsmith of Church Street, Toronto, and a few nights afterwards they succeeded in cracking the safe of P. Jamieson, clothier, on Yonge Street. At this time of the year this country is generally visited by droves of crooks from across the border to whom the ordinary fire proof safes in which the valuables of our country jewelers are usually held, are about as soft a thing as they could desire. Our advice to all jewelers is to keep a sharp lookout for the safety of their premises, more especially to those who have not got burglar proof safes. To the latter we would say if you can't afford to buy a good safe, place your present one so that it can be easily seen from the street and keep a light burning all night so as to light it up. If you sleep on the premises get a small Scotch or English terrier dog, they are better than any watchman and cost less. If no one sleeps on the premises, have two watch dogs, a terrier and a large savage mastiff or bull dog if possible locked in the store all night, and your chance of finding your stock safe and sound every morning will be very much bettered. There is nothing a burglar likes better than to get into a dark store, especially when the safe is in some out of the way place where it can't be seen from the street. The above hints can be put into practice with little expense or trouble and will add materially to the safety of any merchant's premises. A word to the wise should be sufficient.

SHAKESPEARE MODERNIZED.—The *American Storekeeper* gets off the following improvement on Shakespeare in a recent issue: "There is a tide in the affairs of men, which, taken at the flood, leads on to fortune; omitted, all the voyage of their lives is bound in shallows and in miseries." After ebbing for years, and after a yet more trying season of dead "slack water," the tide of commerce now begins to make strongly. The shrewdest and most careful observers agree that the flood is fairly upon us. It is a tide which comes but once in ten years—a commercial life-time. The next few months bids fair to prove the turning point in the business career of this generation of merchants. The care and skill, the boldness and discretion with which you buy Fall and Winter stock, and the vigor and prudence with which you reach out for the trade of the coming season, will go far to determine whether this tide is to carry you to success and a competence, or whether you are to wait another ten years, stranded "in shallows and in miseries," for another chance. Have you that ten years to spare, and are you content to spare it? "Fortune knocks once at every man's gate." Flighty, but a great deal of truth in it all the same.

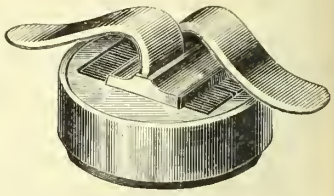


HE HAS ABSCONDED.—Some excitement was caused in jewelry circles on Monday last by the report that Julius Urwitz, proprietor of the retail business formerly owned by Mr. S. P. Kleiser and run under the name of the Toronto Watch Co., had disappeared. His liabilities amount to some $6,000, but at the present time of writing the assets are an unknown quantity. The principal creditors are mostly Montreal merchants and have made an affidavit and on it the sheriff has taken charge of the store and will get an expert to open the safes. Mrs. Urwitz says she knows nothing of her husband's whereabouts, but expects him back in a few days. Meanwhile the creditors are anxiously awaiting developments. If any further lesson were wanted of the absurd way in which our wholesale jewelry trade give credit to irresponsible parties, this case would furnish ample material. Only a few days before he disappeared, a prominent wholesale firm sold him $1,400 worth of goods aud would have probably doubled that amount had Urwitz pressed it. What foundation there is for giving such people credit we fail to see, and were it not that if it goes far enough it is sure to work its own cure, we might feel constrained to draw a moral from this but too common event. Credit is entirely too cheap in Canada, and the sooner that our wholesale men begin to protect their houest retail customers by refusing credit to irresponsible men, the better for their own pockets. Since the above was in type we learn that the entire stock left behind by Urwitz, exclusive of fixtures does not amount to more than $300. As his wife is said to be trying to effect a compromise at 25 cents on the dollar for him, it is beyond doubt a premeditated swindle and a fit case for stern justice. The creditors have a detective working up the case and we trust that no compromise of any kind will be entertained. We will have more to say about this later.

LITERARY NOTES.

"WATCH AND CLOCK MAKING," by David Glasgow, Vice-President of the British Horological Institute, is the latest text-book on this subject. From the hasty glance we have had through it, we should say that the book is extremely well written and contains much of interest to all watchmakers. In the preface the author says, "This volume is intended not only as a text-book for technical classes, but it is designed also as a book of reference for the practical workman." It is splendidly illustrated with 69 new and original engravings, which go far to make the contents plain even to the youngest mechanic. Taking it altogether we should say that this book is one that every watchmaker who desires to become a thorough workman should obtain, as it brings before him in a concise form the latest researches upon this very important subject. The work is published by CASSEL & COMPANY, (limited,) 739 Broadway, New York, where it can be had by all those who wish to keep abreast of the times.

ST. NICHOLAS is one of the best periodicals for young people published anywhere, and the October number is fully up to its usual high standard. An elegant portrait of Martha Washington, makes an admirable frontispiece, and the continued historical article on the life of George Washington, is embellished by a well executed wood cut of the "Father of his Country," and several other illustrations of interest. This number contains many choice engravings, amongst the best of which are "The Tomb of Maxamillian I," "How many a boy was taught to string the bow and how to lay the bolt," and "The Weasel and the Adder." The Letter-press is as usual fully up to the mark. "Little Lord Fauntleroy" still continues to keep up its interest, while in "Some Curious Mariners," "The Crew of the Captain's Gig," and "Old Time Arms and Armor," we have three short articles that it would be hard to excel. We know of no periodical for young people, healthier in tone, abler or more interesting in its splendidly illustrated articles, than *St. Nicholas*.



THE OCTOBER *Century*.—Without doubt the *Century* magazine stands at the head of all publications of its class, and the October number is fully up to its own high standard. To Canadian readers it is of more than ordinary interest on account of Capt. J. W. Collin's article in "Open Letters" on the outlook of the fishery dispute between Canada and the United States. The war papers are as usual splendidly illustrated and of absorbing interest. General W. S. Rosecrans gives a vivid description of his victory at "Corinth," which is interesting in the extreme. The chief attraction of this number will, however, be found in the articles on "Stonewall Jackson." These consist of personal reminiscences of the great southern general, by his sister-in-law Mrs. Margaret J. Preston. and "Stonewall Jackson's last battle," by his aide-de-camp Capt. James Power Smith. In the latter article, Capt. Smith, after describing the memorable battle at Chancellorsville, gives a vivid pen picture of the wounding of this great southern hero. The entire article is so absorbing that one cannot lay it down until it is finished, and we are sorry we have only space for one single extract from it. After describing the wounding of the general and the attempt to carry him off the field under a terrific artillery fire from the federal batteries, during which two of those bearing the litter on which lay the body of their beloved commander fell, Capt. Smith says, "the litter was soon brought, and again rallying a few men, we essayed to carry him farther, when a second bearer fell at my side. This time, with none to assist, the litter careened, and the general fell to the ground, with a groan of deep pain. Greatly alarmed I sprang to his head,and, lifting his head as a stray beam of moonlight came through clouds and leaves, he opened his eyes and wearily said, 'Never mind me, Captain, never mind me.' Raising him again to his feet, he was accosted by Brigadier-General Pender: 'Oh, General, I hope you are not seriously wounded. I will have to retire my troops to re-form them, they are so much broken by this fire.' But Jackson, rallying his strength, with firm voice said, 'You must hold your ground, General Pender, you must hold your ground, sir!' and so uttered his last command on the field." The illustrated article by Franklin D. North on "The Gloucester Fishing Fleet" is a most timely one and gives a vast deal of information about our deep sea fisheries in a very readable form. Matthew Arnold contributes an interesting article on "Common Schools Abroad" and President Gilliman of John Hopkins University writes on "Hand-Craftand Rede-Craft," an ed-

STAPLE AND CHRISTMAS GOODS.

ucational topic of the present day. In the continued story of "Lemnel Baker," Mr. Howells keeps up the interest unflagged as befits one of the best of the present day novelists. Among the short stories "A Soldier of the Empire," by T. N. Page, will be found first-class reading. The good things in this number are so plentiful that space forbids us saying more than that they are all well worth reading, and no class of reader can fail to find something suited to his individual taste.

The illustrations are as usual executed in the highest style of the wood engraver's art and contain some very admirable portraits of celebrated men, amongst whom are "Bjornstjerne Bjornson" Sweden's great statesman, and Rosecrans and Jackson, generals of the late civil war.

The editor of the *Century* makes the important announcement that in the November number of that magazine, they will commence the publication of the authorized "life of Abraham Lincoln," by John G. Nicolay and John Hay who were the great war President's private Secretaries. Lincoln is not only one of the grandest figures in America, but in the world's history, and these papers will therefore be of the greatest possible interest to thinking men the world over.

WORKSHOP NOTES.

GOLD TINGE ON SILVER.—A bright gold tinge may be given to silver by steeping it for a suitable length of time in a weak solution of sulphuric acid and water, strongly impregnated with iron rust.

TO SEPARATE GOLD FROM SILVER.—The alloy is to be melted and poured from a height into a vessel of cold water, to which a rotary motion is imparted, or else it is to be poured through a broom. By this means the metal is reduced to a fine granular condition. The metallic substance is then treated with nitric acid, and gently heated. Nitrate of silver is produced, which can be produced by any of the ordinary methods; while metallic gold remains as black sediment, which must be washed and melted.

MOUNTING THE DIAL.—The pin holes in the dial feet should be drilled with a very small drill, in such a direction that the pins will not come in the way of anything and will be easily gotten at; they should not be drilled below the surface of the plate, but broached until the pin touches it. If the hole should be a little below the surface, it is better to lengthen the copper foot by squeezing it with a pair of blunt nippers until it is above the plate, than to leave it in such a position that no pin can stop it.

RECOVERING GOLD FROM EXHAUSTED COLORING BATHS.—The collected old coloring baths are poured into a sufficiently large pot, an optional quantity of nitro muriatic acid is added, and the pot is placed over the fire, during which time the fluid is stirred with a wooden stick. It is taken from the fire after a while, diluted largely with rain water, and filtered through coarse paper. The gold is recovered from the altered solution with a solution of proto-sulphate of iron (green vitriol), which is stored in air-tight bottles, then freshened with hot water, and finally smelted with borax and a little saltpeter.

SIMPLE TEST BY THE SPECIFIC GRAVITY.—The goldsmith, after having smelted his bench scrapings, sweepings, etc., and reduced it into a button, desires to roughly estimate the percentage of the precious metals contained in it. This can be done approximately as follows: A certain quantity of it is taken and drawn out into a wire, which is to be exactly of the same length as one from fine silver; of course, both must have been drawn through the same hole, silver being nearly one-half lighter than gold, it is natural that the one of fine silver must be lighter, and the increased weight of the wire under test corresponds to the gold contained in it.

DUST PIPES.—Dust pipes are indispensable in a key watch, and when properly screwed on the plate and fitted to the case are expensive. This part of the watch is frequently treated with utter disregard, and we lately saw a very bad case of dust pipe of the set-hand square of a three-quarter plate watch. It was so constructed that if it was made to touch the case it would press upon the center pinion and stop the watch or make it go irregularly; to avoid this, the center parts are left with sufficient end shake to defeat the purpose for which it is designed. A solid top offers advantages in respect to dust, and perfects the key winding watch to an important degree.

THE BARREL ARBOR.—If the pivots of the barrel arbor are of the proper shape (which they generally now are in the best movements, and certainly ought to be), the pivots and holes will only require smoothing, and the barrel freeing on the arbor. Instead of adopting the usual course of turning away the bosses in the barrel and cover to reduce the rubbing surfaces, a deep hollow should be turned and a shoulder formed on each side of the arbor of a sufficient width, and the bosses should be left on the brass as large as possible. It has not been the practice to snail the barrel arbors of fusee watches as there was no trouble with the adjustment of the mainspring, English springs being tapered and generally filed thin at the eye, but the arbors should be snailed (and they probably will be now by the movement makers), and the hook should not project beyond the thickness of the spring.

WISE AND OTHERWISE.

Two bad little boys of Tarentum
First borrowed some pins, and then bent 'em
When their pa took a seat,
They both beat a retreat,
As likewise did the fellow who lent 'em.

A COUNTRY doctor announces that he has changed his residence to the neighborhood of the churchyard, which he hopes may prove a convenience to his numerous patients.

"WHAT is the reason," said an Irishman to another, "that you and your wife are always disagreeing?" "Because," replied Pat, "we are *both of one mind*—she wants to be master, and so do I."

WE are not obliged to believe everything we hear. Stanley was told at Karagwe of a strange people "who had long ears descending to their eet; one ear formed a mat to sleep on, the other served to cover them from the cold, like a dressed hide."

AN indifferent actor was playing in Othello at the Dunedin Theatre. When he came to the passage, "O that men should put an enemy in their mouths to steal away their brains!" a stentorian voice roared from the gallery, "All right, old man, drink away; you're safe."

A Connecticut man claims to have a cat that eats cucumbers. May be all cats do, and that's the music that we hear from the back fences. Instead of being the outpouring of joyful cat hearts, is the wail of the unrequited cucumber down in the deep recesses of the cat. Come to think of it, it looks reasonable.

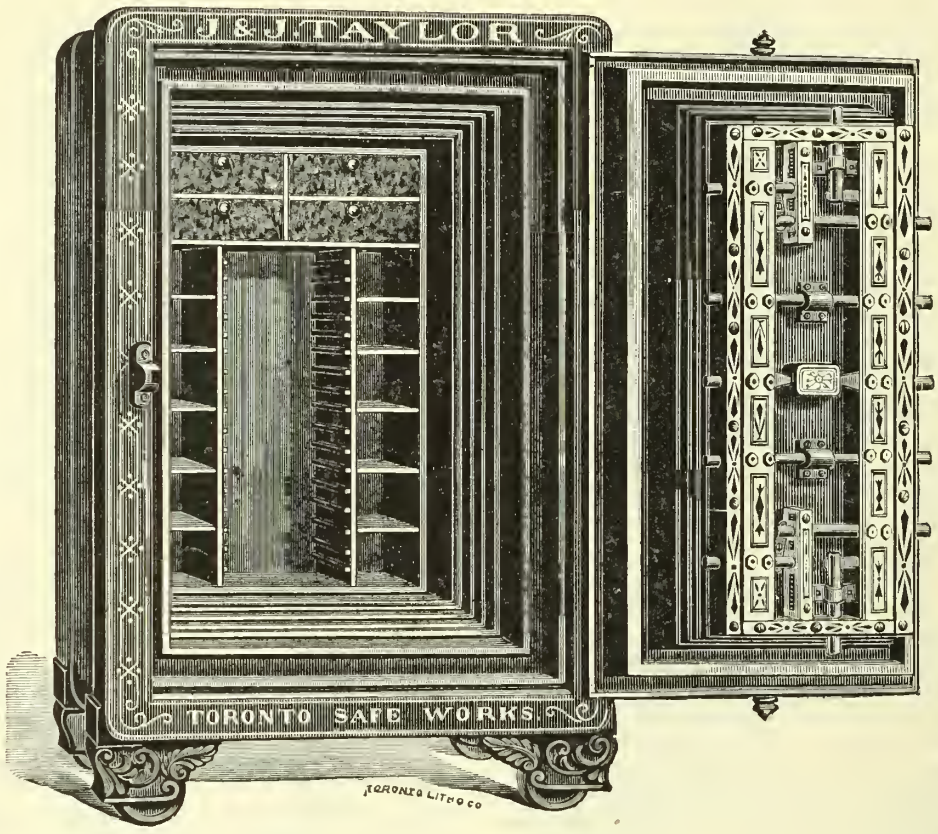
"YOUNG Philosopher" would like to inquire what a "safety" match is, and why so called. A safety match is one in which the young man owns a span of horses, a three-storey house, and a seal ring, while the young lady's father is the possessor of sixty thousand dollars in government bonds, and a whole square of brick blocks.

SYMPATHY always indicates a certain refinement of nature, but it is sometimes curiously misplaced. The Siamese twins were on exhibition, and among the spectators was an Irishman who had an original way of looking at things. He told a friend who was standing at his' side that the most fortunate thing in the world was that they were brothers, because if they had been strangers to each other they would never have been able to get on together.

THERE is a fearfully romantic story going the rounds of the papers to the effect that a young man who was packing eggs wrote on one of them a request that the purchaser would correspond with him and that the incident led to matrimony. This is all in accordance with natural law, however. We have been told that an egg is full of "meet" and the couple met eggsactly as one would eggspect. The only fear we have in connection with the transaction is that the husband was hen-pecked.

THE following conversation was recently overheard, not very far from where we write it.

"I understand you failed in business, Mr. Fraudenbury?"



"Yes, I was unfortunate in a private speculation, but that is not the worst. I was grossly deceived."

"Yes; how so?"

"In my assignee. He's a scoundrel. He wormed his way into my confidence and made me pay ninety-six cents on the dollar! Did you ever hear of such an outrage?"

SOMETHING NEW IN JEWELERS' SAFES

J. & J. TAYLOR'S NEW STYLE JEWELERS' SAFE,

WITH DOUBLE TONGUE AND GROOVE FIRE-PROOF DOORS.

J. & J. TAYLOR, TORONTO SAFE WORKS.

IN ORDER to meet the wishes of the jewelry trade, we have at last succeeded in perfecting a new style of safe for jewelers' use, combining the advantages of first-class

FIRE AND BURGLAR PROOF SECURITY WITH MODERATE COST.

THE above cut represents our new style of Fire and Burglar Proof Safe for Jewelers, which has an entire lining inside of best five ply welded Chrome steel and iron, with heavy Burglar Proof door, made any thickness required, and which is securely attached to the Fire-proof door. The Burglar Proof Door is fitted with rubber tube packing to prevent the use of explosives, and is locked with four wheel Combination Lock having our patent Enlarged Centre Lock Spindle and Bolt Handle.

To the above improvements is also added our new patent

DOUBLE TONGUE AND GROOVE FIRE-PROOF DOORS,

this being the latest improvement in Fire Proof Safes, and PATENTED BY US JANUARY 14TH, 1886. This door is fitted with a TONGUE made of wrought iron, corresponding with and locking into a GROOVE, made of same material, on the door frame. To both of these is connected a SECOND TONGUE and GROOVE made of thin galvanized steel, which is filled with non-conducting material thus making

TWO COMPLETE TONGUES AND TWO GROOVES IN EACH DOOR,

and which we maintain is the best fire-proof safe now made.

Visitors to the coming Industrial Exhibition can see samples of these safes at our exhibit in the Main Building. Do not fail to examine them.

J. & J. TAYLOR,

TORONTO SAFE WORKS,

117 and 119 Front St. East, Toronto.

WATCH COMPANY

OTHER NOTES.

MOUNT HAMILTON OBSERVATORY.—The contract for mounting the great Lick telescope at Mount Hamilton Observatory has been awarded to Warner & Swasey, of Cleveland, for $42,000.

THE AGE OF A WATCH.—It has been estimated that the average life of a watch is five years, and that during that time 5,000,000 watches are made and sold. In former years, before the labor-saving machinery now so extensively used was invented, the annual output for each man employed was fifty watches; now with the help of machinery, each man employed at the business is enabled to turn out one hundred and fifty watches annually.

THE GREAT LICK TELESCOPE.—The great Lick telescope, when mounted and swung against the sky, will have a focus of fifty-five feet in length, and nearly fifteen longer than the largest one ever made. It will be a refractor, which means that the image is formed directly to the eye by the object glass, as contra distinguished from the Gregorian and Herschelian telescopes. The largest telescope ever known of the latter style was Dr. Herschel's. The tube lacked but eight inches of being forty feet in length.

A SOLAR CLOCK.—A prominent watchmaker in Rio Jeneiro has a solar clock fitted up in his establishment which is not only ingenious but practically solves the question of perpetual motion for those places where the sun shines perpetually. He has an electric-bell apparatus in the upper story, and the two wires from the battery are furnished each with a thin, flat horizontal piece of metal, separated by a distance of four to five millimeters one from the other. Just above the flat pieces of metal a bi-convex lens concentrates the rays of the sun upon them at a certain moment, noon, for instance. The action of the sun's rays heats and bends the metal pieces so that they come in contact, thus closing the electric circuit, which rings the bell. This is not all that Mr. Magnin required of the sun; he forces it to wind up the clock in his own room at the same time. The barrel arbor carries a click and a ratchet, which is wound up by the hammer of the electric bell as it moves forward and backward, striking the hour. And even this is not all—this sun has to regulate the clock also. The canon carries a washer with an indentation corresponding to a jointed lever, which is set in motion by the armature of a magnet, and at noon turns the canon so as to bring the minute hand upon the figure twelve.

ROYAL RELIQUES.—A valuable collection of art articles, the history of which is closely allied with the "house of the Hohenzollerns," will shortly be offered at auction in Berlin. Among other objects is one of those artistic snuff boxes of Frederic the Great which he used to present, filled with ducats, to his generals. The cover, beside the Black Eagle and the golden star, bears the legend: "Dieu vit et Frédéric notre héros," (God lives and Frederic our hero), surrounded by a laurel wreath, it bears the names of the battles fought by him from Mollwitz to Zorndorf. Engraved upon the right side are the words, "Vive le roi de Prusse Frédéric le grand," and upon the left side, "Honi soit qui mal y pense." Another snuff dose of the same period is remarkable for its history. Although this great king used to bestow these doses only to generals and ambassadors, he made one exception by bestowing one upon a merchant—an Israelite—who, although very orthodox in his creed, rendered very eminent services during a night, from Friday o Saturday, at the burning of a Catholic church at Oppeln, contrary to the tenants of his religion, and, by almost superhuman efforts, he saved the holy vessels and cut the altar pictures out of their frames. The priests presented him with two commemorative silver vessels, and the king sent for him, and, in a special audience, presented him with the dose, which has until now been preserved in his family. The king was very particular in having all his subjects, without reference to creed, treated alike. A colonel refused repayment to a Jew from whom he had borrowed a sum of money. The former reported him to the king, who grew very angry, and wrote an insulting letter to the colonel, ordering him to pay forthwith or be cashiered, closing with the words "I want you to understand that this Hebrew pays his taxes to me just as well as you do, and you are therefore no more to me than he is. Frederic."

OUR HELP COLUMN.

THE TRADER aims to be of practical value to the Retail Jewelry Trade.

NO CHARGE is therefore made for advertising in this column, but the subject-matter should not exceed five type lines, or about 60 words.

When requested, these advertisements will be published in successive numbers of the paper.

If you have a Store, Stock, or any Special Article to sell; if you wish to buy an Established Business, or enter into Partnership; if you want a Journeyman, Clerk, Salesman, or Foreman; if you want a situation yourself—communicate the fact to THE TRADER PUBLISHING CO., 57 ADELAIDE ST. WEST, TORONTO, and it will be inserted in this column free of charge. This is the only way by which you can reach the entire Trade, and we shall be glad to help you.

A RESPECTABLE YOUTH of 16, wishes to learn the watchmaking. Best of references. Apply stating terms to W. E. BROLEY, Box 224, Elora, Ont.

THE TRADER.

TORONTO, ONT., NOVEMBER, 1886.

The recognized organ of the Jewelry and kindred Industrial Trades of Canada.
Published on the first of every month, and sent free to every dealer in Jewelry and kindred goods in the Dominion of Canada.
Our rates for advertising will be found very low, and will be made known upon application.
We shall be glad to receive correspondence from all parts, and will publish such letters as will be of interest to the Trade. EDITORIAL.

$300 REWARD.

As will be seen by the advertisement in another column, The Canadian Association of Jobbers in American Watches have decided to offer a reward of $300 to any retail jeweler who will furnish information that will convict any member of their Association of breaking his contract, by selling Watch Movements or Silver, Filled or Nickel Cases at less than the regular prices.

We do not propose at this time to discuss the question of whether such an organization is for the benefit of trade in general, or whether, being so, its action since its formation has been such as the trade could thoroughly endorse. These just at the present juncture we consider minor questions. The Association is here, whether it is here to stay or not is another question, which depends almost entirely upon the action of its members. It is in existence, however, and its members are in honor bound to rigidly observe each and all of the conditions to which they agreed when they were admitted as members.

For this reason we say, that as long as a Jobber remains a member of this Association, he should honorably fulfill his obligations towards it. If he knowingly and with the intention of benefitting himself at the expense of his fellow members, (as he must necessarily do if he sells below the contract price) violates his contract, then he is certainly a dishonorable man, and should be exposed as speedily as possible.

Few people care about assuming the *role* of informers, and consider it "*infra dig*," but there are cases when such a course becomes a virtue instead of a disgrace, and this we consider one of them.

Retail merchants may readily believe that a Jobber who would violate his solemn contract entered into with his fellow-Jobbers for the sake of a few paltry dollars gain, will beat *them* at a bargain, every time he gets a chance. The sooner such dishonorable men are weeded out of the trade, the better for both wholesalers and retailers, and the sooner will the trade generally get on a healthier and more profitable basis.

A POPULAR clergyman recently gave a lecture on "Fools." The tickets of admission were inscribed, "Lecture on Fools. Admit one." There was a large audience.

HEROIC TREATMENT.

From our exchanges we learn that the National Association of Jobbers in American Watches in the United States, recognizing the fact that the safety of their organization depends upon the fidelity with which its members keep their obligations have sent out the following document to the retail trade :

"As it is quite as much for the interest of the Retail Trade as for the Jobber that the contract prices of Silver and Filled Cases and American Movements should be strictly maintained, so that one dealer shall not have an unfair advantage over another, we hereby offer a reward of $500 for information that will convict any recognized Jobber in American Watches of giving, directly or indirectly, any better terms, prices or discounts on these goods, than the regular rates established by the Manufacturers."

It is quite evident from the above that the American Jobbers' Association have little or no faith in the integrity of many of its members, and that they have taken a very effective way of stopping violations of their contract. So long as such an association is run for the purpose of keeping goods from being slaughtered, and maintaining a fair price as between retailers themselves we think that it is a good thing for the trade all round. It is only when it becomes dissatisfied with protection and goes in for extortion that such an association ceases to be a benefit and becomes an evil.

Although we do not see eye to eye with the American Jobbers' Association in all that they have done, there can be no doubt but that so far, on the whole, they have not only benefited themselves but the retail trade as well. In our opinion it is a benefit to the retail trade generally, to have a uniform price for watch movements and cases, because it prevents unfair competition and has a tendency to make the prices more uniform and increase the rate of profit on such goods.

If people go into such an association they should do so with the intention of thoroughly and honorably fulfilling their obligations to it. While business competition is a warfare, it should be an honorable one, and the merchant who enters into an agreement with his opponents which he expects them to keep to the letter while he himself breaks it at will, is not only a dishonorable man but an unsafe person to do business with. To such a person, the crime is not in violating his solemn obligation and making a liar out of himself, but in being found out. The only way that such people can be taught a lesson, is to touch the only vulnerable part about them, their pockets, and we would suggest to the American Association the advisability of making every one of its members sign a forfeit bond equal to the amount of the reward offered, so that in case of exposure the person convicted would have the pleasure of paying for his own detection.

It has been pretty broadly hinted that there are those in the Canadian Jobbers' Association who do not practice what they preach and that prices are cut every day. If this is the case we think the Association could not do better than take a leaf out of their American cousins' note-book in this respect, and if they also embodied the suggestion we have made above, we think there would be less heard in the future about cut prices and violation of contracts.

THE ONLY ABSOLUTE GUARANTEE OF QUALITY

IS THE INTEGRITY OF THE MANUFACTURER.

THE AMERICAN WATCH CASE COMPANY, of Toronto, guarantee every case bearing their trade mark, no matter by whom sold.

OUR CANADIAN PATENT FOR THE PERFECTION CASE WAS ISSUED JANUARY 15TH, 1886.

OUR NEW 3 oz. PERFECTION O. F. OR HUNTING CASE NOW READY. ASK YOUR JOBBER FOR THEM.

THE PERFECTION

DUST PROOF Watch Case, although placed by the American Watch Case Co., of Toronto, upon the Market four months ago, has already been pronounced by expert Watch Dealers to be

THE BEST AND CHEAPEST WATCH CASE EVER MADE.

The Perfection has been specially designed with a view to make a Watch Case which would at once be cheap in price and at the same time afford sufficient protection to the movement. This idea has been admirably carried out by taking the excess of Silver from the centre and placing it in the backs, which will be found extra firm and heavy. Although the cheapest Watch Case ever made, it is warranted to give satisfactory wear. Ask your Jobber to show them to you; it is money in your pocket to handle them, therefore take no others instead. Every "Perfection" Case we manufacture bears our stamp and registered Trade Mark as above, and is fully guaranteed as to quality, no matter by whom sold.

OUR NEW PATENT UNBREAKABLE PENDANT SET.

☞ Dealers will please notice that we are now fitting all of our Open-Face Stem-Wind Cases with our new Patent Unbreakable Pendant Set, the simplest, strongest and best device for the purpose ever invented. They are made so as to take any regular American Full-Plate Movement with Female Winding Pinion. Our 3 oz. S. W. Perfection Cases are also fitted with it.

IS LIFE WORTH LIVING?

The paper under the above caption, read by Mr. A. Blue, secretary of the Ontario Bureau of Industries, at the meeting of the Medical Association held in Toronto last month, was an exceedingly able one in many respects. In this paper the writer after showing the average cost of living amongst the mechanics and workingmen of this country, gives an estimate of their earnings and savings, from which it appears that out of 1,605 wage-earners with dependents, last year, only 950 had a surplus over the cost of living, the average surplus being $93.07 ; 410 came out even, and 245 closed the year with an average deficit of $56.24.

The reason for this state of things, Mr. Blue thinks is the unfair division between capital and labor. In reference to this he says, "the statistics available do not answer the question as to the distribution of wealth with sufficient clearness, but they seem to denote that an inordinately large proportion goes to the capitalist. In Canada, as appears by the census of 1881, the total amount paid for wages in the manufacturing industries was $59,408,512, while the excess of products over labor and materials was $70,362,113 ; that is to say, of $509.03 net product per capita, the workingman received as his portion $233.03, and the employer retained $276. In the United States, as the census of 1880 shows, the amount paid for wages was $947,953,795, while the portion of employers of labor was $1,024,801,847 ; that is, of $722 net product per capita the workingman received $347 and his employer retained $375. In Canada, 54¼ per cent. of the product of industry is taken for rent, interest, and profits, and in the United States 52 per cent. of it is taken, while the remainder in each case is given as wages for the skill and labor required in the work of production. This may be a fair and just distribution—the presumption is against it."

Commenting upon the above extract from Mr. Blue's report the Toronto *Globe* takes up the burthen of the tale, and in order to curry favor with the workingmen, whose votes it wants, and to get a slap at the manufacturers whom it has stupidly driven out of its own party, it says: "Thus the owners of capital after receiving 6 per cent. on their investment, get more than fifty cents out of every dollar from sales. This seems a large share considering the amount and quality of exertion done by employers and employed respectively.

These important figures come from a gentleman who is generally acknowledged to be a very painstaking, able, and accurate statistician. The Bureau of Statistics, under Mr. Blue's direction, has already rendered services which workingmen are bound to take note of."

From this it adduces the fact that the capitalist is getting 54¼ per cent. profit out of what the workman earns and that without any exertion on his own part, and that the latter is a very badly used person and ought immediately to raise a rebellion to put out the government which makes such a thing possible. Such articles as these may be good enough for campaign literature, but they should be taken *cum grano salis* by even the readers of the *Globe* before they can be taken as a solution of the capital and labor question.

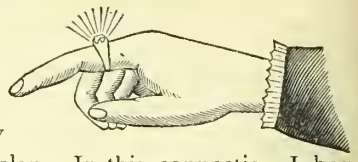
As a matter of fact Mr. Blue's statement about the division between capital and labor is entirely wrong, and we are astonished that such a careful and reliable statistician as the secretary of the Bureau of Industries usually is, should fall into such a gross and palpable error. There is an old saying that figures can't lie, but if they can't tell an untruth they can easily be so arranged as to prove almost anything. A careful examination proves that Mr. Blue has made up his statement by adding the cost of raw material and wages together and calling it the cost of manufacture. This he subtracts from the total amount of goods manufactured, and the difference he calls the manufacturers' profit. As Mr. Blue works it the figures stand thus :

Raw material,	$179,905,443
Wages,	59,408,512
Total cost of goods,	$239,313,955
Total amount produced,	309,676,068
Capitalists' apparent profit,	$70,362,113

From these figures Mr. Blue gets the results on which he bases his statement that the capitalist gets 54¼ per cent. profit on all the goods manufactured in Canada.

Now let us see how Mr. Blue's statement is borne out by his own figures. From the Dominion census of 1881 we find that there were 254,935 mechanics in Canada at that time. Dividing the total product $309,676,068 by the number of mechanics 254,935, would give a net result of $1214.72 as the net product per capita instead of $509.03, as stated by Mr. Blue in his report. Dividing the amount of raw material used by the workmen employed, we find that $705.34 is the average amount of material used per capita, while the total wages earned divided by the total number of workmen shows that $233.03 was the average earning per man.

In a foot note to his paper, however, Mr. Blue states that in his calculations he allows the capitalists 6 per cent. interest on their capital invested, (as per census returns of 1881) and 10 per cent. on sales for expenses of manufacturing, such as rent, insurance and management. The returns alluded to, show a total capital invested of $165,302,623, six per cent. of which would amount to $9,918,157. Taking Mr. Blue's estimate of 10 per cent. as a fair ratio of expenses on which a manufacturing business can be run, (* see foot note) we find that $30,967,606 should in addition be deducted from the capitalist's share for that item. The statement as thus corrected would therefore read as follows :



Raw material,	$179,905,443
Wages,	59,408,512
6 per cent. interest on capital,	9,918,157
10 per cent. expenses,	30,967,606
Total cost of goods,	$280,199,718
Total amount produced,	309,676,068
Balance of profit,	$29,476,350

Analyzing these figures and bringing them down to the per capita basis from which Mr. Blue draws his deductions, we get the following results : Average product per capita for Canadian mechanics, $1,214.72, which according to Mr. Blue's allowances may be fairly apportioned as follows :

Raw material,	$705.34	or 58 per cent.
Wages,	233.03	or 19¼ "
Interest and Expenses,	160.96	or 13¼ "
Profit to capitalist,	115.39	or 9½ "
Total,	$1214.72	or 100 per cent.

It will thus be seen by the above analysis of Mr. Blue's own figures, that his statement as to the relative profit of the capitalist and the mechanic, are very far from being correct. No wonder that when referring to his own statement, as to their unfair distribution by which the capitalist gets 54¼ and the mechanic 45¾ per cent. he says : "This may be a fair and

JEWELRY REPAIRS.

Every Retail Jeweler in Canada has at some time or other felt the need of a JEWELRY REPAIR SHOP that could not only do such jobs in first-class style, but return them without delay. In this connection I beg to notify the Jewelry Trade throughout Canada that having fitted up my new factory with all the modern steam machinery requisite to the successful carrying on of a first-class jewelry manufacturing business, I have also opened a repairing department in connection therewith. I respectfully solicit your custom therefore for repair work of all kinds, and gold and silver plating in all its branches. Every job done by me will be executed in a first-class manner, and my prices will be found as low as consistent with good workmanship.

Special attention is also given by me to the execution of orders for special jewelry to be made up either from original or selected designs. For such things as Lockets, Diamond or other Earrings Brooches, Earrings or Chain work of any kind, I have special facilities and can guarantee satisfaction every time. When you have any new special work or jewelry repairs, give me a chance. Remember my address, A. H. WELCH, FINE JEWELRY MANUFACTURER, 31 ADELAIDE STREET WEST, TORONTO.

just distribution—the presumption is against it." With this sentence we entirely agree, and will only add, that not only is the presumption, but the actual facts against it.

So far as Mr. Blue is personally concerned we exonerate him from any sinster motive in connection with his error. We cannot say the same however of the *Globe*, which taking Mr. Blue's statement as being a fact, (although it should have been at once detected by any ordinary reader), launches a whole column of editorial invective against the manufacturers of this country, and charges them in so many words with being oppressors of the worst kind and literally grinding the faces of the poor. Such attempts to set the employee against his employer is worthy only of socialistic politicians who would welcome anarchy any time so long as they could profit by it.

* NOTE.—Mr. Blue estimates 10 per cent. as a fair proportion to allow for expenses of rent, insurance and management. Such a proportion is laughed at by all the practical men we have talked to about this, who say that it takes at least from 15 to 20 per cent. to cover such incidentals as rent, insurance, fuel, light, postage, wear and tear of machinery, (which is 10 per cent. on its own cost per annum), materials used in manufacturing, but not incorporated in the goods manufactured, cost of management, risk of losses, etc.

WHAT THEY SAY ABOUT US.

Thanks very much for your valuable paper.

J. A. T. CATON & Co.,
Wholesale Jewelers, Victoria, B. C.

The August and September numbers of THE TRADER have not reached me. If you have any back numbers kindly send them, as I would not miss them for quite a sum.

E. H. RODGERS, Jeweler,
Upper Bedford, Que.

Please accept my best thanks for inserting my advertisement in your help column of THE TRADER free of charge, as through it I have secured a job. I have had replies from all parts of Canada between Montreal and Calgary, N. W. T.

Yours truly,
WM. J. SIMPSON,
Toronto, Ont.

Could you please send me the July, August, September and October numbers of THE TRADER, which, through some error no doubt, I did not receive. I value the paper very highly.

J. BALL,
Hanover, Ont.

"I ATTENDED two theatres the first night I was in New York," wrote a rural buck to his fond parents, "and three balls the next. Had a glorious time the first, and only got two dollars on my watch the next." The unsophisticated old people are still wondering what he meant.

CORRESPONDENCE.

To the Editor of THE TRADER.

SIR,—As one of the "Curiosities of Literature," connected with watches we may cite the following, which can be seen in the churchyard at Lydford, Devonshire, England :

Here lies in a horizontal position
The outside case of
George Routledge, Watchmaker.
Integrity was the mainspring, and Prudence
The regulator of all the actions of his life ;
Humane, generous and liberal,
His hand never stopped till he relieved distress ;
So nicely regulated were his movements
That he never went wrong,
Except when set a-going by people
Who did not know his key ;
Even then he was easily set right again.
He had the art of disposing of his time so well
That his hours glided away in
One continued round of pleasure,
Till, in an unlucky moment his
Pulse stopped beating.
He run down November 14th, 1801, aged 57
In hopes of being taken in hand by
His Maker,
Thoroughly cleaned, repaired, wound up,
And set a-going
In the world to come, when time
Shall be no more.

Oct. 20th, '86. "TRAVELLER."

To the Editor of THE TRADER.

DEAR SIR,—Your correspondent from Aurora "John Bull," whose article appeared in your September issue, suggests a very good thing in recommending that a *trade union* be organized for the better protection of watchmakers and jewelers. If any trade wants it, certainly our craft is in want of some kind of protection. I have been in the watch and jewelry business *over fifty* years, served eight years of my boyhood in apprenticeship, spent hundreds of dollars for suitable tools and materials, worked hard early and late to acquire a perfect knowledge of my trade, and have lived to see the day when a Tailor, Shoemaker, Barber or Blacksmith can give up his profession or trade and at once go into the watch and jewelry business, hang out his sign, buy all the goods that he wants, sell a watch, clock or piece of jewelry *at cost* if he can't make ten cents on the article, do all repairing for about one quarter what any practical watchmaker has to charge and live, deceiving his customers and the public, killing the business generally and making those that have for years been toiling and striving to build up an honest legitimate trade, heartily wish that they were out of it or had never had anything to do with the business. *Yes, a thousand times yes.* Let us have a *trade union* if it will effect a remedy and cure the disease.

Yours truly,
Oct. 15th, 1886. ONTARIO.

A MOST astonishing phenomenon of the Japanese earthquake was the splitting of the Papandayang mountain. In a flash of time it was split into seven parts. Where the lone mountain had stood loomed up seven peaks, each 7,000 feet high.

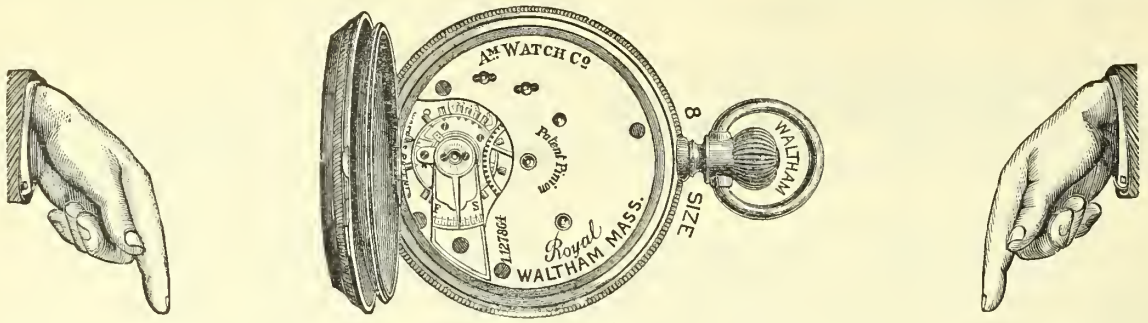
BY EXCELSIOR.

PART II.

FITTING HAIR SPRINGS.

(63.) *Testing the spring.* Lastly, we turn the balance a little, so that it will start off promptly on being liberated, and lower our bristle upon the rim to hold it so till we are ready to begin, then count the vibrations and proceed as before described (36,) except that we now shift the spring in the clamp instead of in the tweezers. If the number of vibrations is about right, we pin the spring to the collet (37, 38,) and try again, shifting the spring if necessary till the correct number is obtained, then pin it in the stud at the point grasped by the clamp, put the watch together, and a very little regulation will finish the job (53, 78.) In this way you will never have to change a spring once pinned in the watch, for it is obvious that it will perform almost exactly the same there as in our Holder, provided the regulator and stud occupied the same relative positions in each. In timing springs before breaking off the superfluous outer coils, the claws grasping the proper coil should be raised sufficiently for them to clear the other coils vibrating below. And, of course, the first trials should be made with a small vibration to avoid danger of loosening the spring in the wax.

(64.) *Rule for selecting a spring.* But if we should get say 250 vibrations with our first spring, when we required 300, instead of sticking other springs on and trying each one in the same way till we find one to suit, as is usually done, we test the strength of our first spring in a hair-spring gauge—Bottum's is too well known to need description—and examine the rest of our stock of springs in the gauge, without attaching them to the balance, and find what we want by means of the following Rule: *The forces of two different springs, attached to the same balance, will be in the same proportion to each other as the squares of the numbers of vibrations which each makes.* Supposing that the spring tried gave 250 vibrations, when we want 300, and in the gauge the strength is, say, 20. Then our problem may be stated thus: If a spring which gives 250 vibrations per minute gauges 20, what must a spring gauge that will give 300 vibrations?



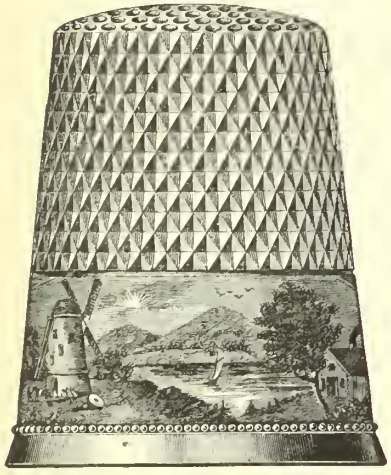
(65.) According to our rule, the square of 250 will be in the same proportion to the square of 300, (the desired number of vibrations,) as 20, the force of our present spring, is to the force of spring which will give 300 vibrations—which is what we want to find out. We will therefore represent that unknown force by the letter X, during this calculation, and having squared 250 and 300 (*i. e.*, multiplied each into itself), we write the proportion down as follows: 62,500 : 90,000 :: 20 : X. Now multiply the two end terms of the proportion together, and the two middle terms together, and the two products will be equal, according to the law of proportions. Multiplying, we get $62{,}500X = 1{,}800{,}000$, and by dividing we find that one X is equal to about 29, which is the gauge of a spring that will make 300 vibrations per minute; or, to express our method more methodically, $X = \frac{90000 \times 20}{62500} = 29$, nearly. As it takes but a moment to lay each spring on the balance-bridge, and seize it with the tweezers where it lies in the regulator, then test its strength in the gauge, we save all the trouble of attaching it to the balance, counting, etc. In fact, we can gauge a number of springs, while we would be testing one in the usual way. Of course, any other figures obtained by the workman in each particular case may be substituted for those given above.

(66.) Having found among our springs one which gauges 29, we have but little more to do, and that has been already described. With a fair stock of springs, it is quite practicable to fit one in and have the watch passably regulated in one hour. Even the Breguet spring can be fitted in half the usual time with this tool, and done better, with no risk of injuring it by numerous trial pinnings in the collet and stud, which is almost unavoidable while following the usual methods, as I shall show in my next article, which will be on the isochronism of the hair-spring.

(67.) Cases are occasionally found where the tool cannot be used exactly as described, and when it will be required to attach the holder clamp to the balance-bridge, place the upper pivot in its hole, and vibrate the balance by hand, counting, etc., as before. But these instances are exceedingly rare, for in most English lever and other under-sprung watches the spring can just as well be stuck to the *upper* pivot for trial, while the balance is placed in the watch for running as usual. And even after the spring is pinned in the collet, that can be stuck on the upper side of the balance with wax, concentric with the pivot, and tested as before described, the balance receiving its motion from the movement, the same as if the watch was finished and going.

(68.) *The regulator.* A few words about the regulator are necessary, since even its purpose does not seem to be always comprehended. If we could make the ideal perfect regulator, it would be in effect a movable stud, which would allow of being shifted in either direction as the exigencies of the timing should require, but would then become the *end* of the working portion of the spring, holding it as firmly as the real stud does, and cutting off the part behind it from any influence upon the time of the watch. But since this cannot be practically realized—at least, it has not been done, so far as I know—we should come as near to this ideal as we can, by placing the regulator pins as closely together as possible, without binding on the spring when the regulator is shifted. The most perfect results in time are obtained when the regulator stands pretty well back towards the "slow," *i. e.*, near the stud—and, in fitting in a spring, if it does not give the correct number of vibrations with the regulator standing between the middle of its scale and the stud, the spring should be drawn further through the stud to shorten it, rather than move the regulator further towards the "fast."

(69.) *Poising the balance.* After the watch is put in beat and is fitted for running, we must know if the balance is perfectly in poise, for if it is heavier on one side it can never give reliable time. The poise cannot be finally tested until now, with most watches, because they generally have an open cut, in one side of the collet, making it lighter on that side; and it would be useless to finish the poise till the position of that cut had been fixed, as any turning of the collet for the purpose of putting the watch in beat would bring the cut into a different position and throw the balance out of poise again. If the balance has movable screws in its rim, the perfecting of the poise may be done by drawing out one of these screws a little. If much correction is needed, two or more screws should be drawn, so that their position would be altered but little, and nearly alike. But this mode of correcting the poise is not allowable with a cut balance, which is



NO travelling salesmen. That is what "N. T. S." means, but it also means much more. It means that my system of selling goods without travelling salesmen is enabling retail jewelers who handle my goods to buy them cheaper than their opponents in business possibly can who buy from houses that sell their goods on the road. If I employed travelling salesmen, I would be obliged, in figuring the cost of each new article, to add a proportion of the $10 per day paid the traveller for salary and expenses. As it is, I propose to reach the Trade through my advertisements, and at an almost nominal cost. In buying my goods you do not have to pay any **TRAVELLING** expenses whatever. I pay no travelling railway fares, no hotel bills, no extra baggage, and no incidentals. I have everything marked away down at rock bottom prices, and am not afraid to place them before you, for I know they are always bottom for first-class goods. I do not propose to start you with baits. You can inspect my entire stock and purchase just what you want, when you want, and in quantities to suit your trade. I guarantee to sell any goods in my line cheaper than any other jobbing house in the Dominion of Canada. If you do not believe this, give me a call and a sample order and you will be convinced. If you can pay me a visit, it will pay you, as I have always a lot of good stock that I can sell at less than manufacturer's cost. If you can't come to the city yourself, send me a trial order and I will guarantee you entire satisfaction. ☞ Mail orders promptly attended to, but always remember that

S. FRENKEL, WHOLESALE JEWELER, 55 YONGE ST., TORONTO, keeps no travelling **SALESMEN.**

adjusted for heat and cold, but only for uncut or unadjusted balances, in cheap watches. A collet with a very wide cut should not be permitted with an adjusted compensation balance, but rejected and a new one made with the cut entirely closed. In such a balance there are generally four screws called "quarter-screws," which may be moved to perfect the poise,—one at each end of the center-bar, and another pair midway between them on the rim. But the latter pair should only be moved very slightly, as it is likely to disturb the compensation for heat and cold; while the former pair will affect only the rate, and even this may be avoided by moving both screws to poise the balance,—one of them in, and the opposite one out, which of course maintains the *mean* distance of the two from the center of the balance the same as it was before. See also (215.)

(70.) The rule is to take off the hair-spring and collet to poise the balance, which shows the astonishing stupidity of those who "make the rules" and of those workmen who blindly follow rules so palpably wrong. Notwithstanding that it is so taught in "the best shops in Europe," I advise the reader to use his own reason and common sense on this and all other matters, regardless of what "the best workmen, may have practiced from their boyhood. There is no lack of old fogies in our trade, as in all others, but we should not choose them for our teachers.

(71.) It is, of course, desirable that the balance should be in poise before the spring is put on, as that facilitates the final poising. Besides that, the parts then on the staff are considered fixed and permanent, but the collet and spring are movable; therefore the fixed parts, as a whole, should be poised, and then the movable parts prevented from destroying that poise. Inasmuch as our object is to have the balance in poise while running, it must be plain that the balance should be in poise with everything on it *exactly as it will be when running*. That is, the roller-table, the hair-spring and the collet, and all other parts should be on the staff; and if the collet or any other piece is not perfectly poised *in itself*, its final position must be determined before the poising is finished. In chronometers it is common to drill a hole in the roller-table, opposite the impulse jewel and notch, to make up for the metal there cut out and balance its weight; and a similar course would be desirable in fine lever watches. Chronometer collets and springs can be poised separately if desired. As already stated, the best remedy for an open circular collet is to make a closed one.

(72.) *Poising tools.* There are two kinds of poising tools, the notch and the straight edge. It is best to do the main portion of the poising upon the notch tool, using the straight-edge for the final tests only, as much time will be saved thereby. The poising tool consists simply of two jaws or pieces of hard metal, whose distance apart can be changed to suit the length of the piece being poised. By making suitable notches in a straight-edge tool, you have both kinds in one. The jaws may be of either brass or steel, with the edges perfectly straight, smooth, polished and thin, like two knife blades, parallel to each other and with the edges upward. At each end of the jaws may be made a pair of notches—one pair fine, the other larger. The notch should be about the depth and a little *wider* than any pivot that is to go in it, the bottom semi-circular in form, and the edges filed very thin so as to present almost a knife edge to the pivot, and must be kept clean and polished.

(73.) The staff should be so placed in the notches that they will not rub on the shoulders of the pivots. If a balance seems to be correct and does not turn of itself, whirl it with a bristle, and if it stops with all sides up, indifferently, it may be placed on the straight edges, which should be horizontal so that there will be no tendency for it to roll. It is not necessary to whirl the balance here, but simply place it with different sides up, and if it shows no disposition to change its position it is in poise, for there is no friction on the pivots to prevent it rolling over if there was the slightest tendency to do so. Whirling the balance will inevitably cause one or the other of the shoulders to bring up against the jaws, and necessitate another test. But a well fitted notch leaves little to be desired, or accomplished by the straight edges.

(74.) *Rules for poising.* In these tests the hair-spring should be unpinned from the stud, and there should be a preponderance of weight on the side where the outer end of the spring is, corresponding to the weight of so much of the spring as exceeds the number of coils—that is, to the weight of any fractional part of a coil there may be at the outer end, *whether it belongs before or behind the stud when pinned.* This may seem unreasonable at first thought, but experience shows that, if the spring is evenly coiled, an allowance for the weight of this fractional end will secure a correct poise when the spring is properly pinned in the stud, and this allowance is easily made either by the judgment of the experienced workman, or by hanging an equal length of the spring-wire on the opposite arm of the balance and at an equal distance from the center. This balancing weight should be very slightly too heavy rather than too light, if exactness is not attainable.

(75.) This rule applies only to the plain flat spiral springs, not to the Breguet or helical springs. Nor does it apply even to the plain spiral when it is unevenly coiled, or its outer end is so irregularly shaped that the workman cannot judge of the balancing weight or its proper position as there described. In all of the above cases, and also when the workman has no spring-wire suitable for the balancing weight, or has not experience enough to judge without balancing, the poise should be first tested without the spring and its collet, then with the collet on and the pin in its place in the collet—but without the spring. If any error is found, the correction should be made in the collet itself, not in the balance, till the collet can be turned in any position without disturbing the poise. This can be done before the spring is fitted, whenever it is seen that the rule given in section (74) is not applicable. The subsequent addition of the spring will not seriously disturb the poise. Of course, the flat spring can be poised as in (74) *before* its end is formed into its irregular shape. A helical spring can be poised according to that rule, after the lower terminal curve is formed and pinned in the collet, but *before* the upper curve is formed, *i. e.*, while the upper end retains its cylindrical shape. But after both terminal curves are formed, the balance cannot be correctly poised with the spring on. It is generally supposed that, if the terminal curves are properly formed, the center of gravity of the entire spring will be on the balance center when running. But this is a mistake which I shall show up hereafter; nor can a Breguet spring be poised after the terminal curve, or even the elbow, are formed, except so far as the experience and *judgment* of the workman may enable him to approximate to *probable* correctness.

(76.) *Testing the poise.* The poise may be tested after the watch is running, by timing it for 3 or 6 hours each in the four vertical positions, *viz.*, with figures XII and VI, III and IX alternately upwards, and if the times are the same in the different positions, the balance is supposed to be in poise. GUARANTEE NOTICE.

All Spoons and Forks bearing the stamp

G. RODGERS, A 1

are made of the finest nickel silver and are plated and hand-burnished under my personal supervision, and standard of quality—each article is guaranteed perfect in finish and durability.

All Knives bearing the stamp

G. RODGERS

12 DWT.

are plated on the best English cast steel with pure silver, and are hand-burnished and warranted to give perfect satisfaction. The well-known reputation of my goods has induced other makers to adopt a similar name, calculated to mislead the public. See that the trade mark reads and is spelled G. RODGERS, A1, on Spoons and Forks, or G. RODGERS, 12 Dwt., on Knives.

SOLD ONLY BY

THE ACME SILVER COMPANY,

TORONTO,

to whom all orders should be addressed.

G. RODGERS,

Known to the trade in Sheffield, England, and on this Continent since 1846.

No connection with Joseph Rodgers, Roger Bros., Wm. Rogers, or Rogers & Bro.

(85, 93). But in order that this test should be trustworthy it is necessary that the balance jewel-holes be well fitted to the pivots, the escapement in perfect order, and the lever poised, so that there may be equal friction in each position; and the watch must be wound up an equal distance for each test, so that the motive force may be the same in each position. Otherwise, errors due to unequal friction or action, imperfect fitting, or lack of isochronism in the spring, may be erroneously ascribed to want of poise in the balance.

(77.) *Timing the spring.* I will conclude with a description of my method of timing to seconds. As an error of one second in a minute will amount to 24 minutes in a day, it is important to be as exact as possible in our trials. In the usual method of fitting springs, where the balance is caused to vibrate only by the strength of the spring, counteracted by the staggering of the balance as it is supported by the stiffness of the spring itself as held in the tweezers, there is no possibility of any accuracy till the spring is actually pinned and tried in the watch. But with my tool we may observe correctly from the start.

(78.) Passing over those cases already mentioned (33, 36,) where no counting or timing is required, but only a comparison of the speed of two contiguous balances, we will suppose that a spring has been selected, etc., (22 to 36,) the balance placed ready for the start, (63,) the movement secured in a movement-holder, dial downwards, and we wish to count the vibrations for one minute. For this we need either a regulator or watch whose seconds-hand makes one revolution in exactly 60 seconds. If we have such a regulator, we take a small hand-mirror or piece of looking glass, place it beside the movement and at an angle that will reflect the regulator dial with its seconds-hand, so that we can keep the balance in our eye plainly enough to count its vibrations while we are watching the seconds-hand in the mirror. As the seconds-hand crosses the figure 60 on its dial we raise the bristle and commence counting the vibrations, (36), giving an occasional glance in the mirror, and by watching the seconds-hand as it approaches the end of the minute, we can very easily tell exactly when the time is up. If we have a watch that can be depended on as correct, we may place its seconds-dial as near our balance as possible and observe that, as before.

(79.) When we wish to test for a longer time than a minute, we dispense with the counting and go by the seconds-hand, comparing it either with a regulator or a watch, and at the exact instant the time of the trial closes, we give the plug (60) a twist and bring the bristle down upon the balance, after which we can examine the hands at our leisure. The method of comparing time closely, described by Mr. Fritz in the *Jewelers' Circular* for January, is an excellent one if the movement is already cased or boxed up, and I have followed it with great satisfaction. (See Appendix.)

TO BE CONTINUED.

GOLD FROM AUSTRALIA.—The production of gold in Victoria, Australia, in 1885, was 735,218 ounces, which was the smallest yield since 1852. The gold production of Victoria appears to be steadily declining, but hopes are expressed that the opening of new mines will add to the yield of alluvial gold this year. The quantity of quartz crushed in the last quarter of 1885, was 213,321 tons, and the average yield per ton was only 9 dwts., 14 grains, or, say, $9.50 per ton of 2240 pounds. Nevertheless, the amounts of dividends during the quarter were £144,297, or nearly 20 per cent. of the value of the output.

SELECTED MATTER.

A MISTAKEN MAN.

A jewelry maker, foolish man,
When he to look for trade began,
Did first declare
That he would ne'er
Expend a cent for advertising.

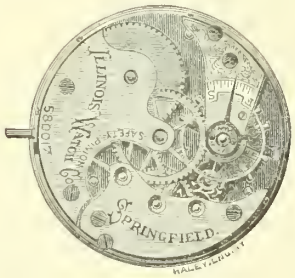
His stock he sold at bankrupt sale,
And he abides in a stone jail,
Without a friend to go his bail,
A fact that's not at all surprising.

And I expect that you'll agree
That such a man should not be free,
And I am right,
And you are right,
But he is wrong as wrong can be.

LEGEND OF THE STRASBURG CLOCK.

The famous Strasburg clock furnishes one of the most interesting of the Rhineland tales, and it is little known in connection with the wonderful clock. A celebrated mechanic once lived in Strasburg, whose only thought was a care for his motherless daughter, and to produce some lasting work of art. He brooded so much over his mechanical plans that he neglected the commonest civilities, and became known as a crank. This made his pretty daughter very unhappy, but she said nothing, in the hope that his mysterious plans would soon reach success.

A rich magistrate and a young mechanic were suitors for her hand, but she refused the dignity and power offered by the one for the humble station of the other, though her decision was kept from her father until he should complete his work. Meantime she induced him to accept her lover for a partner, and the young man soon began to manage the elder's affairs.



One day Guta, for that was her name, heard her father shouting joyously. She flew towards the mysterious chamber, followed by her lover. The great work was done! They were admitted to look at the ingenious clockwork, now moving lightly and easily on its springs. The aged man, his white locks in disorder, his face proud and full of dignity, held the weeping girl in his arms as he gazed with a joyous awe at his wonderful work.

The inventor's name was soon on every tongue, and his fame brought members of the guild from Basel, whose citizens offered to buy the clock. Strasburg then agreed to purchase it, and selected a side chapel in the cathedral for its reception. Basel's citizens, however, unwilling to be disappointed, urged that another such clock be made, and offered the inventor a considerable sum. Then there was excitement in Strasburg, as its glory would surely depart, were other towns, argued the citizens, to boast of an equal work of art. The master must never be permitted to construct a second clock was the unanimous opinion.

The offended magistrate, whose pride still suffered because of Guta's rejection of his hand, now saw the opportunity he had been waiting for. He caused the inventor to be brought before a tribunal to promise never to build a second clock. He proudly and firmly declined, saying: "God has given me

The ILLINOIS WATCH COMPANY are now delivering their new FOUR and SIX size movements.

The SMALLEST, PRETTIEST and BEST Ladies' Watch is the new FOUR size made by the ILLINOIS WATCH COMPANY.

THE

ILLINOIS WATCH COMPANY

Everyone who tries the present product of the ILLINOIS WATCH COMPANY orders again.

talents. I have now done enough for my town and its glory. I see no crime in benefitting others by my art." The counsellors cast down their eyes before his noble look, but they nevertheless decided to blind him, as that was the only way to prevent him from constructing a second clock. The accused heard the sentence with a contemptuous look, but he finally asked that he might undergo the punishment before his work, as he wished to give it some final improvements The request was granted.

Long and tenderly the inventor gazed at his clock, when the revengeful magistrate urged that the execution of the sentence be hurried. At this, nerved by the taunt, the old man quietly removed the principal springs that caused the motion of the clock, and surrendered himself for the torture. The clock suddenly began to whirr. The weights fell rapidly to the ground. The bell struck inharmoniously thirteen times and breathed out its final sound like a wail of despair. The inventor, now blind, stood erect like a demon of revenge, and cried: "Rejoice, proud citizens, in my work; the clock is destroyed and my revenge complete."

During the moment of consternation and horror that followed, the young artesan led the old man into the arms of his unhappy daughter. The magistrate who had incited the dreadful crime became an object of contempt, and died cursed by the people. Guta and her lover confessed their attachment, and were united, with the unfortunate inventor's blessing. The clock was finally restored in 1842, and the glory of the restorer quite equals that of the constructor.—*London Jeweller and Metalworker.*

M. BOURGUIGNON'S CRAFTY CUSTOMERS.

Among the most noted of the Parisian jewelers of the past generation, whose labors served to bring the art of imitating diamonds to the perfection of to-day, was Bourguignon. One morning a lady entered his shop, looking rather flushed and excited. Drawing from her muff a number of morocco cases of many shapes and sizes, she opened them one after another and spread their contents out on the counter.

"I wish to know the price of a *parure* to be made in exact imitation of this," she said: that is to say if you *can* imitate the workmanship with sufficient precision for the difference never to be observed."

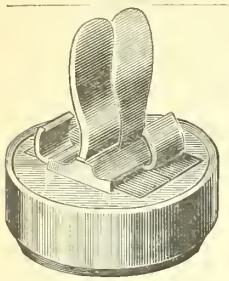
Bourguignon examined the articles attentively, named his price, and gave the most unequivocal promise that he would make a *parure* which should be an exact counterpart of the one before him. The lady insisted again. She was urgent—as is often the case with the fair sex. Was he sure the imitation would be perfect? Had he observed the beauty and purity of the diamonds? Could he imitate their peculiar cut, &c.? "*Soyez tranquille, madame,*" replied Bourguignon: "the same workman shall have the job, and you may rely on an exact counterpart of his former work."

The lady opened her eyes in astonishment and horror, but M. Bourguignon added coolly:

"I will attend to the matter myself, as I did when I received the commands of the gentleman who ordered this very *parure*, last February, I think"; and with the greatest unconcern he proceeded to search his ledger to ascertain which of his workmen had made it.

Not only was domestic deception carried on by means of Bourguignon's artistic skill, but diplomatic craft likewise often sought his aid. Numberless are the snuff-boxes, "adorned with valuable diamonds," which were secretly issued from his workshop and publicly presented as rewards for state services; innumerable the portraits, "set in brilliants," which have been mounted there to gladden the hearts of chargés d'affaires, attachés and vice-consuls.

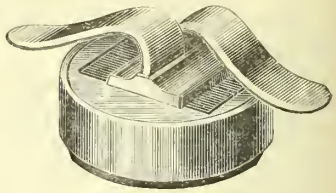
The great Mehemet Ali, like all great men who, when they commit little actions, always do so on a great scale, may be said to be the first who introduced the bright delusions of M. Bourguignon to the innocent acquaintance of the children of that prophet, "who suffered no deceiver to live."



The wily old Mussulman, who knew the world too well not to be conscious of the value of an appearance of profusion on certain occasions, had announced that every pasha who came to the seat of government, to swear allegiance to his rule, would return to his province laden with presents of jewels for his wives. It may readily be imagined that, under such conditions the duty became a pleasure, and that there was need of no second bidding.

Meanwhile, Mehemet had dispatched an order to his envoy, then sojourning in Paris, to send him forthwith as many of the deceptions of the "lying Franks," in the way of imitation diamonds, as he could collect. Bourguignon undertook to fill the order, the result of which, no doubt, caused many a "mashallah!" of delight to fall from the lips of the harem beauties of Egypt, and many an "Allah Hu!" from those of their husbands at sight of so much generosity.—*Exchange.*

SWORDS USED BY EXECUTIONERS.



Visitors to the Markisches Museum, in Berlin, are always attracted by a curious collection of executioners' swords. In old times it was customary for these instruments of punishment to bear inscriptions, and most of the swords in the museum are inscribed. The oldest is 94 centimeters (37 inches) long and 6 centimeters (2 2/5 inches) wide, and it bears the inscription: "If thou act in the service of virtue this sword shall not strike thee." The date is 1324. A second sword, rather smaller, is inscribed: "Soli deo gloria." A sword ornamented with arabesques bears on each side the nscription: "Vive la justice. 1721. G. Z." Another sword is inscribed: "Fide sed cui vide soli deo gloria." Upon one side of an ancient sword appears the inscription: "When I raise the sword I wish the poor sinner eternal life," while upon the other runs the injunction: "Keep from evil doing if thou wouldst escape this judge." The museum preserved the sword which is believed to have put an end to the life of the unfortunate friend of Frederick the Great, Von Kalte. On both sides runs the inscription: "When I raise my sword on high may God give the poor sinner eternal life." Another interesting blade is inscribed: "This sword is whetted, and I am deputed by God and the authorities to punish wicked people."

ST. LOUIS heard of the death of Christopher Columbus the other day, and unveiled a statue of the great discoverer with appropriate ceremonies. The statue represents Columbus at the moment when, the evening of October 11, 1492, he imagined he saw a light to the westward, and is looking forward with an expression half anxious, half triumphant to this beacon of an unknown world.

WATCHMAKERS' SPECIALTIES

We will continue for November,

OUR SPECIAL $55.25 OCTOBER OFFER.

We are now stamping our Chucks "Moseley," on the face. Take your choice; the genuine or imitation.

AMERICAN LATHES

Are now absolutely necessary to secure a situation in any shop in the United States. The best shops in Canada also insist on their workmen being supplied with a good American Lathe. Fit yourself to hold the best situation in a first-class shop by buying a Moseley, the *best*, therefore the *cheapest*.

READ OUR BIG OCTOBER OFFER: To enable every Watchmaker, Improver and Apprentice to advance his position, we offer for this month a Moseley—with head and tail stocks, 1 No. 6 Wire Chuck, 1 No. 8 Wire Chuck, 1 No. 10 Wire Chuck, 1 No. 24 Wire Chuck, 1 No. 48 Wire Chuck, 1 No. 2 Wheel Chuck, 1 No. 4 Wheel Chuck, 1 Screw Chuck, 1 Taper Chuck, 6 Cement Brasses, 6 Steel Tapers, 1 Boxwood Polishing Lap, 1 Emery Lap for grinding Dials, Drills, Cutters, etc., Chuck Block and Belting, complete as above, for $55.25.

Avail yourself of this unparalleled offer. Every Moseley Lathe guaranteed absolutely perfect in every particular. Full illustrated Catalogue on application.

E. BEETON, Canadian Agent, P.O. Box 193, TORONTO.

EDITORIAL NOTES.

SPECIAL NOTICE.

Jewelers throughout Canada will oblige the Editor by sending into this office for insertion in these notes any items of news pertaining to the Jewelry business that they think would be of interest to the Trade generally.

CUSTOMS SEIZURE.—An American jewelry traveller, named H. Goldberg, of Boston, had his stock seized last month by the Customs authorities at Montreal for undervaluation.

FIRE.—We are sorry to learn that our old friend Mr. Robert Wood, jeweler of Port Arthur, had his store destroyed by fire about a fortnight ago. We trust he was amply insured against loss.

SIMON SCHRECK, jeweler, of St. Thomas, has sold out his business to H. C. Flack, jeweler, of the same town. We understand that Mr. Schreck proposes to go into the hotel business.

STOLEN.—We direct the attention of our readers to the list of watches stolen from Mr. C. Hollingshead, jeweler, of Woodbridge, Ont., which will be found in our Help Column.

DISSOLVED.—The well known jewelry firm of G. W. A. Lange & Son, of Victoria, B. C., has been dissolved. The business will in future be carried on by G. W. A. Lange under his own name.

JAMES BOWLES, a clerk in the employ of Messrs. Lazerus & Co., of Montreal, Que., who absconded a few weeks ago with some twenty valuable watches belonging to the firm, has been arrested at Albany, N.Y. He will probably be extradited.

OF COURSE.—William Holmgravs, bookkeeper and cashier for Shourds, Storey & Kasper, jewelers, Chicago, Ill., U.S., has been missing for some days. It is reported to-day that his accounts are $10,000 short. It is believed he is in Canada.

IMPROVEMENT.—Messrs. Kent Bros., retail jewelers, of Toronto, have just put an elegant new plate glass window in their store, bringing it forward to the level of the street line. It is a big improvement and when filled with jewelry will make a very attractive appearance.

PERFECTION.—The demand for the "Perfection" has increased so much of late that the American Watch Case Company, of Toronto have decided to devote more attention to them than formerly. The general verdict seems to be that they are "the most case for the money ever offered to the trade."

COUNTERFEITING.—G. Carry, a jeweler of St. Thomas, Ont., was arrested last month for manufacturing counterfeit coin. The moulds and other appliances and some coin were found on his premises concealed in an old stove. He has been committed to stand his trial at the next Assizes.

THEY WANT HIM.—The Customs detective officers are looking for James Burley, a newly-arrived English jeweler, whom they suspect of smuggling a lot of unset stones into the country. If this should meet James' eye we trust he will step down to the Custom House and shell out his boodle.

A BIG DEAL.—Messrs. Schwob Bros., of Montreal, have disposed of the old business of A. S. Murray & Co., of London, Ont., to Mr. G. R. Thompson, of Winnipeg. Mr. Thompson is a young man with a thorough knowledge of the jewelry business and money and grit enough to make anything he tackles a success. We wish him a prosperous future.

A BOLD THIEF.—A young man went into Morphy's jewelry store on Yonge Street one day last week and asked to see some gold watches. He was accommodated, but no sooner had he got one in his hand than he bolted for the door and disappeared like a flash. The detectives are looking for him.

AN OLD FRIEND ?—Charles Conklin, well known by more than one jeweler in Canada as one of the most daring burglars that ever operated in this country, has effected his escape from the jail at Grand Rapids, Michigan, U. S. As it is possible that he will make a break for this side, Canadian jewelers would do well to keep their weather eye open for him.

OUR CARD BASKET.—During the past month *The Trader* was visited by several members of the craft outside the city, amongst whom were Mr. McCullough of the firm of Davis & McCullough, the well-known jewelers of Hamilton, and T. Gillean, of London, Ont. Both these gentlemen report trade as being above the average in their respective localities and look for a continuance of the present "good times."

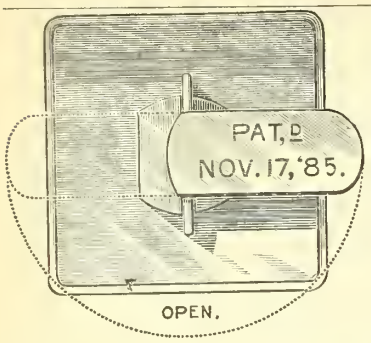
SKIPPED.—Mr. M. C. Wright, manager of the Toronto branch of the Homes Electric Protective Co., skipped out last week. It is said that he was heavily involved financially and had forged the Company's paper to the extent of some $200.00. His defalcation does not affect the Company in any way, as it is one of the wealthiest concerns in America.

THE ILLUSTRATED CATALOGUE, just issued by Messrs. Kent Bros., of this city, to their customers in the country, is one of the best printed and most complete thing of the kind we have ever seen, and reflects the highest credit on Mr. W. F. Ross, the compiler. This enterprising firm are pushing things and ought to find a large addition to their trade through this new venture.

E. F. BLACK, formerly jeweler of Wingham, Ont., was in the city on business a few days ago. He sold out his jewelry business last spring on account of his health, and has since been engaged in cattle ranching out in Montana, U. S. He looks strong, robust and tanned, and thinks after a year or two he will come back to Canada and go into business again.

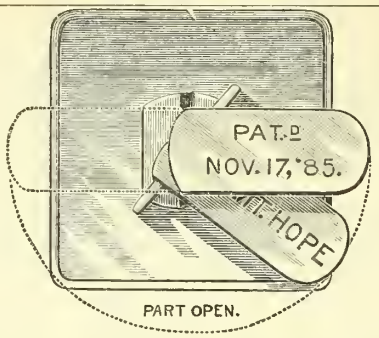
MR. GEORGE BACON, of the firm of Bates & Bacon, one of the most whole-souled and genial New Yorkers that ever sold rolled plate goods, dropped in to see us last month. He looks as cheerful as ever, and reports business fairly booming over on the other side this fall. He was much astonished at the rapid strides Toronto had made as a manufacturing and wholesale centre since his last visit ten years ago.

SAM JONES, THE REVIVALIST, is particlarly hard on those merchants who are carrying on business in their wife's name. He says they are ignorant of one of the fundamental principles of Christianity, and we think he is about right. This plain kind of talk has raised a small storm about his ears, but he must have struck some one pretty hard, else they would have kept quiet. Hogs don't usually squeal until they are hurt.



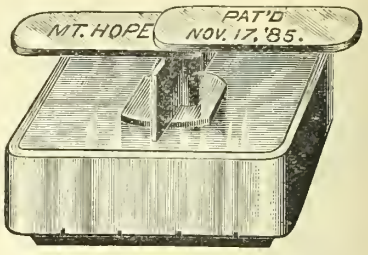
THE TRADE BOOM.—Without doubt, a trade boom has struck Canada, and we trust has come to stay. The reports from ten of the leading jobbers in Canada in answer to our enquiry regarding trade, were unanimous that it was ahead of anything for the past five years. As jewelry is a luxury, this business may be safely regarded as the barometer of trade, and it is therefore evident that there must be a general advance all along the line to make it so much better than usual.

OUR HELP COLUMN.—Will our readers please bear in mind that to ensure insertion in this column, advertisements should reach us not later, if possible, than the 20th of the preceding month. We are often in receipt of advertisements for the Help Column on the day on which our journal is issued, accompanied with a request that it be inserted in that month's issue. Compliance with the above request will save us holding late advertisements over for another month.



THEY HAD THEIR EYE ON HIM.—Referring to the most solemn of all Hebrew days, Yom Kippur, the great fast day of atonement, *The Hebrew Standard* very pithily remarks: "That those who beat their breasts on Yom Kippur often beat their creditors during the other days of the year." The editor of *The Standard* must have had the Toronto quartette, Messrs. Urwitz, Herwich, Bush and Stern, in his mind's eye when he penned this truism.

BANQUETTED.—Morrice Schwob Esq., senior partner of the well-known watch importing firm of Schwob Bros., of Montreal, was last month tendered a complimentary banquet by a number of Montreal's most prominent citizens on the occasion of his appointment to the Vice-Consulship of France for that city. Mr. Schwob is a gentleman of sterling character, highly respected by every one who knows him, and in our opinion "la belle France" could not have a worthier representative.



AN ELEGANT CATALOGUE.—The illustrated catalogue of Ansonia Clocks just issued by The Goldsmiths' Company is one of the most complete things of the kind ever presented to the Canadian jewelry trade. It shows in colors all the newest and most saleable goods made by this popular factory, and must prove a great help to any merchant ordering goods by letter. The Goldsmiths' Company are sending them free to the entire trade, and any jeweler who fails to get one, can have a copy by dropping a post card to the firm at 48 Yonge Street.

29 ADELAIDE STREET EAST, - - TORONTO.

A HANDSOME CARD.—Messrs. P. W. Ellis & Co. have just sent out to the trade a very handsome lithographed card, issued by the "Dueber Watch Case Mfg. Co.," which is unique in its way. The lithographic color work is splendidly executed, especially the two female ladies in the foreground. If we might be allowed to criticize, we would say that the young lady in gray has rather a far away look in her eyes and seems to be taking more stock in the handsome young salesman than the case he is attempting to sell to her companion.

THE URWITZ CASE.—Up to the time of going to press there are no new developments in this case worth mentioning. Messrs. P. W. Ellis and Max Saunders have been appointed trustees to the estate,and they have determined to leave no stone unturned in bringing Urwitz to justice. The creditors have very properly refused all offers of a compromise and insist on 100 cents on the dollar or nothing. They have employed first-class Canadian and American detectives on the job and some interesting developments may be expected ere long.

A SINGULAR ACCIDENT.—An engraver named Frank Biddis, employed by the American Watch Case Company, of Toronto, met with a very singular and painful accident on the 22nd of last month. It appears that Biddis is a very skillful base-ball pitcher, and while practicing at noon hour on the day named, and delivering the ball, the bone of the arm was broken in two places above the elbow, by the force of the effort. He was taken to the hospital where the breaks were attended to, but the doctors say that it will be about two months before he can resume work.

ASSAULT.—One of the outcomes of the Chas. Stern failure has been the assault by Mr. Stern and two of his employees upon Mr. W. F. McLean, the proprietor of the Toronto *World*. The *World* in noticing this failure, took occasion to pass some very severe strictures upon a certain class of traders and plainly accused Stern of dishonesty in the matter. This, Stern and his employees resented by publicly assaulting Mr. McLean on King Street. That gentleman has sworn out warrants for their arrest for this assault, and the matter will probably be ventilated in the Police Court.

A BOSS CASE.—The definition of a "Boss" case is somewhat similar to the definition of a Mascot. A Mascot is a—Mascot, and a Boss case is a—Boss case, and that's all there is about it. When a filled case, on account of real merit, gets a reputation such as the "Boss" enjoys at present, it is the best possible evidence that there are enough level-headed jewelers left in the world to know a good thing when they see it and to buy it in preference to cheap, snide goods, which in the long run are bound to bring disgrace upon the seller and annoyance to the wearer. Honesty is not only the best policeman, but it is the best ingredient we know of in building up a business.

IN DIFFICULTIES.—Mr. Charles Stern, of Toronto, wholesale dealer in jewelry and fancy goods is in financial difficulties. It is said by those who ought to know, that his assets and liabilities are about equal. If so he may get a compromise of some kind and go on again. Mr. Stern is a hard worker, but of late his business seems to have been eating its head off. This is one side. On the other hand it is said that the whole thing is a swindle of the most glaring kind and that Stern should be put through as far as the law will allow. At this time of writing it is impossible to state which statement is correct and nothing can be definitely said about it until an official statement is published. Mr. John Donaldson, of this city, has been appointed assignee, and is busy preparing a statement of Mr. Stern's affairs. We shall have more to say about this case when the complete statement of the business is made public.

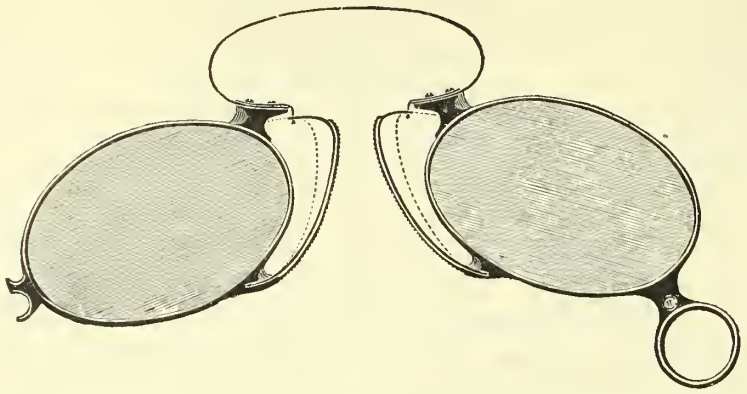
LOOK OUT.—It is quite evident that there are at least two or three gangs of burglars from the States operating in Canada at the present time. We would, therefore, caution our readers, especially those in outlying places without adequate police protection, to look out for a visit from these gentry, and to take every precaution that they can to prevent them getting hold of their valuables. If there are any who have not joined the Jewelers' Security Alliance they should do so at once by addressing either John Segsworth, the President, or James Ryrie, the Secretary. Although the Alliance does not guarantee to keep out burglars, if you do get burglarized it bears the entire expense of a first-class detective to ferret out the case and recover the goods if at all possible. If you have not a first-class safe, drop a line to J. & J. Taylor & Co., of this city, for particulars of their new cheap burglar-proof safe, and buy one if you can afford it. In any case you will do well to carry out the suggestions we made regarding protection against burglars in our last issue.

LOOK OUT FOR HIM.—A well-dressed young man who gave out that he was from Illinois and was studying medicine in Toronto, visited the store of Mr. William Ashall, jeweler, Yonge Street, on 5th October and asked to see some watches. He selected a $90 gold watch and offered in payment a cheque for $100 signed by Sherman A. Thomson, jr., on the Aurora National Bank of Illinois, payable to John W. Taylor, or bearer. The young man represented that he was Taylor, and received the watch and $10 cash in change. Mr. Ashall banked the cheque, and on Monday last was notified that Sherman A. Thomson was not known to the bank. Taylor was traced to a boarding house on Gerrard street east, where he arrived about the beginning of the month, but left again on the 6th. He gave out there that he came from Hartford, Conn. The case has been put into the hands of the detectives, but so far without result. The trade will do well to look out for strangers who want to pay for goods with checks. Since writing the above, we learn that J.W. Taylor has been captured at Goderich, Ont., with the watch in his possession. He has been brought back to Toronto, and will no doubt be committed to stand his trial at the next Assizes.

A LEVEL-HEADED JEWELER.—While visiting H. Benham & Co's store the other day we had an opportunity of examining the Stern System of Electric Protection from burglars now being operated there. The walls and ceiling of their capacious vault were being lined with large sheets of millboard covered all over by narrow strips of tin foil with a fine wire running through the centre of each strip. A substantial wooden flooring had been put in as also a handsome chestnut door frame and door, both of which were intersected by wires apparently in the greatest confusion—all these wires being so arranged that in the event of a break occurring, or their being tampered with in any way, an alarm is immediately sounded in the central office, whence armed messengers are immediately sent to investigate the premises. Every point in the store where a self respecting burglar would attempt to gain an entrance was also efficiently guarded by wire—in fact, should it ever happen that we have to take to the burglary line, we shall make it our especial care to steer clear of H. B. & Co.'s store and pray Heaven to protect us from Stern's Electric Protection. Mr. Stern, the inventor, informs us that his company has adopted Pinkerton's famous motto: "We never sleep."

AMONGST THE WATCH COMPANIES.—We clip the following from our newsy contemporary the New York *Jeweler's Weekly* regarding the doings of the large watch companies:

THE AMERICAN WALTHAM WATCH COMPANY have just received official advices by cable that they have received the highest award, a gold medal, at the exhibition at Liverpool for superiority in quality and elegance of finish of pocket timekeepers.



THE ELGIN NATIONAL WATCH COMPANY, on the 11th inst., issued notice to the trade of the discontinuance of the well-known H. H. Taylor grade in key-winder. The price of the movement has been greatly reduced to facilitate the closing out of stock on hand.

THE ILLINOIS WATCH COMPANY have added a new 18-size full-plate movement to their list, to be known as the No. 60. It has four pairs jewels, in settings, and patent regulator, and being an exceedingly well-finished movement for a moderate price, is sure to meet with a large sale.

THE HAMPDEN WATCH COMPANY has just about finished their new factory and expect to employ about 1200 hands in all, when they get in full running order. The new addition they expect will more than double their capacity. They also intend to manufacture Ladies' Size movements in the "sweet pretty soon."

A BIG FAILURE.—The trade in Toronto were considerably startled to learn of the assignment of Messrs. Rothschild & Co., wholesale jewelers of this city and the disappearance of the members of the firm. The firm consisted of M. Hervich and L. Bush, and from what we can gather it appears that they made an assignment to Sheriff Jarvis on the 23rd October and left the city the same evening. Very little is known of the actual state of their affairs, but report has it that English and German houses will suffer severely by their failure. It is said that they have been buying heavily this season and that the bulk of these new goods are "hypothicated," with brokers in this city whose percentages are enough to bankrupt any honest dealer. Very few in the wholesale trade will be sorry to see this firm broken up, as they were

The Montreal Optical and Jewellery Company, L'd.

$300. REWARD! $300.

Canadian Association of Jobbers

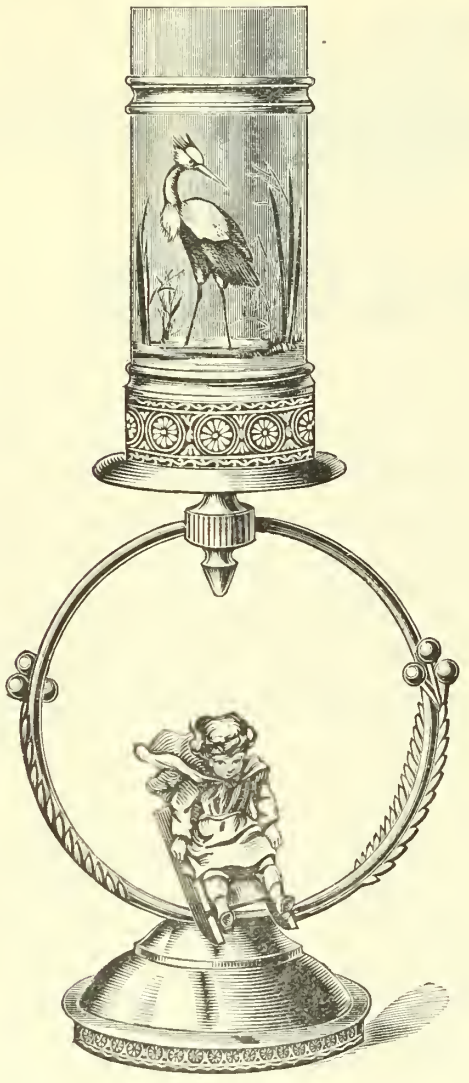
—IN—

AMERICAN WATCHES.

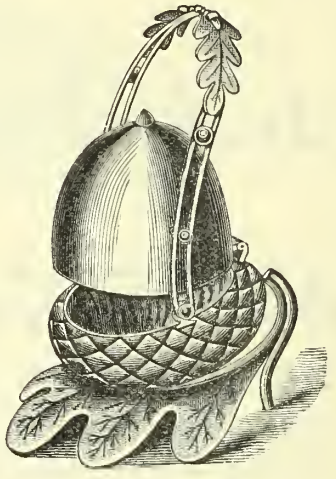
Owing to numerous statements by Retailers that they have bought American Movements and Silver Cases from Members of this Association, at less than Association Prices, the above reward of $300 is hereby offered for information that will convict any Member of this Association of giving, directly or indirectly, any better terms, prices or discounts on these goods, than the regular rates established by the Association, or any infringement of the following By-Law :

BY-LAW 9.

SEC. 1.—The Members of this Association are understood to agree to sell American Watch Movements at the list price for Canada as decided on by the Watch Movement Companies, and to sell Silver Watch Cases at prices agreed on by the Silver Watch Case Manufacturers' Association. The only discounts to be allowed are five per cent. for cash in thirty days, or six per cent. for cash in ten days, or three per cent. for cash sixty days, or net four months from date of invoice.



SEC. 3.—It is further understood that the Members of this Association will not deliver Silver Cases or American Movements upon consignment, nor date bills ahead, nor give presents to any firm, or employee of any firm, in lieu of special terms of discount, nor in any other manner violate the true intent of the Constitution and By-Laws, nor in any way defeat the expressed objects of this Association.



It is quite as much for the interest of the Retail trade as for the Jobber that the Contract Prices of Silver and Filled Cases and American Movements should be strictly maintained, so that one dealer shall not have an unfair advantage over another, and we hope every retailer will feel bound to maintain the integrity of the business and uniformity of prices, by aiding the Executive Committee in discovering any violation of agreement on the part of Members.

not looked upon by other jobbers as doing a strictly legitimate business. It is only a few months ago since they were expelled from the Jobber's Association for violating their contract, and their reputation, never very sweet, has been none the more savory since then. The presence of such firms is a source of danger to any trade and the more of them that "git up and git" the better for honest legitimate dealers.

WHO KILLED THE MOOSE?—A very prominent Toronto retail jeweler went out on a moose-hunting expedition last month, and not only succeeded in killing game but came near being killed himself. It appears that when he shot his first moose, a big bull weighing about a ton, the infuriated brute charged him with head down and tail over the dash-board. Our hero thinking that discretion was the better part of valor, and remembering that "he who shoots and runs away, may live to shoot another day, but he who by a moose is slain, will never hunt the moose again," climbed up a small tree as fast as his strength could get him there. In his hurry he lost his repeater and revolver, and retained nothing but his *skeandhu*, which as the moose declined to come to close quarters by climbing the tree, was of no earthly use to him. The old bull finding that the hunter was beyond his reach, resolved to starve him out and patiently stood on guard at the foot of the tree. Our hero, getting nervous, "halloed" for all he was worth; the only reply he got was the echo of his own voice. After a sojourn of several hours in his cold and cramped retreat, during which he had ample time to reflect on the misdoings of the past and resolve to lead a better life in the future, our hero had almost made up his mind to jump down and tackle the brute with his knife only, when his ears were saluted with the glad yelp of the hounds who were evidently not far away. The old monarch of the forest turned on his new assailants as soon as they appeared on the scene, and succeeded in holding them at bay until a well-directed shot from the old guide laid him low. Our friend says he don't want any more adventures such as that was, and has got the head of the old bull stuffed and hung in his hall as a trophy of his prowess. His friends are still in the habit of asking him every time they see him, who killed the moose?

LITERARY NOTES.

THE NOVEMBER *Century* is of more than ordinary interest, inasmuch as with it commences the only authentic history of the life of Abraham Lincoln that has ever been published. To every thinking man, the figure of Lincoln is one of the grandest in the world's history, and his fame always more than national, must continue to grow as years roll on. The authors, Messrs. Nicolay and Hay, both private Secretaries of the great President during his entire term of office, are peculiarly fitted both by opportunity and attainments to perform such a task, and from the opening chapters we should say that from a literary standpoint alone, the subject will be handled in such a masterly manner as to place it amongst the foremost biographical works of the age.

The illustrated paper by Dr. Charles Waldstien on "The Temple of the Ephesian Artemis, and the Ancient Silver Patera from Bernay," in which he argues that the silver plate of Bernay is the identical work of the ancient Ephesian Silversmiths mentioned in the Acts of the Apostles, should make this article interesting reading to every member of the craft in the present day.

The war papers treat of the battle of Chancelorville, which is described by Generals Hunt, Longstreet, Doubleday, Law and Alexander. As usual these war papers possess a fascination few can resist, and one can hardly lay the magazine down until the article is entirely finished. They are as usual profusely illustrated by maps and drawings from war time photographs which add materially to their interest.

In the literary articles, Mr. Howell's continuation of the "Ministers Charge" is as absorbing as ever, while in "The Fate of a Voice" and "The Hundredth Man," Mrs. Mary H. Foote and Frank R. Stockton, show themselves both entertaining and instructive. The Topics of the Times, Open Letters, and Bric-a-brac articles are as usual first-class and fully up to the usual standard.

The principal illustrations relate to the Life of Lincoln. A splendid picture of the great President as he appeared in 1860 forms a very appropriate frontispiece to this number, while a portrait of Boone from Sully's painting from life, and numerous other sketches give us a good idea of the early family life of the Lincoln family.

ST. NICHOLAS.—With the November issue *St. Nicholas* commences a new year, and one of great promise to its readers. Louisa M. Alcott contributes a very entertaining story, "The Blind Lark," while Brander Matthews has made an admirable collection of Victor Hugo's stories to young people which have all the quaintness and charm of the great French novelist. "Richard Carr's Baby" is the odd title of a most spirited description of an inter-collegiate football match, which cannot fail to entertain the boys. The opening chapters of the new Serial Juan and Juanita, by Francais C. Baylor gives promise of a treat for the little folk through the winter. The illustrations are as usual admirable, and the number one of the best the St. Nicholas has yet sent out.

WORKSHOP NOTES.

TO RECOVER THE GOLD.—In order to recover the gold from contact gilding baths, add hydrochloric acid to the gold solution, evaporate the whole to dryness, treat the residue with nitro-muriatic acid and precipitate the gold with sulphate of iron from the obtained solution. The precipitate, consisting of fine gold powder, is washed and then dried.

GOLD FROM OLD CRUCIBLES.—Some of our correspondents may have old crucibles on hand, and to such we would say, pound the crucibles to a fine powder in an iron mortar, then wash the sand away by taking a little of the powder at a time in the saucer, and dipping the saucer in and out of a pail or vessel of water. The sand will wash away, leaving the gold in the bottom of the saucer.

WHITENING SILVER CASES, ETC.—Pickle for whitening silver watch cases, silver filigree, etc., after soldering is made as follows: One ounce nitric acid, two ounces sulphuric acid, eight ounces rain water. If the article can be boiled in the pickle it is all the better, and is the only way to clean filigree work. Watch cases, spoons, etc., can be heated until quite warm and then immersed in the pickle.

TO CLEAN PINCHBECK TRINKETS.—To clean pinchbeck watch chains, brass plates, dust caps, wheels or other brass parts of a clock or regulator, Mr. Morgossy recommends the use of about one-half deciliter of acetic acid, or strong wine vinegar, mixed with a spoonful of salt, put into a plate or other flat vessel. Immerse the article, let it remain in it for about five minutes, if a chain, long enough to soften the dirt; then take it out and rub it between the hands; keep doing this until thoroughly clean, and it will become bright as when new; then rinse in cold water, and dry with a cloth or in sawdust. Dirty wheels or other watch parts can simply be dampened with the mixture and brushed with chalk.

TO REDUCE COIN GOLD TO A LOWER KARAT.—A correspondent asks how to figure in order to reduce coin gold to a lower karat. We presume he means United States coin, which is 21 3/5 karats fine. Multiply these figures by the number of ounces or pennyweights in the coin used, divide by the karat you wish to reduce to, and the difference between the result and the number of ounces or pennyweights of copper to be mixed with your gold. For example, given 100 ounces of coin to reduce to 10 karats fine: Multiply 100 by 21 3/5 and the result is 2,160. This divided by 10, the karat desired, equals 216, which, minus 100, gives 116 ounces of copper or other alloy to be mixed with the 100 ounces of coin.

TO PUT IN A MAINSPRING.—If there is no spring winder on hand the repairer will have to put in the spring, after it has been hardened and oiled, with his fingers. Holding the barrel with one hand, put the outer coil into it and see that the end is properly hooked and fastened in place, then hold it so with one thumb, while with the other thumb you work in the next half coil; then hold it there, and with the opposite thumb work in another half coil and so on, the opposite thumb working in a half coil at a time till all is in. This is a good way with thin and narrow springs; but when they are wide or very thick or soft, it is liable to twist the spring out of flat, and make the centre stand up. When the spring is in, always be sure that the centre lies flat in the barrel, that the point does not dig into either head, but stands free between them when on the arbor hook, and see that the hook is sound, well-shaped and fits the hole properly; for if the spring slips off when you wind it, it will probably snap and break. In handling the barrel, it is, of course, to be held with clean tissue paper to keep the skin from soiling it.

WISE AND OTHERWISE.

A BAD marriage is like an electric machine—it makes you dance, but you can't let go.

IT was a large manufacturer of New Jersey who said to his guests: "Ladies and gentlemen, after the grapes ye shall have beefsteak and masharoons, and then venison' straight from France.

"WHAT's your occupation, bub?" asked a visitor at the Capitol of a bright boy whom he met in the corridor. The boy happened to be a page in the House. "I'm running for Congress, sir," he replied.

"DOES your sister Annie ever say anything about me, sissy?" asked an anxious lover of a little girl. "Yes" was the reply; "she said if you had rockers on your shoes they'd make a nice cradle for my doll."

"I'M ashamed of the age in which we live," said a maiden of thirty-eight. "You may be ashamed of yours, but I'm not of mine," replied a nineteen year old companion. And it wasn't much of a nose that went up, either.

"MISS BROWN," asked a little girl of her governess," what was papa doing the other evening when he held your hand so long?" "Oh, that was palmistry, my dear." "Does mamma know about it?" "No. Pa mystery again, darling." "And suppose she had caught you?" "I'd palmysterics off on her, precious."

HE: "You don't play or sing, I'm surprised. Now I come to think of it, somebody told me painting was your *forte*; painting is the most fascinating, most———" She: "No I don't paint." He: "How foolish of me; of course it was writing; writing is the most———" She: "No! No! No! I'm like the young men of the present day. I simply sit down and try to look intelligent."

OTHER NOTES.

THE trip around the world can now be made in exactly sixty-nine days. Jules Verne's fancy was altogether too slow.

"WHAT's the matter, Uncle Erastus?" he asked facetiously, as the old man came limping in. "Got the gout?" "No, sah, I'se got de bill fo' dat whitewashin' what I did fo' yer las' yeah." The fellow that got this fired at him is the kind of Christian Sam Jones likes to shake up.

SEVEN thousand dollars in silver, the proceeds of a fair, were being taken to the bank at Mount Pulaski, Ill., recently, when the horses ran away, the waggon was overturned, and the money scattered in the street. Citizens gathered it up, and when counted at the bank there was but 60 cents missing.

THE FIRST GOLD FROM CALIFORNIA.—In the Smithsonian Institution at Washington is the small nugget of gold, a little larger than a pea, that first met the eye of James Marshall in the sawmill raceway at Sacramento, and was the beginning of those discoveries in California that have added nearly $1,500,000,000 in gold to the world's stock of the precious metals.

OUR HELP COLUMN.

THE TRADER aims to be of practical value to the Retail Jewelry Trade.

NO CHARGE is therefore made for advertising in this column, but the subject-matter should not exceed five type lines, or about 60 words.

When requested, these advertisements will be published in successive numbers of the paper.

If you have a Store, Stock, or any Special Article to sell; if you wish to buy an Established Business, or enter into Partnership; if you want a Journeyman, Clerk, Salesman, or Foreman; if you want a situation yourself—communicate the fact to THE TRADER PUBLISHING CO., 57 ADELAIDE ST. WEST, TORONTO, and it will be inserted in this column free of charge. This is the only way by which you can reach the entire Trade, and we shall be glad to help you.

ADVERTISER would like to hear of good second hand show-case for sale. Nickel or wood. From 6 to 8 feet in length. State price and particulars. Lock Box 252, Stayner, Ont. (11)

JEWELRY Business for sale in new and thriving village in Western Ontario. A good and rare chance for young man with small capital. Satisfactory reasons given for selling. For full particulars apply to Box 109, Dutton, Ont. (11)

NEW AND UNIQUE DESIGNS OF ENGRAVING

FOR

Keystone Silver Watch Cases.

HAPPILY CONCEIVED.

FAULTLESSLY EXECUTED.

EXCEPTIONALLY POPULAR.

KEYSTONE SILVER CASES

POSSESS THE MOST MARKED ADVANTAGES.

The originality displayed in their construction secures a strength, closeness of fit and wearing quality which make them THE BEST SILVER CASES in THE TRADE. The New Series of engraving for these handsome and reliable cases is probably the largest and most varied ever devised.

KEYSTONE WATCH CASE CO.

19TH & BROWN STS., PHILADELPHIA, PA.

CHICAGO. **NEW YORK.**

ESTABLISHED 1872.

The Plainville Stock Co.,

Manufacturing Jewelers,

Would respectfully invite the attention of the Trade to their unusually fine and large stock of

ROLLED PLATE AND SOLID GOLD FRONT JEWELRY.

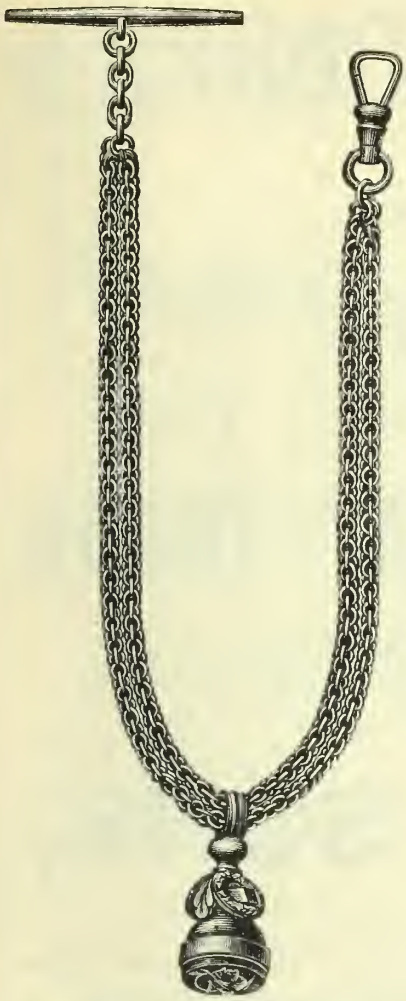
We offer many and attractive designs, all of which are original and unique. The workmanship upon our goods is unexcelled, and the stock used is of the finest quality.

We make a specialty of

LACE AND BROOCH PINS, DROPS AND SETS,

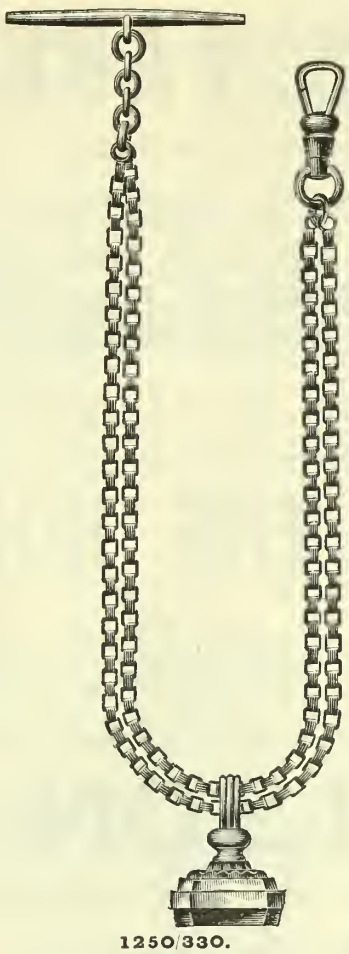
which we have in almost endless variety. These are made after new patterns designed by our own artists, and are chaste and elegant. In addition, we have a full line of goods for the Fall and Holiday Trade, which we will take great pleasure in showing to our customers.

In order to protect the Trade from being imposed upon by goods of an inferior quality, made in imitation of ours, we have adopted a Trade Mark as follows:



P. S. CO.

This mark will be stamped in an inconspicuous manner upon all our goods, and is a guarantee to the dealer of their quality. Retail dealers will be furnished with the names of jobbers who carry our goods, on application.



Full lines can always be seen at our New York Office: No. 176 BROADWAY.

THE ONLY ABSOLUTE GUARANTEE OF QUALITY

IS THE INTEGRITY OF THE MANUFACTURER.

THE AMERICAN WATCH CASE COMPANY, of Toronto, guarantee every case bearing their trade mark, no matter by whom sold.

OUR CANADIAN PATENT FOR THE PERFECTION CASE WAS ISSUED JANUARY 15TH, 1886.

OUR NEW 3 oz. PERFECTION O. F. OR HUNTING CASE NOW READY. ASK YOUR JOBBER FOR THEM.

THE PERFECTION

DUST PROOF Watch Case, although placed by the American Watch Case Co., of Toronto, upon the Market four months ago, has already been pronounced by expert Watch Dealers to be

THE BEST AND CHEAPEST WATCH CASE EVER MADE.

The Perfection has been specially designed with a view to make a Watch Case which would at once be cheap in price and at the same time afford sufficient protection to the movement. This idea has been admirably carried out by taking the excess of Silver from the centre and placing it in the backs, which will be found extra firm and heavy. Although the cheapest Watch Case ever made, it is warranted to give satisfactory wear. Ask your Jobber to show them to you; it is money in your pocket to handle them, therefore take no others instead. Every "Perfection" Case we manufacture bears our stamp and registered Trade Mark as above, and is fully guaranteed as to quality, no matter by whom sold.

OUR NEW PATENT UNBREAKABLE PENDANT SET.

☞ Dealers will please notice that we are now fitting all of our Open-Face Stem-Wind Cases with our new Patent Unbreakable Pendant Set, the simplest, strongest and best device for the purpose ever invented. They are made so as to take any regular American Full-Plate Movement with Female Winding Pinion. Our 3 oz. S. W. Perfection Cases are also fitted with it.

EDITORIAL.

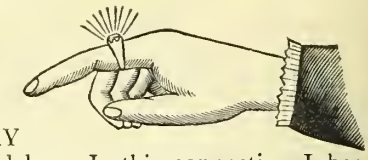
WANTED, A NATIONAL CURRENCY.

To our mind one of the greatest needs of Canada at the present time is that of a national currency which shall pass current and at par in any part of the entire Dominion. At the present time our monetary system is a mixed one, the Federal Government issuing all notes under four dollars and the banks all over that denomination. The result of this system is to hinder the free exchange of commodities throughout the country on account of the ignorance or prejudice of banks about which people at a distance know little and care less. It certainly seems absurd that in depositing the notes of a Winnipeg or Halifax bank, a Toronto merchant should have to pay his banker a larger rate of exchange than on any foreign currency. But so it is. American currency can be exchanged, for, from one-eighth to one-quarter of one per cent., but our banks have been known to charge as high as three and five per cent. exchange on the notes of Canadian banks in the distant provinces,which are probably as solvent as any banks in the country. This is not right and it should be put a stop to as soon as possible.

We contend that what this country wants and will have before long, is a national banking system, something similar to that of the United States, by which all the notes will be issued and guaranteed by the Government. Such notes like the American Government currency would pass at par not only in Canada but in any part of the United States and would do much towards helping our international trade, as also the free exchange of goods between the various provinces of the Dominion.

The Banks of Canada have by far too good a thing as things at present stand. For every dollar of gold reserve they have, they are empowered by Government to issue five of their own notes. By this privilege they are enabled to get interest on four times the amount of money they actually invest, a thing that no private individual ever gets a chance to do. Then again as every person knows, a great deal of paper money is destroyed every year by being burned in fires, sunk with vessels lost at sea, and in a thousand other ways. At the present time this loss is so much clear gain to the banks, while its benefit ought certainly to accrue to the people at large, and would do so had we a national currency of our own.

We are glad to see that the workingmen have taken up this question and that they propose shortly to bring it within the scope of practical politics. This is one of the questions that professional politicians fight shy of on account of the immense influence of the banks, but it is one nevertheless of more vital importance to the future of the country, than nine-tenths of the questions about which the regular Grit or Tory papers are continually fighting. The only trouble about such a question is, that it will benefit the country at large and not any political party, and it will probably only be because they are compelled to do so that either of them will take it up. It is bound to come, however.



DISTRIBUTION OF THE INCREMENT OF LABOR.

In our November number we took issue with Mr. A. Blue, Secretary of the Ontario Bureau of Statistics, on a statement of his in regard to the profits made by the Capitalist or Manufacturer in Canada. Although Mr. Blue did not squarely say so, the inference that anyone would casually draw from his article was that the Canadian Manufacturer gets 54¼ per cent. and the mechanic only 45¾ per cent. of the increment of labor, or profit on the goods made in this country. This division, Mr. Blue says, "may be fair, but the presumption is against it." That we may not be accused of putting a wrong or forced construction on Mr. Blue's words, we quote the editorial utterance of the Toronto *Globe*, a paper not only in accord with the Government Mr. Blue has the honor to serve, but a personal admirer of that gentleman himself. They interpret Mr. Blue's meaning to be as follows :—"Thus, the owners of capital after "paying 6 per cent. upon their investment, get more than fifty "cents out of every dollar from sales. This seems a large "share, considering the amount and quality of exertion done by "the employers and employed respectively."

As we pointed out in our last issue, Mr. Blue made the mistake, (unintentionally we thought) of omitting to deduct from the manufacturers' profits the amounts he himself had specified for interest and expenses of manufacture, because when that was done there remained only 9½ instead of 54¼ per cent. as profit to the manufacturers. The Toronto *Mail* did us the honor to copy our article upon this subject and remark upon it editorially, and in reply to their strictures upon Mr. Blue, that gentleman publishes a letter in which he makes the following statement :—"THE TRADER, I understand you to "say, thinks that 15 or 20 per cent. would be a fairer allowance "for expenses; but it proceeds to show that on the basis of 6 "per cent. for interest ($9,918,157) and 10 for expenses "(30,967,606) there remains of the Capitalist's apparent profit "only $29,476,350 or 22.8 per cent. of the net product instead "of $43,913,694 or 33.8 per cent. by my showing. THE "TRADER has made the mistake of calculating expenses on the "gross product of manufactures instead of on the capital in-"vested—on $309,676,068 instead of $165,302,623—and the "result is a gross error of $14,437,344. Upon its own highest "rate of 20 per cent. for expenses and 6 per cent. for interest, "the net profit of the manufacturers would be $27,383,432 or "21 per cent. of the net product."

It will be observed in the above extract from Mr. Blue's letter to the *Mail* that he has apparently changed his mind as to the per centage of profit the manufacturer has. His first statement being 54¼ per cent. and his second that they get

JEWELRY REPAIRS.

Every Retail Jeweler in Canada has at some time or other felt the need of a JEWELRY REPAIR SHOP that could not only do such jobs in first-class style, but return them without delay. In this connection I beg to notify the Jewelry Trade throughout Canada that having fitted up my new factory with all the modern steam machinery requisite to the successful carrying on of a first-class jewelry manufacturing business, I have also opened a repairing department in connection therewith. I respectfully solicit your custom therefore for repair work of all kinds, and gold and silver plating in all its branches. Every job done by me will be executed in a first-class manner, and my prices will be found as low as consistent with good workmanship.

Special attention is also given by me to the execution of orders for special jewelry to be made up either from original or selected designs. For such things as Lockets, Diamond or other Earrings Brooches, Earrings or Chain work of any kind, I have special facilities and can guarantee satisfaction every time. When you have any new special work or jewelry repairs, give me a chance. Remember my address, A. H. WELCH, FINE JEWELRY MANUFACTURER, 31 ADELAIDE STREET WEST, TORONTO.

33.8 per cent. profit; certainly one or the other must be an error.

As far as we are able to judge they are both wrong. Mr. Blue says that we make the mistake of calculating the expenses of running a business at 10 per cent. on the entire product, instead of on the capital invested by the manufacturers. This is really the point now at issue between Mr. Blue and ourselves, and we propose to show that in this, as in his first statement, the Secretary of the Ontario Bureau of Statistics is as far astray as ever. If Mr. Blue will take the trouble to interview any dozen wholesale merchants of this city, who simply buy and sell their goods, and can therefore calculate almost to a cent how much their expenses really are, he will find that 10 per cent. is about the allowance made by such firms on their total sales to cover the expense of selling their goods and converting them into money. If Mr. Blue were to suggest to one of these gentlemen the theory that their total expenses should be 10 per cent. upon their cash capital and not upon their total sales, he would be very speedily convinced from a look at their ledger that if he could effect such a saving in many wholesale firms' expenses he could command a salary such as few people on this side of the Atlantic ever dreamed of. To show, in a few words, the absurdity of such a proposition, we will suppose a merchant or manufacturer commences business with $1,000 of capital, and during the year turns out or sells $10,000 worth of goods. Ten per cent. on his capital would be $100. Does Mr. Blue imagine that a $10,000 business can be carried on at a total expense for rent, insurance, salary, fuel, etc., of only $100? The thing has only to be stated to show its absurdity.

The expenses of manufacturing, however, are considerably larger than those of the merchant who simply buys and sells. The manufacturer, as a rule, has every expense connected with marketing his goods in the same proportion that the wholesale merchant has, but in addition he has a host of expenses connected with their production of which the latter never dreamed. The manufacturer is compelled to invest a large amount of money in machinery, the wear and tear of which alone is calculated by experts to be 10 per cent. of its own value per annum. The machinery of to-day, owing to the progress of inventive talent, may be out of date six months from now, in which case it is worth hardly any more than it will bring for old iron. Then again he has to have power to drive his machinery, and no matter whether such power be steam or water, it is a serious item of expense. In addition to all these there are the thousand and one things used in manufacturing that, while too small in their individual amounts to be put into the regular material account, help very largely to swell the "expense account" and reduce the margin of profit.

Mr. Blue not being a practical merchant or manufacturer, forgets that raw material and wages are only part of the cost of the goods manufactured, and that the money spent in "expense account" in their manufacture and sale is just as much a part of their cost as either the raw material or wages.

We stated in our last article on this subject that although we took Mr. Blue's estimate of 10 per cent. for expenses as being correct, we did so simply to allow him the benefit of the doubt and to show the error into which he had fallen. We did not then, and do not now think that 10 per cent. is a large enough allowance for a manufacturer's expenses. As we stated before, from what we can learn from all practical sources, these expenses will run at least to 15 per cent. on the total amount of production, if not more.

As far as we can see, this statement of Mr. Blue's is not only erroneous in itself, but calculated to do harm by creating dissatisfaction between the employer and the employees. That this is the case has been proved in more than one case where employees taking the *Globe's* editorial statements on this subject for gospel have agitated for what Mr. Blue and the *Globe* would call a fairer distribution of the profits than they have hitherto received.

No one expects anything better from the *Globe*, which will do anything to gain a party success, but from a Bureau of Statistics—which should be reliable, if it is anything at all—something fairer should be expected.

CORRESPONDENCE.

To the Editor THE TRADER:

DEAR SIR,—Please accept thanks for your space containing my ad. in November issue, for show case. I have had responses from which I was able to select.

Yours, with thanks,
Lock Box 252,
Stayner, Ont.

PORTAGE LA PRAIRIE, Nov. 19th, 1886.

To the Editor of THE TRADER.

The writer has been waiting since his last letter to see some other craftsman put in his oar, but since a certain bashfulness seems to prevail among the fraternity, I shall as promised, proceed to describe how I repaired the unfortunate watch before mentioned. But first let me describe the workshop. It was a telegraph office on the then partially constructed Canadian Pacific Telegraph line, and situated about 150 miles west of Port Arthur. The shanty was twelve feet long by eight feet wide and seven feet high. The roof was formed of "scoops" (hollowed half logs) packed with moss. The floor was made of flatted poles packed in sand. One small window admitted the light, while an equally primitive door admitted the Company's telegraphic patrons in the shape of a couple of line repairers once a month, two timber men at work on ties, and an occasional roving Indian. In one corner of the shanty, occupying a quarter of the ground space stood the writer's "little trundle bed," a cook stove and cooking utensils, camp kitchen, etc., occupied another quarter of the space. A table, one end used for eating off, the other end occupied by my telegraph instruments, left very little of the shanty unoccupied; so that when election returns, stock reports or sensations of any kind were coming in on the wires, and the surplus population of Gull River (Falcon Station) crowded into the building, one man occupied the bed, another perched on the stove, another one might stand in the doorway and listen to the ticking of the instruments.

It was in this office that the fell deed was committed. One of the tiemen had "wound his watch up too tight," so he said, and knowing the writer had been at the trade for a couple of years, brought the sick timepiece in to have its case diagnosed. With the aid of a jack-knife and the end of a nail sharpened

like a small screwdriver, it was ascertained that the barrel hook was broken off. Here was a "go." All the tools available within thirty miles were 3 chopping axes, a hammer, a hunting knife, pocket knife, three cornered file and telegraph wire pliers, with a pair of climbers, telegraph vise, spade, coil of telegraph wire and a fragment of copper wire thrown in. However the reputation of the craft in emergencies must be sustained. Punching out the fragment of the hook left in the barrel, by means of a piece of sharpened telegraph wire, I took a small piece of the copper wire, reduced it to the proper size, wore a notch in one end with the jack knife, drove it through the barrel a proper distance, and then using the pliers as an anvil and the back of the hunting knife as a hammer, carefully rivetted the hook in its place. After the watch was carefully put together and a little sweet oil applied, need I say the watch ran like a charm for a week or two. Then that soft copper wire cut through, the monkey wrench refused to hang on the safety valve, the eccentric overbanked on the piston rod and the rag wheel came to a sudden halt. Not having stolen any of the jewels out to compensate me for wear and tear of intellect, I was so discouraged that when my watch stopped shortly after it was hung on a nail and thereafter its owner, when on the march westward over the line to Wabigom, 60 miles distant, when sleeping out at nights noted the snail-like revolution of the "great dipper" around the polar star, when he was wakened every couple or hours by the intense cold and admonished to heap more logs on the fire, then to pray for morning.

Some time ago I received a couple of watches from the West. One had been experimented on by a man in the Rocky Mountains who thought he was pretty handy at anything. The other had been run over by a heavily loaded wagon. A careful examination and comparison showed that in both cases the injuries were about equal. The one had been crushed in and the other had been *crushed out*, so to speak. The mechanic had taken out the barrel and by means of a coarse three cornered file had done some ghastly work on the inner coil of the mainspring and barrel arbor. The various jewels had come in for attention and fragments of them were taken off as mementoes. Neither were the pivots neglected, some of them being beautifully curved.

Perhaps Mr. Editor you would tell us on the quiet what kind of watchmakers you keep in Ontario. Do they use the old brush and chalk method? Do they have trade secrets that they are afraid to impart, or do any of these fancies indicate the reason for their reticence in committing themselves to paper? If some of them do not waken up and contribute to the spicy little TRADER, the humble writer will be compelled in the discharge of a painful duty, to do as the Manitoba *Free Press* was credited with doing in the case of the immortal Nicholas Flood Davin, to take a long pole, reach up to the pinnacle of fame and knock some of them off.

Yours,

H. J. WOODSIDE.

AN OPPORTUNITY FOR INVENTORS.—A German firm, Charles Beck, of Ebingen, Wurtemberg, proposes, in the *L'union Horlogerie*, to order 1,000 tricycles, cash down, from any inventor who will send them a model of a tricycle to be propelled either by spring, electricity, or weight of rider; any one of our readers who wishes to enter into competition and, by applying to *The Jewelers' Circular* office obtain specifications.

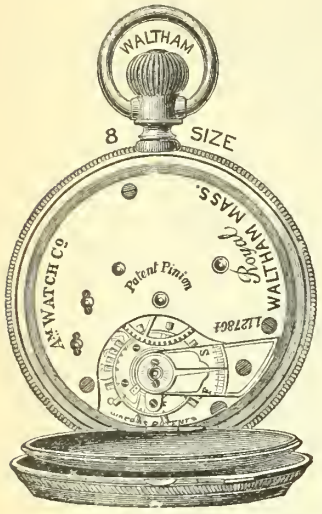
A PRACTICAL TREATISE ON

THE BALANCE SPRING.

Including Making, Fitting, Adjusting to Isochronism and Positions, and Rating, also Adjustment for Heat and Cold.

BY EXCELSIOR.

PART III.



THE ADJUSTMENT TO POSITIONS.

(80) The *adjustment to positions* is another point which must now receive attention. We know that in nearly all watches the balance has a larger motion, or longer vibration, in a horizontal position than when it is in a vertical position, or with its edge up. This is caused by a greater friction on the balance pivots in the latter case. The adjustment to positions is effected by equalizing the frictions, so that the hair-spring will be able to move the balance through the same arc in any position in which it may be held. Generally, watches are adjusted for the two horizontal positions, dial upward and balance-bridge upwards, and two vertical positions, with the figure XII upwards, and III upwards. But a fine watch should be adjusted for all four vertical positions, XII, VI, III and IX upwards. In all cases the equalizing of the frictions is to be done by *lessening the greater* ones—never increasing frictions unless that is unavoidable.

(81.) The two horizontal frictions are equalized by making the ends of the balance pivots equally flat and well polished. The extent of the vibrations can be readily observed when the dial is upwards, by setting the movement holder upon a piece of looking-glass on the bench. The balance and works can even be examined with the eye-glass while in that position, by looking from one side at such an angle that its image will be reflected into the glass. This is much better than holding the movement above one's head in order to see its under side, insures a true and equal horizontal position each time, and obviates the trembling of the hand while holding it, which interferes with the motion of the balance—and is, besides, easier and safer.

(82.) If the vertical vibrations are smaller than the horizontal ones, the other conditions being as described in sections (93, 94,) the only way is to flatten the ends of the pivots, till the balance will keep up about the same motion in all positions. Some workmen not only flatten the ends, but go further and use round grinders or laps to hollow out the pivot end a little, and cause the entire weight to be sustained upon the ring of metal left around the outer edge of the pivot end. This brings the rubbing surface nearly as far from the center of the pivot in the horizontal as in the vertical position, but the practice is objectionable for several reasons, besides being difficult of execution. It is sufficient for all practical purposes to make the end of the pivots perfectly flat, or as nearly so as may be found necessary on trial.

(83.) On the other hand, if the vibrations are greater in the vertical than in the horizontal position, then we slightly round off the end of the pivots to increase the arc in the horizontal position to an equal extent. These changes of the shape of the pivots should be done in a lathe, and very slowly and cautiously, lest we do too much. The best tool is a pivot burnisher, as that both polishes and hardens the surface. If a stone or lap is used, the burnisher should finish the job. In rounding off the end, the departure from a perfect flatness on the end of the pivot should be only sufficient to prevent actual contact with

WHAT I CLAIM.

1. I claim to have the largest and best assorted Stock of Jewelry in the Dominion of Canada. My Stock consists of American and English Gold, Gold Plated and Rolled Plate Jewelry of all descriptions. American and Swiss Watches, Canadian and American Gold and Silver Watch Cases, Spectacles, Opera Glasses, and Optical Goods of all kinds.
2. I buy all my Goods in big lots and pay spot cash for everything I buy, therefore my customers may be sure that I am at no disadvantage as compared with any house in America.
3. I employ no Travellers, but give my customers the benefit of this saving in expense.
4. It will pay you to come to the city and inspect my Goods, because I will sell you from 10 to 20 per cent. lower than any other house in the Trade. Don't forget this. It is no chestnut.

the end-stone, so that the rounding off shall be barely perceptible to the eye. First remove a narrow ring around the outer edge and try. If not enough, take off a little nearer to the center of the pivot. If too much is taken off, we shall have to flatten the end again, which will shorten the pivot. Therefore we take off but little at a time, and as equally as possible off each pivot. Always remove any "feather-edge" that may appear at the corners of the pivots, with an oil-stone slip.

(84.) Having substantially equalized the vibrations, any remaining error can be easily compensated for by the isochronizing of the spring, which should *follow*, not precede, the adjustment to positions. Most workmen test that adjustment by *timing* the watch in different positions, and make the alterations of the pivots according to the errors found in the time, instead of by the differences in the vibrations as above directed But it is clear that if the spring were isochronal, there would be no change of time in the different positions, even if the frictions and arcs of vibration were different. Hence that test is of no use, except before the spring is isochronized, and even then it is a mere waste of time and labor, because the same information can be gained instantly by simply observing the extent of the arcs of vibration in the different positions. For, if the arcs are the same, the times will be the same. And when we have equalized the arcs, we may be certain that they will be performed in equal times, without taking the trouble to try them.

(85.) *Faulty methods.* Other methods of adjusting to positions are often followed by "the best workmen." Some throw the balance out of poise in such a way as to equalize the vibrations in different positions. For instance, if the watch goes faster in the hanging position, or XII up, than when horizontal, they make it go slower by increasing the arc of vibration, thus: Allowing the balance to come to rest, they make that side which is at the top when the figure XII is up heavier, by drawing out one or two screws in the rim or otherwise. Or, if it loses in that position, they make the bottom heavier, so that the motion will be lessened. Now in an adjusted compensation balance this would probably destroy the adjustment for heat and cold. Even with an unadjusted balance this plan may be unsuccessful, for a greater vibration may be either quicker or slower, according to the spring—and the change of vibration may produce the opposite effect to that designed. Or, if the spring be isochronal, it will have no effect upon the time except the injurious one caused by the want of poise.

(86.) Others bend the hair-spring to one side, instead of leaving it free and concentric with the balance axis, as it should be. For instance, if the watch loses with XII up, but goes correctly with III up, the spring is bent towards the figure XII, so that when that side is upwards, the spring will partly support the balance and lessen the friction in that position. Workmen who follow this method adjust only for the two horizontal positions and two vertical positions, viz.:—XII up and III up. And they calculate that, by thus adding a side pressure of the pivot to the friction upon its end, they will increase the friction while in the horizontal positions, and so make it equal in the horizontal and vertical positions. Now it is sufficient to say that either of the two preceding methods is entirely wrong in principle, being directly destructive of the isochronism of the spring, and injures the watch in *all* positions for the sake of a little apparent improvement in one or two. No good workman will practice either of them, nor will he need to do so if he properly understands his business.

(87.) The arc of vibration should be the same in each of the four vertical positions. If it is not, there may be different causes. The balance may be out of poise; the balance jewel holes may not be round, not evenly polished inside, or too large for the pivot—allowing the balance to fall towards the lever, escape wheel, etc., or away from them, and interfere or change the action of the parts. The change of the arcs when held in the different positions will guide us to the cause. Inasmuch as the greater the friction is, the smaller the arc will be, we know in which position to remedy the inequality of the friction, and we may also ascertain the effect of our alterations by simply noting the change in the arcs. It is desirable to equalize the frictions in the different positions as nearly as possible, as it leaves less to be accomplished by isochronizing the spring, and there is a limit to the amount of irregularity which this adjustment can compensate for. Besides, the more perfect all the parts of the watch are, the finer the performance which we may hope to obtain from the spring.

PART IV.

THE ISOCHRONAL ADJUSTMENT.

(88.) We have now reached that portion of our subject which relates to the final adjustments of the hair-spring for the purpose of insuring that the vibrations of the balance, whether they be great or small, shall always be accomplished in equal times, when the spring is said to be isochronized or adjusted to isochronism. In my previous articles I have given general directions for fitting springs, which, if followed, will prevent any very great errors of time from varying arcs of vibration, and which, moreover, must be attended to before the last finishing touches, presently to be described, can be proceeded with. The isochronal adjustment of the hair-spring is, without doubt, the most delicate and least understood operation the watchmaker is called upon to perform. Many who talk and write most glibly about it do not appear to know even the meaning of the term. And upon considering their ideas we are forced to the conclusion that unless their practice is better than their theories, it is not worth much; or else, if they do really understand the subject, they are purposely trying to lead others off upon a wrong tack, in order to keep their knowledge to themselves. But to this there are, of course, honorable exceptions.

(89.) I do not propose to advance any new theories, but to regard it in a very practical light, as a merely mechanical problem, requiring no profound knowledge, either scientific or mathematical, but which may be satisfactorily solved by any watchmaker of ordinary skill and patience. And I shall endeavor to give all necessary instructions for doing so. Even if the workman does not intend to undertake the isochronal adjustment, it is important that he should know how to discover whether the watches he buys and pays an extra price for as isochronized, are so or not, for there is as much swindling of ignorant dealers on "isochronal hair springs" as on "compensation balances, adjusted for heat and cold," of which not one out of a hundred so called are adjusted at all.

(90.) *Action of non-isochronal springs.* If the hair-spring is not isochronal, the watch will vary from correct time whenever the extent of the motion of the balance, or the "arc of vibration," as it is termed, is changed. In a watch having a going-barrel the vibrations are largest or longest when first wound up, and become smaller as the motive power becomes weaker, so that during every hour of the 24 the watch may keep a perceptibly

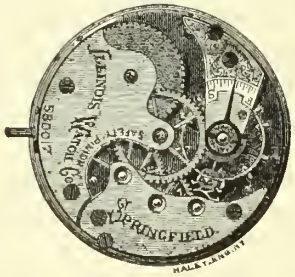
different time. Some springs perform the short vibrations in less time than they do the long ones, while others do the reverse. A well made and well fitted spring will not vary much from uniform time, while a spring that is misshapen, crooked, out of center, unevenly coiled or tempered, that has been scraped, ground, much bent, or is very soft, will vary sometimes several minutes during the day, although it may be somewhere near right at the *end* of the day. Every change of the arc of vibration caused by jarring, carrying, keeping it in different positions or different temperatures, irregular winding, poor oil, dirt, etc. causes it to vary, so that for accurate timekeeping it is valueless.

(91.) In duplex and cylinder escapements the resistance to the momentum of the balance caused by the pressure of the escape wheel during the free arc of motion of the balance, is greater or less in proportion to the greater or less motive force, and therefore these escapements are in some degree self-compensating for irregular motive forces. Yet they do vibrate further when first wound up. In English levers and chronometers the fusee and chain are employed to equalize the motive power. But, to do this accurately, the fusee must be cut in conformity to the varying strength of the particular main-spring used, which is seldom done, as is shown by the varying arcs. But were it so, the friction upon the balance pivots *in different positions* is another disturbing influence in all watches. And even if the watch is adjusted for positions, the thickening of the oil, accumulation of dirt, etc., by running, cause the vibrations to gradually diminish.

(92.) As it is practically impossible to prevent the arc of vibration from varying more or less, it is necessary in fine watches, after reducing that variation to the smallest possible amount, to adjust the hair-spring within those limits, so that no error of time shall result from such unavoidable changes of the arcs of the balance. This adjustment or isochronizing of the hair-spring can be done in different ways, which we shall consider at some length. But before undertaking this, and even before we can safely test our spring to see what and how much adjustment it requires, there are certain other points to be attended to.

(93.) *Requirements of isochronism.* Besides observing the instructions already given for the correct forming and fitting of the spring itself, the balance and the lever must be perfectly poised; the balance, spring, lever, and all other parts in the watch, even the springs in the case, must be free from magnetism; the movement must be in good condition to transmit the motive force uniformly to the balance; the escapement particularly must be as perfect as it can be made; the end-shake of the balance, lever and escape-wheel no greater than is necessary to give freedom of motion, so that there can be no material change in their relative positions; the pivots of the lever and balance staffs well fitted to their jewel holes; the lever pivots well polished and free from any "binding" in any position of the movement; the balance pivots straight, hard and round, well-polished, as small as is consistent with strength, their shoulders well clear of the jewels, and the balance not running too near the plate, bridge or any other part; the hole jewels thin and the holes round and finely polished; the holes not perfectly cylindrical, but a little rounded out or enlarged towards each end, to diminish the extent of surface in contact with the pivots, and prevent any possible binding by either the jewel or pivot not being set exactly true, as well as to lessen the adhesion of the oil to the pivot; and in lever watches the ruby pin must be perfectly firm in its place and vertical, or parallel to the balance axis, and the slot in the end of the lever polished and well fitted to the ruby pin.



SELECTED MATTER.

THE HOARDED WEALTH OF INDIA.

Never during its existence has India been so rich in jewellery as now. The people are always adding to their stock. Savings from nearly all sources are disposed of in this way, and these savings are being constantly made—often at the expense of clothing, sometimes at the expense of greater necessaries of life. The making and the storing away of wealth in this form is the national peculiarity of this country. It is indulged in by all classes of natives. Jewellery is regarded as the most stable kind of wealth, and fortunes are never counted without estimating the value of the stock of jewellery. It can always be pledged or diposed of. The market for its sale is never closed and never depressed. The most ignorant native who wishes to sell a piece of jewellery knows its market value quite well; he can scarcely be cheated. Jewellery forms the greatest factor in matrimony. The most lowly bride has her *stridhan*, which is often equal in value to five years' income of the bridegroom. There is often a scarcity of clothing; sometimes a scarcity of cooking-pots; generally not a particle of furniture; but nearly always a stock of jewellery. The wife that has no jewellery possesses nothing else; she cannot be robbed. The family that does not possess jewellery is absolutely indigent. One of the greatest boasts of the jewellery-owner is that his hoards cannot be taxed. A man may own jewellery valued at a lac of rupees, and pay no income tax. This is a source of great satisfaction. Jewellery yields no recurring income, but it is prized more than Government paper. "If it never increases it never diminishes," is a national saying, common amongst men and women alike. No native marriage, except amongst the most impoverished, takes place without a transfer of jewellery, and very frequently of new jewellery. So great in value is the new jewellery that is introduced into families by marriage, that we dare not estimate it; the amount would be so fabulous. True the investment of wealth in jewellery in India is the greatest and most remarkable institution in the country. Every other investment sinks into insignificance beside it. Under no native prince or rajah of former times has jewellery accumulated as it has accumulated under the British Government in British India. For a century past the sacking of towns has been unknown; the plunder of individuals has been greatly restrained; and wealth in the form of jewellery has accumulated. Now, if men set store by their wealth in jewellery,, and if one man estimates another by his wealth in jewels, is it not manifest that as this kind of wealth increases, and is found to be secure to the possessor, the people who gauge themselves as others gauge them—by the jewel wealth—must be contented, as far as the possession, and security of this kind of wealth can content them? We can scarcely imagine the possessor of considerable wealth in jewellery being discontented. There must be political contentment amongst the class of jewelery-owners; and one-half of the people of India are jewellery-owners. It is only when the day of taking stock of the family jewellery comes round, such as the occasion of a wedding or a great gala day, that a stranger can form the slightest conception of the amount of wealth in the family in the form of jewellery. Amazement at once strikes him as he is for the first time permitted to see the amount of accumulated wealth. The inventory day is, *par*

excellence, the women's day. Gathered round the iron safes, the cash-boxes, the metallic boxes, the neatly carved wooden boxes, the delight of the women is observed in their eyes as each pair of golden bracelets, studded with pearls; each pair of diamond, or emerald or sapphire earrings; each nose-ring with large pearls, massive gold chains, and a large number of rings, expensively and even extravagantly gemmed are handed round the family circle for admiration—and great is the family delight. The towns of India must be peaceful towns, and the laws of India must be good laws, where jewellery wealth, amounting in value to crores and crores, can be held secure by the meanest of the subjects of the great Empress Victoria. The Government that has permitted this great jewellery wealth to grow into monster proportions, and that has never coveted a single grain of the hoarded gold, as is proved by the history of the wealth itself, is entitled to respectful regard. We cannot in honesty or justice refuse to approve of a Government that has followed out this policy of upholding and maintaining the rights of the people to their jewelled possessions for more than a century. When we single out this item of India's wealth, we do so for a useful purpose, in the interests of the people themselves, and not in the interests of the Government or of income-tax law-makers. In continuing to hoard and keep unremunerative such vast treasures as are now held in India, the people are unnecessarily impoverishing themselves. The system has had the fullest scope, and has been availed of by the people to the fullest extent, showing their abounding confidence in the national idiosyncrasy. It is now much overdone, and should be moderated. When wealth is hoarded in a country in millions, and lies unproductive, it attracts the covetous, and is a source of national weakness. It should be profitably employed in the creation and support of industries that may advance the progress of the country. One main cause of the proverty of India is the want of varied employment for its people. As in Ireland—a country whose economic poverty is not dissimilar from that seen around us—two-thirds of the population are agricultural. The burden placed on the soil is much greater than it can bear. There is no prospect of relief from the congestion in India by means of emigration, such as Lord Salisbury is sanguine will bring prosperity and peace to Ireland. The people, whether for good or ill, are inalienably rooted to the soil, and there is also for them a much narrower field for selection. The only hope for the regeneration of the country is the gradual opening up of industrial enterprises. The vast population of India consumes everthing produced in the world; it manufactures nothing. The men who wrap their talents in a napkin and bury them in the ground, should look to it; they are not merely fatuously relinquishing much "unearned increment," but they are deliberately retarding the progress of the country. Nowhere under the sun should the thousand arts of peace prosper to greater advantage than in India; nowhere are precious opportunities so wantonly neglected.—*Exchange.*

THE YANKEE CLOCK-PEDDLER.

Near one of the rural towns of Ohio there dwelt, a few years ago, an elderly gentleman who went by the familiar name of "Uncle Phil." He was a rigid member of the Lutheran Church, sober, exemplary and withal possessed of considerable wealth. Like some of his neighbors in that region of the country, he entertained a bitter prejudice against "Yankees," and especially against the gentlemen of that ilk who traveled through the country dispensing that peculiar New England product known as the Connecticut clock. So, notwithstanding his piety, Uncle Phil often avowed his intention of kicking out of his door the first Yankee clock-peddler that should enter.

One sultry day in summer a covered wagon drew up at his gate. A keen-eyed, gaunt-looking man alighted, and rapping softly at the door, requested in subdued tones a drink of water. After drinking, the traveler asked permission of the old gentleman to sit and rest for a few minutes, saying he was overcome by the heat. The stranger said but little, and the old gentleman eyed him suspiciously. Presently the old man's countenance began to brighten.

"What papers have you there?" he asked, pointing to the stranger's pocket, which bore the appearance of a traveling post-office.

"Oh," was the answer, "those are a few copies of our *Lutheran Observer*, that I carry to read along the road."

"Indeed! then you belong to the Lutheran Church?"

"Yes, sir. Would you not like to look at a copy of the paper?"

The old man was delighted with his visitor and asked him to stay for dinner. Of course he accepted.

As they were putting up the team, the old gentleman remarked:

"You drive a queer-looking wagon."

"Yes,' said the stranger; "I have been out West, and have suffered several months from chills and fever. Wishing to get home to my family and having no means of defraying my expenses, I purchased a few clocks to sell along the way."

The stranger stayed and fed himself and horses free of charge. He did more. He sold Uncle Phil five of his best clocks and took his note, which he turned into money within two hours after the sale.

"Well," said the landlord to our peddler on his return to the inn, "didn't I tell you that he would abuse you?"

"Very much mistaken," said the seller of clocks; "the old man is a gentleman. Here, take these papers," handing him the *Observers*, "I have no further use for them."

Uncle Phil has since then discovered the true character of his shrewd, but unscrupulous visitor, and indulges in no more threats against Yankee clock-peddlers.

THE GEM OF THE PAPAL TIARA.

The Papal tiara is sumptuously ornamented with precious stones, and set off with a beautiful diamond. The cupola is formed of eight rubies, twenty-four pearls, and an emerald. The cross is composed of twelve brilliants. The lappets are of rubies and pearls. Two golden bands retain it in position when worn. The principal diamond in the tiara once decorated the brow of the Grand Mogul, of whom it was purchased by Charles the Rash, of Burgundy, and was abandoned by him at the battle of Granson, 1466. It was found under a wagon by a soldier, who first rejected it as worthless, but afterward altering his opinion, picked up what he thought was but a fragment of crystal, and sold it to a curé for a crown. A cunning citizen of Berne purchased it for three crowns, and resold it for 5,000 ducats. It again changed owners for 7,000 ducats, was afterward bought by Ludovic, Duke of Milan, for 14,000 ducats, and was subsequently acquired by Pope Julius II. for 20,000. —*Exchange.*

DIRECTIONS

FOR USING

Wathier's Self-Adjusting

HAIR SPRING STUD INDEX.

1st. Place the lower part of Balance Staff in round hole (A). Then turn Balance Wheel until Ruby Pin comes over oblong hole (B). Now let the Balance down until Roller Table rests on steel centre plate. The Balance is now ready for the spring.

2nd. Place the hair spring on the staff, with the stud in exact line with the line on the INDEX corresponding in name with the movement you wish to put in BEAT. Now fasten the hair spring collet on the staff and you will find movement in perfect BEAT.

PRICE, NICKEL PLATED, ONLY $1.35.

EDITORIAL NOTES.

SPECIAL NOTICE.

Jewelers throughout Canada will oblige the Editor by sending into this office for insertion in these notes any items of news pertaining to the Jewelry business that they think would be of interest to the Trade generally.

P. D. Ross, formerly of Toronto, but now editor of *The Montreal Star*, was in the city last month and paid us a fraternal visit.

G. H. GORDON, jeweler, of Amherst, N.S., has cleared out. Liabilities about $4,000, assets, nil.

L. A. PETRIE, jeweler, of Spring Hill, U.S., has assigned. Nominal assets about $4,500 and liabilities about $5,000.

THE WOLTZ BROTHERS have opened a very attractive jewelry store on Leader Lane, in this city, where we trust they will do a good paying business.

THE CREDITORS of Julius Urwitz, the Toronto absconding jeweler, have realized ten cents on the dollar. He should be kept out of Canada until he has paid the other ninety.

SOLD HIS BUSINESS.—Charles Davies, the well-known King Street jeweler, of this city, has disposed of his business to Messrs. T. E. Brown & Co.

A CLOCK FACTORY.—It is currently reported that owing to the trouble with the patents under which they manufacture in the U. S., the Yale Clock Company propose to move their factory to Canada. Montreal is spoken of as the city where they will probably locate.

THE LATEST NOVELTY in clocks that has come under our notice is the placque clock, for which Mr. E. Scheuer is the sole wholesale agent. They are admirably suited for holiday trade, and everybody should have some of them.

THE GOLDSMITHS' COMPANY are making a big boom in Ansonia clocks this season, and report trade in this and other lines better than they ever had at any previous year. Their manager, Mr. Barr, is a "hustler" and no mistake.

A. H. WELCH, the well-known manufacturing jeweler of this city has just added an enamelling department to his factory, and is now prepared to do any work in that line in the highest style of the art. He reports business brisk and prospects for trade good.

THE STERN FAILURE.— It now appears that the liabilities of Charles Stern are $54,000, with assets amounting to about $58,500. His offer of fifty cents on the dollar has been refused and it has not yet been de ided what will be done with the estate.

A CANARD.—A report has been circulated amongst the trade to the effect that Mr. George R. Joseph, of Joseph & Sons, Montreal, is about to retire from the road. George says this report is entirely without foundation ; he denies the allegation and defies the allegator.

ARTISTIC FANCY GOODS.—Our readers will see by the advertisement on another page that Messrs. H. & A. Nelson have just to hand a large importation of artistic fancy goods specially suited for the jewelry trade. Dealers who handle such goods shoul l give them a call when in the city.

MR. D. H. CUNNINGHAM, jeweler, of Bothwell, has just moved into his new store, which is one of the finest in that go-ahead town. In Mr. Cunningham the people of Bothwell have a first-class jeweler, an energetic and pushing man of business and good citizen. We wish him continued success.

MR. JOHN M. INGLIS, wholesale watch importer, of Montreal, has returned from Switzerland where he has spent the summer. He has effected arrangements there which will place his house in the van so far as Swiss watches are concerned, and thinks he will show the trade a few "eye openers" before the year is out.

THE URWITZ CASE.—The detectives have been hunting Julius Urwitz, the Toronto absconding jeweler, so closely that he has been forced to leave New York State. We trust they will keep at him unti he is brought to book and made an example of. Such a scoundrel should not be allowed to enjoy his ill-gotten gains in quietude.

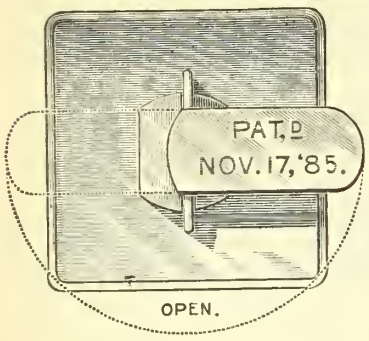
W. F. SNELL.—We learn from *The Strathroy Age* that our old friend Mr. W. F. Snell, jeweler of that town, has enlarged his premises and increased his stock so that "this truly magnificent jewelry emporium is an ornament to the business houses of Strathroy." We are glad to hear such a good report of W. F., and trust he may go on prospering and to prosper.

ALAS! POOR TOBY.—Tobias Epstein, the Toronto gent's furnishing man, and once jeweler, who defrauded his creditors and then skipped out of Canada, has been traced to Steubenville, Ohio, where he had commenced business. The assignee has seized his stock on behalf of the Toronto creditors, and the U.S. courts will be asked to decide who has the best right to the money.

A NEW CLOCK LIST.—Messrs. Levy Brothers, the well-known wholesale jewelers of Hamilton, have just issued new price lists of clocks which will prove invaluable to the trade, as they embrace the illustrated catalogues of "Seth Thomas" and "New Haven" clock companies. These will be found very convenient when ordering goods and the firm should reap a large return for their enterprise.

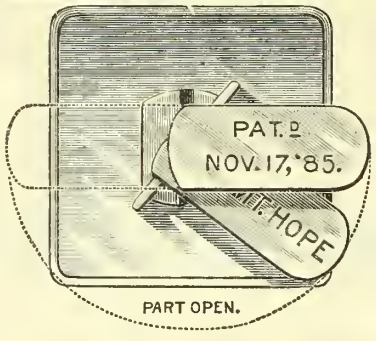
A HIGH COMPLIMENT.—An Australian wholesale jewelry buyer, who paid a visit to the factory of the American Watch Case Co., of this city, pronounced their invisible joint case the finest he had ever seen in any country. Their "Perfection" cases, of which he saw the first samples,completely surprised him, as he had no idea that goods of such perfect finish could be made in Canada and sold at prices so low.

THE PROSPECTS for a good Christmas trade were never better that we know of, than they are this year. Crops are fairly good and prices fully up to the average, and it only requires some good hard weather to make the public realize that Christmas is at hand and that it is in order to loosen the purse strings and distribute a little of our savings in suitable presents. We trust that the Christmas trade of 1886 will make this a red letter year to our Canadian jewelers.



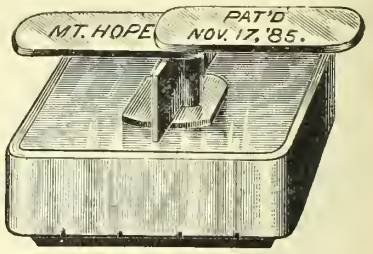
THE DEATH OF MR. THOMAS ALLEN, OF MONTREAL, which occurred in that city on Nov. 12th, removes one of the oldest and most respected members of the craft in Canada. Mr. Allen, who had reached the ripe old age of 80, and was a native of Berwickshire, Scotland, from which he emigrated to Canada when quite a youth. The business will be continued by his sons who have been associated with him in it for some years.

E. BEETON, advertises in another column some jewelers' specialties that will be found almost invaluable to any workman desiring a first-class reputation. These high-class American lathes and tools are simply perfection, and as everything that Mr. Beeton sells has been practically tested by himself before being offered to the trade, his customers may rest assured that his specialties are just those things that should find a place on every go-ahead watchmaker's bench.



JEWELERS' SECURITY ALLIANCE.—With this issue of THE TRADER new certificates of membership are forwarded to all who are entitled to receive them, those of last year being now of no value. As it is intended that this shall be made to do service for several years, a gummed label to be placed on the space at the bottom will be forwarded after annual meeting each year to those in good standing. That these certificates may be kept in good condition, therefore it will be advisable that those receiving them have them neatly framed and hung in some conspicuous position according to the rules of the Alliance.

THE STERN CASE.—In our last issue we noted the fact that Mr. Chas. Stern and one of his nephews had seen fit on account of some comments made by the *Toronto World* upon the failure, to make an assault upon the proprietor, Mr. W. F. McLean. For this criminal assault the Police Magistrate deservedly sentenced them to ten days imprisonment each. For his impartial action Col. Denison deserves the commendation of the entire press, as this will be a warning to such people not to take the law into their own hands, and assault an editor every time he publishes anything with which they cannot agree.



ENLARGING.—We dropped into Mr. S. Frenkel's warehouse the other day and found half a dozen men at work tearing down partitions and enlarging the premises to almost double its former size. Mr.Frenkel stated that since he had began to advertise in THE TRADER his trade had increased so fast that he had no room to move around, and he expected if it kept on that he would have to buy out the Express Company and occupy the whole building. Said he: "There's nothing like having the goods that people want and then letting them know it through your journal." Right you are, Mr. Frenkel.

HEMMING BROS.,

29 ADELAIDE STREET EAST, - - TORONTO.

A CHANGE OF BASE.—A despatch from Montreal says: "At a meeting of the Holmes Electric Protective Company a motion was passed ratifying the decision of the directors with regard to the acceptance of an offer made by a syndicate of Toronto gentlemen for the purchase of the business of the Company in Canada. The syndicate is composed of Messrs. John Leys, T. G. Blackstock, R. Jennings, A. R. Riches, and A. J. Pattison, who have applied for an Act of incorporation, the details of which, however, have not yet been completed. The meeting decided that so soon as the syndicate completed its incorporation its offer would be accepted.

A LARGE CONSIGNMENT.—The other day when visiting the establishment of Messrs. P. W. Ellis & Co., we were shown an immense consignment of Whitcomb lathes, just received from the manufacturers in the U. S., a full description of which will be found on another page. The stock of Messrs. Ellis in such things as lathes and watchmakers' tools of all kinds is simply immense, and we do not think that they are going beyond the mark when they claim that they have the largest and best stocked material emporium in America. It is certainly a boon to the trade that they are able to get from one house anything that they can possibly want in this line.

This enterprising firm has also added to its already splendidly equipped factory an enamelling department, and are now prepared to do any kind of enamel work, no matter how fine. This is a big stride in the manufacture of artistic jewelry and the firm deserves credit for its enterprise.

A CHEAP SAFEGUARD.—We are often asked if the Jeweler's Security Alliance is alive yet. It still lives, but has so much money on hand the directors thought it unwise to make any more calls on the members until the present fund was exhausted. So far the Alliance has had none of its members molested by burglars. It does not guarantee its members against burglary, but it does guarantee that if any of them is burglarized that within twenty-four hours it will have some of the best detectives in America on their track and never let up until they are brought to book. One of the best Government detectives in Canada said the other day: "That burglars kept clear of the safes of members of the Jeweler's Security Alliance as religiously as if they were infected with the cholera." Every jeweler should make it a point to join, and if you want any information drop a line to Toronto to James Ryrie, the Secretary, or John Segsworth, President of the Alliance.

THE ROTHSCHILD SWINDLE.—In reference to this swindle, things remain pretty much as at the time of our last issue. One of their Montreal creditors visited Messrs. Herwitz and Bush, at Elmira, N.Y., their present city of refuge, when they made an offer of twenty-five cents on the dollar. It is needless to say that this cheeky offer was declined with thanks. In connection with the affair Mr.W.A Addinsella accountant of Birmingham, England, visited Toronto last week in the interest of the Birmingham creditors. He states that Herwitz while in that city last July, bought $60,000 on credit from manufacturers there. So far they have not received a cent of the money and from present appearances are not likely to do so. These goods it is learned were properly passed through the Customs at this port and the question now is, what has become of them? The creditors are making strong efforts to find them and we trust they will succeed. The more fully the facts come to light the more plainly is it seen that the whole thing must have been a premeditated swindle. So far as Canada is concerned, it is well rid of such a precious pair of scoundrels and it is to be devoutly hoped that the creditors may succeed in stripping them of their ill gotten gain. Such merchants are a disgrace to any country and this swindle should be so thoroughly advertised by the trade papers that no honest man with any self-respect should ever have any dealings with the pair in future.

JEWELRY AUCTION SALES.—The jewelry auction sales epidemic has again set in here, and the probability is that before the year is out there will be as many of them going on as there are auctioneers in the city. As we have said before, these sales are practically swindles upon an ignorant public, who would do well to shun them and buy what goods they want from an honest reliable dealer, who does not try to make them believe that an article is worth ten dollars and then sell it at five and makes a good profit on the transaction. The very fact that these auction sales are continued by the same parties from year to year, proves very plainly that they do not resort to this method of forcing sales because they are hard up, but because there's money in it for them. If they sacrifice goods as they pretend and as the public are led to believe, they would sell only when necessity forced them to do so. The fact is that in many cases it is not even old stock that is sold, but new goods bought specially for this class of trade. Every jeweler knows that there is no money in auctioning fine goods, but that the profit is made on cheap goods got up to imitate the real thing. If the public knew that they were only buying inferior goods at first-class prices, these jewelry auctions would have to adjourn within twenty-four hours for want of a quorum. The fools not all being dead yet, and a fresh supply coming forward every year ready to be bled, makes these auctions the pleasant and profitable things that they are. There is a good deal of talk amongst our legitimate retailers at present about how to counteract this innovation, but as long as they are without any organization, so long will they have to suffer their market to be flooded by the goods of hard-up jobbers and manufacturers, who having stocked up the regular trade, resort to this disreputable way of getting rid of the balance of their stock. A strong organization properly managed would soon bring these gentlemen to their senses. If our retailers would simply refuse to buy a dollar's worth of goods from any house that sells to these auction firms, they would soon find the evil abated. This, however, can only be effected by combination, and it remains to be seen whether self interest will be strong enough to effect such a desirable end.

LITERARY NOTES.

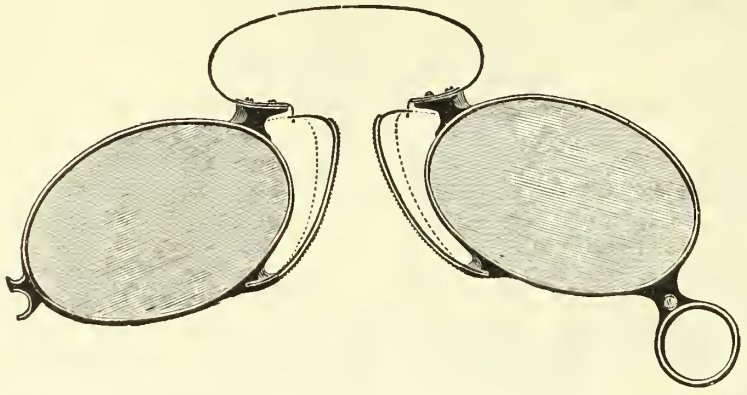
THE CENTURY MAGAZINE for December is just to hand, and is a number of more than usual interest. The life of Lincoln of course forms the principal topic, and is treated in such a way as to make it almost fascinating even to that class of readers who enjoy the perusal of romance in preference to historical history. By the time these inimitable papers are completed, the world in general and the American people in particular, will have learned how "great" a man Abraham Lincoln was, and that "true greatness," does not necessarily consist of an overgrown genealogical tree, but has its root deep down in human nature and often does spring direct from the "common" people.

The war papers in this issue show how "Getteysburg" was won by the Federal troops under Gen. Meade. As this was the turning point of the war, the history of how the Southern General Lee, won on the first day and lost on the second, will alway form one of the most interesting episodes of the great war drama.

Space prevents us from giving a more extended notice of this number, but we would advise every one of our readers to peruse the advertisement of the *Century's* attractions as set forth in another column and subscribe for it forthwith.

ST. NICHOLAS for December is as replete with interesting things for the little folk as the *Century* is for their elders. There is nothing that we know of so calculated to make boys and girls contented and happy as a good illustrated magazine of the high class to which the *St. Nicholas* belongs. Francais Hodgson Burnett's new fairy tale "The Story of Prince Fairyfoot" begins in this number and is one of her best. The illustrated article on "How a great Battle Panorama is made," by T. R. Davis is alone worth the price of the number to any ordinary boy and will be found good reading by older people. In addition to these there are a great many short stories suitable to the Christmas season and illustrations of so humorous a character as to make even an oyster smile. One of the best presents that any parent can give their children is this magazine for a year.

WORKSHOP NOTES.



PICKLE.—A good pickle is prepared by mixing one-eighth of one ounce of sulphuric acid with one ounce of rain water.

CLEANING GOLD TARNISHED IN SOLDERING.—Gold tarnished in soldering is usually cleaned in dilute sulphuric acid. The pickle is made in about the proportion of one ounce of acid to one ounce of rain water.

HARDENING in petroleum of small articles of steel can be recommended. The tempering is done in the ordinary way; the articles remain white and do not warp. Be careful, however, not to go near the fire with the oil.

BURNISHING POWDER.—A good burnishing powder is prepared

The Montreal Optical and Jewellery Company, L'd.

Christmas Specialties.

OUR TRAVELLERS ARE NOW OUT WITH FULL LINES OF SAMPLES OF

STAPLE AND CHRISTMAS GOODS.

from ½ pound white chalk, 2 ounces pipe clay, 2 ounces white lead, ½ ounce magnesia carbonate, and colored with the same quantity of jewelers' rouge. It is said to be unrivaled for cleansing silver.

To Refine Sweepings.—To 8 ounces of the dirt which has been washed and burnt, add salt 4 ounces; pearl-ash, 4 ounces; red tartar, 1 ounce; saltpeter, ½ ounce; mix thoroughly in a mortar, melt in a crucible, and dissolve out the precious metals in a button.

Benzine.—Dirty benzine may be again rendered fit for use by filtering through animal charcoal. One of our friends stops the end of an ordinary pint glass funnel with paper, and presses therein calcined bone dust till it is about three parts full. On the top of this is poured the benzine to be filtered.

To Blue Screws Evenly.—Take an old watch barrel and drill as many holes into its head as you desire to blue screws at a time. Fill it about one-fourth full of brass or iron filings, put in the head, and then fit a wire long enough to bend over for a handle into the arbor holes—head of barrel upwards. Brighten the heads of your screws, set them point downwards into the holes already drilled, and expose the bottom of the barrel to your lamp, until the screws assume the color you wish.

Barrel Arbor.—In the absence of a suitable tap or screw plate, when turning in a Swiss barrel arbor, if the collet is good it may be used as a plate. Soften the collet and file two slight passages across the threads with a fine three-cornered file; screw a piece of brass wire through the collet, so as to free the threads from burr; then re-harden the collet and cut the screw on the arbor with it, A pair of pliers with faces curved to suit the collet are used to hold it. In an emergency the old arbor may be prepared for use as a tap if the old collet is not available.

Wise and Otherwise.

Phonograph is feminine gender—because it talks back.

What does a man see in the wild, wild waves? Sea foams.

A man may not possess a castle in Spain, and yet have a Cochin China.

Mrs. Partington says that her minister preached about "the parody of the probable son."

What riles a country postmistress is to have a postal card come to the office written in French.

The butcher who sells ox tails for soup and calves' heads for dinners undoubtedly makes both ends meat.

"How much did you pay for that hat?" asked an old colored person of his fellow tramp. "Well, I don't know, for when I bought it there wasn't anybody in the shop."

Geography and grammer strive with each other to form the pith of the following clever puns: Which is the coldest river? -The ice is (Isis.) There is another colder—the icer (Iser.)

"We all knows," said a cockney school-committeeman to a new teacher he was examining for her position, "that A, B and C is wowels; but what we wants to know is vy they is so."

A Paisley publican was complaining of his servant maid that she could never be found when required. "She'll gang oot o' the house," said he, "twenty times for ance she'll come in."

A poor preacher was caught in a shower on his way to church. He said: "I shall certainly take cold if I go into the pulpit so wet." "O! no, you won't," was the reply. "You are always dry enough there."

The growing custom of putting the choir at the pulpit end of the church has the very serious drawback that it prevents a man from turning around and looking up at the organ in a critical manner just before the contribution plate reaches his pew.

A meddlesome old woman was sneering at a young mother's awkwardness with her infant, and said: "I declare, a woman never ought to have a baby unless she knows how to hold it." "Nor a tongue, either," quietly responded the young mother.

An Irish horse-stealer, who, when O'Connell had obtained his acquittal, exclaimed in the exuberance of his gratitude, "Och, counselor, I've no way here to thank yer honor; but I wisht I saw you *knocked down in my own parish*,—would'nt I bring a faction to the rescue!"

An English officer at Venice, walking one day from the Doge's palace, thought he observed one of the figures on the clock tower of St. Mark's stoop down and take up something. He looked again, and he positively saw the figure take a pinch of snuff. The officer confessed that he was apprehensive he was losing his senses or that his vision was deranged, when an old woman, observing his consternation, soon explained the seeming miracle by telling him that one of the figures that struck the hour being out of repair, her nephew, Jacopo, was engaged as a substitute till the machine was put in order.

Other Notes.

Deceptive Advertising.—The laws of the German "paternal" government do not permit misrepresentations in advertisements, and the old fogies who "do not believe in advertising," chuckle over the "protection" afforded them by a code of laws very proper, perhaps, for the fifteenth, but entirely unfitted for the nineteenth century. An advertiser who stated in his handbills and circulars last Christmas that "he sold at cost price," etc., using the ordinary phraseology, had his handbills confiscated by the police, and beside this he received the warning that at a repetition of the offence, a l the terrors of the law "made and provided in such cases" would be invoked against him.

"The Best Watchmaker."—The story is told of a French watchmaker who, on opening his shop in one of the streets of Paris, "hung out his shingle," on which he modestly advertised himself as "the best watchmaker in Paris." Shortly afterward a competitor established himself in his neighborhood, who, not desiring to hide his light under a bushel, sought to excel the former, and announced himself in gold letters on his sign as "the best watchmaker in the world." "Competition is the life of trade," and so it proved in this instance, because a third watchmaker established soon after between the two, who eclipsed both of them by modestly stating himself to be "the best watchmaker on the street."

The Production of Silver.—In the thirty years extending up from 1857, the production of silver in the United States was about $750 000,000, of which India has absorbed 50 per cent. In that period the production of silver in all quarters of the world was about $2,185,000,000, so that India alone has absorbed $59,000,000 more than all the remainder of the world. At the same time, or, at least, in the fifteen years covered by minute statistical records, the purchasing power of silver in India has increased, as it will buy from 15 to 20 per cent. more of the products of Indian labor, or of the labor itself, than in 1870. The demand for silver, therefore, still exceeds the supply in that country. Nor is this surprising. Silver is the great medium of exchange among that people, who in the aggregate are very rich, inhabiting a country of inexhaustible fertility; and yet if all the silver in the outside were added to their present stock, and if it were all used as money, they would have a per capita covering only a third to a half as large as the United States or France. But the principal consumption of silver in India is in works of art or in hoarding.

A Remarkable Diamond.—In August, 1884, the arrival in London of the celebrated 457 karat fine white diamond from South Africa, and its subsequent purchase by a syndicate of London and Paris diamond merchants, were announced. The g m was intrusted to the care of one of the most skillful cutters, who has been engaged on the stone for the past eight months, and expects to complete the work in April next. As anticipated, the stone will turn out the most wonderful "brilliant cut" diamond on record. surpassing in weight, as also, it is believed, in color, purity and lustre, all the crown and historical brilliants of the world. The stone in its almost finished state, weighs still 230 karats; but in order to give it the best possible shape and lustre, it is intended to reduce its weight to something under 200 karats. The Koh-i-noor weighs only 106 karats, the Regent of France 136¾ karats, the Star of the South 125 karats, and the Piggott 82¼ karats. The Great Mogul weighs 279 karats; it is, however, a lumpy stone, only rose cut, and if cut to a proper shaped brilliant, it would probably not weigh more than 140 karats

THE TRADER is printed by R. G. McLEAN, 13 Adelaide St. E., Toronto, who makes a specialty of Jewelers' Work. Samples and estimates on application.

THE CENTURY

FOR 1886-7.

THE CENTURY is an illustrated monthly magazine, having a regular circulation of about two hundred thousand copies, often reaching and sometimes exceeding two hundred and twenty-five thousand. Chief among its many attractions for the coming year is a serial which has been in active preparation for sixteen years. It is a history of our own country in its most critical time, as set forth in

THE LIFE OF LINCOLN,

By His Confidential Secretaries, John G. Nicolay and Col. John Hay.

This great work, begun with the sanction of President Lincoln, and continued under the authority of his son, the Hon. Robert T. Lincoln, is the only full and authoritative record of the life of Abraham Lincoln. Its authors were friends of Lincoln before his presidency; they were most intimately associated with him as private secretaries throughout his term of office, and to them were transferred upon Lincoln's death all his private papers. Here will be told the inside history of the civil war and of President Lincoln's administration,—important details of which have hitherto remained unrevealed, that they might first appear in this authentic history. By reason of the publication of this work,

THE WAR SERIES

Which has been followed with unflagging interest by a great audience, will occupy less space during the coming year. Gettysburg will be described by Gen. Hunt (Chief of the Union Artillery), Gen. Longstreet, Gen. E. M. Law and others; Chickamauga, by Gen. D. H. Hill; Sherman's March to the Sea, by Generals Howard and Slocum. Generals Q. A. Gillmore, Wm. F. Smith, John Gibbon, Horace Porter and John S. Mosby will describe special battles and incidents. Stories of naval engagements, prison life, etc., etc., will appear.

NOVELS AND STORIES.

"The Hundredth Man," a novel by Frank R. Stockton, author of "The Lady, or the Tiger?" etc., begins in November. Two Novelettes by George W. Cable, Stories by Mary Hallock Foote, "Uncle Remus," Julian Hawthorne, Edward Eggleston and other prominent American authors will be printed during the year.

SPECIAL FEATURES

(with illustrations) include a series of articles on affairs in Russia and Siberia, by George Kennan, author of "Tent Life in Siberia," who has just returned from a most eventful visit to Siberian prisons; papers on the Food Question with reference to its bearing on the Labor Problem; English Cathedrals; Dr. Eggleston's Religious Life in the American Colonies; Men and Women of Queen Anne's Reign, by Mrs. Oliphant; Clairvoyance, Spiritualism, Astrology, etc., by the Rev. J. M. Buckley, D.D., editor of the *Christian Advocate;* astronomical papers; articles throwing light on Bible history etc.

PRICES. A FREE COPY.

Subscription price, $4.00 a year, 35 cents a number. Dealers, postmasters and the publishers take subscriptions. Send for our beautifully illustrated 24-page catalogue (free), containing full prospectus, etc., including a special offer by which new readers can get back numbers to the beginning of the War Series at a very low price. A specimen copy (back number) will be sent on request. Mention this paper.

Can you afford to be without THE CENTURY?

THE CENTURY CO., New-York.

"THE IDEAL MAGAZINE"

for young people is what the papers call ST. NICHOLAS. Do you know about it,—how good it is, how clean and pure and helpful? If there are any boys or girls in your house will you not try a number, or try it for a year, and see if it isn't just the element you need in the household? The *London Times* has said, "We have nothing like it on this side." Here are some leading features of

ST. NICHOLAS

FOR 1886-87.

Stories by Louisa M. Alcott and Frank R. Stockton,—several by each author.

A Short Serial Story by Mrs. Burnett, whose charming "Little Lord Fauntleroy" has been a great feature in the past year of ST. NICHOLAS.

War Stories for Boys and Girls. Gen. Badeau, chief-of-staff, biographer, and confidential friend of General Grant, and one of the ablest and most popular of living military writers, will contribute a number of papers describing in clear and vivid style some of the leading battles of the civil war. They will be panoramic descriptions of single contests or short campaigns, presenting a sort of literary picture-gallery of the grand and heroic contests in which the parents of many a boy and girl of to-day took part.

The Serial Stories include "Juan and Juanita," an admirably written story of Mexican life, by Frances Courtenay Baylor, author of "On Both Sides"; also, "Jenny's Boarding-House," by James Otis, a story of life in a great city.

Short Articles, instructive and entertaining, will abound. Among these are: "How a Great Panorama is Made," by Theodore R. Davis, with profuse illustrations; "Winning a Commission" (Naval Academy), and "Recollections of the Naval Academy"; "Boring for Oil" and "Among the Gas-wells," with a number of striking pictures; "Child-Sketches from George Eliot," by Julia Magruder; "Victor Hugo's Tales to his Grandchildren," recounted by Brander Matthews; "Historic Girls," by E. S. Brooks. Also interesting contributions from Nora Perry, Harriet Prescott Spofford, Joaquin Miller, H. H. Boyesen, Washington Gladden, Alice Wellington Rollins, J. T. Trowbridge, Lieutenant Frederick Schwatka, Noah Brooks, Grace Denio Litchfield, Rose Hawthorne Lathrop, Mrs. S. M. B. Piatt, Mary Mapes Dodge, and many others, etc., etc.

The subscription price of ST. NICHOLAS *is $3.00 a year; 25 cents a number. Subscriptions are received by booksellers and newsdealers everywhere, or by the publishers. New volume begins with the November number. Send for our beautifully illustrated catalogue (free) containing full prospectus, etc., etc.*

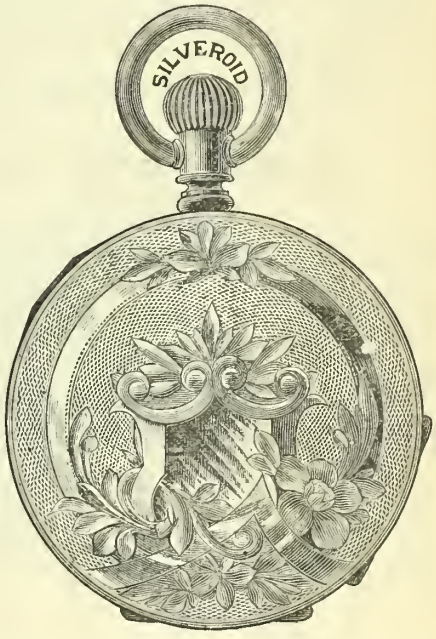
THE NEW METAL CASE



SILVEROID!

The metal of which these cases are made is a new one, far superior to any other in use for low-price watch-cases. It is stronger, is capable of a high degree of polish, has the lustre of silver, and will not tarnish.

PRICES SAME AS THOSE FOR ANY OTHER METAL CASES NOW IN THE MARKET.

A FULL LINE NOW IN THE HANDS OF THE JOBBING TRADE.

Send for sample, and don't be put off with any other than the

SILVEROID!

KEYSTONE WATCH CASE CO.

19TH & BROWN STS., PHILADELPHIA, PA.

NEW YORK. **CHICAGO.**

ESTABLISHED 1872.

The Plainville Stock Co.,

Manufacturing Jewelers,

Would respectfully invite the attention of the Trade to their unusually fine and large stock of

ROLLED PLATE AND SOLID GOLD FRONT JEWELRY.

We offer many and attractive designs, all of which are original and unique. The workmanship upon our goods is unexcelled, and the stock used is of the finest quality.

We make a specialty of

LACE AND BROOCH PINS, DROPS AND SETS,

which we have in almost endless variety. These are made after new patterns designed by our own artists, and are chaste and elegant. In addition, we have a full line of goods for the Fall and Holiday Trade, which we will take great pleasure in showing to our customers.

In order to protect the Trade from being imposed upon by goods of an inferior quality, made in imitation of ours, we have adopted a Trade Mark as follows:

P. S. CO.

This mark will be stamped in an inconspicuous manner upon all our goods, and is a guarantee to the dealer of their quality. Retail dealers will be furnished with the names of jobbers who carry our goods, on application.

Full lines can always be seen at our New York Office: No. 176 BROADWAY.

PLAINVILLE STOCK COMPANY,

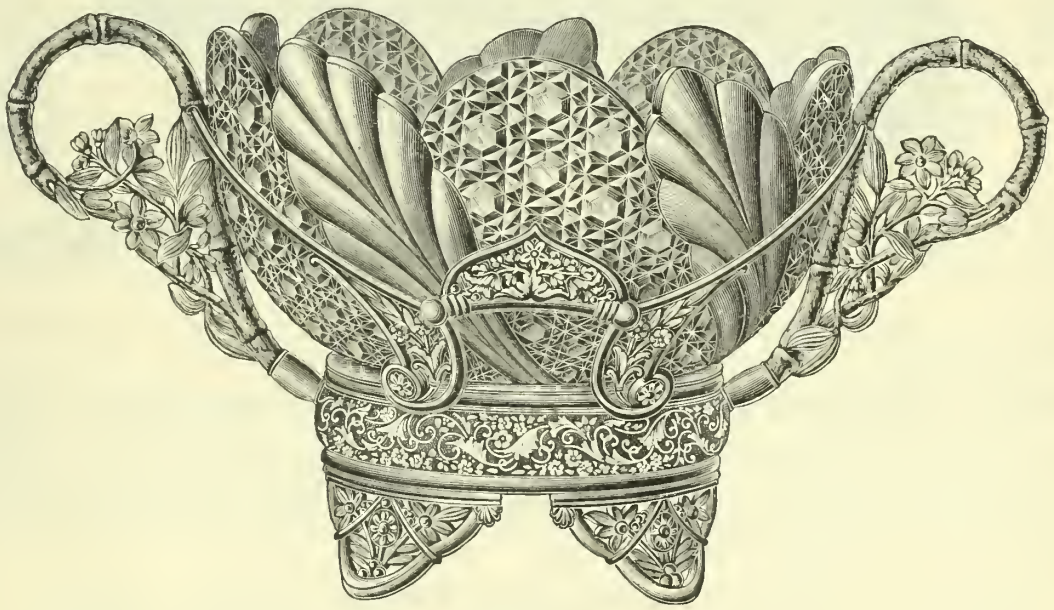
PLAINVILLE, MASS.

SIMPSON, HALL, MILLER & CO.,

WALLINGFORD, CONN.

—MANUFACTURERS OF—

Artistic and Useful Hollow Ware,



ELECTRO-PLATED UPON FINE HARD WHITE METAL.

There is nothing in Designing, Ornamentation or Manufacturing which our artists and workmen cannot produce.

OUR FACILITIES FOR EXECUTING FINE WORK ARE UNEXCELLED.

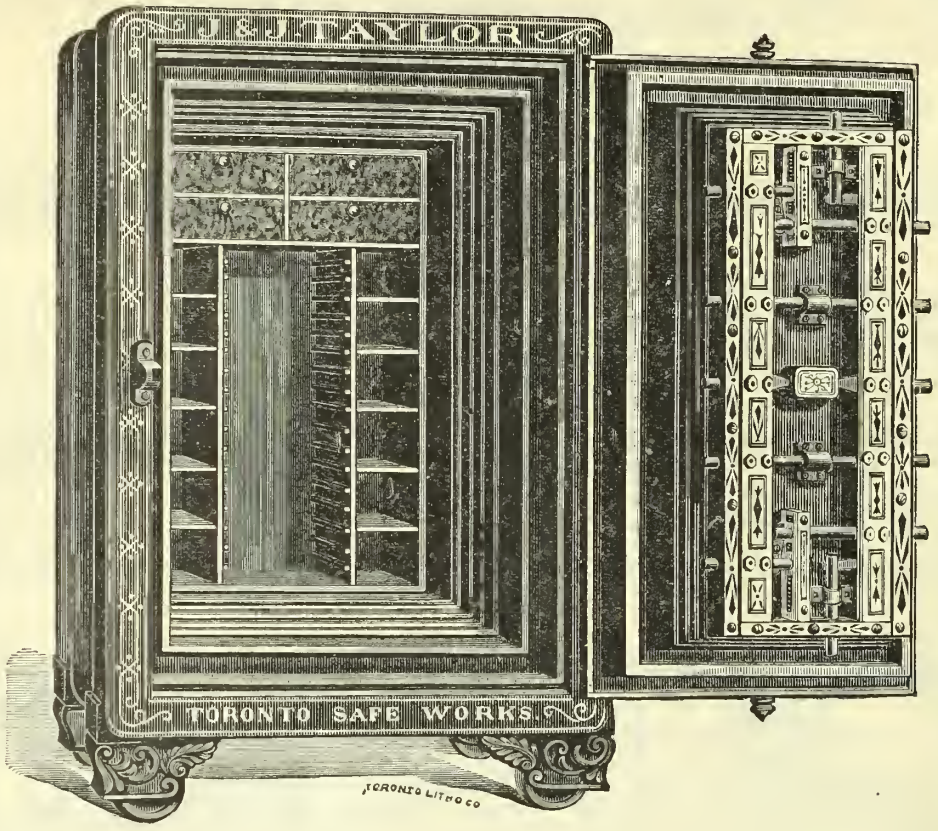
OUR ASSORTMENT IS SUITABLE FOR THE BEST TRADE.

WE CARRY A STOCK OF MANUFACTURED GOODS SUFFICIENT TO MEET THE DEMANDS OF THE LARGEST TRADE.

SPOONS, FORKS, ETC., PLATED UPON THE FINEST NICKEL SILVER IN

EXTRA, DOUBLE, TRIPLE AND SECTIONAL PLATE.

Full lines of over FORTY STAPLE AND FANCY PIECES in each pattern in Geneva, St. James, Countess Windsor, Oval Thread, etc. Made under the supervision, and quality guaranteed and controlled by WM. ROGERS formerly of Hartford and Meriden. (Wm. Rogers, Sr., died 1883.)



WM. ROGERS, - - WALLINGFORD, CONN.

No connection with any concern in Waterbury, Meriden, or Hartford using name of Rogers in any form.

FACTORIES: WALLINGFORD, CONN., U.S., AND MONTREAL, CANADA.

SOMETHING NEW IN JEWELERS' SAFES

J. & J. TAYLOR'S NEW STYLE JEWELERS' SAFE, WITH DOUBLE TONGUE AND GROOVE FIRE-PROOF DOORS.

J. & J. TAYLOR, TORONTO SAFE WORKS.

IN ORDER to meet the wishes of the jewelry trade, we have at last succeeded in perfecting a new style of safe for jewelers' use, combining the advantages of first-class

FIRE AND BURGLAR PROOF SECURITY WITH MODERATE COST.

THE above cut represents our new style of Fire and Burglar Proof Safe for Jewelers, which has an entire lining inside of best five ply welded Chrome steel and iron, with heavy Burglar Proof door, made any thickness required, and which is securely attached to the Fire-proof door. The Burglar Proof Door is fitted with rubber tube packing to prevent the use of explosives, and is locked with four wheel Combination Lock having our patent Enlarged Centre Lock Spindle and Bolt Handle.

To the above improvements is also added our new patent

DOUBLE TONGUE AND GROOVE FIRE-PROOF DOORS,

this being the latest improvement in Fire Proof Safes, and PATENTED BY US JANUARY 14TH, 1886. This door is fitted with a TONGUE made of wrought iron, corresponding with and locking into a GROOVE, made of same material, on the door frame. To both of these is connected a SECOND TONGUE and GROOVE made of thin galvanized steel, which is filled with non-conducting material thus making

TWO COMPLETE TONGUES AND TWO GROOVES IN EACH DOOR,

and which we maintain is the best fire-proof safe now made.

Visitors to the coming Industrial Exhibition can see samples of these safes at our exhibit in the Main Building. Do not fail to examine them.

J. & J. TAYLOR,

TORONTO SAFE WORKS

117 and 119 Front St. East, Toronto.
